A dot (●) indicates material that has been revised since publication of the Draft EIR. Long changes are indicated with opening dots (❶) and closing dots (❶).

CANDLESTICK POINT–HUNTERS POINT SHIPYARD PHASE II DEVELOPMENT PLAN PROJECT

Final Environmental Impact Report

Volume I: Final EIR Executive Summary
Administrative Draft 1

San Francisco Redevelopment Agency File No. ER06.05.07
City and County of San Francisco Planning Department File No. 2007.0946E
State Clearinghouse No. 2007082168

San Francisco Redevelopment Agency
One South Van Ness Avenue, Fifth Floor, San Francisco, California 94103, *and*
City and County of San Francisco Planning Department
1650 Mission Street, Suite 400, San Francisco, California 94103

Draft EIR Publication Date: November 12, 2009
San Francisco Redevelopment Agency Commission Public Hearing Dates: December 15, 2009, January 5, 2010
San Francisco Planning Commission Public Hearing Date: December 17, 2009
Draft EIR Public Review Period: November 12, 2009–January 12, 2010
Final EIR Certification Hearing Date: June 3, 2010

June 2017

Contents

Volume I: Final EIR Executive Summary

Executive Summary ES-1
Purpose of the Summary ES-1
Project Description ES-1
Project Objectives ES-2
Approval Requirements ES-4
Areas of Controversy/Issues to Be Resolved ES-6
Project Variants ES-8
Alternatives ES-13
Summary of Impacts ES-23

Volume II: Final EIR (Chapter I to Section III.M)

CHAPTER I Introduction I-1
I.A Project Overview I-1
I.B History of Planning Process I-1
I.B.1 Introduction I-1
I.B.2 Redevelopment Plans I-2
I.B.3 The San Francisco General Plan I-4
I.C Purpose of the EIR I-6
I.D Environmental Review Process I-8
I.D.1 Notice of Preparation and Summary of Comments I-8
I.D.2 Public Review of the Draft EIR I-10
I.D.3 Final EIR and EIR Certification I-11
I.D.4 CEQA Findings for Project Approval I-11
I.D.5 Mitigation Monitoring and Reporting Program I-12
I.E Organization of the EIR I-12

CHAPTER II Project Description II-1
II.A Project Overview II-1
II.B Project Location II-1
II.B.1 Regional Location II-1
II.B.2 Candlestick Point II-1
II.B.3 Hunters Point Shipyard Phase II II-4
II.C Project Setting II-4
II.C.1 Candlestick Point II-4
II.C.2 Hunters Point Shipyard Phase II II-4
II.D Project Objectives II-5
II.E Project Characteristics II-7
II.E.1 Land Use Plan II-7
II.E.2 Parks and Open Space Plan II-24
II.E.3 Transportation Improvements II-34
II.E.4 Infrastructure Plan II-45
II.E.5 Community Benefits II-47

II.E.6 Green Building Concepts II-48
II.F Development Schedule II-49
II.F.1 Abatement and Demolition II-52
II.F.2 Site Preparation and Earthwork/Grading II-53
II.F.3 Construction Equipment II-79
II.G Approval Requirements II-80
II.G.1 General Plan Amendments, Planning Code Amendments, Redevelopment Plan Amendments II-82
II.G.2 Disposition and Development Agreement II-82
II.G.3 Design for Development II-82
II.G.4 Project Plans II-83
II.H Technical, Economic, and Environmental Characteristics II-83

CHAPTER III Environmental Setting, Impacts, and Mitigation Measures III.A-1
III.A Introduction to Analysis III.A-1
III.A.1 Comments Received on the Notice of Preparation III.A-1
III.A.2 Scope of the EIR III.A-1
III.A.3 Format of the Environmental Analysis III.A-2
III.B Land Use and Plans III.B-1
III.B.1 Introduction III.B-1
III.B.2 Setting III.B-1
III.B.3 Regulatory Framework III.B-32
III.B.4 Impacts III.B-32
III.C Population, Housing, and Employment III.C-1
III.C.1 Introduction III.C-1
III.C.2 Setting III.C-1
III.C.3 Regulatory Framework III.C-8
III.C.4 Impacts III.C-11
III.D Transportation and Circulation III.D-1
III.D.1 Introduction III.D-1
III.D.2 Setting III.D-1
III.D.3 Regulatory Framework III.D-26
III.D.4 Impacts III.D-31
III.E Aesthetics III.E-1
III.E.1 Introduction III.E-1
III.E.2 Setting III.E-1
III.E.3 Regulatory Framework III.E-44
III.E.4 Impacts III.E-49
III.F Shadows III.F-1
III.F.1 Introduction III.F-1
III.F.2 Setting III.F-1
III.F.3 Regulatory Framework III.F-3
III.F.4 Impacts III.F-5
III.G Wind III.G-1
III.G.1 Introduction III.G-1
III.G.2 Setting III.G-1
III.G.3 Regulatory Framework III.G-4
III.G.4 Impacts III.G-4
III.H Air Quality III.H-1
III.H.1 Introduction III.H-1
III.H.2 Setting III.H-1

III.H.3 Regulatory Framework III.H-13
III.H.4 Impacts III.H-18
III.I Noise and Vibration III.I-1
III.I.1 Introduction III.I-1
III.I.2 Setting III.I-6
III.I.3 Regulatory Framework III.I-15
III.I.4 Impacts III.I-20
III.J Cultural Resources and Paleontological Resources III.J-1
III.J.1 Introduction III.J-1
III.J.2 Setting III.J-2
III.J.3 Regulatory Framework III.J-27
III.J.4 Impacts III.J-31
III.K Hazards and Hazardous Materials III.K-1
III.K.1 Introduction III.K-1
III.K.2 Setting III.K-5
III.K.3 Regulatory Framework III.K-36
III.K.4 Impacts III.K-46
III.L Geology and Soils III.L-1
III.L.1 Introduction III.L-1
III.L.2 Setting III.L-1
III.L.3 Regulatory Framework III.L-17
III.L.4 Impacts III.L-22
III.M Hydrology and Water Quality III.M-1
III.M.1 Introduction III.M-1
III.M.2 Setting III.M-1
III.M.3 Regulatory Framework III.M-27
III.M.4 Impacts III.M-49

Volume III: Final EIR (Section III.N through Chapter VIII)

III.N Biological Resources III.N-1
III.N.1 Introduction III.N-1
III.N.2 Setting III.N-3
III.N.3 Regulatory Framework III.N-36
III.N.4 Impacts III.N-47
III.O Public Services III.O-1
III.O.1 Introduction III.O-1
Police Protection III.O-1
III.O.2 Setting III.O-1
III.O.3 Regulatory Framework III.O-6
III.O.4 Impacts III.O-7
Fire and Emergency Medical Services III.O-13
III.O.5 Setting III.O-13
III.O.6 Regulatory Framework III.O-15
III.O.7 Impacts III.O-16
Schools III.O-23
III.O.8 Setting III.O-23
III.O.9 Regulatory Framework III.O-25
III.O.10 Impacts III.O-28
Libraries III.O-32
III.O.11 Setting III.O-32
III.O.12 Regulatory Framework III.O-34

III.O.13 Impacts III.O-34
III.P Recreation III.P-1
III.P.1 Introduction III.P-1
III.P.2 Setting III.P-1
III.P.3 Regulatory Framework III.P-6
III.P.4 Impacts III.P-10
III.Q Utilities III.Q-1
III.Q.1 Introduction III.Q-1
Water III.Q-1
III.Q.2 Setting III.Q-1
III.Q.3 Regulatory Framework III.Q-11
III.Q.4 Impacts III.Q-13
Wastewater III.Q-19
III.Q.5 Setting III.Q-19
III.Q.6 Regulatory Framework III.Q-24
III.Q.7 Impacts III.Q-25
Solid Waste III.Q-36
III.Q.8 Setting III.Q-36
III.Q.9 Regulatory Framework III.Q-39
III.Q.10 Impacts III.Q-42
Electricity, Natural Gas, and Telecommunications III.Q-57
III.Q.11 Setting III.Q-57
III.Q.12 Regulatory Framework III.Q-58
III.Q.13 Impacts III.Q-58
III.R Energy III.R-1
III.R.1 Introduction III.R-1
III.R.2 Setting III.R-1
III.R.3 Regulatory Framework III.R-8
III.R.4 Impacts III.R-14
III.S Greenhouse Gas Emissions III.S-1
III.S.1 Introduction III.S-1
III.S.2 Setting III.S-2
III.S.3 Regulatory Framework III.S-9
III.S.4 GHG Emissions Inventory III.S-20
III.S.5 Impacts III.S-33

CHAPTER IV Project Variants IV-1
IV.A Introduction IV-1
IV.B Variant 1: R&D Variant (No Stadium—Additional Research & Development) IV-6
IV.B.1 Overview IV-6
IV.B.2 Project Objectives IV-6
IV.B.3 Characteristics IV-6
IV.B.4 Potential Environmental Effects IV-14
IV.C Variant 2: Housing Variant (No Stadium—Relocation of Housing) IV-73
IV.C.1 Overview IV-73
IV.C.2 Project Objectives IV-74
IV.C.3 Characteristics IV-76
IV.C.4 Potential Environmental Effects IV-83

IV.Ca Variant 2A: Housing/R&D Variant (No Stadium—Relocation of Housing; Additional R&D) IV-140
IV.Ca.1 Overview IV-140
IV.Ca.2 Project Objectives IV-143
IV.Ca.3 Characteristics IV-143
IV.Ca.4 Potential Environmental Effects IV-147
IV.D Variant 3: Candlestick Point Tower Variants IV-173
IV.D.1 Overview IV-173
IV.D.2 Project Objectives IV-179
IV.D.3 Characteristics IV-179
IV.D.4 Potential Environmental Effects IV-180
IV.E Variant 4: Utilities Variant IV-231
IV.E.1 Overview IV-231
IV.E.2 Project Objectives IV-231
IV.E.3 Characteristics IV-231
IV.E.4 Potential Environmental Effects IV-237
IV.F Variant 5: San Francisco 49ers and Oakland Raiders Shared Stadium at Hunters Point Shipyard IV-266
IV.F.1 Overview IV-266
IV.F.2 Project Objectives IV-266
IV.F.3 Characteristics IV-266
IV.F.4 Potential Environmental Effects IV-266

CHAPTER V Other CEQA Considerations V-1
V.A Introduction V-1
V.B Significant Environmental Effects of the Project V-1
V.C Significant Environmental Effects That Cannot Be Avoided If the Project Is Implemented V-1
V.D Significant Irreversible Environmental Effects V-4
V.E Effects Not Found to Be Significant V-9
V.F Irreversible Damage V-10
V.G Direct or Indirect Economic or Population Growth V-10
V.H Urban Decay V-14

CHAPTER VI Alternatives VI-1
VI.A Introduction VI-1
VI.A.1 Legislative Framework VI-1
VI.A.2 Analytic Method VI-2
VI.A.3 Project Objectives VI-3
VI.B Description of Alternatives to the Project VI-3
VI.C Analysis of Project Alternatives VI-6
VI.C.1 Alternative 1: No Project VI-7
VI.C.2 Alternative 2: CP-HPS Phase II Development Plan; No Yosemite Slough Bridge VI-29
VI.C.3 Alternative 3: Reduced CP-HPS Phase II Development; San Francisco 49ers Stay at Existing Candlestick Park Stadium; Limited State Parks Agreement; Yosemite Slough Bridge Serving Only Transit, Bicycles, and Pedestrians VI-59
VI.C.4 Alternative 4: Reduced CP-HPS Phase II Development; Historic Preservation; No HPS Phase II Stadium, Marina, or Yosemite Slough Bridge VI-91

VI.C.4a Subalternative 4A: CP-HPS Phase II Development Plan with Historic Preservation VI-124
VI.C.5 Alternative 5: Reduced CP-HPS Phase II Development; No HPS Phase II Stadium, State Parks Agreement, or Yosemite Slough Bridge VI-132
VI.D Environmentally Superior Alternative VI-164
VI.D.1 Alternatives Considered But Eliminated from Further Analysis in the EIR VI-164
VI.E Comparison of Alternatives VI-177

CHAPTER VII Report Preparers and Persons Consulted VII-1
VII.A Lead Agencies VII-1
VII.B Other City Agencies VII-1
VII.C EIR Consultants VII-2
VII.D Project Sponsor VII-4
VII.E Project Attorney VII-5
VII.F Agency Attorney VII-5
VII.G Project Design Team VII-5
VII.H Project Transportation Consultant VII-6

CHAPTER VIII Acronyms/Abbreviations and Glossary VIII-1
VIII.A Acronyms/Abbreviations VIII-1
VIII.B Glossary VIII-14

EIR Appendices

Appendix A Notice of Preparation (NOP) and NOP Comments
Appendix A1 PBS&J, Analysis of Project Development Schedule Modifications and Environmental Impact Report, April 10, 2010
Appendix A2 PBS&J, Analysis of Revised Development Schedule Compared to the Noise Impacts Analyzed in the Draft EIR, March 25, 2010
Appendix A3 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Revised Project Phasing, March 23, 2010
Appendix A4 Fehr & Peers, Roadway and Transit Phasing Plan, March 17, 2010
Appendix A5 ENVIRON, Updated Project Phasing Effect on Air Quality and Climate Change Analyses Candlestick Point–Hunters Point Shipyard Phase II Development Plan, April 26, 2010
Appendix B Bayview Jobs, Parks, and Housing Initiative (Proposition G), November 20, 2007
Appendix C1 PBS&J Environmental Justice Report, November 2009
Appendix C2 Rahaim, John, SF Planning Director to Carlin, Michael, SFPUC: Projections of Growth by 2030, July 9, 2009
Appendix D CHS Consulting, Fehr & Peers, LCW Consulting Candlestick Point–Hunters Point Shipyard Phase II Development Plan Transportation Study, November 4, 2009
Appendix D1 Fehr & Peers, CP HPS Phase II Developmental Plan Transportation Study—Transit Delay Analysis Erratum, April 2010
Appendix E There is no appendix associated with Section III.E
Appendix F There is no appendix associated with Section III.F
Appendix G Cermak Peterka Petersen Pedestrian Wind Assessment, March 10, 2008
Appendix H1 PBS&J Air Quality Model Input/Output, July 2009
Appendix H2 MACTEC Construction Workers and Equipment Resources, October 1, 2009
Appendix H3 ENVIRON, Ambient Air Quality and Human Health Risk Assessment, May 2010 [Main Text and Attachment IV Only]

- Appendix H4 ENVIRON, Community Hazards and San Francisco Health Code Article 38 Analyses Candlestick Point–Hunters Point Shipyard Phase II Redevelopment Project, May 2010
- Appendix I1 Wilson Ihrig San Francisco 49ers Stadium Operational Noise Study, October 15, 2009
- Appendix I2 PBS&J Short-Term Noise Measurements, May 20, 2009
- Appendix I3 PBS&J Traffic Noise Model Output, October 6, 2009
- Appendix J Page & Turnbull Secretary's Standards Evaluation of Proposed Treatments for Dry Docks 2, 3, and 4, October 5, 2009
- Appendix J1 CIRCA, Historic Context Statement, July 2009
- Appendix J2 CIRCA, Historic Resources Survey, October 2009
- Appendix J3 CIRCA, Historic Resources Evaluation for Candlestick, April 2010
- Appendix J4 CIRCA, Rarity of HPS Military/Industrial Buildings, April 2010
- Appendix K There is no appendix associated with Section III.K
- Appendix L ENGEO Preliminary Geotechnical Report Hunters Point Shipyard Phase II and Candlestick Point, May 21, 2009
- Appendix M1 PBS&J and Baseline Stormwater Runoff Calculations, November 2009
- Appendix M2 BASELINE Water Quality Data Analysis, November 2009
- Appendix N1 PBS&J Candlestick Point/Hunters Point Shipyard Project Biological Resources Technical Report, December 2008, Updated November 2009
- Appendix N2 MACTEC, Yosemite Slough Bridge Drawings—Stadium and Non-Stadium Options
- Appendix N3 Draft Parks, Open Space, and Habitat Concept Plan, November 2009
- Appendix N4 H.T. Harvey & Associates Candlestick Point/Hunters Point Shipyard Tree Survey, October 16, 2009
- Appendix O There is no appendix associated with Section III.O
- Appendix P1 ESA Potential Wind Conditions at Executive Park Development, March 10, 2009
- Appendix P2 Senate Bill 792 Tidelands and submerged lands: City and County of San Francisco: Hunters Point Naval Shipyard and Candlestick Point, October 11, 2009
- Appendix Q1 PBS&J SFPUC Water Supply Assessment for the Proposed Candlestick Point–Hunters Point Shipyard Phase II Project, October 27, 2009
- Appendix Q2 Arup, Amendment to Water Demand Memorandum #16—Variant 2A (Housing/R&D Variant), April 28, 2010
- Appendix Q3 Hydroconsult Engineers Hydrologic Modeling to Determine Potential Water Quality Impacts, October 19, 2009
- Appendix R There is no appendix associated with Section III.R
- Appendix S ENVIRON Climate Change Technical Report Candlestick Point Hunters Point Shipyard Phase II, October 22, 2009
- Appendix T1 CP/HP Distict Heating and Cooling Description, Revised August 20, 2009
- Appendix T2 ARUP MBR Decentralized Wastewater Treatment EIR Description, August 19, 2009
- Appendix T3 ARUP CP-HPII EIR Write-Up Automated Waste Collection System, September 3, 2009
- Appendix T4 ENVIRON, Updated Air Quality Analysis Candlestick Point–Hunters Point Shipyard Phase II Development Plan—Updated Variants 2A and 3 (Tower Variant D), Alternative 2, and Subalternative 4A, April 26, 2010
- Appendix T5 ENVIRON, Updated Greenhouse Gas Emissions Calculation for Candlestick Point–Hunters Point Shipyard Phase II Development Plan—Variants 2A and 3 (Tower Variant D), Alternative 2, and Subalternative 4A, March 12, 2010
- Appendix T6 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Project Variant 2A, March 15, 2010
- Appendix T7 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Subalternative 4A, April 8, 2010
- Appendix U CBRE Candlestick Point–Hunters Point Shipyard Phase II Development Plan Secondary Land Use Effects, October 2009
- Appendix V1 Page & Turnbull Hunters Point Shipyard Feasibility Study, Revised September 9, 2009
- Appendix V2 CBRE Proposed Hunters Point Shipyard Phase II Redevelopment—Parcel C Financial Feasibility Analysis of Historic Reuse Options, October 30, 2009

Volume V: Final EIR Comments & Responses (Letter 50 through Letter 86)
Volume VI: Final EIR Comments & Responses (Letter 87 through Section G)

CHAPTER IX Comments and Responses IX-1

A. Introduction ..... C&R-1
- A.1 Purpose of the Comments and Responses Document ..... C&R-1
- A.2 Environmental Review Process ..... C&R-1
- A.3 Document Organization ..... C&R-3

B. Refinements Since Publication of the Draft EIR ..... C&R-4
- B.1 Project Refinements ..... C&R-5
- B.2 Variant Refinements ..... C&R-6
- B.3 Modifications to Mitigation Measures ..... C&R-9
- B.4 Subalternative 4A: CP HPS Phase II Development Plan with Historic Preservation ..... C&R-10

C. Project Approvals ..... C&R-12

D. List of Persons Commenting ..... C&R-13

E. Comments and Responses ..... C&R-21
- E.1 Master Responses ..... C&R-21
  - Master Response 1: SB 18 ..... C&R-22
  - Master Response 2: Potential Native American Burial Sites ..... C&R-24
  - Master Response 3: Impacts of the Project on Yosemite Slough (Biological Resources) ..... C&R-28
  - Master Response 4: Purpose and Benefits of the Yosemite Slough Bridge ..... C&R-54
  - Master Response 5: Health of Bayview Hunters Point Community ..... C&R-66
  - Master Response 6: Seismic Hazards ..... C&R-77
  - Master Response 7: Liquefaction ..... C&R-82
  - Master Response 8: Sea Level Rise ..... C&R-88
  - Master Response 9: Status of the CERCLA Process ..... C&R-105
  - Master Response 10: Pile Driving through Contaminated Soils ..... C&R-113
  - Master Response 11: Parcel E-2 Landfill ..... C&R-115
  - Master Response 12: Naturally Occurring Asbestos ..... C&R-122
  - Master Response 13: Post Transfer Shipyard Cleanup ..... C&R-125
  - Master Response 14: Unrestricted Use Alternative ..... C&R-132
  - Master Response 15: Proposition P and the Precautionary Principle ..... C&R-134
  - Master Response 16: Notification Regarding Environmental Restrictions and Other Cleanup Issues ..... C&R-138
  - Master Response 17: Enforcement of Environmental Restrictions and Mitigation Measures ..... C&R-142
  - Master Response 18: Traffic Mitigation Measures ..... C&R-144
  - Master Response 19: Proposed BAAQMD Guidelines ..... C&R-154
- E.2 Individual Responses ..... C&R-166
  - Responses to Written Comments ..... C&R-166
  - Responses to Oral Comments ..... C&R-1871

F. Draft EIR Revisions ..... C&R-2175
F.1 Changes to Executive Summary ..... C&R-2176
F.2 Changes to Chapter I (Introduction) ..... C&R-2231
F.3 Changes to Chapter II (Project Description) ..... C&R-2233
F.4 Changes to Section III.A (Introduction to the Analysis) ..... C&R-2253
F.5 Changes to Section III.B (Land Use and Plans) ..... C&R-2255
F.6 Changes to Section III.C (Population, Housing, and Employment) ..... C&R-2261
F.7 Changes to Section III.D (Transportation and Circulation) ..... C&R-2263

Executive Summary

PURPOSE OF THE SUMMARY

This summary is intended to highlight the major areas of importance in the environmental analysis for the Project as required by Section 15123 of the *California Environmental Quality Act* (CEQA) Guidelines. The summary includes a brief description of the Project, the Project objectives, approval requirements, areas of controversy/issues to be resolved, and a summary of alternatives to the Project. In addition, this chapter provides a table summarizing (1) potential environmental impacts that would occur as a result of the Project; (2) the level of significance of the environmental impacts prior to implementation of any applicable mitigation measures; (3) the recommended mitigation measures that avoid or reduce significant environmental impacts; and (4) the level of significance after mitigation measures are implemented (refer to Table ES-2 [Summary of Environmental Effects and Project Requirements/Mitigation Measures] at the end of this chapter).

PROJECT DESCRIPTION

The Project is located on approximately 702-acres east of United States Route 101 (US-101) in the southeast area of the City and County of San Francisco (City). It occupies the waterfront area from south of India Basin to Candlestick Cove. Figure II-1 (Project Location) illustrates the regional location of the Project and the location of the Project within the City.

The Project proposed by Lennar Urban includes a mixed-use community with a wide range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers National Football League (NFL) team. Additionally, new transportation and utility infrastructure would serve the Project including a bridge across Yosemite Slough.

Specifically, the Project proposes development of 10,500 residential units with an associated population of 24,465 residents; 885,000 gross square feet (gsf) of retail; 150,000 gsf of office; 2.5 million gsf of Research & Development (R&D) uses; a 220-room, 150,000 gsf hotel; 255,000 gsf of artist live/work space; 100,000 gsf of community services; 251.3 acres of new parks, sports fields, and waterfront recreation areas, as well as 84 acres of new and improved State parkland; a 69,000-seat 49ers stadium; and a 75,000 gsf performance arena. The permanent employee population associated with the Project would be 10,730.

In addition, a 300-slip marina would be provided. Shoreline improvements would also be provided to stabilize the shoreline. The Project would include structured and on-street parking and various infrastructure improvements to support the development.

The Project includes amendments of the Bayview Hunters Point and Hunters Point Shipyard Redevelopment Plans, and amendments of the San Francisco General Plan and *Planning Code*, consistent with the development project.

PROJECT OBJECTIVES

Project objectives are identified to both describe the underlying purpose of the Project and to guide the selection of potential Project alternatives. CEQA Guidelines Section 15126.6(a) requires that an EIR "describe a reasonable range of alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives but would avoid or substantially lessen any of the significant effects of the project." Typically, project objectives represent a combination of both the Lead Agency and the developer's intent and purpose in moving forward with the project.

In May 2007, the Board of Supervisors and the Mayor approved a resolution endorsing a Conceptual Framework for the integrated planning of both Hunters Point Shipyard and Candlestick Point. The Conceptual Framework was the result of a long planning process undertaken by the City and County of San Francisco, acting by and through the Mayor's Office of Economic and Workforce Development, the Redevelopment Agency of the City and County of San Francisco, and Lennar Urban.

The City's overarching goal for the Project is to revitalize the Bayview Hunters Point community by providing increased business and employment opportunities; housing options at a range of affordability levels; improved public recreation and open space amenities; an integrated transportation, transit, and infrastructure plan; and other economic and public benefits, all of which would collectively have no net negative impact on the City's General Fund.

Subsequently, and in response to the Conceptual Framework, the San Francisco voters approved Proposition G in June 2008, which is called the Bayview Jobs, Parks, and Housing Initiative ("the Initiative"). Proposition G repealed Proposition F, which had established a special use district for the Project site; instead, Proposition G proposed that new zoning be established along with a land use program (Proposition G is included as Appendix B to this EIR). The Initiative states that the Project must be consistent with the following objectives, which are also identified in this EIR as the Project's objectives:

1. The integrated development should produce tangible community benefits for the Bayview and the City, and in so doing should:
   - Improve the Candlestick Point State Recreation Area to enhance public access to the waterfront and enjoyment of the Bay
   - Create new public recreational and public open spaces in the Candlestick Point-Hunters Point Shipyard Development Plan (CP-HPS Development Plan)
   - Preserve the shoreline of the CP-HPS Development Plan site primarily for public park and public open space uses, including an extension of the Bay Trail along the waterfront
   - Create a range of job and economic development opportunities for local, economically disadvantaged individuals and business enterprises, particularly for residents and businesses located in the Bayview
   - Provide neighborhood-serving retail
   - Subsidize the creation of permanent space in the Shipyard for the existing artists
   - Transform the contaminated portions of the Shipyard Property into economically productive uses or public open space, as appropriate

- Implement the CP-HPS Development Plan with public benefits, whether or not the 49ers decide to remain in San Francisco, including developing alternate uses for the stadium site on the Shipyard Property that are consistent with the overall CP-HPS Development Plan objectives

2. The integrated development should re-connect Candlestick Point and the Hunters Point Shipyard site with the larger BVHP neighborhood and should maintain the character of the Bayview for its existing residents, and in so doing should:
   - Foster the creation of strong commercial, institutional, cultural and urban design ties between the development on Candlestick Point and the Hunters Point Shipyard and the Bayview in particular and the City in general
   - Provide automobile, public transportation, and pedestrian connections between the Shipyard, Candlestick Point, and the larger BVHP neighborhood
   - Create substantial affordable housing, jobs, and commercial opportunities for existing Bayview residents and businesses
3. The integrated development should include substantial new housing in a mix of rental and for-sale units, both affordable and market-rate, and encourages the rebuilding of Alice Griffith Housing, and in so doing should:
   - Provide new affordable housing that is targeted to the lower income levels of the Bayview population, including new units that are suitable for families, seniors, and young adults
   - Include housing at levels dense enough to create a distinctive urban form and at levels sufficient to make the CP-HPS Development Plan financially viable; attract and sustain neighborhood retail services and cultural amenities; create an appealing walkable urban environment served by transit; help pay for transportation and other infrastructure improvements; and achieve economic and public benefits for the Bayview in particular and the City generally
   - Upon consultation with Alice Griffith Housing residents and the receipt of all required governmental approvals, rebuild Alice Griffith Housing to provide one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area
   - Include a mix of stacked flats, attached townhomes and—in appropriately selected locations—low-rise, mid-rise, and high-rise towers, to help assure the economic feasibility of the development and provide a varied urban form
4. The integrated development should incorporate environmental sustainability concepts and practices, and in so doing should:
   - Apply sustainability principles in the design and development of public open spaces, recreation facilities, and infrastructure including wastewater, storm water, utility, and transportation systems
   - Incorporate green building construction practices
   - Include energy efficiency and the use of renewable energy
   - Encourage green development projects, such as green office, research and development, or industrial projects, including a green technology, biotechnology, or digital media campus
5. The integrated development should encourage the 49ers—an important source of civic pride—to remain in San Francisco by providing a world-class site for a new waterfront stadium and necessary infrastructure, and in so doing should:
   - Provide the parking necessary to operate the stadium

- Provide the necessary transportation infrastructure, including automobile, public transit and pedestrian connections between Candlestick Point, Hunters Point Shipyard, and the larger BVHP neighborhood, to facilitate the efficient handling of game day traffic

6. The integrated development should be fiscally prudent, with or without a new stadium, and in so doing should:
   - Minimize any adverse impact on the General Fund relating to the development of the Project Site by relying to the extent feasible on the development to be self-sufficient
   - Encourage substantial private capital investment

APPROVAL REQUIREMENTS

Consistent with the intended uses of the EIR, implementation of the Project would require multiple approvals from City, regional, state, and federal agencies. Table ES-1 (Major Project Approvals) presents the major approval requirements.

Table ES-1 Major Project Approvals

CITY AND COUNTY SAN FRANCISCO APPROVAL PROCESS AND PERMITS

Redevelopment Agency Commission

- Certifies the Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and a mitigation monitoring and reporting program
- Reports to the Board of Supervisors on the amendments to Redevelopment Plans
- Approves amendments to the *Hunters Point Shipyard Redevelopment Plan* and approves amendments to the Hunters Point Shipyard Design for Development
- Approves amendments to the *Bayview Hunters Point Redevelopment Plan* and approves a Design for Development for Candlestick Point
- Approves land transfer agreements with the Navy, City, and State agencies
- Approves land transfer agreements with Port Commission, State Lands Commission, and California Department of Parks and Recreation (CDPR)
- Approves Disposition and Development Agreements and Owner Participation Agreements

Port Commission

- Approves land transfer agreements with Agency, State Lands Commission, and CDPR

Planning Commission

- Certifies the Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and mitigation monitoring and reporting program
- Approves shadow determinations/impacts
- Adopts amendments to the General Plan to accommodate the Project and to find the amendments for the *Hunters Point Shipyard Redevelopment Plan* and *Bayview Hunters Point Redevelopment Plan* in conformity with the General Plan
- Adopts resolution recommending to the Board of Supervisors approval of amendments to the Planning Code/Zoning Maps for the Project
- Authorizes cooperative agreement with Redevelopment Agency

Table ES-1 Major Project Approvals

Board of Supervisors

- Affirms certification of Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and a mitigation monitoring and reporting program
- Approves General Plan amendments
- Approves amendments to the *Hunters Point Shipyard Redevelopment Plan* and the *Bayview Hunters Point Redevelopment Plan*
- Approves amendments to the Planning Code/Zoning Maps
- Approves other necessary code amendments
- Approves a Joint Facilities Agreement and Tax Allocation Agreements with the Redevelopment Agency
- Approves land transfer agreements

San Francisco Public Utilities Commission

- Approves Project infrastructure for water, sewer, stormwater, electricity

Department of Building Inspection

- Approves Project construction-related permits.

Department of Public Works

- Approves subdivision maps, public improvements, and infrastructure

Department of Public Health

- Recommends ordinance to Board related to oversight of environmental controls; oversees compliance with environmental controls

Municipal Transportation Authority

- Approves transit improvements

Department of Recreation and Parks

- Approves land transfers
- Recommends to Planning Commission shadow determinations/impacts

Art Commission

- Approves public art and the design of public structures on City property

San Francisco Housing Authority

- Approves replacement of Alice Griffith housing

REGIONAL, STATE, AND FEDERAL APPROVALS

Bay Conservation and Development Commission

- Approves amendments of the Bay Plan and Seaport Plan
- Approves permits for activities within BCDC's jurisdiction, including the proposed Yosemite Slough bridge
- Reviews Project land use plan for federal consistency under the Coastal Zone Management Act for activities not previously authorized in Consistency Determination No. CN 1-99

State Lands Commission

- Approves public trust land exchange agreement

California Department of Parks and Recreation

- Approves agreement for the reconfiguration of Candlestick Point State Recreation Area
- Approves General Plan Amendment for the reconfiguration of Candlestick Point State Recreation Area

California Department of Transportation

- Approves any necessary encroachment permits for the Project roadway improvements

Regional Water Quality Control Board

- Approves Section 401 water quality certification

Table ES-1 Major Project Approvals

Bay Area Air Quality Management District

- Approves any necessary air quality permits for individual uses

Navy

- Authorizes the execution of necessary transactional documents with the Redevelopment Agency to transfer property at Hunters Point Shipyard for the development of the Project

US Army Corps of Engineers

- Approves permit for fill related to the Yosemite Slough bridge, shoreline improvements, and other activities
- Consults with USFWS or NMFS regarding federally listed species prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to Section 7 of federal ESA
- Consults with NMFS regarding pile-driving and harbor seal and California sea lion prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to *Marine Mammal Protection Act*
- Consults with NMFS regarding modifying designated EFH prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to the *Magnuson-Stevens Act*

Department of the Interior

- Approves conversion of portions of Candlestick Point State Recreation Area reconfiguration improved with Land and Water Conservation Fund grants

US Coast Guard

- Issues determination regarding vessel navigability for the Yosemite Slough bridge

US Department of Housing and Urban Development

- Approves land transfer agreements involving Alice Griffith public housing site and funding approvals

SOURCE: Agency, Planning Department.

This Table is not intended to provide an exhaustive or exclusive list of the numerous public agency approvals that may be necessary to carry out the Project over its 20-year build-out. Instead, the Table provides a list of the major land use entitlements and related approvals anticipated from local and State agencies that may rely on this EIR. It is also anticipated that other permit and transactional approvals will be necessary as these major entitlements are implemented and that the approving public agencies, to the extent required by law, will rely on this EIR, in accordance with the requirements of CEQA and the CEQA Guidelines, in granting such approvals. This Table also lists federal agencies that would have jurisdiction over certain aspects of the Project.

AREAS OF CONTROVERSY/ISSUES TO BE RESOLVED

This EIR has been prepared by the Redevelopment Agency and the City (Planning Department) as co-lead agencies for the Project, in conformance with the substantive and procedural requirements of CEQA and the CEQA Guidelines (as amended through 2007),[1] Agency CEQA guidelines, Chapter 31 of the *San Francisco Administrative Code*, and Planning Department CEQA guidelines. In accordance with *Public Resources Code* Section 21002.1, the purpose of this EIR is to identify the significant environmental impacts of the Project, to identify alternatives to the Project, and to indicate the manner in which those significant effects could be mitigated or avoided.

This EIR evaluates the Project's environmental effects at a project level of detail and examines all phases of the Project, including planning, construction, and operation, as well as the direct, indirect, and cumulative impacts that might result. It is anticipated that each discretionary approval related to the implementation of the Project would rely on this EIR and would not require preparation of subsequent

[1] *California Environmental Quality Act*, (*Pub. Res. Code* Sec. 21000 et seq.; CEQA) and the CEQA Guidelines (*Cal. Code Regs.* Sec. 15000 et seq.).

environmental documentation, unless otherwise required by CEQA pursuant to *Public Resources Code* Section 21166 and CEQA Guidelines Sections 15162 through 15164.

Lennar Urban filed an Environmental Evaluation application (EE application) with the Planning Department on August 27, 2007. The filing of the EE application initiated the environmental review process as outlined below. The EIR process provides an opportunity for the public to review and comment upon the Project's potential environmental effects and to further inform the environmental analysis. As a first step in complying with the procedural requirements of CEQA, the Notice of Preparation (NOP) process was used to determine whether any aspect of the Project, either individually or cumulatively, may cause a significant effect on the environment and, if so, to narrow the focus (or scope) of the environmental analysis.

The Agency and the City filed the NOP with the California Office of Planning and Research, State Clearinghouse, as an indication that an EIR would be prepared. In turn, the State Clearinghouse distributed the NOP to public agencies and interested parties for a 30-day public review period beginning August 31, 2007. In addition, the NOP was also sent to organizations, companies, and/or individuals that the Agency and the City believed might have an interest in the Project. The purpose of the public review period was to solicit comments on the scope and content of the environmental analysis contained in the Draft EIR. In addition, in order to solicit further comments on the scope and content of the environmental analysis to be included in the EIR, the Agency and the City held two public scoping meetings.

A copy of the NOP is included as Appendix A to this EIR. The NOP included the India Basin Shoreline, which would be evaluated on a programmatic basis, as part of the Project; however, since publication of the NOP, the Agency and the City decided to remove the India Basin Shoreline area from the Project and will analyze development in that area as part of a separate EIR.

This EIR addresses environmental issues that are known or were raised by agencies or interested parties during the NOP public review period for the proposed project. In response to the NOP, nine comment letters were submitted to the Agency and the City by public agencies, organizations, and individuals. The NOP comment letters are summarized below:

- **California Department of Transportation (Caltrans)** provided comments pertaining to traffic volume and congestion on the State Highway System and recommended that a traffic impact analysis be prepared.
- **California Public Utilities Commission (CPUC)** provided comments identifying CPUC as a responsible agency if new at-grade rail crossings were proposed. The letter suggested that the unused railroad tracks leading to the Shipyard be removed as mitigation for development in the area.
- **California Department of Parks and Recreation** provided comments for the analysis of the Project in relation to the Candlestick Point State Recreation Area (CPSRA) and consistency with the adopted CPSRA General Plan. The comments also addressed public access to the shoreline, hazardous materials, proposed transportation improvements, and stormwater.
- **San Francisco Bay Conservation and Development Commission (BCDC)** provided a comment regarding BCDC's jurisdiction over the Project, including the 100-foot BCDC jurisdictional band and the BCDC priority use areas identified in the Bay Plan. The Bay Plan identifies Hunters Point Shipyard (HPS) as a "Port priority" use area and Candlestick Point as "Waterfront Park" and "Beach" priority areas.

- **The Bay Trail Project** provided comments on the proposed extension of the Bay Trail. The Bay Trail Project is a nonprofit organization administered by the Association of Bay Area Governments and is responsible for implementation of the Bay Trail Plan. The comments addressed consistency of the proposed Bay Trail improvements with the Bay Trail Plan and the relationship of the trail with proposed transportation improvements.
- **City of Brisbane** provided comments regarding the characterization of the US-101/Geneva/Harney interchange and Geneva Avenue extension and analysis of the Project in relation to future transportation improvements necessary to serve the Project.
- **Literacy for Environmental Justice** provided comments regarding the cleanup of the Shipyard, and stated that such actions must be to residential standards.
- **Arc Ecology** provided comments regarding Project alternatives, social and economic impacts, and the level of environmental review that was proposed for the Project. Additional concerns focused on the content of the NOP.
- An **individual** resident in Bayview Hunters point provided comments regarding accessibility to the waterfront, aesthetics and neighborhood character of the waterfront area, and traffic.

PROJECT VARIANTS

Six variants of the Project were formulated by the Agency, the City, and Lennar Urban. These variants include the following:

- Variant 1: San Francisco 49ers move outside the project area (no football stadium constructed at HPS Phase II)—R&D Variant
- Variant 2: San Francisco 49ers move outside the project area (no football stadium constructed at HPS Phase II)—Housing Variant
- Variant 2A: San Francisco 49ers move outside the project area (no football stadium constructed at HPS Phase II)—Housing/R&D Variant
- Variant 3 (Tower Variants A, B, C, and D): Four Candlestick Point tower variants would have the same land use program and overall description as with the Project, but would have different locations and heights for residential towers at Candlestick Point
- Variant 4: A utilities variant would include an automated solid waste collection system, decentralized wastewater treatment, and district energy
- Variant 5: Shared stadium where both the San Francisco 49ers and Oakland Raiders would play at the stadium at HPS Phase II

Three variants (Variants 1, 2, and 2A) address the scenario of the San Francisco 49ers moving to the City of Santa Clara or elsewhere with no football stadium constructed at HPS Phase II. Each of those three variants includes a different land use program at the HPS Phase II site. Variant 1 (R&D Variant) would include increases in R&D space at the stadium location. Variant 2 (Housing Variant) would relocate 1,350 residential units from Candlestick Point to the stadium site. Variant 2A (Housing/R&D Variant) would relocate 1,650 housing units from Candlestick Point to the stadium site, and, in addition, includes an additional 500,000 sf of R&D compared to the Project (for a total of 3,000,000 sf of R&D); 500,000 sf of the total R&D for Variant 2A would be constructed on the stadium site along with the residential uses.

The Candlestick Point Tower Variant (Variant 3) would have the same land use program and overall description as the Project, but would have different locations, heights, and massing of residential towers at Candlestick Point (expressed as four options for this variant: Candlestick Point Tower Variant (Variant 3 [Tower Variants A, B, C, and D]).

A Utilities Variant (Variant 4) would include an automated solid waste collection system, decentralized wastewater treatment, and district energy. A 49ers/Raiders Shared Stadium Variant (Variant 5) would include the scenario of a shared stadium, where both the 49ers and Oakland Raiders would play at a new stadium at HPS Phase II.

None of the variants would alter the Project Objectives, which are provided in detail in Chapter II (Project Description) of this EIR. The variants are analyzed at a project level of detail, which is equal to the Project analysis included in Chapter III (Environmental Setting, Impacts, and Mitigation Measures), Section III.A through Section III.S of this EIR. The environmental impacts that would result from implementation of the variants are presented following the description of each variant. A comparison of the variant development programs to the Project is presented in Table ES-1a (Comparison of Variants to the Project). Table ES-1b (Impact Comparison of Project Variants) summarizes the effects of the Variants compared to the Project.

Table ES-1a Comparison of Variants to the Project

Differences	*Project*	*Variant 1: R&D Variant (No Stadium, Additional R&D)*	*Variant 2: Housing Variant (No Stadium, Housing)*	*Variant 2A: Housing/ R&D Variant (No Stadium)*	*Variant 3: Candlestick Point Tower Variants (Different Tower Heights and Locations, Larger Floor Plates)*	*Variant 4: Utilities Variant (Additional On-Site Infrastructure)*	*Variant 5: 49ers/Raiders Shared Stadium*
						Same overall development plan as Project, but with minor shifts in building locations to accommodate 570,000 gsf for the proposed utility systems (with 330,000 gsf located below ground).	Same development plan as Project
Land Use Plan							
Residential (units)—Candlestick Point	7,850	7,850	6,500	6,225[a]	7,850	7,850	7,850

NOTE: Each topic is compared to the Project and for each impact area, impacts are equal to (=), greater than (>), or less than (<) the Project impacts.

ALTERNATIVES

A number of alternatives were analyzed that would avoid or substantially lessen some of the significant effects of the project. These alternatives, which are fully addressed in Chapter 6 (Alternatives) of this document, include the following:

- **Alternative 1: No Project**—Consistent with Section 15126.6(e)(1) of the CEQA Guidelines, this alternative assumes that no new development would occur at Candlestick Point and HPS Phase II would be developed with new uses consistent with the existing *Hunters Point Shipyard Redevelopment Plan* (HPS Redevelopment Plan).

  This alternative was selected in accordance with CEQA Guidelines Section 15126.6(e)(3)(A), which states that when the project is the revision of an existing land use or regulatory plan, policy, or ongoing operation, the "no project" alternative would be the continuation of the existing plan, policy, or operation into the future. This discussion would allow the decision-makers to compare the impacts of approving the Project with the impacts of not approving the Project.

- **Alternative 2: CP-HPS Phase II Development Plan; No Yosemite Slough Bridge**—Alternative 2 would have the same land use program proposed with the Project, including the State Parks agreement. Alternative 2 would not include the Yosemite Slough bridge. The main roadway connection between Candlestick Point and HPS Phase II would be via Ingalls Street. A bus rapid transit route would be constructed along an abandoned railroad right-of-way to provide access between Candlestick Point and HPS Phase II. This alternative assumes that the 49ers Stadium is relocated to HPS Phase II and the Agency enters into an agreement with CPSRA to reconfigure CPSRA land in the same way as for the Project.

  This alternative was selected to avoid impacts to biological resources associated with bridge construction and operation. Significant traffic, noise, and air quality impacts would not be reduced. This alternative would result in greater transportation-related impacts on game days because vehicular ingress and egress to and from the stadium would be delayed and traffic levels would be increased on local streets, including Innes Avenue, Evans Avenue, and Ingalls Street.

- **Alternative 3: Reduced CP-HPS Phase II Development; San Francisco 49ers Stay at Existing Candlestick Park Stadium; Limited State Parks Agreement; Yosemite Slough Bridge Serving Only Transit, Bicycles, and Pedestrians**—Alternative 3 would be a reduced development alternative. Total housing with this alternative would be 5,210 units, about half of the units proposed with the Project. At Candlestick Point, residential development would be decreased and retail and arena uses would not be developed. Replacement of the Alice Griffith Public Housing site would occur and consist of 1,210 housing units. Minor improvements would be made to the CPSRA under the Limited State Parks Agreement. At HPS Phase II, housing would be increased; other uses at HPS Phase II would be similar to the Project. A new Yosemite Slough bridge serving only transit, bike and pedestrian traffic would extend Arelious Walker Drive from Candlestick Point to HPS Phase II. This alternative assumes that the 49ers football team would continue to use the existing Candlestick Park stadium. At HPS Phase II, the alternative would not include a new 49ers Stadium.

  This alternative was selected to provide an alternative to the Project that reduces construction-related impacts generally and operational impacts associated with traffic, air quality, noise, demand for public services, biological resources, and other growth-related impacts. The development program of this alternative would be reduced compared to the Project and would generate fewer vehicle trips and reduce the area subject to development. This alternative would reduce traffic and noise impacts associated with an increase in vehicle trips and air quality impacts associated with Project

construction and operation. This alternative would reduce impacts to biological resources associated with bridge construction and operation as a result of the narrower bridge footprint and reduced bridge traffic. Construction and/or operational impacts related to the amount of development and the development footprint, such as soil erosion and stormwater runoff, as well as operational impacts related to population and employment growth, such as police and fire services, would also be reduced by this alternative.

- **Alternative 4: Reduced CP-HPS Phase II Development; Historic Preservation; No HPS Phase II Stadium, Marina, or Yosemite Slough Bridge**—Alternative 4 would also be a reduced development alternative. Total housing with this alternative would be 7,350 units, about 30 percent less than proposed with the Project. The proposed floor areas for most uses would be approximately 30 percent smaller at full build-out in comparison to build-out of the Project. No improvements would be made in the CPSRA. This alternative includes preservation of five potentially historic structures at HPS Phase II. This alternative does not include construction of a bridge over Yosemite Slough.

  This alternative was selected to include historic preservation of the five eligible structures on HPS and to provide a reduced development alternative to the Project. This alternative would reduce the area subject to development and would avoid significant impacts to historic resources at HPS Phase II. Reduced development would result in fewer vehicle trips. This alternative would reduce traffic and noise impacts associated with the increase in vehicle trips and air quality impacts associated with Project operation and construction. This alternative would also avoid impacts to biological resources associated with bridge construction and operation. Construction and/or operational impacts related to the amount of development and the development footprint, such as soil erosion and stormwater runoff, as well as operational impacts related to population and employment growth, such as police and fire services, would also be reduced by this alternative.

  - **Subalternative 4A: CP-HPS Phase II Development Plan with Historic Preservation**—This subalternative to Alternative 4 retains all of the historic buildings, but includes the same land use plan as described for the Project rather than a reduced development plan as under Alternative 4. This subalternative would preserve the same five historically eligible structures (Buildings 208, 211, 224, 231, and 253) as Alternative 4. The Project's land use plan would be implemented under this subalternative in terms of total square footage of land uses and district locations. However, unlike the Project, Buildings 211, 224, 231, and 253 would be retained and not demolished. The displaced R&D that, under the Project, would be built at the location of Buildings 211, 224, 231, and 253 would be distributed throughout the remainder of the HPS Phase II development and total floor area for R&D would remain the same as the Project, at 2,500,000 sf. However, the building heights in the R&D District on HPS Phase II would increase to accommodate the displaced square footage. Buildings 211, 231, and 253 would be rehabilitated under the Secretary of Interior's Standards to accommodate approximately 338,000 gsf of R&D and 1,000 parking spaces. Building 224, the air raid shelter, would be rehabilitated to provide museum space. Subalternative 4A would also retain existing grades, allowing railroad spurs and other historic elements to remain. A wave protection berm is proposed to accommodate a 36-inch sea level rise. The Bay Trail would run on top of the berm, which would be designed to include seat steps. All other components of Subalternative 4A would remain the same as under the Project.

- **Alternative 5: Reduced CP-HPS Phase II Development; No HPS Phase II Stadium, State Parks Agreement, or Yosemite Slough Bridge**—Alternative 5 would have the same land use program proposed with the Project, except that the new stadium at HPS Phase II and the Yosemite Slough bridge would not be constructed. The total number of housing units would be the same as for the Project; however, because this alternative would not include the CPSRA boundary

reconfiguration, the land area available for development would be smaller. Approximately 1,350 units would be shifted from Candlestick Point to HPS Phase II. This alternative assumes a State Parks agreement does not occur and there is no agreement with the 49ers for a stadium at the Project site.

This alternative was selected to reduce construction impacts generally and to avoid impacts to biological resources associated with bridge construction and operation. Significant traffic, noise, and air quality impacts would not be reduced. Construction impacts that relate to the size of the development footprint would also be reduced by this alternative.

Other alternatives were considered, but eliminated from further analysis in this EIR, including:

- Alternative San Francisco 49ers stadium locations (City of Brisbane or Port of San Francisco sites)
- Alternative land use plans and locations for the 49ers Stadium on HPS Phase II
- Alternative land use plan for Candlestick Point
- Develop Candlestick Point for parks and open space only
- Alternative locations for the Project within the City of San Francisco
- Alternative locations for the Project outside the City of San Francisco

Table ES-1c (Summary of Project Alternatives) provides an overview of how the land uses of the Alternatives compare to the land uses of the Project. Table ES-1d (Comparison of the Significant and Unavoidable Impacts of the Project to Each of the Alternatives) provides a summary comparison of the significant and unavoidable impacts of the Project compared to each of the Alternatives.

TRANSPORTATION					
Impact TR-1 The Project would result in construction-related transportation impacts in the Project vicinity due to construction vehicle traffic and roadway construction and would contribute to cumulative construction impacts in the Project vicinity. Mitigation measure MM TR-1 would reduce but not avoid construction-related transportation impacts during construction activities. Therefore, construction transportation impacts would remain significant.					
Significance of Alternative Compared to Project	<	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/LTS	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-2 Implementation of the Project would cause an increase in traffic that would be substantial relative to the existing and proposed capacity of the street system, and result in significant and unavoidable impacts. Although implementation of a Travel Demand Management Plan was assumed in developing Project travel demand estimates, and would be essential to ensure that impacts at additional locations do not occur, traffic congestion caused by the Project and the Project's contribution to cumulative impacts would still be significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-3 The Project would result in significant impacts and would contribute to significant cumulative impacts at intersections in the Project vicinity where no feasible traffic mitigation measures have been identified.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-4 At the intersection of Tunnel/Blanken, the Project would result in significant Project AM peak hour traffic impacts, and contribute to cumulative PM peak hour traffic impacts, for which a feasible mitigation measure has been identified. The identified mitigation measure would improve traffic operations, but not to acceptable levels of service.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-5 Project contributions at some study area intersections that would operate at LOS E or LOS F under 2030 No Project conditions were determined to be significant, and no feasible mitigation measures have been identified.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-6 Project contributions at the intersections of Geneva/US-101 Southbound Ramps and Harney/US-101 Northbound Ramps, which would operate at LOS F under 2030 No Project conditions, were determined to be significant, and a mitigation measure has been identified to avoid this impact. However, implementation of mitigation measure MM TR-6 is uncertain, and this impact would remain significant.

Impact TR-8 Project contributions at the intersections of Bayshore/Geneva, which would operate at LOS F under 2030 No Project conditions, were determined to be significant, and a mitigation measure has been identified to avoid this impact. However, implementation of mitigation measure MM TR-8 is uncertain, and this impact would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-10 The Project would result in significant Project traffic spillover impacts and contribute to cumulative traffic spillover impacts. The identified mitigation measures would reduce, but not avoid, traffic spillover impacts.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/LTS	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-11 The Project would contribute to significant cumulative traffic impacts at four freeway segments. No feasible mitigation is available.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-12 The Project would result in significant impacts at four freeway on-ramp locations. No feasible traffic mitigation is available.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-13 The Project would contribute to significant cumulative traffic impacts at 12 freeway ramp locations. No feasible traffic mitigation is available.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-14 The Project would result in significant impacts related to freeway diverge queue storage at the Harney/US-101 Northbound Off-ramp. Mitigation measure MM TR-6 has been identified to avoid this impact, but its implementation is uncertain. Therefore, this impact would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-15 The Project would contribute to significant cumulative traffic impacts related to freeway diverge queue storage at some off-ramp locations. Mitigation measure MM TR-6 has been identified to avoid this impact at the US-101 Northbound off-ramp to Harney Way, and US-101 Southbound Off-ramp to Harney Way/Geneva Avenue. However, implementation is uncertain. For the other ramps, no feasible mitigations have been identified. Therefore, this impact would remain significant.

Impact TR-21 The Project would increase congestion and contribute to cumulative conditions at intersections along San Bruno Avenue, which would increase travel times and impact operations of the 9-San Bruno. Implementation of mitigation measures MM TR-21.1 and MM TR-21.2 could reduce impacts to transit operations. However, since feasibility of MM TR-21.1 is uncertain, and since MM TR-21.2, without MM TR-21.1, would reduce, but not completely avoid, impacts on the 9-San Bruno, Project impacts and Project contributions to cumulative impacts on the 9-San Bruno would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-22 The Project would increase congestion and contribute to cumulative conditions at intersections along Palou Avenue, which would increase travel times and impact operations of the 23-Monterey, 24-Divisadero, and the 44-O'Shaughnessy. Implementation of mitigation measure MM TR-22.1 and MM TR-22.2 would reduce impacts to transit operations. However, since feasibility of MM TR-22.1 is uncertain, and since MM TR-22.2, without MM TR-22A, would reduce, but not completely avoid, impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy, Project impacts and Project contributions to cumulative impacts on the these lines would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-23 The Project would increase congestion at intersections along Gilman Avenue and Paul Avenue, which would increase travel times and would impact operations of the 29-Sunset. Implementation of mitigation measures MM TR-23.1 and MM TR-23.2 would reduce impacts to transit operations. However, since feasibility of MM TR-23.1 is uncertain, and since MM TR-23.2, without MM TR-23.1, would reduce, but not completely avoid, impacts on the 29-Sunset, Project impacts and Project contributions to cumulative impacts on the 29-Sunset would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-24 The Project would increase congestion at intersections along Evans Avenue, which would increase travel times and impact operations of the 48-Quintara-24th Street. Implementation of mitigation measures MM TR-24.1 and MM TR-24.2 would reduce impacts to transit operations. However, since feasibility of MM TR-24.1 is uncertain, and since MM TR-24.2, without MM TR-24.1, would reduce, but not completely avoid, impacts on the 48-Quintara-24th Street, Project impacts and Project contributions to cumulative impacts on the 48-Quintara-24th Street would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-25 The Project would increase congestion at intersections in the study area, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the 54-Felton. Implementation of mitigation measure MM TR-25 would reduce, but not avoid impacts.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU

Impact TR-26 The Project would increase congestion at intersections along Third Street, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the T-Third. Implementation of mitigation measures MM TR-26.1 and MM TR-26.2 would reduce impacts to transit operations. However, since feasibility of MM TR-26.1 is uncertain, and since MM TR-26.2, without MM TR-26.1, would reduce, but not completely avoid, impacts on the T-Third, Project impacts and Project contributions to cumulative impacts on the T-Third would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-27 The Project would increase congestion at the intersection of Geneva Avenue and Bayshore Boulevard. This would increase travel times and impact operations of the 28L-19th Avenue/Geneva Limited. Implementation of mitigation measures MM TR-27.1 and MM TR-27.2 would reduce impacts to transit operations. However, since feasibility of MM TR-27.1 is uncertain, and since MM TR-27.2, without MM TR-27.1, would reduce, but not completely avoid, impacts on the 28L-19th Avenue/Geneva Limited, Project impacts and Project contributions to cumulative impacts on the 28L-19th Avenue/Geneva Limited would remain significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-28 The Project would increase congestion on US-101 mainline and ramps, which would increase travel times and impact operations of the 9X, 9AX, 9BX-Bayshore Expresses, and 14X-Mission Express. The Project would also contribute to cumulative impacts on these transit routes on US-101. No feasible mitigation has been identified.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-30 The Project would increase congestion and contribute to cumulative congestion on US-101 and on Bayshore Boulevard, which would increase travel times and adversely affect operations of SamTrans bus lines on these facilities. No feasible mitigation has been identified.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-32 The Project's proposed transit preferential treatments and significant increases in traffic volumes on Palou Avenue would result in impacts on bicycle travel on Bicycle Routes #70 and #170 between Griffith Street and Third Street. The effectiveness of mitigation is uncertain. Therefore, the impact would remain significant.					
Significance of Alternative Compared to Project	<	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/SU	SU/SU	SU/SU
Impact TR-38 For as many as 12 times a year 49ers games at the proposed stadium would result in significant impacts on study area roadways and intersections. Implementation of mitigation measure MM TR-38 would lessen game-day impacts; however, traffic impacts would remain significant.					
Significance of Alternative Compared to Project	<	=	<	<	<
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/NI

Table ES-1d Comparison of the Significant and Unavoidable Impacts of the Project to Each of the Alternatives

	Alternative 1 No Project[a]	*Alternative 2 No Bridge Alt*[b]	*Alternative 3 49ers at Candlestick*[c]	*Alternative 4 Lesser Build with Historic Preservation*[d]	*Alternative 5 No Park Agreement*[e]
Impact TR-39 The existing game day service and Project transit improvements would not be adequate to accommodate projected transit demand. Implementation of mitigation measure MM TR-39 would reduce game-day impacts on transit capacity; however, traffic impacts on transit operations would remain significant.					
Significance of Alternative Compared to Project	<	=	<	<	<
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/NI
Impact TR-46 Weekday evening secondary events at the stadium would result in increased congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without a secondary event, and result in significant impacts at nine additional intersections and one additional freeway off-ramp. Implementation of mitigation measure MM TR-46 would reduce but not avoid impacts.					
Significance of Alternative Compared to Project	<	=	<	<	<
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/NI
Impact TR-47 The existing transit service and Project improvements would not be adequate to accommodate projected transit demand during secondary events with attendance of 37,500 spectators. In addition, transit lines serving the area would experience additional delays due to traffic generated by the secondary event.					
Significance of Alternative Compared to Project	<	=	<	<	<
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/NI
Impact TR-51 Weekday evening events at the arena would exacerbate congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without an arena event, and result in significant traffic impacts at Harney Way and Jamestown Avenue, which was operating acceptably under Project conditions without an arena event. Mitigation measure MM TR-51 would reduce but not avoid impacts.					
Significance of Alternative Compared to Project	<	=	<	<	=
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/SU
Impact TR-52 Sell-out weekday evening events at the arena could impact existing and proposed transit service. However, traffic congestion would impact transit operations. Implementation of mitigation measure MM TR-23.1 would reduce impacts to less than significant. Due to the uncertainty of this mitigation the impact would remain significant.					
Significance of Alternative Compared to Project	<	=	<	<	=
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/SU
AIR QUALITY					
Impact AQ-4 Operation of the Project would violate BAAQMD CEQA significance thresholds for mass criteria pollutant emissions from mobile and area sources and contribute substantially to an existing or projected air quality violation at full build-out in the year 2029.					
Significance of Alternative Compared to Project	<	=	<	<	=
Level of Significance after Mitigation (Project/Alternative)	SU/LTS	SU/SU	SU/SU	SU/SU	SU/SU

Table ES-1d Comparison of the Significant and Unavoidable Impacts of the Project to Each of the Alternatives

	Alternative 1 No Project[a]	*Alternative 2 No Bridge Alt*[b]	*Alternative 3 49ers at Candlestick*[c]	*Alternative 4 Lesser Build with Historic Preservation*[d]	*Alternative 5 No Park Agreement*[e]
NOISE					
Impact NO-2 Construction activities associated with the Project would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 and 2908 of the *Municipal Code*, vibration levels would still be significant.					
Significance of Alternative Compared to Project	=	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/SU	SU/SU
Impact NO-3 Construction activities associated with the Project would result in a substantial temporary or periodic increase in ambient noise levels.					
Significance of Alternative Compared to Project	<	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/LTS	SU/SU	SU/SU	SU/SU	SU/SU
Impact NO-6 Operation of the Project would generate increased local traffic volumes that could cause a substantial permanent increase in ambient noise levels in existing residential areas along the major Project site access routes.					
Significance of Alternative Compared to Project	<	=	=	=	=
Level of Significance after Mitigation (Project/Alternative)	SU/LTS	SU/SU	SU/SU	SU/SU	SU/SU
Impact NO-7 Noise during football games and concerts at the proposed stadium would result in temporary increases in ambient noise levels that could adversely affect surrounding residents for the duration of a game or concert.					
Significance of Alternative Compared to Project	<	=	<	<	<
Level of Significance after Mitigation (Project/Alternative)	SU/NI	SU/SU	SU/NI	SU/NI	SU/NI
CULTURAL RESOURCES					
Impact CP-1 Construction activities associated with the Project could result in a substantial adverse change in the significance of a historical resource.					
Significance of Alternative Compared to Project	=	=	=	<	=
Level of Significance after Mitigation (Project/Alternative)	SU/SU	SU/SU	SU/SU	SU/LTS	SU/SU

< Alternative does lessen the severity of the impact
> Alternative increases the severity of the impact
= Alternative impact is similar to the Project impact
NI = No Impact
LTS = Less-Than-Significant impact
SU = Significant and Unavoidable Impact

a. No Project
b. CP-HPS Phase II Development Plan, HPS Phase II Stadium, State Parks Agreement, and without the Yosemite Slough Bridge
c. Reduced CP-HPS Phase II Development, San Francisco 49ers Stay at Existing Candlestick Park Stadium, with Limited State Parks Agreement, and Yosemite Slough Bridge Serving Only Transit, Bicycles, and Pedestrians
d. Reduced CP-HPS Phase II Development; Historic Preservation; State Parks Agreement; No HPS Phase II Stadium, Marina, or Yosemite Slough Bridge
e. Reduced CP-HPS Phase II Development, No HPS Phase II Stadium, No State Parks Agreement, and without the Yosemite Slough Bridge

SUMMARY OF IMPACTS

Table ES-2, which is provided below, summarizes the (1) potential environmental impacts that would occur as a result of the proposed project, provided in the form of an "impact statement"; (2) the level of significance of the environmental impact prior to implementation of any applicable mitigation measures; (3) the recommended mitigation measures that avoid or reduce significant environmental impacts; and (4) the level of significance after mitigation measures are implemented.

There are generally two ways that the impact analysis is structured and then presented in Table ES-2. In most cases, there are three impact statements, with the first one reflecting the combined impact of Candlestick Point and HPS Phase II (i.e., Impact XX-#, such as Impact PH-2); the second addressing the impact at Candlestick Point (i.e., Impact XX-#a, such as Impact PH-2a); and the third addressing the impact at HPS Phase II (i.e., Impact XX-#b, such as Impact PH-2b). Where impacts could occur as a result of construction of the Yosemite Slough bridge, the marina, or the shoreline improvements, those impacts are usually discussed separately, resulting in four or more impact discussions, which would be numbered Impact PH-2c, Impact PH-2d, and Impact PH-2e, using the numbering sequence of the preceding example. In these cases, the impacts are still summarized with a combined impact of the Project. In some instances, the analyses for Candlestick Point and Hunters Point Shipyard Phase II are similar, and, therefore, are discussed together as the Project (i.e., Impact XX-#, such as Impact LU-2); in these cases, the analysis is not differentiated by area. One exception to this general format is in Section III.N (Biological Resources), where Project impacts are presented after the discussion of individual impacts at Candlestick Point and HPS Phase II. Project impacts begin with Impact BI-22 and conclude with Impact BI-26.

The impact statements provided in Table ES-2 (in the first column) reflect whether the impact is caused by construction of the Project; implementation of the Project (meaning the conditions that would exist after the Project were constructed, which is generally related to the development pattern); or operation of the Project (reflecting conditions that would exist during actual operational activities, such as additional motor vehicle trips resulting from uses at the Project site). In a few instances, the impact statement is factual, such as "The Project would conform to the current regional air quality plan." In all cases, the impact statement reflects the condition that would result after the implementation of all of the identified mitigation measures.

The Draft EIR uses the following terms to describe the level of significance of impacts identified during the course of the environmental analysis:

- **Significant Impact (S)**—A "significant effect" is defined by Section 15382 of the CEQA Guidelines as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment … [but] may be considered in determining whether the physical change is significant." As defined in this EIR, a significant impact exceeds the defined significance criteria and will result in significant and unavoidable impacts, either with or without feasible mitigation. If there are no feasible mitigation measures to reduce the impact, including compliance with existing local, State, and federal laws and regulations, it is considered significant and unavoidable (SU) at the conclusion of the analysis. If there are feasible mitigation measures to reduce the impact, including compliance with existing local, State, and federal laws and

regulations, it is considered significant and unavoidable with mitigation (SU/M) at the conclusion of the analysis

- **Potentially Significant Impact (PS)**—Impact that could exceed the defined significance criteria, but can be eliminated or reduced to a less-than-significant level through implementation of the identified mitigation measures.
- **Less-Than-Significant Impact (LTS)**—Impact that does not exceed the defined significance criteria or would be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and federal laws and regulations.
- **No Impact (NI)**—No adverse changes (or impacts) to the environment are expected.
- **Significant and Unavoidable Impact (SU)**—Impact that exceeds the defined significance criteria and cannot be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and federal laws and regulations and/or implementation of all feasible mitigation measures.
- **Significant and Unavoidable Impact with Mitigation (SU/M)**— Impact that exceeds the defined significance criteria and can be reduced through compliance with existing local, State, and federal laws and regulations and/or implementation of all feasible mitigation measures, but cannot be reduced to a less-than-significant level.
- **Less-Than-Significant Impact with Mitigation (LTS/M)**—Impact that is reduced to a less-than-significant level through implementation of the identified mitigation measures.

Project impacts are assessed in light of existing regulatory requirements that would serve to mitigate potential impacts. The effectiveness of existing regulations to mitigate potential impacts is often affected by discretionary requirements, site characteristics, and project features and design-level considerations that are not yet detailed. Because there is some discretion in how these regulations can be applied, for some impacts, these requirements are included as mitigation measures to outline the specific process by which the Project will comply with these regulations.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
SECTION III.B(LAND USE AND PLANS)			
Impact LU-1 Implementation of the Project would not physically divide an established community.	**NI**	No mitigation is required.	**NI**
Impact LU-2 Implementation of the Project would not conflict with land use plans, policies, or regulations adopted to avoid or mitigate an environmental effect.	**LTS**	No mitigation is required.	**LTS**
Impact LU-3 Implementation of the Project would not have a substantial adverse impact on the existing character of the vicinity.	**LTS**	No mitigation is required.	**LTS**
SECTION III.C (POPULATION, HOUSING, AND EMPLOYMENT)			
Impact PH-1 Construction of the Project would not induce substantial direct population growth.	**LTS**	No mitigation is required.	**LTS**
Impact PH-2 Operation of the Project would not induce substantial direct or indirect population growth.	**LTS**	No mitigation is required.	**LTS**
Impact PH-2a Operation of Candlestick Point would not induce substantial direct or indirect population growth.	**LTS**	No mitigation is required.	**LTS**
Impact PH-2b Operation of HPS Phase II would not induce substantial direct or indirect population growth.	**LTS**	No mitigation is required.	**LTS**
Impact PH-3 The Project would not displace existing housing units or residents, necessitating the construction of new units elsewhere.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact PH-3a Implementation of the Project would not displace existing housing units and residents at Candlestick Point, necessitating the construction of new units elsewhere.	**NI**	No mitigation is required.	**NI**
Impact PH-3b Implementation of the Project would not displace existing housing units or residents at HPS Phase II, necessitating the construction of new units elsewhere.	**NI**	No mitigation is required.	**NI**
		SECTION III.D (TRANSPORTATION AND CIRCULATION)	
Impact TR-1 Construction of the Project would result in transportation impacts in the Project vicinity due to construction vehicle traffic and roadway construction and would contribute to cumulative construction impacts in the Project vicinity.	**PS**	**MM TR-1** Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program. The Project Applicant shall develop and implement a Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program to minimize impacts of the Project and its contribution to cumulative impacts related to construction activities and construction traffic. The program shall provide necessary information to various contractors and agencies as to how to maximize the opportunities for complementing construction management measures and to minimize the possibility of conflicting impacts on the roadway system, while safely accommodating the traveling public in the area. The program shall supplement and expand, rather than modify or supersede any manual, regulations, or provisions set forth by SFMTA, DPW or other City departments and agencies. Preparation of the Construction Management Program shall be the responsibility of the Project Applicant, and shall be reviewed and approved by SFMTA and DPW prior to initiation of construction. The Project Applicant shall update the program prior to approval of development plans for Phase 2, Phase 3, and Phase 4 of construction to reflect any change to Project development schedule, reflect transportation network changes, to update status of other development construction activities, and to reflect any changes to City requirements. The program shall: ■ Identify construction traffic management practices in San Francisco, as well as other jurisdictions that although not being implemented in the City could provide useful guidance for a project of this size and characteristics. ■ Describe procedures required by different departments and/or agencies in the City for implementation of a construction management plan, such as reviewing agencies, approval process, and estimated timelines. ■ Describe coordination efforts associated with the Navy remediation efforts and scheduling regarding construction vehicle routing via the Crisp gate.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Identify construction traffic management strategies and other elements for the Project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities in the Bayview Hunters Point area. These could include construction strategies, demand management strategies, alternate route strategies, and public information strategies. ■ Coordinate with other projects in construction in the immediate vicinity, so that they can take an integrated approach to construction-related traffic impacts. ■ Present guidelines for selection of construction traffic management strategies.	
Impact TR-2 Implementation of the Project would cause an increase in traffic that would be substantial relative to the existing and proposed capacity of the street system, even with implementation of a Travel Demand Management Plan.	**PS**	**MM TR-2** TDM Plan. The Project Applicant shall prepare and implement a final TDM plan, which shall include the following elements: ■ Visitor Variable, Market-Rate Parking Pricing ■ Maximum Permitted Parking Ratios ■ Flexible Parking Management Strategies ■ Unbundled Residential Parking ■ Transit Strategies and Support Strategies ■ Central Transit Hub ■ Enhanced Transit Service and Bicycle Facilities ■ Bicycle Support Facilities ■ Wayfinding Signs ■ EcoPass for Residents ■ Carshare Services ■ Employee TDM Programs > Information Boards/Kiosks > In-building Real-Time transit monitors with sightlines of transit hubs > Commuter Benefits > Employee EcoPass > Carpool/Vanpools > Guaranteed Ride Home Program > Compressed Work Weeks, Flex Time, and Telecommuting ■ CP-HPS Transportation Management Association ■ On-site Transportation Coordinator and Website ■ Targeted Marketing	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Monitoring of Transportation Demand ■ Monitoring Effectiveness of Congestion-Reducing and Traffic-Calming Efforts The final TDM plan shall be approved as part of the Disposition and Development Agreement (DDA).	
Impact TR-3 Implementation of the Project would contribute traffic to significant cumulative impacts at intersections in the Project vicinity.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-4 At the intersection of Tunnel/Blanken, implementation of the Project would result in significant Project AM peak hour traffic impacts, and would contribute to cumulative PM peak hour traffic impacts.	**PS**	**MM TR-4** Restripe the northbound and southbound approaches of the intersection of Tunnel/Blanken to provide dedicated left-turn lanes adjacent to shared through/right-turn lanes. The restriping would require prohibition of parking for 160 feet in the southbound approach (loss of eight parking spaces) and for 100 feet in the northbound approach (loss of five parking spaces). Implementation of the intersection restriping shall be the responsibility of SFMTA, and shall be implemented when intersection improvements associated with the Visitacion Valley Redevelopment Plan (i.e., signalization) are no longer sufficient to maintain acceptable intersection level of service conditions.	**SU/MM**
Impact TR-5 Implementation of the Project would contribute traffic at some study area intersections that would operate at LOS E or LOS F under 2030 No Project conditions.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-6 Implementation of the Project could contribute traffic at the intersections of Geneva/US-101 Southbound Ramps and Harney/US-101 Northbound Ramps, which would operate at LOS F under 2030 No Project conditions.	**PS**	**MM TR-6** Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts. The City of Brisbane and Caltrans, as part of the Harney Interchange Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) shall coordinate with the City of Brisbane and Caltrans to ensure Project-generated vehicle trips are accounted for in the Harney Interchange analyses and design. Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA or its equivalent. The Project Applicant shall contribute its fair share to the Harney Interchange Project.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-7 Implementation of the Project could contribute traffic to the intersections of Amador/Cargo/Illinois, which would operate at LOS E under 2030 No Project.	**PS**	**MM TR-7** Feasibility study of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. SFMTA shall conduct a feasibility study with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. Sufficient right-of-way is available to implement this improvement; however, provision of two southbound lanes would require narrowing a portion of the island to the west of the southbound approach to Cargo Way. Implementation of the intersection improvements shall be the responsibility of SFMTA and the Port of San Francisco, and shall be implemented when traffic operating conditions with the existing intersection configuration worsens to unacceptable levels. If determined feasible, the Project Applicant shall contribute its fair share to the intersection improvements.	**SU/MM**
Impact TR-8 Implementation of the Project could contribute traffic to the intersections of Bayshore/Geneva, which would operate at LOS F under 2030 No Project.	**PS**	**MM TR-8** Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts. The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure projected traffic volumes are accounted for in the design of the Geneva Avenue Extension. Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA or its equivalent. The Project Applicant shall contribute its fair share to the Geneva Avenue Extension Project.	**SU/MM**
Impact TR-9 Implementation of the Project would have less-than-significant Project and cumulative impacts at some study area intersections that would operate at LOS E or LOS F under 2030 No Project conditions.	**LTS**		**LTS**
Impact TR-10 Implementation of the Project would result in significant Project traffic spillover impacts and contribute to cumulative traffic spillover impacts.	**PS**	MM TR-2 and MM TR-17 would apply to this impact.	**SU/MM**
Impact TR-11 Implementation of the Project would contribute to significant cumulative traffic impacts at four freeway segments.	**PS**	No feasible mitigation is identified.	**SU**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-12 Implementation of the Project would result in significant impacts at four freeway on-ramp locations.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-13 Implementation of the Project would contribute to significant cumulative traffic impacts at 12 freeway ramp locations.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-14 Implementation of the Project could result in significant impacts related to freeway diverge queue storage at the Harney/US-101 Northbound Off-ramp.	**PS**	MM TR-6 would apply to this impact.	**SU/MM**
Impact TR-15 Implementation of the Project could contribute to significant cumulative traffic impacts related to freeway diverge queue storage at some off-ramp locations (US-101 Northbound off-ramp to Harney Way, and US-101 Southbound Off-ramp to Harney Way/Geneva Avenue).	**PS**	MM TR-6 would apply to this impact.	**SU/MM**
Impact TR-16 Implementation of the Project would increase traffic volumes and would not make a considerable contribution to cumulative traffic volumes on Harney Way.	**PS**	**MM TR-16** Widen Harney Way as shown in Figure 5 in the Transportation Study. Prior to issuance of the grading permit for Development Phase 2 of the Project, the Project Applicant shall widen Harney Way as shown in Figure 5 in the Transportation Study. Prior to the issuance of grading permits for Phases 2, 3 and 4, the Project Applicant shall fund a study to evaluate traffic conditions on Harney Way and determine whether additional traffic associated with the next phase of development would result in the need to modify Harney Way to its ultimate configuration, as shown in Figure 6 in the Transportation Study, unless this ultimate configuration has already been built. This study shall be conducted in collaboration with the SFMTA, which would be responsible for making final determinations regarding the ultimate configuration. The ultimate configuration would be linked to intersection performance, and it would be required when study results indicate intersection LOS at one or more of the three signalized intersection on Harney Way at mid-LOS D (i.e., at an average delay per vehicle of more than 45 seconds per vehicle). If the study and SFMTA conclude that reconfiguration would be necessary to accommodate traffic demands associated with the next phase of development, the Project Applicant shall be responsible to fund and complete construction of the improvements prior to occupancy of the next phase.	**LTS/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-17 Implementation of the Project would not exceed available transit capacity, because the Project and the Project's contribution to cumulative demand would be accommodated within the existing transit service, proposed TEP service, plus the service proposed as part of the Project.	**PS**	**MM TR-17** Implement the Project's Transit Operating Plan. The Project Applicant shall work with SFMTA to develop and implement the Project's Transit Operating Plan. Elements of the Project Transit Operating Plan shall include: ■ Extension of the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street into Hunters Point Shipyard. ■ Increased frequency on the 24-Divisadero to 6 minutes in the AM and PM peak periods. Extension of the 29-Sunset from its current terminus near the Alice Griffith housing development, near Gilman Avenue and Giants Drive, into the proposed Candlestick Point retail area. The 29-Sunset would operate a short line between Candlestick Point and the Balboa Park BART station. This would increase frequencies on the 29-Sunset by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak periods between Candlestick Point and the Balboa BART station. Every other bus would continue to serve the Sunset District (to the proposed terminus at Lincoln Drive and Pershing Drive in the Presidio) at 10-minute headways. ■ Convert T-Third service between Bayview and Chinatown via the Central Subway from one-car to two-car trains or comparable service improvement. Extension of the 28L-19th Avenue Limited from its TEP-proposed terminus on Geneva Avenue, just east of Mission Street, into the Hunters Point Shipyard transit center. The 28L-19th Avenue Limited would travel along Geneva Avenue across US-101 via the proposed Geneva Avenue extension and new interchange with US-101, to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center. ■ The 28L-19th Avenue Limited would operate a short line to the Balboa Park BART station. This would increase frequencies on the 28L-19th Avenue Limited by reducing headways between buses from 10 minutes to 5 minutes for the segment between Hunters Point Shipyard and the Balboa Park BART station. Every other bus would continue to the Sunset District (to the proposed terminus at North Point Street and Van Ness Avenue) at 10-minute headways. If the TEP-proposed extension of the 28L has not been implemented by the SFMTA by the time implementation of this measure is called for in the Transportation Study (Appendix D), the Project Applicant shall fund the extension of that line between its existing terminus and Bayshore Boulevard. ■ New CPX-Candlestick Express to downtown serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on US-101 toward downtown, terminating at the Transbay Terminal. ■ New HPX-Hunters Point Shipyard Express to downtown serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Avenue, with stops at the India Basin and Hunters View areas, before continuing along Evans Avenue to Third Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.	**LTS/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-18 With full implementation of the Project with proposed transit improvements, the Project demand and the Project's contribution to cumulative demand would not exceed the proposed transit system's capacity at the study area cordons.	**PS**	MM TR-17 would apply to this impact.	**LTS/MM**
Impact TR-19 Implementation of the Project would add transit trips and the Project's contribution to cumulative transit trips to the Downtown Screenlines would not increase demands in excess of available capacity.	**LTS**	No mitigation is required.	**LTS**
Impact TR-20 Implementation of the Project would add transit trips and the Project's contribution to cumulative transit trips would not contribute significantly to Regional Screenlines conditions where overall ridership is projected to exceed available capacity.	**LTS**	No mitigation is required.	**LTS**
● **Impact TR-21** Implementation of the Project could increase congestion and contribute to cumulative conditions at intersections along San Bruno Avenue, which would increase travel times and impact operations of the 9-San Bruno.	**PS**	**MM TR-21.1** Maintain the proposed headways of the 9-San Bruno. To address Project impacts to the 9-San Bruno, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the San Bruno Avenue corridor, generally between Campbell Avenue and Silver Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 9-San Bruno. ■ Install a transit-only lane on northbound San Bruno Avenue for the one-block section (400 feet) between Silliman Street and Silver Avenue. This would involve removal of five metered spaces on the east side of San Bruno Avenue, just south of Silver Avenue. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic. ■ Install a transit-only lane on southbound San Bruno Avenue at the approach to Dwight Street/Paul Avenue. This lane would function as a so-called "queue-jump" lane, allowing buses to bypass queues on southbound San Bruno Avenue at the intersection. The lane should begin approximately 200 feet north of Dwight Street and extend one block (about 300 feet) south of Paul Avenue to Olmstead Street. This would involve the removal of up to 20	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		on-street parking spaces on the west side of San Bruno Avenue. This treatment could be limited to peak hours only, which would minimize the impact of the parking loss. The segment of San Bruno Avenue between Dwight Street and Olmstead Street is designated as Bicycle Routes #705 and 5 (Class III signed routes). ■ At the intersection of San Bruno/Silver install signal priority treatments on westbound Silver Avenue, where buses waiting to turn left from Silver Avenue onto southbound San Bruno Avenue must currently wait through almost an entire signal cycle due to the heavy oncoming traffic on eastbound Silver Avenue. Installation of a transit signal pre-emption at this location that provides a "green" signal for westbound vehicles but holds eastbound vehicles when buses are present would allow transit vehicles to turn left onto San Bruno Avenue without having to wait for opposing eastbound through traffic to clear. The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include comprehensive replacement of stop-controlled intersections with interconnected traffic signals equipped with transit priority elements. **MM TR-21.2** Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Should mitigation measure MM TR-21.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	
● **Impact TR-22** Implementation of the Project would contribute traffic to cumulative conditions at intersections along Palou Avenue, which would increase travel times and impact operations of the 23-Monterey, 24-Divisadero, and the 44-O'Shaughnessy.	**PS**	**MM TR-22.1** Maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy. To address Project impacts to the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Palou Avenue corridor, generally between Griffith Street and Newhall Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy. ■ Convert one of the two westbound travel lanes on Palou Avenue between Keith Street and Newhall Street (three blocks) to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Because the westbound lanes between Third Street and Newhall Street are relatively narrow, parking would likely need to be prohibited on the north side of Palou Avenue between Third Street and Newhall Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane. ■ Convert one of the two eastbound travel lanes on Palou Avenue between Newhall Street and Third Street (one block) to a transit-only lane at all times. Because the eastbound travel lanes between Newhall Street are relatively narrow, parking would likely need to be prohibited on the south side of Palou Avenue between	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

Newhall Street and Third Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane. In the eastbound direction, east of Third Street, buses would re-enter the single mixed-flow traffic lane at the bus stop on the far (east) side of Third Street.

- There are currently pedestrian corner bulbs on the northwest and southwest corners of the intersection of Palou Avenue and Third Street. In order to accommodate the transit-only lanes west of Third Street, these bulbouts would be reconfigured or removed. Although removing pedestrian bulb-outs may increase pedestrian crossing distances and is generally inconsistent with the City's desire to prioritize pedestrian activity, in this case, the improvement would offer substantial benefits to transit travel times by allowing a transit-only lane through a congested intersection. This would be consistent with the City's transit-first policy.
- During the PM peak period only, prohibit parking on westbound Palou Avenue for the four-block segment between Griffith Street/Crisp Avenue and Keith Street, to provide for a PM peak period curb transit-only lane along this segment. This would create a continuous westbound transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street during the PM peak period.
- As an alternative to the bulleted measures above, narrow the existing sidewalks on Palou Avenue from Third Street to Crisp Avenue (seven blocks) from 15 feet to 12 feet in width. The pedestrian bulb-outs on the west side of Third Street would be removed. The resulting 12-foot-wide sidewalks would be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Palou Avenue. This would preserve on-street parking along the corridor and provide a seven-block transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Subsequent to publication of the Draft EIR, SFMTA and the Project Applicant conducted an evaluation of this alternative measure and determined that it is a feasible and viable alternative to the four bulleted items above.

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include signal priority treatments at other signalized intersections including at Bayshore/Cortland, Bayshore/Industrial, and Bayshore/Oakdale.

MM TR-22.2 Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O'Shaughnessy. Should mitigation measure MM TR-22.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O'Shaughnessy. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-23 Implementation of the Project would increase congestion at intersections along Gilman Avenue and Paul Avenue, which would increase travel times and would impact operations of the 29-Sunset.	**PS**	**MM TR-23.1** Maintain the proposed headways of the 29-Sunset. To address Project impacts to the 29-Sunset, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Gilman Avenue and Paul Avenue corridor, generally between Arelious Walker Drive and Bayshore Boulevard. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 29-Sunset. ■ For the five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, prohibit on-street parking on westbound Gilman Avenue during the AM and PM peak periods to provide for three westbound travel lanes. During the peak periods convert one of the three westbound travel lanes to transit-only. During off-peak periods, parking would be allowed, and buses would travel in one of the two mixed-flow lanes. The peak period transit lanes would impact 90 parking spaces. ■ For the same five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, restripe the eastbound direction to provide two travel lanes, one of which would accommodate on-street parking and one of which would be a mixed-flow travel lane. During the AM and PM peak periods, prohibit on-street parking in the eastbound direction, and operate one of the two eastbound lanes as transit-only lanes. The peak period transit lanes would impact 80 parking spaces. ■ As an alternative to the two bulleted measures above, convert one of the travel lanes in each direction on Gilman Avenue from Third Street to Griffith Street to transit-only. This would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Gilman Avenue. This would preserve on-street parking along the corridor and provide four-block transit-only lanes on Gilman Avenue between Griffith Street and Third Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Subsequent to publication of the Draft EIR, SFMTA and the Project Applicant conducted an evaluation of this alternative measure and determined that is a feasible and viable alternative to the two bulleted items above, ■ Prohibit on-street parking on the north side of Paul Avenue, between Third Street and Bayshore Boulevard to create two westbound through lanes. Convert one westbound through lane to transit-only in the AM and PM peak periods. The peak period transit-only lane would impact 40 parking spaces. At the intersection of Paul Avenue and Bayshore Avenue, provide transit signal priority treatment (i.e., queue jump) to allow transit vehicles to maneuver into the mixed flow left-hand lane, facilitating a left-turn movement immediately west of Bayshore Boulevard from westbound Paul Avenue to southbound San Bruno. The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include transit priority treatments on San Bruno Avenue, on the portions where the 29-Sunset travels.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		MM TR-23.2 Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset. Should mitigation measure MM TR-23.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	
Impact TR-24 Implementation of the Project would increase congestion at intersections along Evans Avenue, which would increase travel times and impact operations of the 48-Quintara-24th Street.	**PS**	**MM TR-24.1** Maintain the proposed headways of the 48-Quintara-24th Street. To address Project impacts to the 48-Quintara-24th Street, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Evans Avenue corridor, generally between Hunters Point Boulevard and Napoleon Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 48-Quintara-24th Street. ■ On Evans Avenue, between Jennings Street and Napoleon Street (a nine-block segment—about 6,000 feet), convert one of the two travel lanes in each direction to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic. The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include extension of transit only lanes in one or both directions between Napoleon Street and Cesar Chavez Street or onto Hunters Point Boulevard and Innes Avenue. **MM TR-24.2** Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Should mitigation measure MM TR-24.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	**SU/MM**
Impact TR-25 Implementation of the Project would increase congestion at intersections in the study area, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the 54-Felton.	**PS**	**MM TR-25** Purchase additional transit vehicles to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. SFMTA shall purchase additional transit vehicles to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-26 Implementation of the Project would increase congestion at intersections along Third Street, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the T-Third.	**PS**	**MM TR-26.1** Maintain the proposed headways of the T-Third. To address Project impacts to the T-Third, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvement that could reduce Project impacts on transit operations along Third Street between Thomas Avenue and Kirkwood Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the T-Third. ■ Reconfigure the section of Third Street between Thomas Avenue and Kirkwood Avenue (9 blocks) where the light rail vehicles currently share the travel lane with auto traffic to provide a dedicated transit right-of-way, consistent with the rest of the route. This would require either removal of one travel lane in each direction on Third Street, or removal of on-street parking and some sidewalk bulbouts. In addition, left-turns from Third Street in this segment would be restricted in both directions. Treatment for transit-only lanes can range from striping to physical elevation or barriers to protect transit right-of-way from mixed-flow traffic. Implementation of the roadway reconfiguration shall be the responsibility of SFMTA, and shall be implemented when the results of the study described above indicate transit improvements are necessary. The Project Applicant shall fully fund the costs of implementing the transit priority improvements prior to approval of subsequent phases of development. **MM TR-26.2** Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Should mitigation measure MM TR-26.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	**SU/MM**
Impact TR-27 Implementation of the Project could increase congestion at the intersection of Geneva Avenue and Bayshore Boulevard. This would increase travel times and impact operations of the 28L-19th Avenue/Geneva Limited.	**PS**	**MM TR-27.1** Ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension. The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension. **MM TR-27.2** Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Should mitigation measure MM TR-27.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-28 Implementation of the Project would increase congestion on US-101 mainline and ramps, which would increase travel times and impact operations of the 9X, 9AX, 9BX-Bayshore Expresses, and 14X-Mission Express. The Project would also contribute to cumulative impacts on these transit routes on US-101.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-29 Implementation of the Project would not contribute to cumulative impacts on the 14X-Mission Express transit route when on I-280.	**LTS**	No mitigation is required.	**LTS**
Impact TR-30 Implementation of the Project would increase congestion and contribute to cumulative congestion on US-101 and on Bayshore Boulevard, which would increase travel times and adversely affect operations of SamTrans bus lines on these facilities. No feasible mitigation has been identified.	**PS**	No feasible mitigation is identified.	**SU**
Impact TR-31 During implementation of the Project, bicycle facilities would be expanded to serve additional users. This would be a beneficial impact of the Project.	**NI**	No mitigation is required.	**NI**
Impact TR-32 Implementation of the Project's proposed transit preferential treatments and significant increases in traffic volumes on Palou Avenue could result in impacts on bicycle travel on Bicycle Routes #70 and #170 between Griffith Street and Third Street.	**PS**	**MM TR-32** Determine the feasibility of relocating Bicycle Routes #70 and #170. Prior to issuance of the grading permit for Development Phase 1, the Project Applicant shall fund a study to determine the feasibility of relocating Bicycle Routes #70 and #170. The study of the bicycle route relocation, necessary environmental clearance documentation, and implementation shall be the responsibility of SFMTA.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-33 During implementation of the Project, pedestrian facilities would be expanded to serve additional users. This would be a beneficial impact of the Project.	**NI**	No mitigation is required.	**NI**
Impact TR-34 Implementation of the Project would result in traffic volumes on area roadways that would not substantially affect pedestrian circulation and safety in the Project vicinity.	**LTS**	No mitigation is required.	**LTS**
Impact TR-35 Implementation of the Project would not result in significant impacts associated with a lack of an adequate supply of parking that could not be accommodated within alternative modes.	**LTS**	No mitigation is required.	**LTS**
Impact TR-36 Implementation of the Project roadway improvements would displace on-street parking spaces, and the existing demand could be accommodated in the nearby vicinity.	**LTS**	No mitigation is required.	**LTS**
Impact TR-37 Implementation of the Project would not result in significant impacts associated with a lack of adequate supply of loading spaces.	**LTS**	No mitigation is required.	**LTS**
Impact TR-38 For as many as 12 times a year, 49ers games at the proposed stadium would result in significant impacts on study area roadways and intersections.	**PS**	**MM TR-38** Transportation Management Plan (TMP) for the stadium. The stadium operators shall develop and maintain a Transportation Management Plan (TMP) for the stadium. The stadium operator shall work with representatives from the SFMTA, the State Highway Patrol, the Police Department, private charter operators, Caltrain and others on a continuing basis to develop and refine the TMP, as determined appropriate by SFMTA. The final stadium TMP shall be approved by SFMTA. Preparation of the TMP shall be fully funded by the stadium operator, and shall be completed in time for implementation on opening day of the stadium. The following actions shall be included in the TMP: ■ Information on transportation options to the stadium, including game day service by the various regional service providers shall be distributed to season ticket holders, employees, and other patrons if possible.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ A brochure, information packet, and/or web page providing full information on transit access to the stadium, similar to that currently offered at the 49ers website, shall be updated and maintained. ■ The use of charter buses to the stadium shall be encouraged and expanded. A number of measures shall be considered that could be implemented at low-cost to expand the use of group charters, including reduced parking costs, publicize the groups in 49ers publications and mailings, provide priority parking, provide lounges for bus drivers and provide support services for rooter clubs. ■ Residential Permit Parking Program and/or additional parking restrictions, such as time limits, during game days, particularly in the Bayview Hunters Point areas, shall be explored with residents to reduce potential for intrusion of stadium vehicles into the adjacent neighborhood during a football game or secondary event. ■ The stadium operator shall implement measures to encourage carpools of 4-plus persons per vehicle. ■ The stadium operator shall charge a higher parking cost for low occupancy vehicles. ■ The stadium operator shall develop a separate TDM plan for employees of the stadium and concessionaires. The plan shall consider measures such as providing employees and concessionaires with free or subsidized transit passes to encourage transit use and reduce vehicular travel to the stadium. Employees shall not receive preferential parking. ■ The stadium operator shall develop measures with CPSRA to ensure that game day spectators do not park in CPSRA day use parking lots. Strategies to be explored include limiting parking in CPSRA lots to a limited duration during game days (e.g., to a two-hour period), or an increase in parking fees equivalent to game day parking, and ticketing and enforcement. ■ The TMP shall ensure that regular transit routes operate acceptably near the stadium. The plan should consider providing alternate routes for those transit lines that do not have exclusive right-of-way on game days (48-Quintara-24th Street, 44-O'Shaughnessy, 29-Sunset) onto transit-only facilities such as the BRT right-of-way to the south and Palou Avenue to the north (which would be a transit-only facility on game days).	
● **Impact TR-39** Implementation of the Project with existing game day service and Project transit improvements would not be adequate to accommodate projected transit demand.	**PS**	**MM TR-39** *Transit Service during Game Days.* SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area on game days. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park Station) and Caltrain (Bayshore Station). Although the specific frequencies of individual routes should be determined based on patron characteristics that may evolve over time, the increased transit service, taken as an aggregate, should generally compensate for the projected shortfall of 3,600 passengers per hour on the existing and proposed transit lines. Prior to opening day at the new stadium, the City and stadium operator shall determine costs associated with the increased service and determine funding sources. Examples of funding sources that shall be considered include a surcharge on game tickets or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-40 For as many of 12 times per year during game days, bicycle access in the vicinity of the proposed stadium would be constrained, however, accommodations for bicycle access and circulation would be provided.	**LTS**	No mitigation is required.	**LTS**
Impact TR-41 For as many of 12 times per year during game days, pedestrian access in the vicinity of the proposed stadium would be constrained, however, accommodations for pedestrian access and circulation would be provided.	**LTS**	No mitigation is required.	**LTS**
Impact TR-42 For as many as 12 times per year during game days, access to state park facilities for vehicles, bicyclists and pedestrians would be constrained, and heavy traffic congestion could discourage use of the park. However, access for vehicles, bicyclists, and pedestrians would be maintained.	**LTS**	No mitigation is required.	**LTS**
Impact TR-43 For as many of 12 times per year during game days, parking demand associated with sell-out events would exceed the proposed on-site supply, resulting in a parking supply shortfall. The shortfall would be accommodated within other on-street and off-street parking facilities, and some patrons may elect to take transit to the stadium.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-44 Implementation of the Project would result in stadium game day loading demand that would be accommodated within the proposed on-site supply.	**LTS**	No mitigation is required.	**LTS**
Impact TR-45 During game days, accommodation for emergency access would be provided.	**LTS**	No mitigation is required.	**LTS**
● **Impact TR-46** Weekday evening secondary events at the stadium would result in increased congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without a secondary event, and result in significant impacts at nine additional intersections and one additional freeway off-ramp.	**PS**	**MM TR-46** Traffic Control Officers. The stadium operator shall develop as part of a stadium Transportation Management Plan (TMP), a strategy for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, similar to what would be in place for football game days. The secondary event component of the stadium TMP shall be approved by SFMTA. The stadium operator shall fully fund implementation of the secondary event (i.e., non-49ers football events) measures.	**SU/MM**
● **Impact TR-47** With implementation of the Project, the existing transit service and Project improvements would not be adequate to accommodate projected transit demand during secondary events with attendance of 37,500 spectators. In addition, transit lines serving the area would experience additional delays due to traffic generated by the secondary event.	**PS**	**MM TR-47** Transit Service during Secondary Events. SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large special events. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park stations) and Caltrain (Bayshore station). ■ Routes 24-Divisadero, 28L-19th Avenue Limited, and 44-O'Shaughnessey would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to the 48-Quintara-24th Street route and the new HPX service. If each of these routes were increased to have five-minute frequencies (typically considered the maximum frequency that can be regularly maintained), the transit capacity toward the stadium would increase by 828 passengers per hour, for a total of 3,928 passengers. Even with the additional service on these two lines, there would be a shortfall of 1,797 passengers per hour in transit capacity. ■ Additional express service to key regional transit destinations and regional charter express service, similar to what is offered on football game days, would offset a portion of the shortfall in transit capacity. The amount and nature of special service to special stadium events would depend on the type and size of the special event. Generally, the capacity of the express service should compensate for the shortfall of 1,797 passengers per hour for a 37,500-person event (transit supply, would of course, be designed on a case-by-case basis depending on the expected size of the secondary event).	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ SFMTA and the stadium operator shall implement a stadium transportation systems plan similar to that developed for game-day operations (except that the Yosemite Slough bridge shall not be available for private automobiles), on a case-by-case basis depending on the expected size of the secondary event. Prior to opening day at the new stadium, the City and the stadium operator shall determine costs associated with the increased service and determine funding requirements. Examples of funding sources that shall be considered include a surcharge on game tickets, parking or admission surcharge, or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.	
Impact TR-48 With implementation of the Project, bicycle circulation would not be impeded during secondary events at the stadium.	**LTS**	No mitigation is required.	**LTS**
Impact TR-49 With implementation of the Project, pedestrian circulation would not be impeded during arena events.	**LTS**	No mitigation is required.	**LTS**
Impact TR-50 With implementation of the Project, parking demand associated with a secondary event with an attendance of 37,500 spectators would be accommodated within the proposed supply.	**LTS**	No mitigation is required.	**LTS**
Impact TR-51 With implementation of the Project, weekday evening events at the arena would exacerbate congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without an arena event, and result in significant traffic impacts at Harney Way and Jamestown Avenue, which was operating acceptably under Project conditions without an arena event.	**PS**	**MM TR-51** Transportation Management Plan (TMP). The arena operator shall develop a Transportation Management Plan (TMP) for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, and for developing incentives to increase transit ridership to the arena. If Variants 1, 2, or 2A are implemented the TMP shall provide for SFMTA to increase the frequency on regularly scheduled Muni routes (primarily the CPX-Candlestick Express) serving the arena area prior to large events at the arena and for the arena operator to provide additional shuttle service to key regional transit destinations, such as BART, Caltrain, and the T-Third light-rail route. Implementation of this mitigation measure would likely speed vehicle entrance and exit to the arena site as well as maintain orderly traffic and transit operations and reduce intrusion onto minor routes to and from the arena. Traffic control officers would facilitate traffic flow at the intersection of Harney/Jamestown which would operate at LOS F conditions with a sell-out arena event. The final arena TMP shall be approved by SFMTA. Preparation of the TMP Plan shall be fully funded by the arena operator, and shall be completed in time for implementation on opening day of the arena.	**SU/MM**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact TR-52 With implementation of the Project, sell-out weekday evening events at the arena could impact existing and proposed transit service.	**PS**	MM TR-23.1 would apply to this impact.	**SU/MM**
Impact TR-53 With implementation of the Project, bicycle circulation would not be impeded during arena events.	**LTS**	No mitigation is required.	**LTS**
Impact TR-54 With implementation of the Project, pedestrian circulation would not be impeded during arena events.	**LTS**	No mitigation is required.	**LTS**
Impact TR-55 With implementation of the Project, arena parking demand would be accommodated on street and within proposed off-street parking facilities.	**LTS**	No mitigation is required.	**LTS**
Impact TR-56 Implementation of the Project would not impact air traffic.	**NI**	No mitigation is required.	**NI**
Impact TR-57 Implementation of the Project would not create hazards due to any proposed design features.	**LTS**	No mitigation is required.	**LTS**
Impact TR-58 Implementation of the Project would not result in significant emergency access impacts.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.E (AESTHETICS)	
Impact AE-1 Construction activities associated with the Project would not have a substantial adverse effect on a scenic vista or scenic resources.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AE-2 Construction activities associated with the Project would not result in temporary degradation of the visual character or quality of the site.	**PS**	**MM AE-2** Mitigation for Visual Character/Quality Impacts During Construction. Construction documents shall require all construction contractors to strictly control the staging of construction equipment and the cleanliness of construction equipment stored or driven beyond the limits of the construction work area. Construction equipment shall be parked and staged on the Project site. Staging areas shall be screened from view at street level with solid wood fencing or green fence. Prior to the issuance of building permits, the Project Applicant (through the construction contractor[s]) shall submit a construction staging, access, and parking plan to the San Francisco Department of Building Inspection for review and approval. On-street parking of construction worker vehicles shall be prohibited. Vehicles shall be kept clean and free of mud and dust before leaving the Project site. Project contractors shall sweep surrounding streets used for construction access daily and maintain them free of dirt and debris.	**LTS/M**
Impact AE-3 Construction activities associated with the Project would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties.	**LTS**	No mitigation is required.	**LTS**
Impact AE-4 Implementation of the Project would not have a substantial adverse effect on a scenic vista.	**LTS**	No mitigation is required.	**LTS**
Impact AE-5 Implementation of the Project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting.	**LTS**	No mitigation is required.	**LTS**
Impact AE-5a Implementation of the Project at Candlestick Point would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AE-5b Implementation of the Project at HPS Phase II would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting.	**LTS**	No mitigation is required.	**LTS**
Impact AE-6 Implementation of the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.	**LTS**	No mitigation is required.	**LTS**
Impact AE-6a Implementation of the Project at Candlestick Point would not substantially degrade the existing visual character or quality of the site or its surroundings.	**LTS**	No mitigation is required.	**LTS**
Impact AE-6b Implementation of the Project at HPS Phase II would not substantially degrade the visual character or quality of the site or its surroundings.	**LTS**	No mitigation is required.	**LTS**
Impact AE-7 Implementation of the Project would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties.	**PS**	**MM AE-7a.1**, **MM AE-7a.2**, **MM AE-7a.3**, **MM AE-7a.4**, **MM AE-7b.1**, and **MM AE-7b.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AE-7a Implementation of the Project at Candlestick Point would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties.	**PS**	**MM AE-7a.1** Lighting Direction/Fixtures and Screening Walls to Minimize Glare and Light Spill. The Project Applicant shall ensure that all parking lot and other security lighting shall be directed away from surrounding land uses and towards the specific location intended for illumination. State-of-the-art fixtures shall be used, and all lighting shall be shielded to minimize the production of glare and light spill onto surrounding use. All parking structures shall be constructed with screening walls of sufficient height to block spill light from vehicle headlights. **MM AE-7a.2** Low-level/Unobtrusive Light Fixtures. The Project Applicant shall ensure that landscape illumination and exterior sign lighting shall be accomplished with low-level, unobtrusive fixtures. **MM AE-7a.3** Lighting Plan. The Project Applicant shall prepare a lighting plan for each phase of the Project and submit it for review and approval to the San Francisco Police Department and the Agency prior to the issuance of building permits. Outdoor lighting shall maintain a minimum required illumination, as determined appropriate by the San Francisco Police Department and the Planning Department, for all parking and pedestrian areas. In addition, the plan shall include details such as beam spreads and/or photometric calculation, location and type of fixtures, exterior colors, details on foundations, and arrangement of exterior lighting such that it does not create glare, hazardous interference on adjacent streets, or properties or result in spill light that would adversely impact sensitive receptors in the project area. **MM AE-7a.4** Non-reflective Exterior Surfaces to Minimize Glare Impacts. The Project Applicant shall ensure that design of the proposed structures shall include the use of textured or other nonreflective exterior surfaces and nonreflective glass.	**LTS/M**
Impact AE-7b Implementation of the Project at HPS Phase II would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties.	**PS**	**MM AE-7b.1** Testing of the Field-Lighting System. Prior to opening the stadium, the Stadium Operator shall test the installed field-lighting system to ensure that lighting meets operating requirements in the stadium and minimizes obtrusive spill lighting in the ballpark facility. Testing shall include light-meter measurements at selected locations in the vicinity to measure spill lighting from stadium field-lighting fixtures, permit adjustment of lighting fixtures, and confirm that spill-lighting effects shall be within an acceptable range and compatible with typical street lighting fixtures. **MM AE-7b.2** Stadium Lighting Orientation and Cut-Off Shields. Prior to opening the stadium, the Stadium Operator shall ensure that stadium lighting is oriented in such a manner to reduce the amount of light shed onto sensitive receptors and incorporate "cut-off" shields as appropriate to minimize any increase in lighting at adjacent properties, providing that it still meets the standard of lighting for football operations.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		SECTION III.F (SHADOWS)	
Impact SH-1 Implementation of the Project would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space.	**LTS**	No mitigation is required.	**LTS**
Impact SH-1a Implementation of the Project at Candlestick Point would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space.	**LTS**	No mitigation is required.	**LTS**
Impact SH-1b Implementation of the Project at HPS Phase II would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.G (WIND)	
Impact W-1 Implementation of the Project would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces.	**PS**	**MM W-1(a)** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact W-1a Implementation of the Project at Candlestick Point would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces.	**PS**	**MM W-1a** Building Design Wind Analysis. Prior to design approval of Project buildings, for high-rise structures above 100 feet, the Project Applicant shall retain a qualified wind consultant to provide a wind review to determine if the exposure, massing, and orientation of the building would result in wind impacts that could exceed the threshold of 26-mph-equivalent wind speed for a single hour during the year. The wind analysis shall be conducted to assess wind conditions for the proposed building(s) in conjunction with the anticipated pattern of development on surrounding blocks to determine if the Project building(s) would cause an exceedance of the wind hazard standard. The analysis shall be conducted as directed by the City's wind study guidelines, including, if required, wind tunnel modeling of potential adverse effects relating to hazardous wind conditions. The Agency shall require the Project Applicant to identify design changes that would mitigate the adverse wind conditions to below the threshold of 26-mph-equivalent wind speed for a single hour of the year. These design changes could include, but are not limited to, wind-mitigating features, such as placing towers on podiums with a minimum 15-foot setback from street edges, placement of awnings on building frontages, street and frontage plantings, articulation of building facades, or the use of a variety of architectural materials.	**LTS/M**
Impact W-1b Implementation of the Project at HPS Phase II would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces.	**PS**	**MM W-1(a)** would apply to this impact.	**LTS/M**
		SECTION III.H (AIR QUALITY)	
Impact AQ-1 Construction activities associated with the Project would not result in short-term increases in emission of criteria air pollutants and precursors that exceed BAAQMD CEQA significance criteria.	**PS**	**MM HZ-15** would apply to this impact.	**LTS/M**
Impact AQ-2 Construction activities associated with the Project would not result in impacts to on-site and off-site populations from Project-generated emissions of DPM.	**PS**	**MM AQ-2.1** and **MM AQ-2.2** would apply to this impact	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AQ-2a Construction at Candlestick Point would not result in impacts to off-site populations from Project-generated emissions of DPM.	**PS**	**MM AQ 2.1** Implement Emission Control Device Installation on Construction. To reduce DPM emissions during Project construction, the Project Applicant shall require construction equipment used for the Project to utilize emission control technology such that 50% of the fleet will meet USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) during the first two years of construction activities, increasing to 75% of the fleet in the third year and 100% of the fleet starting in the fourth year and for the duration of the Project.	**LTS/M**
Impact AQ-2b Construction at HPS Phase II would not result in impacts to off-site populations from Project-generated emissions of DPM.	**PS**	**MM AQ-2.1** would apply to this impact.	**LTS/M**
Impact AQ-2c Construction activities associated with the Project would not result in impacts to the existing Alice Griffith Public Housing from Project-generated emissions of DPM.	**PS**	**MM AQ-2.1** would also apply to this impact. **MM AQ-2.2** Implement Accelerated Emission Control Device Installation on Construction Equipment Used for Alice Griffith Parcels. In addition to mitigation measure MM AQ-2.1, in order to minimize the potential impacts to residents living in Alice Griffith from the construction activities in that area, the Project Applicant will require that all construction equipment used in the Alice Griffith parcels (CP01 though CP06) utilize equipment which meets the USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) throughout the entire duration of construction activities on those parcels.	**LTS/M**
Impact AQ-3 Construction activities associated with the Project would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}.	**PS**	**MM HZ-15** would apply to this impact.	**LTS/M**
Impact AQ-3a Construction at Candlestick Point would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}.	**PS**	**MM HZ-15** would apply to this impact.	**LTS/M**
Impact AQ-3b Construction at HPS Phase II would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}.	**PS**	**MM HZ-15** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AQ-4 Operation of the Project would violate BAAQMD CEQA significance thresholds for mass criteria pollutant emissions from mobile and area sources and contribute substantially to an existing or projected air quality violation at full buildout.	**S**	No feasible mitigation is available.	**SU**
Impact AQ-5 Operation of the Project would not cause local concentrations of CO to exceed State and federal ambient air quality standards due to motor vehicles trips.	**LTS**	No mitigation is required.	**LTS**
Impact AQ-6 Implementation of HPS Phase II would not expose nearby receptors to an increase in local concentrations of toxic air contaminants due to the operation of Research and Development uses.	**PS**	**MM AQ-6.1** If a facility with sources of TAC emission wishes to locate on a plot size smaller than 1 acre, an analysis will be required to show the facility, in conjunction with all other TAC emitting facilities in the R&D areas, will not cause these thresholds of a residential cancer risk of 10 in one million and a chronic noncancer HI of 1.0 to be exceeded at the nearest residential locations. **MM AQ-6.2** Each facility with sources of TAC emissions on a plot of 1 acre or larger will limit their emissions such that residential cancer risk and chronic non-cancer hazard index evaluated at the facility boundary does not exceed 10 in one million or 1.0, respectively. If these thresholds are exceeded at the boundary, an analysis will be required to show the facility, in conjunction with all other TAC emitting facilities in the R&D areas, will not cause these thresholds to be exceeded at the nearest residential locations.	**LTS/M**
Impact AQ-7 Operation of the Project would not expose receptors to concentrations of $PM_{2.5}$ above a 0.2 $\mu g/m^3$ action level for $PM_{2.5}$ and, therefore, would not substantially affect the health of nearby receptors as a result of an increase in local concentrations of vehicle emissions ($PM_{2.5}$) associated with vehicle use attributable to operation of the Project.	**LTS**	No mitigation is required.	**LTS**
Impact AQ-8 Implementation of the Project would not generate objectionable odors affecting a substantial number of people.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact AQ-9 The Project would conform to the current regional air quality plan.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.I (NOISE AND VIBRATION)	
Impact NO-1 Construction activities associated with the Project would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would occur primarily in noise-sensitive areas adjacent or near to active construction sites (which would vary in location and duration over the entire period the proposed Project would be under construction); they would also not occur during recognized sleep hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 and 2908 of the *Municipal Code*.	**PS**	**MM NO.1a.1** and **MM NO-1a.2** would apply to this impact.	**LTS/M**
Impact NO-1a Construction at Candlestick Point would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would occur primarily in noise-sensitive areas adjacent or near to active construction sites (which would vary in location and duration over the entire period the proposed Project would be under construction), they would not occur during recognized sleep	**PS**	**MM NO-1a.1** Construction Document Mitigation to Reduce Noise Levels during Construction. The Project Applicant shall incorporate the following practices into the construction documents to be implemented by the Project contractor: ■ Provide enclosures and mufflers for stationary equipment, shrouding or shielding for impact tools, and barriers around particularly noisy operations on the site ■ Use construction equipment with lower noise emission ratings whenever possible, particularly air compressors ■ Provide sound-control devices on equipment no less effective than those provided by the manufacturer ■ Locate stationary equipment, material stockpiles, and vehicle staging areas as far as practicable from sensitive receptors ■ Prohibit unnecessary idling of internal combustion engines	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 & 2908 of the *Municipal Code*.		■ Require applicable construction-related vehicles and equipment to use designated truck routes to access the Project site ■ Implement noise attenuation measures to the extent feasible, which may include, but are not limited to, noise barriers or noise blankets. The placement of such attenuation measures will be reviewed and approved by the Director of Public Works prior to issuance of development permits for construction activities. ■ Designate a Noise Disturbance Coordinator who shall be responsible for responding to complaints about noise during construction. The telephone number of the Noise Disturbance Coordinator shall be conspicuously posted at the construction site and shall be provided to the City. Copies of the construction schedule shall also be posted at nearby noise-sensitive areas. **MM NO-1a.2** Noise-reducing Pile Driving Techniques and Muffling Devices. The Project Applicant shall require its construction contractor to use noise-reducing pile driving techniques if nearby structures are subject to pile driving noise and vibration. These techniques include pre-drilling pile holes (if feasible, based on soils) to the maximum feasible depth, installing intake and exhaust mufflers on pile driving equipment, vibrating piles into place when feasible, and installing shrouds around the pile driving hammer where feasible. Contractors shall be required to use construction equipment with state-of-the-art noise shielding and muffling devices. In addition, at least 48 hours prior to pile-driving activities, the Project Applicant shall notify building owners and occupants within 500 feet of the Project site of the dates, hours, and expected duration of such activities.	
Impact NO-1b Construction at HPS Phase II would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would be temporary, they would also not occur during recognized sleep hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 and 2908 of the *Municipal Code*.	**PS**	**MM NO-1a.1** and **MM NO-1a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact NO-2 Construction activities associated with the Project would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would still be significant.	**S**	**MM NO-1a.1, MM NO-1a.2,** and **MM NO-2a** would apply to this impact.	**SU/M**
Impact NO-2a Construction activities at Candlestick Point would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would still be significant.	**S**	**MM NO-2a** Pre-construction Assessment to Minimize Pile Driving Impacts. The Project Applicant shall require its geotechnical engineering contractor to conduct a pre-construction assessment of existing subsurface conditions and the structural integrity of nearby buildings subject to pile driving impacts prior to receiving a building permit. If recommended by the geotechnical engineer, for structures or facilities within 50 feet of pile driving, the Project Applicant shall require groundborne vibration monitoring of nearby structures. Such methods and technologies shall be based on the specific conditions at the construction site such as, but not limited to, the following: ■ Pre-pile driving surveying of potentially affected structures. ■ Underpinning of foundations of potentially affected structures, as necessary. ■ The construction plan shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of an excavation. Monitoring results shall be submitted to DBI. In the event of unacceptable ground movement, as determined by DBI inspections, all pile driving work shall cease and corrective measures shall be implemented. The pile driving program and ground stabilization measures shall be reevaluated and approved by DBI. **MM NO-1a.1** and **MM NO-1a.2** would apply to this impact.	**SU/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact NO-2b Rock removal in the Alice Griffith and Jamestown districts would result in vibration levels that exceed the FTA threshold of 80 VdB or could cause damage to structures from vibration caused by the fracturing of bedrock for excavation.	**S**	**MM NO-1a.1** and **MM GE-3a** would apply to this impact.	**SU/M**
Impact NO-2c Construction at HPS Phase II would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would be significant.	**S**	**MM NO-1a.1, MM NO-1a.2,** and **MM NO-2a** would apply to this impact.	**SU/M**
Impact NO-3 Construction activities associated with the Project would result in a substantial temporary or periodic increase in ambient noise levels.	**S**	**MM NO-1a.1, MM NO-1a.2,** and **MM NO-2a** would apply to this impact.	**SU/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact NO-4 Implementation of the Project, including the use of mechanical equipment or the delivery of goods, would not expose noise-sensitive land uses on or off site to noise levels that exceed the standards established by the City.	**LTS**	No mitigation is required.	**LTS**
Impact NO-5 Implementation of the Project would not generate or expose persons on or off site to excessive groundborne vibration.	**LTS**	No mitigation is required.	**LTS**
Impact NO-6 Operation of the Project would generate increased local traffic volumes that could cause a substantial permanent increase in ambient noise levels in existing residential areas along the major Project site access routes.	**S**	No feasible mitigation is available.	**SU**
Impact NO-7 Noise during football games and concerts at the proposed stadium would result in temporary increases in ambient noise levels that could adversely affect surrounding residents for the duration of a game or concert.	**S**	**MM NO-7.1** Mitigation to Minimize Game/Concert-related Temporary Increases in Ambient Noise Levels at Nearby Residences. To ensure that stadium game-and event-induced interior L_{max} noise levels do not exceed an interior noise level of 60 dBA and interfere with speech and other indoor activities in the existing Hunters Point Hill residential community closest to and north of the proposed Stadium (i.e., as identified by the R3 stadium noise model receiver), the Stadium Operator shall: ■ After Stadium Operator enters into lease agreement with Agency, send notification of the establishment of a stadium noise mitigation program (SNMP) to the residential property owners in the identified neighborhood potentially affected by noise from the proposed Stadium ■ Allow property owners an appropriate time after the date of notification about the SNMP to apply for the program, with a reminder sent to the owners before the end of the application period ■ Determine if responding property owners meet qualifications ■ Compile for property-owners reference and send to them a summary of standard types of structural acoustical mitigations ■ Choose a qualified acoustical consultant to survey the potentially affected residential units and recommend sound reduction measures appropriate to offset the modeled stadium noise impacts, which may include: > Acoustical upgrades to windows and doors	**SU/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		> Acoustical stripping around doors and other openings > Ventilation improvements ■ Estimates cost of recommended sound reduction measures, which shall include labor and materials, permit fees, and City inspections; material costs will, as much as possible, be based on "like-for-like", that is, for replacement of existing materials similar in quality or appearance ■ Pay each qualifying property owner the amount of this estimate after obtaining a release from future claims for stadium event noise impacts at each property with each property owner responsible for implementing the sound reduction improvements ■ Establish an ad hoc community working group of neighbors to develop a mediation process should any future disputes arise over the effectiveness of the SNMP in eliminating stadium noise intrusions **MM NO-7.2** Residential Use Plan Review by Qualified Acoustical Consultant. To ensure that stadium game-and event-induced interior L_{max} noise levels do not exceed an interior noise level of 60 dBA and interfere with speech and other indoor activities in the proposed on-site residential uses closest to the proposed Stadium, the Project Applicant shall choose a qualified acoustical consultant to review plans for the new residential uses planned for areas closest to the proposed Stadium and follow their recommendations to provide acoustic insulation or other equivalent measures to ensure that interior peak noise events would not exceed 60 dBA L_{max}.	
Impact NO-8 Implementation of the Project would not expose residents and visitors to excessive noise levels from flights from San Francisco International Airport such that the noise would be disruptive or cause annoyance.	**LTS**	No mitigation is required.	**LTS**
SECTION III.J (CULTURAL RESOURCES AND PALEONTOLOGICAL RESOURCES)			
Impact CP-1 Construction activities associated with the Project could result in a substantial adverse change in the significance of a historical resource.	**S**	**MM CP-1b.1** and **MM CP-1b.2** apply to this impact.	**SU/M**
Impact CP-1a Construction at Candlestick Point would not result in a substantial adverse change in the significance of an historical resource.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact CP-1b Construction at HPS Phase II could result in a substantial adverse change in the significance of an historical resource.	**S**	**MM CP-1b.1** Mitigation to Minimize Impacts on Historic Resources at HPS Phase II. To reduce the adverse effect on historical resources, prior to any structural demolition and removal activities, the Project Applicant shall retain a professional who meets the Secretary of the of the Interior's Professional Qualifications Standards for Architectural History to prepare written and photographic documentation of the potential Hunters Point Commercial Dry Dock and Naval Shipyard Historic District, as identified in the report titled *Bayview Waterfront Plan Historic Resources Evaluation, Volume II: Draft Historic Resources Survey and Technical Report*, July 2009, prepared by Circa Historic Property Development. The documentation for the property shall be prepared based on the National Park Services' (NPS) Historic American Building Survey (HABS) / Historic American Engineering Record (HAER) Historical Report Guidelines. This type of documentation is based on a combination of both HABS/HAER standards (Levels II and III) and NPS new policy for NR-NHL photographic documentation as outlined in the National Register of Historic Places and National Historic Landmarks Survey Photo Policy Expansion (March 2005). The written historical data for this documentation shall follow HABS / HAER Level I standards. The written data shall be accompanied by a sketch plan of the property. Efforts should also be made to locate original construction drawings or plans of the property during the period of significance. If located, these drawings should be photographed, reproduced, and included in the dataset. If construction drawings or plans cannot be located as-built drawings shall be produced. Either HABS / HAER standard large format or digital photography shall be used. If digital photography is used, the ink and paper combinations for printing photographs must be in compliance with NR-NHL photo expansion policy and have a permanency rating of approximately 115 years. Digital photographs will be taken as uncompressed .TIF file format. The size of each image will be 1600x1200 pixels at 300 ppi (pixels per inch) or larger, color format, and printed in black and white. The file name for each electronic image shall correspond with the index of photographs and photograph label. Photograph views for the dataset shall include *(a)* contextual views; *(b)* views of each side of each building and interior views, where possible; *(c)* oblique views of buildings; and *(d)* detail views of character-defining features, including features on the interiors of some buildings. All views shall be referenced on a photographic key. This photograph key shall be on a map of the property and shall show the photograph number with an arrow indicate the direction of the view. Historic photographs shall also be collected, reproduced, and included in the dataset. All written and photographic documentation of the potential Hunters Point Commercial Dry Dock and Naval Shipyard Historic District shall be approved by the SFRA, in consultation with the ERO, prior to any demolition and removal activities. **MM CP-1b.2** Interpretive Displays Depicting History of HPS. Interpretive displays related to the history of HPS shall be installed at Heritage Park at Dry Dock Nos. 2 and 3. The number and type of displays shall be approved by the SFRA, in consultation with the ERO.	**SU/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact CP-2 Construction activities associated with the Project would not result in a substantial adverse change in the significance of archaeological resources, including prehistoric Native American resources, Chinese fishing camps, and maritime related resources.	**PS**	**MM CP-2a** would apply to this impact.	**LTS/M**
Impact CP-2a Construction at Candlestick Point would not result in a substantial adverse change in the significance of archaeological resources, including prehistoric Native American, Chinese fishing camp, and maritime-related archaeological remains.	**PS**	**MM CP-2a** Mitigation to Minimize Impacts to Archaeological Resources at Candlestick Point. Based on a reasonable presumption that archaeological resources may be present within the Project site, the following measures shall be undertaken to avoid any potentially significant adverse effect from the Project on buried or submerged historical resources. Overview: The Project Applicant shall retain the services of a qualified archaeological consultant having expertise in California prehistoric and urban historical archeology. The archaeological consultant shall undertake an archaeological testing program as specified herein. In addition, the archaeological consultant shall be available to conduct an archaeological monitoring and/or data recovery program if required pursuant to this measure. The archaeological consultant's work shall be conducted in accordance with this measure and with the requirements of the Project Archaeological Research Design and Treatment Plan (Archeo-Tec. Archaeological Research Design and Treatment Plan for the Bayview Waterfront Project, San Francisco, California, 2009) at the direction of the City's Environmental Review Officer (ERO). In instances of inconsistency between the requirement of the Project Archaeological Research Design and Treatment Plan and of this archaeological mitigation measure, the requirement of this archaeological mitigation measure shall prevail. All plans and reports prepared by the consultant as specified herein shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO. Archaeological monitoring and/or data recovery programs required by this measure could suspend construction of the Project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce potential effects on a significant archaeological resource as defined in CEQA Guidelines Section 15064.5(a)(c) to a less-than-significant level. Archaeological Testing Program: The archaeological consultant shall prepare and submit to the ERO for review and approval an archaeological testing plan (ATP). The archaeological testing program shall be conducted in accordance with the approved ATP. The ATP shall identify the property types of the expected archaeological resource(s) that potentially could be adversely affected by the Project, the testing method to be used, and the locations recommended for testing. The purpose of the archaeological testing program will be to determine to the extent possible the presence or absence of archaeological resources and to identify and to evaluate whether any archaeological resource encountered on the site constitutes an historical resource under CEQA.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		At the completion of the archaeological testing program, the archaeological consultant shall submit a written report of the findings for submittal to the ERO. If, based on the archaeological testing program, the archaeological consultant finds that significant archaeological resources may be present, the ERO (in consultation with the archaeological consultant) shall determine if additional measures are warranted. Additional measures that may be undertaken include, but are not necessarily limited to, additional archaeological testing, archaeological monitoring, and/or an archaeological data recovery program. If the ERO determines that a significant archaeological resource is present and that the resource could be adversely affected by the Project, the Project Applicant shall either: a. Re-design the Project so as to avoid any adverse effect on the significant archaeological resource; or b. Implement a data recovery program, unless the ERO determines that the archaeological resource is of greater interpretive than research significance and that interpretive use of the resource is feasible. Archaeological Monitoring Program: If the ERO, in consultation with the archaeological consultant, determines that an Archaeological Monitoring Program (AMP) shall be implemented, the AMP shall include the following provisions, at a minimum: ■ The archaeological consultant, Project Applicant, and ERO shall meet and consult on the scope of the AMP prior to the commencement of any Project-related soils disturbing activities. The ERO, in consultation with the archaeological consultant, shall determine what Project activities shall be archaeologically monitored. In most cases, any soils- disturbing activities, such as demolition, foundation removal, excavation, grading, utilities installation, foundation work, driving of piles (foundation, shoring, etc.), and site remediation, shall require archaeological monitoring because of the risk these activities pose to potential archaeological resources and to their depositional context. ■ The archaeological consultant shall train all Project construction personnel who could reasonably be expected to encounter archaeological resources of the expected resource(s), how to identify the evidence of the expected resource(s), and the appropriate protocol in the event of apparent discovery of an archaeological resource. ■ The archaeological monitor(s) shall be present on the Project site according to a schedule agreed upon by the archaeological consultant and the ERO until the ERO has, in consultation with the archaeological consultant, determined that Project construction activities could have no effects on significant archaeological deposits. ■ The archaeological monitor shall record and be authorized to collect soil samples and artifactual/ecofactual material as warranted for analysis. ■ If an intact archaeological deposit is encountered, all soil-disturbing activities in the vicinity of the deposit shall cease. The archaeological monitor shall be authorized to temporarily halt demolition/excavation/pile driving/construction activities and equipment until the deposit is evaluated. If, in the case of pile driving activity (foundation, shoring, etc.), the archaeological monitor has cause to believe that the pile driving activity may affect an archaeological resource, the pile driving activity shall be terminated until an	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

appropriate evaluation of the resource has been made in consultation with the ERO. The archaeological consultant shall immediately notify the ERO of any encountered archaeological deposit. The archaeological consultant shall make a reasonable effort to assess the identity, integrity, and significance of the encountered archaeological deposit and present the findings of this assessment to the ERO as expeditiously as possible.

- Whether or not significant archaeological resources are encountered, the archaeological consultant shall submit a written report of the findings of the monitoring program to the ERO.

Archaeological Data Recovery Program: The archaeological data recovery program shall be conducted in accord with an Archaeological Data Recovery Plan (ADRP). The archaeological consultant, Project Applicant, and ERO shall meet and consult on the scope of the ADRP prior to preparation of a draft ADRP. The archaeological consultant shall submit a draft ADRP to the ERO. The ADRP shall identify how the proposed data recovery program will preserve the significant information the archaeological resource is expected to contain. That is, the ADRP will identify what scientific/historical research questions are applicable to the expected resource, what data classes the resource is expected to possess, and how the expected data classes would address the applicable research questions. Data recovery, in general, should be limited to the portions of the historical property that could be adversely affected by the Project. Destructive data recovery methods shall not be pursued if nondestructive methods are practical.

The scope of the ADRP shall include the following elements:

- Field Methods and Procedures. Descriptions of proposed field strategies, procedures, and operations.
- Cataloguing and Laboratory Analysis. Description of selected cataloguing system and artifact analysis procedures.
- Discard and Deaccession Policy. Description of and rationale for field and post-field discard and deaccession policies.
- Interpretive Program. Consideration of an on-site/off-site public interpretive program during the course of the archaeological data recovery program.
- Security Measures. Recommended security measures to protect the archaeological resource from vandalism, looting, and other potentially damaging activities.
- Final Report. Description of proposed report format and distribution of results.
- Curation. Description of the procedures and recommendations for the curation of any recovered data having potential research value, identification of appropriate curation facilities, and a summary of the accession policies of the curation facilities.

Human Remains and Associated or Unassociated Funerary Objects: The treatment of human remains and associated or unassociated funerary objects discovered during any soil-disturbing activity shall comply with applicable state and federal laws. This shall include immediate notification of the Coroner of the City and County of San Francisco and in the event of the Coroner's determination that the human remains are Native American

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		remains, notification of the California State Native American Heritage Commission (NAHC), which shall appoint a Most Likely Descendant (MLD) (PRC Sec. 5097.98). The archaeological consultant, Project Applicant, and MLD shall make all reasonable efforts to develop an agreement for the treatment of human remains and associated or unassociated funerary objects with appropriate dignity (CEQA Guidelines Sec. 15064.5(d)). The agreement shall take into consideration the appropriate excavation, removal, recordation, analysis, custodianship, curation, and final disposition of the human remains and associated or unassociated funerary objects. Final Archaeological Resources Report: The archaeological consultant shall submit a Draft Final Archaeological Resources Report (FARR) to the ERO that evaluates the historical significance of any discovered archaeological resource and describes the archaeological and historical research methods employed in the archaeological testing/monitoring/data recovery program(s). Information that may put at risk any archaeological resource shall be provided in a separate removable insert within the final report. Once approved by the ERO, copies of the FARR shall be distributed as follows: California Archaeological Site Survey Northwest Information Center (NWIC) shall receive one (1) copy and the ERO shall receive a copy of the transmittal of the FARR to the NWIC. The Major Environmental Analysis division of the Planning Department shall receive three copies of the FARR along with copies of any formal site recordation forms (CA DPR 523 series) and/or documentation for nomination to the National Register of Historic Places/California Register of Historical Resources. In instances of high public interest in or the high interpretive value of the resource, the ERO may require a different final report content, format, and distribution than presented above.	
Impact CP-2b Construction at HPS Phase II would not result in a substantial adverse change in the significance of archaeological resources, including prehistoric Native American resources, Chinese fishing camps, and maritime related resources.	**PS**	**MM CP-2a** would apply to this impact.	**LTS/M**
Impact CP-3 Construction activities associated with the Project would not result in a substantial adverse change in the significance of a paleontological resource.	**PS**	**MM CP-3a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact CP-3a Construction at Candlestick Point would not result in a substantial adverse change in the significance of a paleontological resource.	**PS**	**MM CP-3a** Paleontological Resources Monitoring and Mitigation Program: The Project Applicant shall retain the services of a qualified paleontological consultant having expertise in California paleontology to design and implement a Paleontological Resources Monitoring and Mitigation Program (PRMMP). The PRMMP shall include a description of when and where construction monitoring would be required; emergency discovery procedures; sampling and data recovery procedures; procedures for the preparation, identification, analysis, and curation of fossil specimens and data recovered; preconstruction coordination procedures; and procedures for reporting the results of the monitoring program. The PRMMP shall be consistent with the Society for Vertebrate Paleontology (SVP) Standard Guidelines for the mitigation of construction-related adverse impacts to paleontological resources and the requirements of the designated repository for any fossils collected. During construction, earth-moving activities shall be monitored by a qualified paleontological consultant having expertise in California paleontology in the areas where these activities have the potential to disturb previously undisturbed native sediment or sedimentary rocks. Monitoring need not be conducted in areas where the ground has been previously disturbed, in areas of artificial fill, in areas underlain by nonsedimentary rocks (serpentinite, greenstone), or in areas where exposed sediment would be buried, but otherwise undisturbed. The consultant's work shall be conducted in accordance with this measure and at the direction of the City's Environmental Review Officer (ERO). Plans and reports prepared by the consultant shall be submitted first and directly to the ERO for review and comment, and shall be considered draft reports subject to revision until final approval by the ERO. Paleontological monitoring and/or data recovery programs required by this measure could suspend construction of the Project for up to a maximum of four weeks. At the direction of the ERO, the suspension of construction can be extended beyond four weeks only if such a suspension is the only feasible means to reduce potential effects on a significant paleontological resource as previously defined to a less-than-significant level.	**LTS/M**
Impact CP-3b Construction at HPS Phase II would not result in a substantial adverse change in the significance of a paleontological resource.	**PS**	**MM CP-3a** would apply to this impact.	**LTS/M**
Impact CP-3c Construction of the Yosemite Slough bridge, shoreline improvements, and the marina improvements activities, including in-water activities, would not result in a substantial adverse change in the significance of a paleontological resource.	**PS**	**MM CP-3a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact CP-3d Pile driving associated with construction of the Yosemite Slough bridge, shoreline improvements, and the marina improvements would not result in a substantial adverse change in the significance of a paleontological resource.	**PS**	**MM CP-3a** would apply to this impact.	**LTS/M**
		SECTION III.K (HAZARDS AND HAZARDOUS MATERIALS)	
Impact HZ-1 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with known contaminants from historic uses.	**PS**	**MM HZ-1a** and **MM HZ-1b** would apply to this impact.	**LTS/M**
● **Impact HZ-1a** Construction at Candlestick Point bayward of the historic high tide line would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with known contaminants from historic uses.	**PS**	**MM HZ-1a** Article 22A Site Mitigation Plans. (Applies only to Candlestick Point.) Prior to obtaining a site, building or other permit from the City for development activities involving subsurface disturbance at portions of Candlestick Point bayward of the high tide line, the Project Applicant shall comply with the requirements of San Francisco Health Code Article 22A. If the site investigation required by Article 22A (or, in the case of development activity in CPSRA, which is not subject to Article 22A, a comparable site investigation that is carried out to comply with this measure, and which involves notification to California State Parks if a site mitigation plan is prepared), indicates the presence of a hazardous materials release, a site mitigation plan must be prepared. The site mitigation plan must specify the actions that will be implemented to mitigate the significant environmental or health and safety risks caused or likely to be caused by the presence of the identified release of hazardous materials. The site mitigation plan shall identify, as appropriate, such measures as excavation, containment, or treatment of the hazardous materials, monitoring and follow-up testing, and procedures for safe handling and transportation of the excavated materials, or for protecting the integrity of the cover or for addressing emissions from remedial activities, consistent with the requirements set forth in Article 22A. To the extent that Article 22A does not apply to state-owned land at CPSRA, prior to undertaking subsurface disturbance activities at CPSRA, the Agency and the California Department of Parks and Recreation shall enter into an agreement to follow procedures equivalent to those set forth in Article 22A for construction and development activities conducted at Candlestick Point State Recreation Area.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-1b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with known contaminants from historic uses.	**PS**	**MM HZ-1b** Compliance with Requirements Imposed by Cleanup Decision Documents and Property Transfer Documents. (Applies only to HPS Phase II) Prior to obtaining a grading, excavation, site, building or other permit from the City for development activity at HPS Phase II involving subsurface disturbance, the Project Applicant shall submit documentation acceptable to the San Francisco Department of Public Health that the work will be undertaken in compliance with all notices, restrictions, and requirements imposed pursuant to a CERCLA ROD, Petroleum Corrective Action Plan, FOST, FOSET or FOSL, including notices, restrictions, and requirements imposed in deeds, covenants, leases, easements, and LIFOCs, and requirements set forth in Land Use Control Remedial Design Documents, Risk Management Plans, Community Involvement Plans, and health and safety plans. Such restrictions, imposed by federal and state regulatory agencies as a condition on the Navy transfer of the property to the Agency, will ensure that the property after transfer will be used in a manner that is protective of the environment and human health. The City/Agency may choose to implement this measure by requiring these actions as part of amendments to San Francisco Health Code Article 31, which currently sets forth procedural requirements for development in HPS Phase I, or through an equivalent process established by the City or Agency.	**LTS/M**
Impact HZ-2 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with previously unidentified subsurface contaminants from historic uses.	**PS**	**MM HZ-2a.1** and **MM HZ-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-2a Construction at Candlestick Point would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with previously unidentified subsurface contaminants from historic uses.	**PS**	**MM HZ-2a.1** Unknown Contaminant Contingency Plan. (Applies to Candlestick Point, HPS Phase II, and off-site improvements.) Prior to obtaining the first site, building or other permit for development activities involving subsurface disturbance, the Project Applicant shall prepare and the San Francisco Department of Public Health shall approve a contingency plan to address unknown contaminants encountered during development activities. This plan, the conditions of which shall be incorporated into the first permit and any applicable permit thereafter, shall establish and describe procedures for implementing a contingency plan, including appropriate notification to nearby property owners, schools, and residents and appropriate site control procedures, in the event unanticipated subsurface hazards or hazardous material releases are discovered during construction. Control procedures would include, but would not be limited to, further investigation and, if necessary remediation of such hazards or releases, including off-site removal and disposal, containment or treatment. In the event unanticipated subsurface hazards or hazardous material releases are discovered during construction, the requirements of this unknown contaminant contingency plan shall be followed. The contingency plan shall be amended, as necessary, in the event new information becomes available that could affect the implementation of the plan. This measure	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		shall be implemented for HPS Phase II through additions to Article 31 or through an equivalent process established by the City or Agency as explained in MM HZ-1b. **MM HZ-2a.2** Site-Specific Health and Safety Plans. (Applies to Candlestick Point, HPS Phase II, and off-site improvements.) Prior to obtaining the first site, building or other permit for the Project from the City for development activities involving subsurface disturbance, the Project Applicant shall prepare and submit to SFDPH a site-specific health and safety plan (HASP) in compliance with applicable federal and state OSHA requirements and other applicable laws to minimize impacts to public health and the environment. development of the plan shall be required as a condition of any applicable permit. The plan shall include identification of chemicals of concern, potential hazards, personal protective equipment and devices, and emergency response procedures. The HASP shall be amended, as necessary, in the event new information becomes available that could affect the implementation of the plan. This measure shall be implemented for HPS Phase II through additions to Article 31 or through an equivalent process established by the City or Agency as explained in MM HZ-1b.	
Impact HZ-2b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil and/or groundwater with previously unidentified subsurface contaminants from historic uses.	**PS**	**MM HZ-2a.1** and **MM HZ-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-3 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of off-site transport and disposal of contaminated soil and groundwater.	**PS**	**MM HZ-1b** and **MM HY-1a.3** would apply to this impact	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-3a Construction at Candlestick Point would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of off-site transport and disposal of contaminated soil and groundwater.	**PS**	**MM HY-1a.3** would apply to this impact.	**LTS/M**
Impact HZ-3b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of off-site transport and disposal of contaminated soil and groundwater.	**PS**	**MM HZ-1b** and **MM HY-1a.3** would apply to this impact	**LTS/M**
Impact HZ-4 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of improvements to existing and installation of new underground utilities.	**PS**	**MM HZ-1a, MM HZ-1b, MM HZ-2a.1**, and **MM H2-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-4a Construction at Candlestick Point would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of improvements to existing and installation of new underground utilities.	**PS**	**MM HZ-1a** and **MM HZ-2a.1** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-4b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of improvements to existing and installation of new underground utilities.	**PS**	**MM HZ-1b, MM HZ-2a.1**, and **MM HZ-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-5 Construction activities associated with the Project would not create vertical conduits for hazardous materials that could contaminate groundwater as a result of installation of foundation support piles.	**PS**	**MM HZ-1a, MM HZ-1b** and **MM HZ-5a** would apply to this impact.	**LTS/M**
Impact HZ-5a Construction at Candlestick Point would not create vertical conduits for hazardous materials that could contaminate groundwater as a result of installation of foundation support piles.	**PS**	**MM HZ-5a** Foundation Support Piles Installation Plan. (Applies to Candlestick Point and HPS Phase II.) Prior to obtaining a permit from the City that authorizes installation of deep foundation piles, the Project Applicant shall prepare and submit a plan acceptable to the City stating that pilot boreholes for each pile would be drilled through the artificial fill materials so the piles can be installed without damage or misalignment and to prevent potentially contaminated fill materials from being pushed into the underlying sediments or groundwater. This measure shall be implemented for Candlestick Point through implementation of mitigation measure MM HZ-1a. This measure shall be implemented for HPS Phase II through additions to Article 31 or through an equivalent process established by the City or Agency as explained in MM HZ-1b.	**LTS/M**
Impact HZ-5b Construction at HPS Phase II would not create vertical conduits for hazardous materials that could contaminate groundwater as a result of installation of foundation support piles.	**PS**	**MM HZ-1b** and **MM HZ-5a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-6 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the handling, stockpiling, and transport of soil that may contain contaminants.	**PS**	**MM HZ-1a**, **MM HY-1a.2, MM HZ-1b,** and **MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact HZ-6a Construction at Candlestick Point would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of handling, stockpiling, and transport of soil that may contain contaminants.	**PS**	**MM HZ-1a, MM HY-1a.2**, and **MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact HZ-6b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of handling, stockpiling, and transport of soil that may contain contaminants.	**PS**	**MM HZ-1b, MM HZ-1a.2,** and **MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact HZ-7 Construction activities associated with the Project would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials that could be present in stormwater runoff.	**PS**	**MM HZ-1a, MM HY-1a.2, MM HZ-1b, MM HZ-2a.1,** and **MM HY-1a.1** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-7a Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials that could be present in stormwater runoff.	**PS**	**MM HZ-1a, MM HY-1a.2, MM HZ-2a.1**, and **MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact HZ-7b Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials that could be present in stormwater runoff.	**PS**	**MM HZ-1b, MM HY-1a.2, MM HZ-2a.1**, and **MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact HZ-8 Project occupants or visitors in or near portions of HPS Phase II where remediation has not been fully completed would not be exposed to unacceptable levels of hazardous materials.	**PS**	**MM HZ-1b** and **MM HZ-12** would apply to this impact.	**LTS/M**
Impact HZ-9 Construction at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of Yosemite Slough bridge construction.	**PS**	**MM HZ-9** Navy-approved workplans for construction and remediation activities on Navy-owned property. (Applies only to the portions of HPS Phase II on Navy-owned property). Construction activities and remediation activities conducted on behalf of the Agency or the Project Applicant, on Navy-owned property shall be conducted in compliance with all required notices, restrictions, or other requirements set forth in the applicable lease, easement, or license or other form of right of entry and in accordance with a Navy-approved workplan. This mitigation measure also requires that such activities be conducted in accordance with applicable health and safety plans, dust control plans, stormwater pollution prevention plans, community involvement plans, or any other documents or plans required under applicable law. The City/Agency will access Navy property through a lease, license, or easement. The City/Agency shall not undertake any activity or approve any Project Applicant activity on Navy-owned property until the Navy and other agencies with approval authority have approved a workplan for the activity. The requirement to comply with the approved work plans shall be incorporated into and made a condition of any City/Agency approvals related to activities on Navy property. This measure shall be implemented for HPS Phase II through a process established by the City or Agency as explained in MM HZ-1b.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-10 Construction activities associated with the Project in shoreline areas would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of sediment or soil that may contain chemical or radiological contaminants.	**PS**	**MM BI-4a.1, MM BI-4a.2, MM BI-5b.4, MM BI-12b.1, MM HY-1a.1, MM HY-1a.2, MM HZ-1a, MM HZ-2a.1**, and **MM HZ-10b** would apply to this impact	**LTS/M**
Impact HZ-10a Construction in the shoreline areas at Candlestick Point would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of sediment or soil that may contain chemical contaminants.	**PS**	**MM BI-4.a.1**, **MM BI-4.a.2**, **MM HY-1a.1**, **MM HY-1a.2**, **MM HZ-1a**, and **MM HZ-2a.1** would apply to this impact.	**LTS/M**
Impact HZ-10b Construction in the shoreline areas at HPS Phase II would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of sediment or soil that is radiologically affected or that may contain chemical contaminants.	**PS**	**MM HZ-10b** Regulatory Agency–Approved Workplans and Permits for Shoreline Improvements. Prior to undertaking any shoreline improvement activities that would affect sediment at HPS Phase II, the Agency or its contractor or Project Applicant shall prepare appropriate design documents and submit to USEPA, DTSC, RWQCB, and, if necessary, the Navy and CDPH for approval. A Dredged Material Management Office (DMMO) permit shall be obtained. The design documents shall incorporate the necessary shoreline improvements required for each specific area (e.g., including, but not limited to, rock buttressing, pile replacement, backfilling, riprap, or installation of natural-looking shoreline protection using fill and ACB mats) such that remediation (removal of sediment and any necessary dredging) and structural improvements are performed under the same regulatory approvals and permits. Prior to undertaking any shoreline improvement activities that could affect contaminated sediments left in place and covered or capped with a Navy-installed remedial measure, or that would involve pile replacement in such areas, the Agency or its contractor or Project Applicant shall prepare appropriate design documents that: (1) describes how the cover or cap would be inspected to determine whether proposed shoreline improvements would adversely affect the cover or cap; and (2) describes how construction activities would be performed to mitigate environmental risk and to restore the cover or cap. The design documents shall be submitted to USEPA, DTSC, RWQCB, and, if necessary, the Navy and CDPH for approval. A DMMO permit shall be obtained, as applicable. Prior to undertaking any shoreline improvements that could encounter contaminated sediments, the Agency or its contractor or Project Applicant shall comply with all requirements incorporated into the design documents, work	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		plans, health and safety plans, dust control plans, and any other document or plan required under the Administrative Order of Consent. This includes all restrictions imposed pursuant to a CERCLA ROD, Petroleum Corrective Action Plan, FOSET, including restrictions imposed in deeds, covenants, and requirements set forth in Land Use Control Remedial Design Documents, Risk Management Plans and health and safety plans. Prior to obtaining a grading, excavation, site, building, or other permit from the City that authorizes remedial activities, SFDPH shall confirm that the work proposed complies with the applicable plans required by the Administrative Order of Consent. This measure shall be implemented through additions to Article 31 or through an equivalent process established by the City or Agency as explained in MM HZ-1b. **MM HZ-1b, MM HZ-12, MM HY-1a.1, MM HY-1a.2, MM B1-4a.1, MM BI-4a.2**, **MM BI-5b.4**, and **MM BI-12b.1** would also apply to this impact.	
Impact HZ-11 Construction activities associated with the Project on Navy-owned property, including improvements to existing utilities and installation of new underground utilities, would not expose occupants, construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil, sediment, or groundwater that may contain contaminants from historic uses, including radiological contaminants.	**PS**	**MM HZ-1b** and **MM HZ-9** would apply to this impact.	**LTS/M**
● **Impact HZ-12** Remediation activities conducted on behalf of the City or Project Applicant at the HPS Phase II parcels transferred prior to completion of remediation in an "early transfer" would not expose remediation and construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil, sediment, and/or groundwater that may contain contaminants from historic uses.	**PS**	**MM HZ-12** Compliance with Administrative Order on Consent at Early Transferred Parcels. (Applies only at HPS Phase II.) Prior to undertaking any remediation activities at HPS Phase II on property that the Navy has transferred to the Agency as part of an early-transfer, the Agency or its contractor or Project Applicant shall comply with all requirements incorporated into remedial design documents, work plans, health and safety plans, dust control plans, community involvement plans, and any other document or plan required under the Administrative Order of Consent. This includes all notices, restrictions, and requirements imposed pursuant to a CERCLA ROD, Petroleum Corrective Action Plan, FOSET, including restrictions imposed in deeds, covenants, and requirements set forth in Land Use Control Remedial Design Documents, Risk Management Plans, community involvement plans, and health and safety plans. Prior to obtaining a grading, excavation, site, building, or other permit from the City that authorizes remedial activities, SFDPH shall confirm that the work proposed complies with the applicable plans required by the Administrative Order on Consent. This measure shall be implemented through a requirement in the potential additions to Article 31 imposing requirements to parcels other than Parcel A or through an equivalent process established by the City or Agency.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-13 Construction of off-site roadway improvements would not expose construction workers, the public, or the environment to unacceptable levels of hazardous materials as a result of the disturbance of soil or groundwater that may contain contaminants.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-14 Construction activities associated with the Project would not expose ecological receptors to unacceptable levels of hazardous materials as a result of the disturbance of soil, sediment, and/or groundwater with contaminants from historic uses.	**PS**	**MM HZ-1a, MM HZ-1b, MM HZ-2a.1, MM HZ-9, MM HZ-10b, MM HZ-12**, **MM HY-1a.1, MM HY-1a.2, MM HY-1a.3, MM BI-4a.1, MM BI-4a.2**, and **MM BI-12b.1** would apply to this impact.	**LTS/M**
Impact HZ-14a Construction at Candlestick Point would not expose ecological receptors to unacceptable levels of hazardous materials as a result of the disturbance of soil, sediment, and/or groundwater that may contain contaminants from historic uses.	**PS**	**MM HZ-1a**, **MM HZ-2a.1**, **MM HZ-15**, **MM HY-1a.1, MM HY-1a.2**, **MM HY-1a.3, MM BI-4a.1**, and **MM BI-4a.2** would apply to this impact.	**LTS/M**
Impact HZ-14b Construction at HPS Phase II would not expose ecological receptors to unacceptable levels of hazardous materials as a result of the disturbance of soil, sediment, and/or groundwater that may contain contaminants from historic uses.	**PS**	**MM HZ-1b, MM HZ-1a, MM HZ-9, MM HZ-10b, MM HZ-12, MM HZ-15, MM HY-1a.1, MM HY-1a.2, MM HY-1a.3, MM BI-4a.1, MM BI-4a.2**, and **MM BI-12b.1** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-15 Construction and grading activities associated with the Project would not disturb soil or rock that could be a source of naturally occurring asbestos in a manner that would present a human health hazard.	**PS**	**MM HZ-15** Asbestos Dust Mitigation Plans and Dust Control Plans. Prior to obtaining a grading, excavation, site, building or other permit from the City that includes soil disturbance activities, the Project Applicant shall obtain approval of an Asbestos Dust Mitigation Plan (ADMP) from BAAQMD for areas over 1 acre that potentially contain naturally occurring asbestos and approval of a Dust Control Plan (DCP) from SFDPH for all areas at HPS Phase II and for areas over 0.5 acre at Candlestick Point. Compliance with the ADMP and DCP shall be required as a condition of the permit. The ADMP shall be submitted to and approved by the BAAQMD prior to the beginning of construction, and the Project Applicant must ensure the implementation of all specified dust control measures throughout the construction Project. The ADMP shall require compliance with the following specific control measures to the extent deemed necessary by the BAAQMD to meet its standard: ■ For construction activities disturbing less than one acre of rock containing naturally occurring asbestos, the following specific dust control measures must be implemented in accordance with the asbestos ATCM before construction begins and each measure must be maintained throughout the duration of the construction Project: > Limit construction vehicle speed at the work site to 15 miles per hour > Sufficiently wet all ground surfaces prior to disturbance to prevent visible dust emissions from crossing the property line > Keep all graded and excavated areas around soil improvement operations, visibly dry unpaved roads, parking and staging areas wetted at least three times per shift daily with reclaimed water during construction to prevent visible dust emissions from crossing the property line. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour > Adequately wet all storage piles, treat with chemical dust suppressants, or cover piles when material is not being added to or removed from the pile > Wash down all equipment before moving from the property onto a paved public road > Clean all visible track out from the paved public road by street sweeping or a HEPA filter equipped vacuum device within 24 hours ■ For construction activities disturbing greater than one acre of rock containing naturally occurring asbestos, construction contractors are required to prepare an ADMP specifying measures that will be taken to ensure that no visible dust crosses the property boundary during construction. The plan must specify the following measures, to the extent deemed necessary by the BAAQMD to meet its standard: > Prevent and control visible track out from the property onto adjacent paved roads. Sweep with reclaimed water at the end of each day if visible soil material is carried out from property > Ensure adequate wetting or covering of active storage piles	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

- Hydroseed or apply non-toxic soil stabilizers to disturbed surface areas and storage piles greater than ten cubic yards or 500 square feet of excavated materials, backfill material, import material, gravel, sand, road base, and soil that will remain inactive for seven days or more.
- Control traffic on on-site unpaved roads, parking lots, and staging areas—including a maximum vehicle speed of 15 miles per hour or less
- Control earth moving activities
- Provide as much water as necessary to control dust (without creating run-off) in any area of land clearing, earth movement, excavation, drillings, and other dust-generating activity
- Control dust emissions from off-site transport of naturally occurring asbestos containing materials
- Stabilize disturbed areas following construction

If required by the BAAQMD, air monitoring shall be implemented to monitor for off-site migration of asbestos dust during construction activities, and appropriate protocols shall be established and implemented for notification of nearby schools, property owners, and residents when monitoring results indicate asbestos levels that have exceeded the standards set forth in the plan.

The DCP shall be submitted to and approved by the SFDPH prior to the beginning of construction, and the site operator must ensure the implementation of all specified dust control measures throughout the construction Project. The DCP shall require compliance with the following specific mitigation measures to the extent deemed necessary by the SFDPH to achieve no visible dust at the property boundary:

- Submission of a map to the Director of Health showing all sensitive receptors within 1,000 feet of the site.
- Keep all graded and excavated areas, areas around soil improvement operations, visibly dry unpaved roads, parking and staging areas wetted at least three times per shift daily with reclaimed water during construction to prevent visible dust emissions from crossing the property line. Increased watering frequency may be necessary whenever wind speeds exceed 15 miles per hour
- Analysis of wind direction and placement of upwind and downwind particulate dust monitors.
- Record keeping for particulate monitoring results.
- Requirements for shutdown conditions based on wind, dust migration, or if dust is contained within the property boundary but not controlled after a specified number of minutes.
- Establishing a hotline for surrounding community members who may be potentially affected by Project-related dust. Contact person shall respond and take corrective action within 48 hours. Post publicly visible signs around the site with the hotline number as well as the phone number of the BAAQMD and make sure the numbers are given to adjacent residents, schools, and businesses.
- Limiting the area subject to construction activities at any one time.
- Installing dust curtains and windbreaks on windward and downwind sides of the property lines, as necessary. Windbreaks on windward side should have no more than 50% air porosity.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Limiting the amount of soil in trucks hauling soil around the job site to the size of the truck bed and securing with a tarpaulin or ensuring the soil contains adequate moisture to minimize or prevent dust generation during transportation. ■ Enforcing a 15 mph speed limit for vehicles entering and exiting construction areas. ■ Sweeping affected streets with water sweepers at the end of the day. ■ Hiring an independent third party to conduct inspections for visible dust and keeping records of those inspections. ■ Minimizing the amount of excavated material or waste materials stored at the site. ■ Prevent visible track out from the property onto adjacent paved roads. Sweep with reclaimed water at the end of each day if visible soil material is carried out from property For all areas, this measure shall be implemented through Article 22B (areas over one half acre) or for HPS Phase II through a requirement in the potential additions to Article 31 imposing requirements to parcels other than Parcel A or through an equivalent process established by the City or Agency.	
Impact HZ-16 Construction activities associated with the Project would not result in a health hazard to construction workers, the public, or the environment as a result of the demolition or renovation of existing structures that could include asbestos-containing materials, lead-based paint, PCBs, or fluorescent lights containing mercury.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-16a Construction at Candlestick Point would not result in a health hazard to construction workers, the public, or the environment as a result of the demolition or renovation of existing structures that could include asbestos-containing materials, lead-based paint, PCBs, or fluorescent lights containing mercury.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-16b Construction at HPS Phase II would not result in a health hazard to construction workers, the public, or the environment as a result of the demolition or renovation of existing structures that could include asbestos-containing materials, lead-based paint, PCBs, or fluorescent lights containing mercury.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-17 Construction activities associated with the Project would not expose construction workers to unacceptable levels of hazardous materials in soil, sediment, or groundwater in a manner which would present a human health risk.	**PS**	**MM HZ-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-17a Construction at Candlestick Point would not expose construction workers to unacceptable levels of hazardous materials in soil or groundwater in a manner which would present a human health risk.	**PS**	**MM HZ-2a.2** would apply to this impact.	**LTS/M**
Impact HZ-17b Construction at HPS Phase II would not expose construction workers to unacceptable levels of hazardous materials in soil, sediment, or groundwater in a manner which would present a human health risk.	**PS**	**MM HZ-2a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-18 Construction activities associated with the Project would not result in a human health risk involving the disturbance of naturally occurring asbestos, demolition of buildings that could contain hazardous substances in building materials, or possible disturbance of contaminated soils or groundwater within one-quarter mile of an existing school.	**PS**	**MM HZ-1a, MM HZ-1b, MM HZ-2a.1, MM HZ-2a.2,** and **MM HZ-15** would apply to this impact.	**LTS/M**
Impact HZ-18a Construction at Candlestick Point would not result in a human health risk involving the disturbance of naturally occurring asbestos, demolition of buildings that could contain hazardous substances in building materials, or possible disturbance of contaminated soils or groundwater within one-quarter mile of an existing school.	**PS**	**MM HZ 1a, HZ-2a.1, MM HZ-2a.2,** and **MM HZ-15** would apply to this impact.	**LTS/M**
Impact HZ-18b Construction at HPS Phase II would not result in a human health risk involving the disturbance of naturally occurring asbestos, demolition of buildings that could contain hazardous substances in building materials, or possible disturbance of contaminated soils or groundwater within one-quarter mile of an existing school.	**PS**	**MM HZ-1b, MM HZ-2a.1, MM HZ-2a.2**, and **MM HZ-15** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-19 Simultaneous construction activities at the Project site would not pose a human health risk from the release of contaminants from historic uses or fill.	**PS**	**MM HZ-1a, MM HZ-1b, MM HZ-9,** and **MM HZ-15** would apply to this impact.	**LTS/M**
Impact HZ-20 Construction activities associated with the Project would not result in adverse impacts to construction workers, visitors, or the environment from the routine use, storage, transportation, and disposal of hazardous materials.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-21 Implementation of the Project would not result in adverse impacts to residents, visitors, or the environment from periodic maintenance requiring excavation of site soils to maintain or replace utilities, repair foundations, or make other subsurface repairs.	**PS**	**MM HZ-1a, MM HZ-1b, MM HZ-2a.1, MM HZ-2a.2, MM HZ-9,** and **MM HZ-12** would apply to this impact.	**LTS/M**
Impact HZ-21a Implementation of the Project at Candlestick Point would not result in adverse impacts to residents, visitors, or the environment from periodic maintenance requiring excavation of site soils to maintain or replace utilities, repair foundations, or make other subsurface repairs.	**PS**	**MM HZ-1a**, **MM HZ-2a.1**, and **MM HZ-2a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-21b Implementation of the Project at HPS Phase II would not result in adverse impacts to residents, visitors, or the environment from periodic maintenance requiring excavation of site soils to maintain or replace utilities, repair foundations, or make other subsurface repairs.	**PS**	**MM HZ-1b, MM HZ-2a.1, MM HZ-2a.2, MM HZ-9,** and **MM HZ-12** would apply to this impact.	**LTS/M**
Impact HZ-22 Implementation of the Project would not result in a significant impact involving the routine use, storage, transportation, and disposal of hazardous materials.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-23 Implementation of the Project would not pose a human health risk and/or result in an adverse effect on the environment from reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	**LTS**	No mitigation is required.	**LTS**
Impact HZ-24 Areas designated for research and development uses within HPS Phase II would not pose a human health risk as a result of hazardous air emissions within one-quarter mile of a school.	**PS**	**MM AQ-6.1** and **MM AQ-6.2** would apply to this impact.	**LTS/M**
Impact HZ-25 The Project site is not within the San Francisco Airport Land Use Policy Plan and the Project would not result in a safety hazard for people residing or working in the Project site.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HZ-26 Implementation of the Project would not occur within the vicinity of a private airstrip and would not result in a safety hazard for people residing or working in the Project site.	**NI**	No mitigation is required.	**NI**
Impact HZ-27 Implementation of the Project would not expose people or structures to a significant risk of loss, injury, or death involving fires or conflict with emergency response or evacuation plans.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.L (GEOLOGY AND SOILS)	
Impact GE-1 Construction activities associated with the Project would not result in the loss of topsoil caused by soil erosion.	**PS**	**MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact GE-1a Construction at Candlestick Point, including the Yosemite Slough bridge, would not result in the loss of topsoil caused by soil erosion.	**PS**	**MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact GE-1b Construction at HPS Phase II would not result in the loss of topsoil caused by soil erosion.	**PS**	**MM HY-1a.1** would apply to this impact.	**LTS/M**
Impact GE-2 Construction activities associated with the Project would not result in damage to structures caused by settlement from lowering of groundwater levels.	**PS**	**MM GE-2a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact GE-2a Construction at Candlestick Point and the Yosemite Slough bridge would not result in damage to structures from settlement caused by lowering of groundwater levels.	**PS**	**MM GE-2a** Mitigation to Minimize Dewatering Impacts during Construction. Prior to the issuance of any permit for a construction activity that would involve dewatering that could affect structures on adjacent or nearby properties, the Applicant shall, in compliance with Section 1803.1 of the *San Francisco Building Code* (SFBC), include in the permit application methods and techniques to ensure that dewatering would not lower the water table such that unacceptable settlement (as determined by a California Certified Engineering Geologist [CEG] or California Registered Geotechnical Engineer [GE]) at adjacent or nearby properties would occur. Such methods and technologies shall be based on the specific conditions at the construction site and could include, but are not necessarily limited to, the following: ■ Excavating below the groundwater table in confined areas with steel sheet piling driven below the base elevation of the proposed excavation, installation of bracing to support the excavation walls as required and, if necessary, underpinning the foundations of adjacent structures. Subsequently, the excavation would be carried out and seepage that enters the dammed area would be pumped out. ■ Perform dewatering using methods such as wellpoint systems, drainage ditches, and sump pumps. The excavation or dewatering methods shall be monitored to detect ground settlement and to monitor individual dewatering activities in the vicinity of an excavation. Monitoring results shall be submitted to the San Francisco Department of Building Inspection (DBI). In the event of unacceptable ground movement, as determined by DBI inspections and/or the review of monitoring results, all excavation work shall cease and corrective measures (including, for example, different dewatering methods and/or ground stabilization methods) shall be determined by the Project CEG or GE and reviewed and approved by DBI. No construction permit involving dewatering would be issued until the Project CEG or GE and DBI have approved dewatering and/or ground stabilization methods. The Project CEG or GE shall implement the corrective measures and continue monitoring activities.	**LTS/M**
Impact GE-2b Construction at HPS Phase II would not result in damage to structures caused by settlement from lowering of groundwater levels.	**PS**	**MM GE-2a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact GE-3 Rock removal activities at the Alice Griffith Public Housing site and the Jamestown area would not result in damage to structures from vibration and/or settlement caused by the fracturing of bedrock for excavation.	**PS**	**MM GE-3** Mitigation to Minimize Rock Fragmentation Impacts during Construction. Prior to the issuance of any permit for a construction activity that would involve controlled rock fragmentation that could cause settlement or lateral movement of structures on adjacent or nearby properties, the Applicant shall, in compliance with Section 1803.1 of the *San Francisco Building Code* (SFBC), include in the permit application methods and techniques to ensure that controlled rock fragmentation would not cause unacceptable vibration and/or settlement or lateral movement of structures at adjacent or nearby properties. Such methods and technologies shall be based on the specific conditions at the construction site such as, but not limited to, the following: ■ Pre-excavation surveying of potentially affected structures. ■ Underpinning of foundations of potentially affected structures, as necessary. The excavation plan shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of an excavation. Monitoring results shall be submitted to DBI. In the event of unacceptable ground movement, as determined by DBI inspections, all excavation work shall cease and corrective measures shall be implemented. The controlled rock fragmentation program and ground stabilization measures shall be reevaluated and approved by the DBI.	**LTS/M**
Impact GE-4 Implementation of the Project would not expose people and structures to substantial adverse effects caused by seismically induced groundshaking.	**PS**	**MM GE-4a.1, MM GE-4a.2,** and **MM GE-4a.3** would apply to this impact.	**LTS/M**
Impact GE-4a Implementation of the Project at Candlestick Point, including the Yosemite Slough bridge and Alice Griffith Housing, would not expose people or structures to substantial adverse effects caused by seismically induced groundshaking.	**PS**	**MM GE-4a.1** Site-Specific Geotechnical Investigation with Seismic Analyses. Prior to the issuance of any building permits for the Project site: ■ The Applicant shall submit to the San Francisco Department of Building Inspection (DBI) for review and approval a site-specific, design-level geotechnical investigation prepared by a California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE), as well as project plans prepared in compliance with the requirements of the San Francisco Building Code (SFBC), the Seismic Hazards Mapping Act, and requirements contained in CGS Special Publication 117A "Guidelines for Evaluating and Mitigating Seismic Hazards in California." In addition, all engineering practices and analyses of peak ground accelerations and structural design shall be consistent with SFBC standards to ensure that structures can withstand expected ground accelerations. The CEG or GE shall determine and DBI shall approve design requirements for foundations and all other improvements associated with the permit application. ■ DBI shall employ a third-party CEG and California Registered Professional Engineer (Civil) (PE) to form a Geotechnical Peer Review Committee (GPRC), consisting of DBI and these third-party reviewers. The GPRC shall review the site-specific geotechnical investigations and the site-specific structural, foundation, infrastructure, and other relevant plans to ensure that these plans incorporate all necessary geotechnical mitigation measures. No permits shall be issued by DBI until the GPRC has approved the geotechnical	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		investigation and the Project plans, including the factual determinations and the proposed engineering designs and construction methods. ■ All Project structural designs shall incorporate and conform to the requirements in the site-specific geotechnical investigations. ■ The Project CEG or GE shall be responsible for ensuring compliance with these requirements. **MM GE-4a.2** Seismic Design Compliance Documentation. Prior to the issuance of building permits for the replacement of the Alice Griffith Public Housing site, the Applicant shall submit any and all seismic design compliance documentation to the HUD, as required by that agency. The Project Developer shall confirm, by copy of all documents submitted, including transmittal, compliance with this requirement to DBI. The Project California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE) shall be responsible for verifying Project compliance with this requirement. **MM GE-4a.3** Site-specific Seismic Analyses to Ensure Safety of Bridge Design. Prior to the issuance of any building permits for the Project site, the California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE) for the Project shall confirm that the design-level geotechnical investigation for the Yosemite Slough bridge is based on Caltrans specifications (*Bridge Design Specifications*, Section 20 of *Bridge Memos to Designers*, *Seismic Design Criteria* as previously described) and meets the San Francisco Department of Public Works Bureau of Engineering (BOE) requirements. The Project CEG or GE and California Registered Structural Engineer (SE) shall approve bridge design. No building permits shall be issued until the CEG or GE and SE verify that the Project's bridge design complies with all Caltrans specifications and BOE requirements.	
Impact GE-4b Implementation of the Project at HPS Phase II would not expose people and structures to substantial adverse effects caused by seismically induced groundshaking.	**PS**	**MM GE-4a.1** would apply to this impact.	**LTS/M**
Impact GE-5 Implementation of the Project would not expose people or structures to substantial adverse effects caused by seismically induced ground failure such as liquefaction, lateral spreading, and settlement.	**PS**	**MM GE-4a.1, MM GE-4a.2, MM GE-4a.3**, and **MM GE-5a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact GE-5a Implementation of the Project at Candlestick Point, including the Alice Griffith Housing and Yosemite Slough bridge, would not expose people or structures to substantial adverse effects caused by seismically induced ground failure such as liquefaction, lateral spreading, and settlement.	**PS**	**MM GE-5a** Site-Specific Geotechnical Investigation with Analyses of Liquefaction, Lateral Spreading and/or Settlement. Prior to issuance of building permits for the Project site: ■ The Applicant shall submit to the San Francisco Department of Building Inspection (DBI) for review and approval a site-specific, design-level geotechnical investigation prepared by a California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE), as well as project plans prepared in compliance with the requirements of the San Francisco Building Code (SFBC), the Seismic Hazards Mapping Act, and requirements contained in CGS Special Publication 117A "Guidelines for Evaluating and Mitigating Seismic Hazards in California." In addition, all engineering practices, and analyses of structural design shall be consistent with SFBC standards to ensure seismic stability, including reduction of potential liquefaction hazards. ■ DBI shall employ a third-party CEG and California Registered Professional Engineer (Civil) (PE) to form a Geotechnical Peer Review Committee (GPRC), consisting of DBI and these third-party reviewers. The GPRC shall review the site-specific geotechnical investigations and the site-specific structural, foundation, infrastructure, and other relevant plans to ensure that these plans incorporate all necessary geotechnical mitigation measures. No permits shall be issued by DBI until the GPRC has approved the geotechnical investigation and the Project plans, including the factual determinations and the proposed engineering designs and construction methods. ■ All Project structural designs shall incorporate and conform to the requirements in the site-specific geotechnical investigations. ■ The site-specific Project plans shall incorporate the mitigation measures contained in the approved site-specific geotechnical reports to reduce liquefaction hazards. The engineering design techniques to reduce liquefaction hazards shall include proven methods generally accepted by California Certified Engineering Geologists, subject to DBI and GPRC review and approval, including, but not necessarily limited to: > Structural Measures o Construction of deep foundations, which transfer loads to competent strata beneath the zone susceptible to liquefaction, for critical utilities and shallow foundations o Structural mat foundations to distribute concentrated load to prevent damage to structures > Ground Improvement Measures o Additional over-excavation and replacement of unstable soil with engineering-compacted fill o Dynamic compaction, such as Deep Dynamic Compaction (DDC) or Rapid Impact Compaction (RIC), to densify loose soils below the groundwater table o Vibro-compaction, sometimes referred to as vibro-floatation, to densify loose soils below the groundwater table o Stone columns to provide pore pressure dissipation pathways for soil, compact loose soil between columns, and provide additional bearing support beneath foundations	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		○ Soil-cement columns to densify loose soils and provide additional bearing support beneath foundations ■ The Project CEG or GE shall be responsible for ensuring compliance with these requirements. **MM GE-4a.1**, **MM GE-4a.2**, and **MM GE-4a.3** would also apply to this impact.	
Impact GE-5b Implementation of the Project at HPS Phase II would not expose people or structures to substantial adverse effects caused by seismically induced ground failure such as liquefaction, lateral spreading, and settlement.	**PS**	**MM GE-4a.1** and **MM GE-5a** would apply to this impact.	**LTS/M**
Impact GE-6 Implementation of the Project would not expose people or structures to substantial adverse effects caused by seismically induced landslides.	**PS**	**MM GE-4a.2** and **MM GE-6a** would apply to this impact.	**LTS/M**
Impact GE-6a Implementation of the Project at Candlestick Point, including the Alice Griffith Housing, would not expose people or structures to substantial adverse effects caused by seismically induced landslides.	**PS**	**MM GE-6a** Site-Specific Geotechnical Investigation with Landslide Risk Analyses. Prior to issuance of building permits for the Project site: ■ The Applicant shall submit to the San Francisco Department of Building Inspection (DBI) for review and approval a site-specific, design-level geotechnical investigation prepared by a California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE), as well as project plans prepared in compliance with the requirements of the San Francisco Building Code (SFBC), the Seismic Hazards Mapping Act, and requirements contained in CGS Special Publication 117A "Guidelines for Evaluating and Mitigating Seismic Hazards in California." In addition, all engineering practices, and analyses of structural design shall be consistent with SFBC standards to ensure seismic stability, including reduction of potential landslide hazards. ■ DBI shall employ a third-party CEG and California Registered Professional Engineer (Civil) (PE) to form a Geotechnical Peer Review Committee (GPRC), consisting of DBI and these third-party reviewers. The GPRC shall review the site-specific geotechnical investigations and the site-specific structural, foundation, infrastructure, and other relevant plans to ensure that these plans incorporate all necessary geotechnical mitigation measures. No permits shall be issued by DBI until the GPRC has approved the geotechnical investigation and the Project plans, including the factual determinations and the proposed engineering designs and construction methods.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ All Project structural designs shall incorporate and conform to the requirements in the site-specific geotechnical investigations. ■ The site-specific Project plans shall incorporate the mitigation measures contained in the approved site-specific geotechnical reports to reduce landslide hazards. The engineering design techniques to reduce landslide hazards shall include proven methods generally accepted by California Certified Engineering Geologists, subject to DBI and GPRC review and approval. The design-level geologic and geotechnical studies shall identify the presence of landslides and potentially unstable slopes and shall identify means to avoid the hazard or support the design of engineering procedures to stabilize the slopes, as required by Chapter 18 (Soils and Foundations) of the SFBC, as well as the procedures outlined in CGS Special Publication 117A. SFBC Sections 1803 through 1812 contain the formulae, tables, and graphs by which the Project engineer shall develop the Project's slope-stability specifications, including the appropriate foundation designs for structures on slopes and which would be used by DBI to verify the applicability of the specifications. If the presence of unstable slopes is identified, appropriate support and protection procedures shall be designed and implemented to maintain the stability of slopes adjacent to newly graded or re-graded access roads, work areas, and structures during and after construction, and to minimize potential for damage to structures and facilities at the Project site. These stabilization procedures, including, but not necessarily limited to, the following: > Retaining walls, rock buttresses, screw anchors, or concrete piers > Slope drainage or removal of unstable materials > Rockfall catch fences, rockfall mesh netting, or deflection walls > Setbacks at the toe of slopes > Avoidance of highly unstable areas ■ The Project CEG or GE shall be responsible for ensuring compliance with these requirements. **MM GE-4a.2** and **MM GE-6a** would also apply to this impact.	
Impact GE-6b Implementation of the Project at HPS Phase II would not expose people or structures to substantial adverse effects caused by seismically induced landslides.	**NI**	No mitigation is required.	**NI**
Impact GE-7 Implementation of the Project would not expose people or structures to substantial adverse effects caused by shoreline instability.	**PS**	**MM HY-12a.1** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact GE-9a Implementation of the Project at Candlestick Point, including Alice Griffith Housing and the Yosemite Slough bridge, would not expose people or structures to substantial adverse effects caused by damage from settlement.	**PS**	**MM GE-4a.2**, **MM GE-4a.3,** and **MM GE-5a** would apply to this impact.	**LTS/M**
Impact GE-9b Implementation of the Project at HPS Phase II would not expose people or structures to substantial adverse effects caused by damage from settlement.	**PS**	**MM GE-5a** would apply to this impact.	**LTS/M**
Impact GE-10 Implementation of the Project would not expose people or structures to substantial adverse effects caused by expansive soils.	**PS**	**MM GE-4a.1**, **MM GE-4a.2, GE-4a.3,** and **MM GE-10a** would apply to this impact.	**LTS/M**
Impact GE-10a Implementation of the Project at Candlestick Point, including Alice Griffith Housing and the Yosemite Slough bridge, would not expose people or structures to substantial adverse effects caused by expansive soils.	**PS**	**MM GE-10a** Site-Specific Geotechnical Investigation with Expansive Soils Analyses. Prior to issuance of building permits for the Project site: ■ The Applicant shall submit to the San Francisco Department of Building Inspection (DBI) for review and approval a site-specific, design-level geotechnical investigation prepared by a California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE), as well as project plans prepared in compliance with the requirements of the San Francisco Building Code (SFBC). In addition, all engineering practices, and analyses of structural design shall be consistent with SFBC standards to ensure soils stability, including reduction of potential soil expansion hazards. ■ DBI shall employ a third-party CEG and California Registered Professional Engineer (Civil) (PE) to form a Geotechnical Peer Review Committee (GPRC), consisting of DBI and these third-party reviewers. The GPRC shall review the site-specific geotechnical investigations and the site-specific structural, foundation, infrastructure, and other relevant plans to ensure that these plans incorporate all necessary geotechnical mitigation measures. No permits shall be issued by DBI until the GPRC has approved the geotechnical investigation and the Project plans, including the factual determinations and the proposed engineering designs and construction methods. ■ All Project structural designs shall incorporate and conform to the requirements in the site-specific geotechnical investigations.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ The site-specific Project plans shall incorporate the mitigation measures contained in the approved site-specific geotechnical reports to reduce expansive soils hazards. The engineering design techniques to reduce expansive soils hazards shall include proven methods generally accepted by California Certified Engineering Geologists, subject to DBI and GPRC review and approval. The design-level geologic and geotechnical studies shall identify the presence of expansive soils and potentially unstable soils and shall identify means to avoid the hazard or support the design of engineering procedures to stabilize the soils, as required by Chapter 18 (Soils and Foundations) of the SFBC. SFBC Sections 1803 through 1812 contain the formulae, tables, and graphs by which the Project engineer shall develop the Project's soil-stability specifications, including the appropriate foundation designs for structures on expansive soils and which would be used by DBI to verify the applicability of the specifications. If the presence of expansive soils is identified, appropriate support and protection procedures shall be designed and implemented to maintain the stability of soils adjacent to newly graded or re-graded access roads, work areas, and structures during and after construction, and to minimize potential for damage to structures and facilities at the Project site. ■ The Project CEG or GE shall be responsible for ensuring compliance with these requirements. **MM GE-4a.2,** and **MM GE-4a.3** would also apply to this impact.	
Impact GE-10b Implementation of the Project at HPS Phase II would not expose people or structures to substantial adverse effects caused by expansive soils.	**PS**	**MM GE-10a** would apply to this impact.	**LTS/M**
Impact GE-11 Implementation of the Project would not expose people or structures to substantial adverse effects caused by corrosive soils.	**PS**	**MM GE-4a.2**, **MM GE-4a.3**, and **MM GE-11a** would apply to this impact.	**LTS/M**
Impact GE-11a Implementation of the Project at Candlestick Point, including Alice Griffith Housing and the Yosemite Slough bridge, would not expose people or structures to substantial adverse effects caused by corrosive soils.	**PS**	**MM GE-11a** Site-Specific Geotechnical Investigation with Corrosive Soils Analyses. Prior to issuance of building permits for the Project site: ■ The Applicant shall submit to the San Francisco Department of Building Inspection (DBI) for review and approval a site-specific, design-level geotechnical investigation prepared by a California Certified Engineering Geologist (CEG) or California Registered Geotechnical Engineer (GE), as well as project plans prepared in compliance with the requirements of the San Francisco Building Code (SFBC). In addition, all engineering practices, and analyses of structural design shall be consistent with SFBC standards to ensure soils stability, including reduction of potential hazards from corrosive soils. ■ DBI shall employ a third-party CEG and California Registered Professional Engineer (Civil) (PE) to form a Geotechnical Peer Review Committee (GPRC), consisting of DBI and these third-party reviewers. The GPRC shall review the site-specific geotechnical investigations and the site-specific structural, foundation,	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		infrastructure, and other relevant plans to ensure that these plans incorporate all necessary geotechnical mitigation measures. No permits shall be issued by DBI until the GPRC has approved the geotechnical investigation and the Project plans, including the factual determinations and the proposed engineering designs and construction methods. ■ All Project structural designs shall incorporate and conform to the requirements in the site-specific geotechnical investigations. ■ The site-specific Project plans shall incorporate the mitigation measures contained in the approved site-specific geotechnical reports to reduce potential hazards from corrosive soils. The engineering design techniques to reduce corrosive soils hazards shall include proven methods generally accepted by California Certified Engineering Geologists, subject to DBI and GPRC review and approval. The design-level geologic and geotechnical studies shall identify the presence of corrosive soils and shall identify means to avoid the hazard, as required by Chapter 18 (Soils and Foundations) of the SFBC. SFBC Sections 1803 through 1812 contain the formulae, tables, and graphs by which the Project engineer shall develop the Project's structural design specifications, including the appropriate foundation designs for structures on corrosive soils and which would be used by DBI to verify the applicability of the specifications. If the presence of corrosive soils is identified, appropriate protection procedures shall be designed and implemented to minimize potential for damage from corrosive soils to structures and facilities at the Project site. ■ The Project CEG or GE shall be responsible for ensuring compliance with these requirements. **MM GE-4a.2** and **MM GE-4a.3** would also apply to this impact.	
Impact GE-11b Implementation of the Project at HPS Phase II would not expose people or structures to substantial adverse effects caused by corrosive soils.	**PS**	**MM GE-11a** would apply to this impact.	**LTS/M**
Impact GE-12 Implementation of the Project would not expose people or structures to substantial adverse effects caused by surface fault rupture.	**NI**	No mitigation is required.	**NI**
Impact GE-13 Implementation of the Project would not result in the use of soils incapable of adequately supporting septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact GE-14 Implementation of the Project would not result in a substantial change of topography or destruction of unique geologic features.	**NI**	No mitigation is required.	**NI**
		SECTION III.M (HYDROLOGY AND WATER QUALITY)	
Impact HY-1 Construction activities associated with the Project would not cause an exceedance of water quality standards or contribute to or cause a violation of waste discharge requirements.	**PS**	**MM HY-1a.1, MM HY-1a.2, MM HY-1a.3, MM BI-4a.1, MM HZ-12, MM HZ-15, MM HZ-10b, MM BI-4a.2, MM BI-5b.4, MM BI-12b.1, MM BI-12b.2, MM HZ-1a, MM HZ-2a.1,** and **MM HZ-9** would apply to this impact.	**LTS/M**
Impact HY–1a Construction at Candlestick Point would not cause an exceedance of water quality standards or contribute to or cause a violation of waste discharge requirements.	**PS**	**MM HY-1a.1** Storm Water Pollution Prevention Plan: Combined Storm Sewer System. In compliance with the Article 4.1 of the Public Works Code and the City's Construction Site Water Pollution Prevention Program, the Project Applicant shall submit a site-specific Storm Water Pollution Prevention Plan (SWPPP) to the SFPUC for approval, prior to initiating construction activities in areas draining to the combined sewer system. The SFPUC requires implementation of appropriate Best Management Practices (BMPs) from the California Stormwater Quality Association Stormwater BMP Handbook- Construction or the Caltrans Construction Site BMPs Manual. In accordance with SFPUC's requirements, the SWPPP shall include: ■ An Erosion and Sediment Control Plan that includes a site map illustrating the BMPs that will be used to minimize on-site erosion and the sediment discharge into the combined sewer system, and a narrative description of those BMPs. Appropriate BMPs for Erosion and Sediment Control Plan may include: > Scheduling—Develop a schedule that includes sequencing of construction activities with the implementation of appropriate BMPs. Perform construction activities and control practices in accordance with the planned schedule. Schedule work to minimize soil-disturbing activities during the rainy season. Schedule major grading operations for the dry season when practical. Monitor the weather forecast for rainfall and adjust the schedule as appropriate. > Erosion Control BMPs—Preserve existing vegetation where feasible, apply mulch or hydroseed areas with native, non-invasive species, until permanent stabilization is established, and use soil binders, geotextiles and mats, earth dikes and drainage swales, velocity dissipation devices, slope drains, or polyacrylamide to protect soil from erosion. > Wind Erosion BMPs—Apply water or other dust palliatives to prevent dust nuisance; prevent overwatering which can cause erosion. Alternatively, cover small stockpiles or areas that remain inactive for seven or more days.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

> Sediment Control BMPs—Install silt fences, sediment basins, sediment traps, check dams, fiber rolls, sand or gravel bag barriers, straw bale barriers, approved chemical treatment, and storm drain inlet protection to minimize the discharge of sediment. Employ street sweeping to remove sediment from streets.

> Tracking Controls—Stabilize the construction site entrance to prevent tracking of sediment onto public roads by construction vehicles. Stabilize on-site vehicle transportation routes immediately after grading to prevent erosion and control dust. Install a tire wash area to remove sediment from tires and under carriages.

- Non-Stormwater Management BMPs that may include water conservation practices; dewatering practices that minimize sediment discharges; and BMPs for: paving and grinding activities; identifying illicit connections and illegal dumping; irrigation and other planned or unplanned discharges of potable water; vehicle and equipment cleaning, fueling, and maintenance; concrete curing and finishing; temporary batch plants; implementing shoreline improvements and working over water. Discharges from dewatering activities shall comply with the SFPUC's Batch Wastewater Discharge Requirements that regulate influent concentrations for various constituents.
- Waste Management BMPs shall be implemented for material delivery, use, and storage; stockpile management; spill prevention and control; solid and liquid waste management; hazardous waste management; contaminated soil management; concrete waste management; and septic/sanitary waste management.
- SWPPP Training Requirements—Construction personnel will receive training on the SWPPP and BMP implementation.
- Site Inspections and BMP Maintenance—An inspector identified in the SWPPP will inspect the site on a regular basis, before and after a storm event, and once each 24-hour period during extended storms to identify BMP effectiveness and implement corrective actions if required. The SWPPP shall include checklists that document when the inspections occurred, the results of the inspection, required corrective measures, and when corrective measures were implemented. Required BMP maintenance related to a storm event shall be completed within 48 hours of the storm event.

MM HY-1a.2 Stormwater Pollution Prevention Plan: Separate Storm Sewer System. Consistent with the requirements of the SWRCB General Permit for Storm Water Discharges Associated with Construction and Land Disturbing Activities (Construction General Permit), the Project Applicant shall undertake the proposed Project in accordance with a project-specific Storm Water Pollution Prevention Plan (SWPPP) prepared by Qualified SWPPP Developer, who shall consult with California State Parks on those elements of the SWPPP that cover the Candlestick Park State Recreation Area, including selection of best management practices and other SWPPP improvements. The SFRWQCB, the primary agency responsible for protecting water quality within the project area, is responsible for reviewing and ensuring compliance with the SWPPP. This review is based on the Construction General Permit issued by the SWRCB.

The SWPPP shall include, as applicable, all Best Management Practices (BMPs) required in Attachment C of the Construction General Permit for Risk Level 1 dischargers, Attachment D for Risk Level 2 dischargers, or

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		Attachment E for Risk Level 3 dischargers. In addition, recommended BMPs, subject to review and approval by the SFRWQCB, include the measures listed below. However, the measures themselves may be altered, supplemented, or deleted during the SFRWQCB's review process, since the SFRWQCB has final authority over the terms of the SWPPP. ■ Scheduling: > To reduce the potential for erosion and sediment discharge, schedule construction to minimize ground disturbance during the rainy season. Schedule major grading operations during the dry season when practical, and allow enough time before rainfall begins to stabilize the soil with vegetation or to install sediment-trapping devices. > Sequence construction activities to minimize the amount of time that soils remain disturbed. > Stabilize all disturbed soils as soon as possible following the completion of ground disturbing work. > Install erosion and sediment control BMPs prior to the start of any ground-disturbing activities. ■ Erosion and Sedimentation: > Preserve existing vegetation in areas where no construction activity is planned or where construction activity will occur at a later date. > Stabilize and re-vegetate disturbed areas as soon as possible after construction with planting, seeding, and/or mulch (e.g., straw or hay, erosion control blankets, hydromulch, or other similar material) except in actively cultivated areas. Planting and seeding shall use native, non-invasive species. > Install silt fences, coir rolls, and other suitable measures around the perimeter of the areas affected by construction and staging areas and around riparian buffers, storm drains, temporary stockpiles, spoil areas, stream channels, swales, down-slope of all exposed soil areas, and in other locations determined necessary to prevent off-site sedimentation. > Install temporary slope breakers during the rainy season on slopes greater than 5 percent where the base of the slope is less than 50 feet from a water body, wetland, or road crossing at spacing intervals required by the SFRWQCB. > Use filter fabric or other appropriate measures to prevent sediment from entering storm drain inlets. > Detain and treat stormwater using sedimentation basins, sediment traps, baker tanks, or other measures to ensure that discharges to receiving waters meet applicable water quality objectives. > Install check dams, where applicable, to reduce flow velocities. Check dams reduce erosion and allow sediment to settle out of runoff. > Install outlet protection/energy dissipation, where applicable, to prevent scour of the soil caused by concentrated high velocity flows. > Implement control measures such as spraying water or other dust palliatives to alleviate nuisance caused by dust.	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Groundwater/Dewatering: > Prepare a dewatering plan prior to excavation specifying methods of water collection, transport, treatment, and discharge of all water produced by construction site dewatering. > Impound water produced by dewatering in sediment retention basins or other holding facilities to settle the solids and provide other treatment as necessary prior to discharge to receiving waters. Locate sedimentation basins and other retention and treatment facilities away from waterways to prevent sediment-laden water from reaching streams. > Control discharges of water produced by dewatering to prevent erosion. > If contaminated groundwater is encountered, contact the SFRWQCB for appropriate disposal options. Depending on the constituents of concern, such discharges may be disallowed altogether, or require regulation under a separate general or individual permit that would impose appropriate treatment requirements prior to discharge to the stormwater drainage system. ■ Tracking Controls: > Grade and stabilize construction site entrances and exits to prevent runoff from the site and to prevent erosion. > Install a tire washing facility at the site access to allow for tire washing when vehicles exit the site. > Remove any soil or sediment tracked off paved roads during construction by street sweeping. ■ Non-stormwater Controls: > Place drip pans under construction vehicles and all parked equipment. > Check construction equipment for leaks regularly. > Wash construction equipment in a designated enclosed area regularly. > Contain vehicle and equipment wash water for percolation or evaporative drying away from storm drain inlets. > Refuel vehicles and equipment away from receiving waters and storm drain inlets, contain the area to prevent run-on and run-off, and promptly cleanup spills. > Cover all storm drain inlets when paving or applying seals or similar materials to prevent the discharge of these materials. ■ Waste Management and Hazardous Materials Pollution Control: > Remove trash and construction debris from the project area daily. > Locate sanitary facilities a minimum of 300 feet from receiving waters. Maintain sanitary facilities regularly. > Store all hazardous materials in an area protected from rainfall and stormwater run-on and prevent the off-site discharge of hazardous materials.	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

- > Minimize the potential for contamination of receiving waters by maintaining spill containment and cleanup equipment on site, and by properly labeling and disposing of hazardous wastes.
- > Locate waste collection areas close to construction entrances and away from roadways, storm drains, and receiving waters.
- > Inspect dumpsters and other waste and debris containers regularly for leaks and remove and properly dispose of any hazardous materials and liquid wastes placed in these containers.
- > Train construction personnel in proper material delivery, handling, storage, cleanup, and disposal procedures.
- > Implement construction materials management BMPs for:
- > Road paving, surfacing and asphalt removal activities.
- > Handling and disposal of concrete and cement.

■ BMP Inspection, Maintenance, and Repair:

- > Inspect all BMPs on a regular basis to confirm proper installation and function. Inspect BMPs daily during storms.
- > Immediately repair or replace BMPs that have failed. Provide sufficient devices and materials (e.g., silt fence, coir rolls, erosion blankets, etc.) throughout project construction to enable immediate corrective action for failed BMPs.

■ Monitoring and Reporting:

- > Provide the required documentation for SWPPP inspections, maintenance, and repair requirements. Personnel that will perform monitoring and inspection activities shall be identified in the SWPPP.
- > Maintain written records of inspections, spills, BMP-related maintenance activities, corrective actions, and visual observations of off-site discharges of sediment or other pollutants, as required by the SFRWQCB.
- > Monitor the water quality of discharges from the site to assess the effectiveness of control measures.

■ Implement Shoreline Improvements and work over water BMPs to minimize the potential transport of sediment, debris, and construction materials to the Lower Bay during construction of shoreline improvements.

■ Post-construction BMPs:

- > Re-vegetate all temporarily disturbed areas as required after construction activities are completed. Re-vegetation shall use native, non-invasive species.
- > Remove any remaining construction debris and trash from the project site and area upon project completion.
- > Phase the removal of temporary BMPs as necessary to ensure stabilization of the site.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

> Maintain post-construction site conditions to avoid formation of unintended drainage channels, erosion, or areas of sedimentation.

> Correct post-construction site conditions as necessary to comply with the SWPPP and any other pertinent SFRWQCB requirements.

- Train construction site personnel on components of the SWPPP and BMP implementation. Train personnel that will perform inspection and monitoring activities.

MM HY-1a.3 Groundwater Dewatering Plan. Prior to commencement of construction activities and to minimize potential impacts to receiving water quality during the construction period, the Project Applicant shall through the proper implementation of this dewatering plan, show compliance with SFRWQCB/NPDES requirements, whichever are applicable.

The Dewatering Plan shall specify how the water would be collected, contained, treated, monitored, and/or discharged to the vicinity drainage system or Lower Bay. Subject to the review and approval of the SFRWQCB, the Dewatering Plan shall include, at a minimum:

- Identification of methods for collecting and handling water on site for treatment prior to discharge, including locations and capacity of settling basins, infiltration basins (where not restricted by site conditions), treatment ponds, and/or holding tanks
- Identification of methods for treating water on site prior to discharge, such as filtration, coagulation, sedimentation settlement areas, oil skimmers, pH adjustment, and other BMPs
- Procedures and methods for maintaining and monitoring dewatering operations to ensure that no breach in the process occurs that could result in an exceedance of applicable water quality objectives
- Identification of discharge locations and inclusion of details on how the discharge would be conducted to minimize erosion and scour
- Identification of maximum discharge rates to prevent exceedance of storm drain system capacities
- Additional requirements of the applicable General Permit or NPDES Permit/WDR (including effluent and discharge limitations and reporting and monitoring requirements, as applicable) shall be incorporated into the Dewatering Plan

Any exceedance of established narrative or numeric water quality objectives shall be reported to the SFRWQCB and corrective action taken as required by the SFRWQCB and the Dewatering Plan. Corrective action may include increased residence time in treatment features (e.g., longer holding time in settling basins) and/or incorporation of additional treatment measures (e.g., addition of sand filtration prior to discharge).

MM HZ-1a, **MM HZ-2a.1**, **MM HZ-5a, MM HZ-15**, **MM BI-4a.1,** and **MM BI-4a-2** would also apply to this impact.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-1b Construction at HPS Phase II would not cause an exceedance of water quality standards or contribute to or cause a violation of waste discharge requirements.	**PS**	**MM HY-1a.1, MM HY-1a.2**, **MM HY-1a.3**, **MM HZ-1a**, **MM HZ-2a.1**, **MM HZ-5a**, **MM HZ-10b**,**MM HZ-12, MM HZ-15, MM BI-4a.1**, **MM BI-4a.2**, **MM BI-5b.4**, **MM BI-12b.1**, and **MM BI 12b.2** would apply to this impact.	**LTS/M**
Impact HY-1c Construction of the Yosemite Slough bridge would not cause an exceedance of water quality standards or contribute to or cause a violation of waste discharge requirements.	**PS**	**MM HY-1a1, MM HY-1a.2, MM HZ-1a, MM HZ-2a.1, MM HZ-9, MM BI-4a.1, MM BI-4a.2; MM BI-12b.1**, and **MM BI-12b.2** would apply to this impact.	**LTS/M**
Impact HY-2 Construction activities associated with the Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.	**LTS**	No mitigation is required.	**LTS**
Impact HY-3 Construction activities associated with the Project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-4 Construction activities associated with the Project would not substantially alter the existing drainage pattern of the site, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on or off site.	**PS**	**MM HY-1a.1, MM HY-1a.2,** and **MM HY-1a.3** would apply to this impact.	**LTS/M**
Impact HY-5 Construction activities associated with the Project would not create or contribute runoff water that would exceed the capacity of existing or planned storm sewer systems or provide substantial additional sources of polluted runoff.	**PS**	**MM HY-1a.2** would apply to this impact.	**LTS/M**
Impact HY-6 Implementation of the Project would not contribute to violations of water quality standards or waste discharge requirements.	**PS**	**MM HY-6a.1, MM HY-6a.2, MM HY-6b.1, MM HY-6b.2, MM HY-6b.3, MM BI-18b.1, MM BI-18b.2, MM BI-19b.1,** and **MM BI-19b.2** would apply to this impact.	**LTS/M**
Impact HY-6a Implementation of the Project at Candlestick Point would not contribute to violations of water quality standards or waste discharge requirements.	**PS**	**MM HY-6a.1** Regulatory Stormwater Requirements. The Project Applicant shall comply with requirements of the Municipal Stormwater General Permit and associated City SWMP, appropriate performance standards established in the Green Building Ordinance, and performance standards established by the SFPUC in the San Francisco Stormwater Design Guidelines. The Draft San Francisco Stormwater Design Guidelines have been developed to satisfy the Municipal Stormwater General Permit requirements for new development and redevelopment projects in areas served by separate storm sewers, and are expected to be adopted by December 2009. The Project Applicant shall comply with requirements of the Draft San Francisco Stormwater Design Guidelines. Upon adoption of the Final Stormwater Design Guidelines, the Project shall comply with the Final San Francisco Stormwater Design Guidelines unless discretionary permits have been approved. Per the Draft San Francisco Stormwater Design Guidelines, the Project Applicant shall submit a SCP to the SFPUC, as part of the development application submitted for approval. The SCP shall demonstrate how the following measures would be incorporated into the Project: ■ Low impact development site design principles (e.g., preserving natural drainage channels, treating stormwater runoff at its source rather than in downstream centralized controls)	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

- Source control BMPs in the form of design standards and structural features for the following areas, as applicable:
  - Commercial areas
  - Restaurants
  - Retail gasoline outlets
  - Automotive repair shops
  - Parking lots
- Source control BMPs for landscaped areas shall be documented in the form of a Landscape Management Plan that relies on Integrated Pest Management and also includes pesticide and fertilizer application guidelines.
- Treatment control measures (e.g., bioretention, porous pavement, vegetated swales) targeting the Project-specific COCs: sediment, pathogens, metals, nutrients (nitrogen and phosphorus compounds), oxygen-demanding substances, organic compounds (e.g., PCBs, pesticides), oil and grease, and trash and debris. The SCP shall demonstrate that the Project has the land area available to support the proposed BMP facilities sized per the required water quality design storm. Volume-based BMPs shall be sized to treat runoff resulting from 0.75 inches of rainfall (LEED® SS6.2), and flow-based BMPs shall be sized to treat runoff resulting from a rainfall intensity of 0.2 inches per hour. Treatment trains shall be used where feasible.

Additional requirements:

- LEED® SS6.2: BMPs used to treat runoff shall be designed to remove 80 percent of the average annual post-development total suspended solids loads. BMPs are considered to meet these criteria if they are designed in accordance with SFPUC requirements.
- The SCP shall include an Operations and Maintenance Plan that demonstrates how the treatment control BMPs would be maintained in the long term, what entities would be responsible for BMP maintenance within the public and private rights-of-way, funding mechanisms, and what mechanisms would be used to formalize maintenance and access agreements.
- The Project Applicant shall also prepare a Stormwater Drainage Master Plan (SDMP) for approval by the SFPUC. The SDMP shall include plans for the storm drain infrastructure and plans for stormwater management controls (e.g., vegetated swales, dry wells). The storm drain infrastructure shall illustrate conveyance of the 5-year storm event in a separate storm drain piped system, and conveyance of the 100-year storm event in the street and drainage channel rights-of-way.

MM HY-6a.2 Recycled Water Irrigation Requirements. Prior to application of recycled water at the Project site for landscape irrigation, the Project Applicant shall demonstrate compliance with all terms and conditions of the SFPUC's Operations and Maintenance Plan and the Recycled Water General Permit conditions for the use of recycled water. As required by the Recycled Water General Permit, the Project Applicant shall submit an Operations and Maintenance Plan and an Irrigation Management Plan to the SWRCB. The Project Applicant shall also submit the Operations and Maintenance Plan and the Irrigation Management Plan to the SFPUC. Prior to

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		on-site application of recycled water, the Project Applicant shall obtain written confirmation from the SFPUC that the Project Operations and Maintenance Plan and the Irrigation Management Plan is in compliance with the SFPUC's Operations and Maintenance Plan, and other SFPUC requirements for the use of recycled water. All recycled water provided to Project Applicant, pursuant to the Recycled Water General Permit, shall be treated in and managed in conformance with all applicable provisions of the Recycled Water Policy and shall meet Title 22 Requirements for disinfected tertiary recycled water as described in CCR Title 22, sections 60301.230 and 60301.320. In accordance with the Recycled Water General Permit, the Project Applicant's Operations and Maintenance Plan shall describe methods and procedures for complying with recycled water regulations, and the maintenance of equipment and emergency backup systems to maintain compliance with the General Permit conditions and California Department of Public Health (CDPH) requirements. The Project Applicant shall ensure that all users of recycled water comply with the Operations and Maintenance Plan by developing educational materials (e.g., pamphlet or brochure) that convey key operational elements (e.g., prevention of cross-connections) of the plan. In accordance with the Recycled Water General Permit, the Project Applicant's Irrigation Management Plan shall include measures to ensure the use of recycled water occurs at an agronomic rate while employing practices to minimize application of salinity constituents. The Irrigation Management Plan shall account for soil characteristics, recycled water characteristics, plant species irrigation requirements, climatic conditions, supplemental nutrient additions to support plant growth, and management of impoundments used to store or collect recycled water. The Irrigation Management Plan shall describe any conditions of approval required by the City, CDPH, or SWRCB. The Project Applicant shall implement the following landscape irrigation BMPs in accordance with Recycled Water General Permit Requirements: ■ The Operations and Maintenance Plan shall include leak detection methods and correction within 72 hours of identifying a leak or prior to the release of 1,000 gallons. ■ Recycled water shall not be applied during precipitation events. ■ Impoundment areas shall be managed such that no discharge occurs from storms smaller than the 25-year, 24-hour event. The Project Applicant shall also implement BMPs for general operational controls, protection of workers and the public (e.g., education about not drinking recycled water), and efficient irrigation (e.g., dedicated landscape water meters for monitoring water usage and leak detection). The Project Applicant shall conduct monthly monitoring to quantify the volume of recycled water applied, the locations and total area of application, and the mass of nitrogen and salinity constituents applied. **MM HZ-1a** and **MM HZ-2a.1** would also apply to this impact.	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-6b Implementation of the Project at HPS Phase II would not contribute to violations of water quality standards or waste discharge requirements.	**PS**	**MM HY-6b.1** Limitations on Stormwater Infiltration. Infiltration BMPs on HPS Phase II shall be prohibited. Alternative BMPs for stormwater quality control, reuse, and treatment shall be used. For instance, biofiltration BMPs can be implemented with an impervious liner and subdrain system to treat stormwater runoff while preventing infiltration. Overland flow (greater than the five-year and up to the 100-year storm) shall be conveyed in lined channels or other conveyances that will not result in infiltration. **MM HY-6b.2** Industrial General Permit. The Facility Operator shall apply for an Industrial General Permit prior to operational activities for facilities requiring coverage under the Industrial General Permit, which is determined based on the facility's SIC. The Facility Operator shall comply with all provisions in the Industrial General Permit, including implementation of a SWPPP, to effectively control pollutants to the BAT/BCT during the normal course of operations. Primary components and pollution prevention measures that the SWPPP shall address are described below. The Facility Operator shall refer to the California Stormwater Quality Association Stormwater Best Management Practice Handbook – Industrial and Commercial or equivalent for details on BMP implementation. The SFRWQCB is responsible for overseeing Industrial General Permit activities, including SWPPP compliance. The following BMPs shall be incorporated into the SWPPP. Non-Structural BMPs ■ Good Housekeeping: Good housekeeping generally consists of practical procedures to maintain a clean and orderly facility. ■ Preventive Maintenance: Regular inspection and maintenance of structural stormwater controls (catch basins, oil/water separators, etc.) as well as other facility equipment and systems. ■ Spill Response: Spill clean-up procedures and necessary clean-up equipment based upon the quantities and locations of significant materials that may spill or leak. ■ Material Handling and Storage: Procedures to minimize the potential for spills and leaks and to minimize exposure of significant materials to stormwater and authorized non-stormwater discharges. ■ Employee Training: Training of personnel who are responsible for (1) implementing activities identified in the SWPPP, (2) conducting inspections, sampling, and visual observations, and (3) managing stormwater. The SWPPP shall identify periodic dates for such training. Records shall be maintained of all training sessions held. ■ Waste Handling/Recycling: Procedures or processes to handle, store, or dispose of waste materials or recyclable materials. ■ Recordkeeping and Internal Reporting: Procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary, to the appropriate facility personnel. ■ Erosion Control and Site Stabilization: This may include the planting and maintenance of vegetation, diversion of run-on and runoff, placement of sandbags, silt screens, or other sediment control devices, etc.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Inspections: This includes, in addition to the preventative maintenance inspections identified above, an inspection schedule of all potential pollutant sources. Tracking and follow-up procedures shall be described to ensure adequate corrective actions are taken and SWPPP revisions are made as needed. ■ Quality Assurance: Procedures to ensure that all elements of the SWPPP and Monitoring Program are adequately conducted. <u>Structural BMPs to be Considered</u> ■ Overhead Coverage: Structures that provide horizontal coverage of materials, chemicals, and pollutant sources from contact with stormwater and authorized non-stormwater discharges. ■ Retention Ponds: Basins, ponds, surface impoundments, etc. that do not allow stormwater to discharge from the facility. ■ Control Devices: Berms or other devices that channel or route run-on and runoff away from pollutant sources. ■ Secondary Containment Structures: This generally includes containment structures around storage tanks and other areas for the purpose of collecting any leaks or spills. ■ Treatment: This includes inlet controls, infiltration devices, oil/water separators, detention ponds, vegetative swales, etc. that reduce the pollutants in stormwater discharges and authorized non-stormwater discharges. However, because of extensive site constraints, use of infiltration BMPs shall be limited. **MM HY-6b.3** <u>Clean Marinas California Program.</u> The marina operator shall obtain certification under the Clean Marinas California Program. The Clean Marinas California Program has developed marina BMPs and an inspection and certification process for marinas that meet the program standard for BMP implementation. The marina operator shall implement BMPs that address the following sources of pollution: petroleum containment, topside boat maintenance and cleaning, underwater boat hull cleaning, marina operations, marina debris, boat sewage discharge, solid waste, liquid waste, fish waste, hazardous materials, and stormwater runoff. **MM HY-6a.1, MM HY-6a.2 MM HZ-1b, MM HZ-2a.1, MM HZ-5a, MM HZ-9, MM HZ-10b, MM HZ-12, MM HZ-15, MM BI-18b.1, MM BI-18b.2, MM BI-19b.1,** and **MM BI-19b.2** would also apply to this impact.	
Impact HY-6c Implementation of the Yosemite Slough bridge would not contribute to violations of water quality standards or waste discharge requirements.	**LTS**	No mitigation is required.	**LTS**
Impact HY-7 Implementation of the Project would not otherwise degrade water quality.	**PS**	**MM HY-6a.1, MM HY-6a.2**, and **MM HY-6b.1** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-8 Implementation of the Project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.	**NI**	No mitigation is required.	**NI**
Impact HY-9 Implementation of the Project would not alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, and would not result in substantial erosion or siltation on site or off site.	**PS**	**MM HY-6a.1** would apply to this impact.	**LTS/M**
Impact HY-10 Implementation of the Project would not alter the existing drainage pattern of the site, through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff, and would not result in flooding on site or off site.	**PS**	**MM HY-6a.1** would apply to this impact.	**LTS/M**
Impact HY-11 Implementation of the Project would not create or contribute runoff water that would exceed the capacity of existing or planned storm sewer systems or provide substantial additional sources of polluted runoff.	**PS**	**MM HY-6a.1** would apply to this impact.	**LTS/M**
Impact HY–12 Implementation of the Project would not place housing in a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.	**PS**	**MM HY-12a.1** and **MM HY-12a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-12a Implementation of the Project at Candlestick Point would not place housing in a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.	**PS**	**MM HY-12a.1** Finished Grade Elevations Above Base Flood Elevation. The Project site shall be graded such that finished floor elevations are 3.5 feet above the Base Flood Elevation (BFE), and streets and pads are 3 feet above BFE to allow for future sea level rise, thereby elevating all housing and structures above the existing and potential future flood hazard area. If the FIRM for San Francisco is not finalized prior to implementation of the Project, the Project Applicant shall work with the City Surveyor to revise the City's Interim Floodplain Map. If the FIRM for San Francisco is finalized prior to implementation of the Project, the Project Applicant shall request that the Office of the City Administrator (Floodplain Manager) request a Letter of Map Revision based on Fill (LOMR-F) from FEMA that places the Project outside SFHA and requires that the FIRM is updated by FEMA to reflect revised regulatory floodplain designations. **MM HY-12a.2** Shoreline Improvements for Future Sea-Level Rise. Shoreline and public access improvements shall be designed to allow future increases in elevation along the shoreline edge to keep up with higher sea level rise values, should they occur. Design elements shall include providing adequate setbacks to allow for future elevation increases of at least 3 feet from the existing elevation along the shoreline. Before the first Small Lot Final Map is approved, the Project Applicant must petition the appropriate governing body to form (or annex into if appropriate) and administer a special assessment district or other funding mechanism to finance and construct future improvements necessary to ensure that the shoreline, public facilities, and public access improvements will be protected should sea level rise exceed 16 inches at the perimeter of the Project. Prior to the sale of the first residential unit within the Project, the legislative body shall have acted upon the petition to include the property within the district boundary. The newly formed district shall also administer a Monitoring and Adaptive Management Plan to monitor sea level and implement and maintain the protective improvements.	**LTS/M**
Impact HY-12b Implementation of the Project at HPS Phase II would not place housing in a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map.	**PS**	**MM HY-12a.1** and **MM HY-12a.2** would apply to this impact.	**LTS/M**
Impact HY-13 Implementation of the Project would not place structures within a 100-year flood hazard area or impede or redirect flood flows.	**PS**	**MM HY-12a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact HY-13a Implementation of the Project at Candlestick Point would not place structures within a 100-year flood hazard area that could impede or redirect flood flows.	**LTS**	No mitigation is required.	**LTS**
Impact HY-13b Implementation of the Project at HPS Phase II would not place structures within a 100-year flood hazard area or impede or redirect flood flows.	**PS**	**MM HY-13b** Floodplain Development Permit. To reduce the impacts of placing structures in a 100-year flood hazard area that could impede or redirect flows, the Project Applicant shall implement that following measures: ■ The Project Applicant shall obtain a Floodplain Development Permit from the Office of the City Administrator in accordance with the City's floodplain management ordinance that includes a hydraulic evaluation to determine whether structures or structural elements would impede or redirect flood flows and mandates minimum design and construction standards. Design and construction methods shall comply with NFIP requirements for placing structures in Zone V. ■ The Floodplain Development Permit shall include a "V-Zone Certification" in accordance with the NFIP. As part of the certification, a professional engineer or architect shall consider the NFIP "Free-of-Obstruction" requirement, to ensure that floodwaters or waves would not be deflected into a building or adjacent structure.	**LTS/M**
Impact HY-13c The Yosemite Slough bridge would not place structures within a 100-year flood hazard area or impede or redirect flood flows.	**LTS**	No mitigation is required.	**LTS**
Impact HY-14 Implementation of the Project would not expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.	**PS**	**MM HY-14** Shoreline Improvements to Reduce Flood Risk. To reduce the flood impacts of failure of existing shoreline structures, the Project Applicant shall implement shoreline improvements for flood control protection, as identified in the Candlestick Point/Hunters Point Development Project Proposed Shoreline Improvements report. Where feasible, elements of living shorelines shall be incorporated into the shoreline protection improvement measures. **MM HY-11a.2** would also apply to this impact.	**LTS/M**
Impact HY-15 Implementation of the Project would not expose people or structures to inundation by seiche, tsunami, or mudflow.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
SECTION III.N (BIOLOGICAL RESOURCES)			
(Note: As mentioned in the introductory text, Project impacts for Impact BI-3a through Impact BI-21b are provided by Impact BI-22 through Impact BI-26)			
Impact BI-1 Implementation of the Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.	**NI**	No mitigation is required.	**NI**
Impact BI-2 Implementation of the Project would not have a substantial adverse effect, either directly or through habitat modifications, on any common species or habitats through substantial interference with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	**LTS**	No mitigation is required. Implementation of **MM BI-7b** would be beneficial to grassland-associated raptors and terrestrial biological resources.	**LTS**
Impact BI-3a Construction at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on any plant species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-3b Construction at HPS Phase II and construction of the Yosemite Slough bridge would not have a substantial adverse effect, either directly or through habitat modifications, on any plant species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**
Impact BI-4a Construction at Candlestick Point would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the *Clean Water Act* through direct removal, filling, hydrological interruption, or other means.	**PS**	**MM BI-4a.1** Wetlands and Jurisdictional/Regulated Waters Mitigation for Temporary and/or Permanent Impacts. Wetlands and jurisdictional waters shall be avoided to the maximum extent practicable for all Project components. For example, any measures taken to improve the existing shoreline of Candlestick Point or HPS Phase II for purposes of flood control, erosion control, or repair or stabilization of existing structures shall minimize the amount of fill to be placed in jurisdictional areas. Where avoidance of existing wetlands and drainages is not feasible, and before any construction activities are initiated in jurisdictional areas, the Applicant shall obtain the following permits, as applicable to the activities in question: ■ CWA Section 404 permit from the USACE. ■ Section 10 *Rivers and Harbors Act* Permit from the USACE. ■ CWA Section 401 water quality certification from the RWQCB, and/or Report of Waste Discharge for Waters of the State. ■ CWA Section 402/National Pollution Discharge Elimination System permit from SWRCB [requiring preparation of a Stormwater Pollution Prevention Plan (SWPPP)]. ■ CDFG Section 1602 streambed alteration agreement from CDFG. ■ A permit from the BCDC. ■ Dredging permits from the USACE and BCDC as required, obtained through the Dredged Material Management Office (DMMO) process. Copies of these permits shall be provided to the contractor, along with the construction specifications. The Project Applicant shall be responsible for complying with all of the conditions set forth in these permits, including any financial responsibilities. Compensation for impacts to wetlands and jurisdictional waters shall be required to mitigate any permanent impacts to these habitats to less-than significant-levels. Such mitigation shall also be developed (separately from the CEQA process) as a part of the permitting process with the USACE, or for non-USACE-jurisdictional wetlands,	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		during permitting through the SFRWQCB, BCDC, and/or CDFG. The exact mitigation ratio shall be established during the permitting process, and depends on a number of factors, including the type and value of the wetlands permanently affected by the Project; however, mitigation shall be provided at a ratio of no less than 1:1 (at least 1 acre of mitigation for every 1 acre of waters of the US/State permanently filled). Mitigation could be achieved through a combination of on-site restoration or creation of wetlands or aquatic habitats (including removal of on-site fill or structures such as piers, resulting in a gain of wetland or aquatic habitats); off-site restoration/creation; and/or mitigation credits purchased at mitigation banks within the San Francisco Bay Region. However, any mitigation for impacts to jurisdictional waters providing habitat for special-status fish such as the green sturgeon, Central California Coast steelhead, Chinook salmon, and longfin smelt must result in the restoration or creation (at a minimum 1:1 ratio) of suitable habitat for these species, and any mitigation for impacts to jurisdictional wetlands or other waters that are considered EFH by the NMFS must result in the restoration or creation (at a minimum 1:1 ratio) of EFH. Suitably planned mitigation sites may satisfy mitigation requirements for jurisdictional areas, special-status fish, and EFH simultaneously (i.e., in the same mitigation areas) if the mitigation satisfies all these needs. For funding of off-site improvements or purchase of mitigation bank credits, the Project Applicant shall provide written evidence to the City/Agency that either (a) compensation has been established through the purchase of a sufficient number of mitigation credits to satisfy the mitigation acreage requirements of the Project activity, or (b) funds sufficient for the restoration of the mitigation acreage requirements of the Project activity have been paid to the BCDC, CCC, or other entity or agency that offers mitigation credits in the San Francisco Bay Area. For areas to be restored, to mitigate for temporary or permanent impacts, the Project Applicant shall prepare and implement a Wetland and Jurisdictional Waters Mitigation Monitoring Plan (Mitigation Monitoring Plan). The Plan shall be submitted to the regulatory agencies along with permit application materials for approval, along with a copy to the City/Agency. The Project Applicant shall retain a restoration ecologist or wetland biologist to develop the Wetland and Jurisdictional Waters Mitigation and Monitoring Plan, and it shall contain the following components (or as otherwise modified by regulatory agency permitting conditions): 1. Summary of habitat impacts and proposed mitigation ratios, along with a description of any other mitigation strategies used to achieve the overall mitigation ratios, such as funding of off-site improvements and/or purchase of mitigation bank credits 2. Goal of the restoration to achieve no net loss of habitat functions and values 3. Location of mitigation site(s) and description of existing site conditions 4. Mitigation design: ■ Existing and proposed site hydrology ■ Grading plan if appropriate, including bank stabilization or other site stabilization features ■ Soil amendments and other site preparation elements as appropriate	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

- Planting plan
- Irrigation and maintenance plan
- Remedial measures/adaptive management, etc.

5. Monitoring plan (including final and performance criteria, monitoring methods, data analysis, reporting requirements, monitoring schedule, etc.)
6. Contingency plan for mitigation elements that do not meet performance or final success criteria.

Restoration and/or creation of wetlands or aquatic habitats could occur on site or off site and at one or more locations, as approved by the regulatory agencies. Impacts occurring due to activities on Candlestick Point may be mitigated by restoration or creation activities on HPS Phase II and vice versa. For example, loss of open water habitat that might result from construction of shoreline treatments could potentially be mitigated by the removal of fill or structures from aquatic habitat on HPS Phase II.

The Project Applicant, or its agent, shall implement the Wetland and Jurisdictional Waters Mitigation Monitoring Plan. At least five years of monitoring (or more if required as a condition of the permits) shall be conducted to document whether the success criteria (that are determined as part of the mitigation plan) are achieved, and to identify any remedial actions that must be taken if the identified success criteria are not met. Annual monitoring reports (described below) shall be submitted to CDFG, the USACE, the BCDC, the City/Agency, and the SFRWQCB. Each report shall summarize data collected during the monitoring period, describe how the habitats are progressing in terms of the success criteria, and discuss any remedial actions performed. Additional reporting requirements imposed by permit conditions shall be incorporated into the Wetland and Jurisdictional Waters Mitigation Monitoring Plan and implemented.

Success criteria for specified years of monitoring for vegetated mitigation wetlands are as follows (though these may be subject to change pending development of specific Mitigation and Monitoring Plans and consultation during the permit process):

- Year 1 after restored areas reach elevations suitable for colonization by wetland plants: 10 percent combined area and basal cover (rhizomatous turf) of all vegetation in the preserve wetland; at least two hydrophytic plants co-dominant with whatever other vegetative cover exists.
- Year 3 after restored areas reach colonization elevation: 50 percent combined area and basal cover (rhizomatous turf) of all vegetation; prevalence of hydrophytic species in terms of both cover and dominant species composition of the vegetation; native vascular species shall comprise 95 percent of the vegetation in the preserve wetland.
- Year 5 after restored areas reach colonization elevation: 70 percent combined area and basal cover (rhizomatous turf) of all vegetation; more than 50 percent dominance in terms of both cover and species composition of facultative (FAC), facultative wetland (FACW), and obligate (OBL) species; native vascular species shall comprise 95 percent of the vegetation in the preserve wetlands.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		Other success criteria shall be developed for open water/mud flat habitats (which would not be expected to support vegetation) or for wetland complexes specifically designed to contain extensive areas of channels, pannes, or flats that would not be vegetated. In addition, the final Project design shall avoid substantial adverse effects to the pre-Project hydrology, water quality, or water quantity in any wetland that is to be retained on site. This shall be accomplished by avoiding or repairing any disturbance to the hydrologic conditions supporting these wetlands, as verified through an on-site Wetland Protection Plan that shall be prepared by a restoration ecologist or wetland biologist that is retained by the Project Applicant, and submitted to regulatory agencies for approval, along with a copy to the City/Agency. If such indirect effects cannot be avoided, compensatory mitigation shall be provided for the indirectly affected wetlands at a minimum 1:1 ratio, as described above. Mitigation for indirectly impacted wetlands shall be described in the Wetland and Jurisdictional Waters Mitigation and Monitoring Plan. Project features resulting in impacts to open water areas as a result of the marina, bridge, and breakwater construction shall be designed to be the minimum size required to meet their designated need. The opening in the breakwater shall be large enough and positioned such that it would allow for a complete daily exchange of water within the marina that would otherwise result from normal tidal flow, as determined by a coastal engineer and an aquatic biologist. This opening shall be designed to minimize disruption to the local hydrology generated by the breakwater and allow for normal tidal flow to ensure the daily exchange of nutrients. **MM BI-4a.2** Wetlands and Jurisdictional/Regulated Waters Impact Minimization for Construction-Related Impacts. The Project Applicant shall ensure that the contractor minimizes indirect construction-related impacts on wetlands and jurisdictional/regulated waters throughout the Study Area by implementing the following Best Management Practices (BMPs): ■ Prior to any construction activities on the site, a protective fence shall be installed a minimum of one foot (or greater, if feasible) from the edge of all wetland habitat to be avoided in the immediate vicinity of the proposed construction areas. Prior to initiation of construction activities, a qualified biologist shall inspect the protective fencing to ensure that all wetland features have been appropriately protected. No encroachment into fenced areas shall be permitted during construction and the fence shall remain in place until all construction activities within 50 feet of the protected feature have been completed. ■ Construction inspectors shall routinely inspect protected areas to ensure that protective measures remain in place and effective until all construction activities near the protected resource have been completed. The fencing shall be removed immediately following construction activities. ■ To maintain hydrologic connections, the Project design shall include culverts for all seasonal and perennial drainages that are waters of the United States and/or Waters of the State. ■ Sediment mitigation measures shall be in place prior to the onset of Project construction and shall be monitored and maintained until construction activities have been completed. Temporary stockpiling of excavated or imported material shall occur only in approved construction staging areas. Excess excavated soil shall be disposed of at a regional landfill or at another approved and/or properly permitted location. Stockpiles that are to remain on the site throughout the wet season shall be protected to prevent erosion.	

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Where determined necessary by regulatory agencies, geotextile cushions and other appropriate materials (i.e., timber pads, prefabricated equipment pads, geotextile fabric) shall be used in saturated conditions to minimize damage to the substrate and vegetation. ■ Exposed slopes and banks shall be stabilized immediately following completion of construction activities to reduce the effects of erosion on the drainage system. ■ In highly erodible areas, such as Yosemite Slough, banks shall be stabilized using a non-vegetative material that shall bind the soil initially and break down within a few years. If, during review of the grading permit for this area, the City/Agency determines that more aggressive erosion control treatments are needed, the contractor shall be directed to use geotextile mats, excelsior blankets, or other soil stabilization products. ■ The contractors shall develop a Storm Water Pollution Prevention Plan (SWPPP) prior to construction. As discussed in the Regulatory Framework of the Hydrology and Water Quality section of this EIR, the SWPPP will comply with applicable local, state, and federal requirements. Erosion control BMPs may include, but are not limited to, the application of straw mulch; seeding with fast growing grasses; construction of berms, silt fences, hay bale dikes, stormwater detention basins, and other energy dissipaters. BMPs shall be selected and implemented to ensure that contaminants are prevented from entering the San Francisco Bay during construction and operation of the facilities shall protect water quality and the marine species in accordance with all regulatory standards and requirements. ■ Testing and disposal of any dredged sediment shall be conducted as required by the USACE and the Long-Term Management Strategy (LTMS)[2] ■ All temporarily impacted wetlands and other jurisdictional waters, whether in tidal or non-tidal areas, shall be restored to pre-construction contours following construction. Such impact areas include areas that are dewatered (e.g., using coffer dams) and/or used for construction access. Temporarily impacted wetlands that were vegetated prior to construction shall be revegetated in accordance with a Wetlands and Jurisdictional Water Mitigation and Monitoring Plan as described above. ■ For impacts to tidal habitats: > Conduct all work in dewatered work areas > Install sediment curtains around the worksite to minimize sediment transport > Work only during periods of slack, tide (minimal current) and low wind to minimize transport of sediment laden water

Long-term Management Strategy for the Placement of Dredge Material in the San Francisco Bay, Management Plan 2001.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-4b Construction at HPS Phase II would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the *Clean Water Act* (including, but not limited to, marsh, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	**PS**	**MM BI-4a.1** and **MM BI-4a.2** would apply to this impact.	**LTS/M**
Impact BI-4c Construction of the Yosemite Slough bridge would not have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the *Clean Water Act* (including, but not limited to, marsh, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	**PS**	**MM BI-4c** Mitigation for Shading Impacts to Jurisdictional/Regulated Waters. Mud flats and aquatic habitats impacted by permanent shading from the Yosemite Slough bridge shall be mitigated by the creation or restoration, either on site, off site, and/or via purchase of mitigation bank credits, at a 0.5:1 (mitigation:impacted) ratio. Aside from the mitigation ratio, such mitigation shall be provided as described for mitigation measure MM BI-4a.1. **MM BI-4a.1** and **MM BI-4a.2** would also apply to this impact.	**LTS/M**
Impact BI-5a Construction at Candlestick Point would not have a substantial adverse effect on eelgrass beds, a sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**
Impact BI-5b Construction at HPS Phase II and construction of the Yosemite Slough bridge would not have a substantial adverse effect on eelgrass beds, a sensitive natural community identified in local or regional	**PS**	**MM BI-5b.1** Avoidance of Impacts to Eelgrass. As the design of shoreline treatments progresses, and a specific Shoreline Treatment Plan is determined, the Plan shall minimize any in-water construction required for installation of any treatment measures near either of the two eelgrass locations noted above. **MM BI-5b.2** Eelgrass Survey. Prior to the initiation of construction of the Yosemite Slough bridge or construction of shoreline treatments, an update to the existing eelgrass mapping shall be conducted to determine the precise locations of the eelgrass beds. This survey shall occur when a final Shoreline Treatment Plan has been prepared. The survey shall be conducted by a biologist(s) familiar with eelgrass identification and ecology and approved by NMFS to conduct such a survey. The area to be surveyed shall encompass the mapped eelgrass beds, plus a	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
plans, policies, and regulations or by the CDFG or USFWS.		buffer of 750 feet. Survey methods shall employ either SCUBA or sufficient grab samples to ensure that the bottom was adequately inventoried. The survey shall occur between August and October and collect data on eelgrass distribution, density, and depth of occurrence for the survey areas. The edges of the eelgrass beds shall be mapped. At the conclusion of the survey a report shall be prepared documenting the survey methods, results, and eelgrass distribution within the survey area. This report shall be submitted to NMFS for approval. The survey data shall feed back into the shoreline treatment design process so that Project engineers can redesign the treatments to avoid or minimize any direct impacts to eelgrass beds. If the shoreline treatments can be adjusted so that no direct impacts to eelgrass beds would occur, no further mitigation under this measure would be required for shoreline treatment construction. Management of water quality concerns is addressed through mitigation measure MM BI-5b.4 and shall be required to minimize sediment accumulation on the eelgrass. If direct impacts to eelgrass beds cannot be avoided, either by Hunters Point shoreline treatments or Yosemite Slough bridge construction, mitigation measure MM BI-5b.3 shall be implemented. **MM BI-5b.3** Compensatory Eelgrass Mitigation. If direct impacts to eelgrass beds cannot be avoided, compensatory mitigation shall be provided in conformance with the Southern California Eelgrass Mitigation Policy. Mitigation shall entail the replacement of impacted eelgrass at a 3:1 (mitigation:impact) ratio on an acreage basis, based on the eelgrass mapping described in mitigation measure MM BI-5b.2 and detailed designs of the feature(s) that would impact eelgrass beds. Such mitigation could occur either off site or on site.[3] Off-site mitigation could be achieved through distribution of a sufficient amount of funding to allow restoration or enhancement of eelgrass beds at another location in the Bay. If this option is selected, all funds shall be distributed to the appropriate state or federal agency or restoration-focused non-governmental agency (i.e., CDFG restoration fund, California Coastal Conservancy, Save the Bay, etc). The Project Applicant shall provide written evidence to the City/Agency that either a) compensation has been established through the purchase of a sufficient number of mitigation credits to satisfy the mitigation acreage requirements of the Project activity, or b) funds sufficient for the restoration of the mitigation acreage requirements of the Project activity have been paid. These funds shall be applied only to eelgrass restoration within the Bay. If on-site mitigation is selected as the appropriate option, the Project Applicant shall retain a qualified biologist familiar with eelgrass ecology (as approved by the City/Agency) to prepare and implement a detailed Eelgrass Mitigation Plan. Unless otherwise directed by NMFS, the Eelgrass Mitigation Plan shall follow the basic outline and contain all the components required of the Southern California Eelgrass Mitigation Policy (as revised in 2005),[4] including: identification of the mitigation need, site, transplant methodology, mitigation extent (typically 3:1	

[3] NMFS, Southwest Regional Office, Southern California Eelgrass Mitigation Policy, as revised August 30, 2005. Website: http://swr.nmfs.noaa.gov/hcd/policies/EELPOLrev11_final.pdf. Accessed July 20, 2009.
[4] NMFS, Southwest Regional Office, Southern California Eelgrass Mitigation Policy, as revised August 30, 2005. Website: http://swr.nmfs.noaa.gov/hcd/policies/EELPOLrev11_final.pdf. Accessed July 20, 2009.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		on an acreage basis[5]), monitoring protocols (including frequency, staffing, reviewing agencies, duration, etc), and success criteria. A draft Eelgrass Mitigation Plan shall be submitted to NMFS, for its review and approval prior to implementation, with a copy to the City/Agency. Once the plan has been approved, it shall be implemented in the following appropriate season for transplantation. Restored eelgrass beds shall be monitored for success over a 5-year period. **MM BI-5b.4** Eelgrass Water Quality BMPs. To prevent sediment that could be suspended during construction from settling out onto eelgrass, for any shoreline treatments within 750 feet of identified eelgrass beds, the Project Applicant shall require the selected contractor to implement appropriate BMPs that could include any or all of the following options, or others deemed appropriate by NMFS: 1. Conduct all work in dewatered work areas 2. Conduct all in-water work during periods of eelgrass dormancy (November 1-March 31) 3. Install sediment curtains around the worksite to minimize sediment transport 4. Work only during periods of slack tide (minimal current) and low wind to minimize transport of sediment laden water	
Impact BI-6a Construction at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on any bird species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**PS**	**MM BI-6a.1** Impact Avoidance and Pre-Construction Surveys for Nesting Special-Status and Legally Protected Avian Species. The following measures shall be implemented by the Project Developer to avoid impacts to nesting birds. 1. Not more than 15 days prior to construction activities that occur between February 1 and August 31, surveys for nesting birds shall be conducted by a qualified biologist (one familiar with the breeding biology and nesting habits of birds that may breed in the Project vicinity) that is selected by the Project Developer, and approved by the City/Agency. Surveys shall cover the entire area to be affected by construction and the area within a 250-foot buffer of construction or ground-disturbing activities. The results of the surveys, including survey dates, times, methods, species observed, and a map of any discovered nests, shall be submitted to the City/Agency. If no active avian nests (i.e. nests with eggs or young) are identified on or within 250 feet of the limits of the disturbance area, no further mitigation is necessary. Phased construction work shall require additional surveys if vegetation or building removal has not occurred within 15 days of the initial survey or is planned for an area that was not previously surveyed. Alternatively, to avoid impacts, the Project Developer shall begin construction after the previous breeding season for local raptors and other special-status species has ended (after August 31) and before the next breeding season begins (before February 1). 2. If active nests (with eggs or young) of special-status or protected avian species are found within 250 feet of the proposed disturbance area, a minimum 250-foot no-disturbance buffer zone surrounding active raptor	**LTS/M**

[5] US Army Corps of Engineers, US Environmental Protection Agency, San Francisco Bay Conservation and Implementation Commission, and San Francisco Bay Regional Water Quality Control Board. Long-term Management Strategy for the Placement of Dredge Material in the San Francisco Bay, Management Plan 2001; Appendix F – ESA and EFH Consultation.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

nests and a minimum 100-foot buffer zone surrounding nests of other special-status or protected avian species shall be established until the young have fledged. Project activities shall not occur within the buffer as long as the nest is active. The size of the buffer area may be reduced if a qualified biologist familiar with the species' nesting biology (as approved by the City/Agency) and CDFG determine it would not be likely to have adverse effects on the particular species. Alternatively, certain activities may occur within the aforementioned buffers, with CDFG concurrence, if a qualified biologist monitors the activity of nesting birds for signs of agitation while those activities are being performed. If the birds show signs of agitation suggesting that they could abandon the nest, activities would cease within the buffer area. No action other than avoidance shall be taken without CDFG consultation.

3. Completion of the nesting cycle (to determine when construction near the nest can commence) shall be determined by a qualified biologist experienced in identification and biology of the specific special-status or protected species.

MM BI-6a.2 Burrowing Owl Protocol Surveys and Mitigation. Because burrowing owls may take refuge in burrows any time of year, species-specific measures are necessary to avoid take of this species. The following measures shall be undertaken by the Project Developer to protect burrowing owls.

Prior to construction activities, focused pre-construction surveys shall be conducted for burrowing owls where suitable habitat is present within the construction areas. Surveys shall be conducted by a qualified biologist (i.e., one who is familiar with burrowing owl ecology and experienced in performing surveys for them, approved by the City/Agency) no more than 30 days prior to commencement of construction activities. These surveys shall be conducted in accordance with the CDFG burrowing owl survey protocol contained within California Burrowing Owl Consortium's April 1995 Burrowing Owl Survey Protocol and Mitigation Guidelines, or any more current equivalent should new guidelines be released before construction.

1. If no occupied burrows are found in the survey area, a letter report documenting survey methods and findings shall be submitted to the City/Agency and CDFG, and no further mitigation is necessary.
2. If unoccupied burrows are found during the non-breeding season, prior to construction activities, the Project Developer shall collapse the unoccupied burrows, or otherwise obstruct their entrances to prevent owls from entering and nesting in the burrows. This measure would prevent inadvertent impacts during construction activities.
3. If occupied burrows are found, a letter report documenting survey methods and findings (including a map showing the locations of the occupied burrows) shall be submitted to the City/Agency and CDFG. Impacts to the burrows shall be avoided by providing a construction-free buffer of 250 feet during the nesting season (February 1 through August 31). A buffer of 165 feet from the active burrows should be provided during the non-breeding season (September 1 through January 31) if feasible, though a reduced buffer is acceptable during the non-breeding season as long as construction avoids direct impacts to the burrow(s) used by the owls. The size of the buffer area may be reduced if the CDFG determines it would not be likely to have adverse effects on the owls. No Project activity shall commence within the buffer area until a qualified

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		biologist (as approved by the City/Agency) confirms that the burrow is no longer occupied. If the burrow is occupied by a nesting pair, as recommended by the California Burrowing Owl Consortium's April 1995 Burrowing Owl Survey Protocol and Mitigation Guidelines, a minimum of 6.5 acres of foraging habitat contiguous (immediately adjacent) to the burrow shall be maintained until the nesting season is over. If the foraging habitat contiguous to the occupied burrow is currently less than 6.5 acres, the entire foraging habitat shall be maintained until the nesting season is over. 4. If impacts to occupied burrows are unavoidable, passive relocation techniques approved by CDFG shall be used to evict owls from burrows within the construction area prior to construction activities. However, no occupied burrows shall be disturbed during the nesting season unless a qualified biologist (as approved by the City/Agency) verifies through non-invasive methods that juveniles from the occupied burrows are foraging independently and are capable of independent survival, or verifies the owls have not yet laid eggs. If any breeding owls must be relocated (i.e., after the nesting season has ended), mitigation of impacts to lost foraging and nesting habitat for relocated pairs shall follow guidelines provided in the California Burrowing Owl Consortium's April 1995 Burrowing Owl Survey Protocol and Mitigation Guidelines, which depending upon conditions detailed in the guidance (such as mitigation habitat quality), range from 7.5 to 19.5 acres per pair. This mitigation may take the form of the purchase of credits in a burrowing owl mitigation bank or the preservation and management of the required habitat acreage on site (e.g., in the Grasslands Ecology Park) or off site. If mitigation is provided via on-site or off-site habitat preservation and management, a Burrowing Owl Habitat Management Plan shall be prepared by a qualified biologist and submitted to the CDFG for review and approval, along with a copy to the City/Agency. This plan shall detail the location of the mitigation site, the means of preservation of the site (i.e., via a conservation easement), any enhancement and management measures necessary to ensure that habitat for burrowing owls is maintained in the long term, a monitoring program, and the size of an endowment established for the long-term maintenance of the site.	
Impact BI-6b Construction at HPS Phase II would not have a substantial adverse effect, either directly or through habitat modifications, on any bird species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**PS**	**MM BI-6b** American Peregrine Falcon Nest Protection Measures. To protect the nest of peregrine falcons during construction, the following measures shall be implemented by the Project Developer prior to construction or other disturbance within 500 feet of the Re-gunning crane nest. 1. Not more than 30 days prior to construction activities that occur between February 1 and August 15, surveys for nesting peregrine falcons shall be conducted on the Re-gunning crane, and within a 500-foot buffer surrounding the potential nesting location. Surveys shall be performed by a qualified biologist (i.e., one familiar with falcon biology and nesting) that is selected by the Project Developer, and approved by the City/Agency. The results of the surveys shall be submitted to the City/Agency and the CDFG. If no active peregrine falcon nests, eggs, or breeding activity, are identified on or within 500 feet of the limits of the disturbance area, no further mitigation is necessary. Alternatively, to avoid impacts, the Project Developer can begin construction after the previous breeding season has ended (after August 31) and before the next breeding season begins (before February 1). 2. If active peregrine nests or breeding activity are observed within the survey area, a minimum 250-foot no disturbance buffer zone surrounding the nesting location shall be established until the young have fledged.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		Within this buffer, no Project construction activities shall occur while the nest is active. The size of the buffer area may be reduced if a qualified biologist and CDFG determine it would not be likely to have adverse effects on the falcons. No action other than avoidance shall be taken without CDFG consultation. 3. No new Project construction activity shall commence within the buffer area until young have fledged and the nest is no longer active, or until nesting has been terminated for reasons unrelated to Project activities. Completion of the nesting cycle shall be determined by a qualified biologist who is experienced in peregrine falcon breeding biology (as determined and approved by the City/Agency). **MM BI-6a.1** and **MM BI-6a.2** would also apply to this impact.	
Impact BI-7a Construction at Candlestick Point would not have a substantial adverse effect on the quantity and quality of suitable foraging habitat for raptors.	**LTS**	No mitigation is required. Implementation of **MM BI-7b** would be beneficial to grassland-associated raptors.	**LTS**
Impact BI-7b Implementation of the Project at HPS Phase II would not have a substantial adverse effect on the quantity and quality of suitable foraging habitat for raptors.	**PS**	**MM BI-7b** Enhancement of Raptor Foraging Habitat. The Draft Parks, Open Space, and Habitat Concept Plan shall implement, at a minimum, the following measures in open space areas outside the CPSRA, and if allowed, within the CPSRA area: ■ **Restoration and Management of Grasslands:** To maintain grassland-associated wildlife species on the site, grasslands extensive enough to support such species shall be maintained and enhanced through the restoration of native grasses. Such grassland habitat shall not be well manicured or regularly mown. No trees shall be planted within such areas, and shrub cover would be limited to a few small, scattered patches of low-statured coastal scrub plants. At a minimum, replacement of non-native grassland impacted at HPS Phase II with native-dominated grassland shall occur at a ratio of 1:1 (1 acre of native-dominated grassland restored: 1 acre of non-native grassland impacted). ■ **Increase in Tree/Shrub Cover:** Trees and shrubs (particularly natives) shall be planted and maintained outside the designated grassland restoration area to provide foraging habitat for raptors and other migratory birds, and cover for mammals, reptiles, and smaller birds that may serve as raptor prey. While native vegetation shall be favored, site-appropriate non-native trees and shrubs that provide food or structural resources that are particularly valuable to native wildlife shall also be considered. Approximately 10,000 net new trees shall be planted at the Project site and in the community, in addition to trees that will be replaced as required by the Urban Forestry Ordinance or MM BI-14a. The elements identified above shall be reviewed and approved by a qualified biologist (one familiar with the ecology of the Project site), and the Draft Parks, Open Space, and Habitat Concept Plan shall be implemented during construction of the Project. This plan shall be approved by the City/Agency prior to construction, and its preparation and implementation shall be the financial responsibility of the Project Applicant.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-8a Construction at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on the western red bat, a species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**LTS**	No mitigation is required. **MM BI-7b** and **MM BI-14a** would result in a beneficial effect on habitat for the western red bat.	**LTS**
Impact BI-8b Construction at HPS Phase II would not have a substantial adverse effect, either directly or through habitat modifications, on the western red bat, a species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**LTS**	No mitigation is required. Implementation of **MM BI-7b** and **MM BI-14a** would be beneficial to the habitat for the western red bat.	**LTS**
Impact BI-9a Pile driving associated with construction at Candlestick Point would not have a substantial adverse effect either directly or through habitat modifications, on marine mammals or fish identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-9b Pile driving associated with construction of the marina and the Yosemite Slough bridge would not have a substantial adverse effect at HPS Phase II, either directly or through habitat modifications, on marine mammals or fish identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**PS**	**MM BI-9b** Pile Driving Design and Minimization Measures. To minimize impacts on fish and marine mammals, the Project Applicant shall be implemented the following measure to reduce the amount of pressure waves generated by pile driving. The first set of measures shall be implemented during Project design. The second set of measures shall be implemented during construction. Design Measures: 1. Engineer structures to use fewer or smaller piles, where feasible, and preferably, solid piles. 2. Design structures that can be installed in a short period of time (i.e., during periods of slack tide when fish movements are lower). 3. Do not use unsheathed creosote-soaked wood pilings. The City/Agency, with consultation from a qualified biologist who is familiar with marine biology, as approved by the City/Agency, shall review the final Project design to ensure that these design requirements have been incorporated into the Project. Construction Measures: 1. Drive piles with a vibratory device instead of an impact hammer if feasible. 2. Restrict pile driving of steel piles to the June 1 to November 30 work window, or as otherwise recommended by NMFS (driving of concrete piles would not be subject to this condition). 3. Avoid installation of any piles during the Pacific herring spawning season of December through February. Consult with the CDFG regarding actual spawning times if pile installation occurs between October and April. 4. If steel piles must be driven with an impact hammer, an air curtain shall be installed to disrupt sound wave propagation, or the area around the piles being driven shall be dewatered using a cofferdam. The goal of either measure is to disrupt the sound wave as it moves from water into air. 5. If an air curtain is used, a qualified biologist shall monitor pile driving to ensure that the air curtain is functioning properly and Project-generated sound waves do not exceed the threshold of 180-decibels generating 1 micropascal (as established by NMFS guidelines). This shall require monitoring of in-water sound waves during pile driving. 6. Unless the area around the piles is dewatered during pile driving, a qualified biologist shall be present during pile driving of steel piles to monitor the work area for marine mammals. Driving of steel piles shall cease if a marine mammal approaches within 250 feet of the work area or until the animal leaves the work area of its own accord.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-10a Construction of the Candlestick Point would require the removal of hard substrates (riprap) used by native oysters, but would not have a substantial adverse effect, either directly or through habitat modifications, on this species.	**LTS**	No mitigation is required.	**LTS**
Impact BI-10b Construction at HPS Phase II would require removal of hard substrates (docks, riprap, seawalls, pilings, etc) used by native oysters, but would not have a substantial adverse effect, either directly or through habitat modifications, on this species.	**LTS**	No mitigation is required.	**LTS**
Impact BI-10c Construction of the Yosemite Slough bridge may require removal of hard substrates (docks, riprap, seawalls, pilings, etc) used by native oysters, but would not have a substantial adverse effect, either directly or through habitat modifications, on this species.	**LTS**	No mitigation is required.	**LTS**
Impact BI-11a Construction at Candlestick Point would not have a substantial adverse effect on designated critical habitat for green sturgeon and Central California Coast steelhead, and would not result in impacts to individuals of these species as well as Chinook salmon and longfin smelt through disturbance and loss of aquatic and mudflat	**PS**	**MM BI 4a.1** and **MM BI 4a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
habitat as a result of construction of shoreline revetments.			
Impact BI-11b Construction at HPS Phase II would not have a substantial adverse effect on designated critical habitat for green sturgeon and Central California Coast steelhead, and would not result in impacts to individuals of these species as well as Chinook salmon and longfin smelt through temporary and permanent disturbance of aquatic and mudflat habitat during construction of shoreline revetments.	**PS**	**MM BI 4a.1** and **MM BI 4a.2** would apply to this impact.	**LTS/M**
Impact BI-11c Construction of the Yosemite Slough bridge would not have a substantial adverse effect on designated critical habitat for green sturgeon and Central California Coast steelhead and would not result in impacts to individuals of these species, Chinook salmon, or longfin smelt through disturbance or loss of aquatic and mudflat habitat as a result of construction of shoreline revetments.	**PS**	**MM BI 4a.1** and **MM BI 4a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-12a Construction at Candlestick Point would not have a substantial adverse effect on designated essential fish habitat through (EFH) or result in a substantial change in total available essential fish habitat through placement of riprap and other fill or through temporary water-quality impacts during construction. EFH is a sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFG or USFWS.	**PS**	**MM BI-12a.1** Seasonal Restrictions on In-Water Work. In-water work when juvenile salmonids are moving through the estuary on the way to the ocean or when groundfish and prey species could be directly impacted shall be avoided. Because steelhead are potentially present, the allowed dredge window for this area of the San Francisco Bay is June 1 through November 30. All in-water construction shall occur during this window. If completion of in-water work within this period is not feasible due to scheduling issues, new timing guidelines that shall be established and submitted to NMFS and CDFG for review and approval. **MM BI-12a.2** Worker Training. Personnel involved in in-water construction and deconstruction activities shall be trained by a qualified biologist (experienced in construction monitoring, as approved by the City/Agency) in the importance of the marine environment to special-status fish, birds, and marine mammals and the environmental protection measures put in place to prevent impacts to these species, their habitats, and Essential Fish Habitat. The training shall include, at a minimum, the following: ■ A review of the special-status fish, birds, and marine mammals and sensitive habitats that could be found in work areas ■ Measures to avoid and minimize adverse effects to special-status fish, birds, marine mammals, their habitats, and Essential Fish Habitat ■ A review of all conditions and requirements of environmental permits, reports, and plans (i.e., USACE permits) **MM BI-4a.1** and **MM BI-4a.2** would also apply to this impact.	**LTS/M**
Impact BI-12b Construction at HPS Phase II would not have a substantial adverse effect on designated essential fish habitat through (EFH) through placement of riprap and other fill, or through temporary water-quality impacts during construction. EFH is a sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFG or USFWS.	**PS**	**MM BI-12b.1** Essential Fish Habitat Avoidance and Minimization Measures. The following mitigation measures have been adapted from Amendment 11 of the West Coast Groundfish Plan[6] and Appendix A of the Pacific Coast Salmon Plan.[7] Incorporation of the following, or equivalent mitigation as otherwise required by the USACE or NMFS, would reduce the impacts to Essential Fish Habitat (EFH) to a level considered less than significant. Unless modified by the federal permitting agencies (NMFS or USACE), these measures shall be implemented during construction by the Project Applicant. Any reporting required shall be specified in the USACE permits and reports shall be submitted to the USACE and NMFS. ■ If dredging is required, permits will be obtained through the Dredged Material Management Office (DMMO) process, and the following mitigation from the Long-Term Management Strategy (LTMS) shall be implemented: > Dredging shall avoid areas with submerged aquatic vegetation (eelgrass beds or other EFH areas of particular concern) especially where the action could affect groundfish, prey of outmigrating juvenile salmon or groundfish, larval marine species, or habitat for native oysters	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*

> Sediments shall be tested for contaminants as per EPA and USACE requirements. Contaminated sediments shall be disposed of in accordance with EPA and USACE guidelines

> Slopes of the dredged area shall be gradual enough so that sloughing is unlikely to occur. Verification of these conditions shall be achieved through follow-up bathymetric surveys

> To minimize turbidity and potential resuspension of contaminated sediments, dredging shall use suction equipment, or similar equipment, when feasible. Where an equipment type may generate significant turbidity (i.e., clamshell), dredging shall be conducted using adequate engineering and best management practices to control turbidity. These include, but are not limited to, sediment curtains and tidal work windows.

- All construction equipment used in conjunction with in-water work (pipelines, barges, cranes, etc.) shall avoid wetlands, marshes, and areas of subaquatic vegetation (including eelgrass beds)
- Upland disposal options shall be considered for all spoils generated by on-site construction, especially if high levels of contaminants are present
- Maximize the use of clean dredged material for beneficial use opportunities, such as salt marsh restoration
- Use Best Management Practices (BMPs) for controlling pollution from marina operations, boatyards, and fueling facilities that meet, as applicable, the BMPs listed in the National Management Measures to Control Nonpoint Source Pollution from Marinas and Recreational Boating[8]

MM BI-12b.2 Deconstruction/Construction Debris Recovery. A Seafloor Debris Minimization and Removal Plan shall be prepared by the Project Applicant and approved by the City/Agency, prior to initiation of in-water deconstruction (dismantling) or construction activities. The Plan shall be implemented during in-water deconstruction or construction activities, and such activities shall be monitored by a qualified biologist who is experienced in construction monitoring (as approved by the City/Agency). The Seafloor Debris Minimization and Removal Plan shall include, at a minimum:

- Debris field boundaries associated with deconstruction activities
- Identification of measures taken to minimize the potential for debris to fall into aquatic habitats (i.e., the use of netting below in-water construction or deconstruction areas)
- Deconstruction equipment, tools, pipes, pilings, and other materials or debris that are inadvertently dropped into the Bay, along with their descriptions and locations
- Circumstances requiring immediate cessation of deconstruction activities and immediate initiation of search and recovery efforts, including procedures for implementing those recovery efforts
- How lost debris that is to be removed post-deconstruction is to be identified, who will be conducting search and recovery operations, and the survey methods to be employed to locate lost equipment and materials
- Criteria that will be used to:

[8] National Management Measures to Control Nonpoint Source Pollution from Marinas and Recreational Boating. EPA 841-B-01-005, November 2001.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		> Determine whether recovery efforts are appropriate for the object being recovered and do not result in potential environmental impairment greater than if the debris was allowed to remain in place > When sufficient effort has been expended to recover a lost object(s) with no success and continued efforts to recover the seafloor debris have diminishing potential for success and/or result in environmental impairment greater than leaving the debris in place ■ Person(s) responsible for implementing the Plan and making the determination on the type of recovery required ■ How debris is to be disposed of or recycled ■ Metrics for determining when recovery efforts will be considered complete Following completion of all post deconstruction recovery efforts for seafloor debris, a report shall be prepared by the Project Applicant and submitted to the City/Agency detailing, at a minimum, (1) recovery activities during deconstruction and post-deconstruction, (2) listings of all lost and recovered debris, (3) final disposition of recovered debris, and (4) discussion of what debris could not be recovered and why. **MMBI-4a.1, MM BI-4a.2, MM BI-5b.1, MM BI-5b.2, MM BI-5b.3, MM BI-5b.4, MM BI-12a.1**, and **MM BI-12a.2** would also apply to this impact.	
Impact BI-12c Construction of the Yosemite Slough bridge would not have a substantial adverse effect on designated essential fish habitat through (EFH) through placement of riprap and other fill, or through temporary water-quality impacts during construction. EFH is a sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFG or USFWS.	**PS**	**MM BI-4a.1, MM BI-4a.2, MM BI-12a.1, MM BI-12a.2, MM BI-12b.1**, and **MM BI-12b.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-13a Construction at Candlestick Point would not interfere substantially with the movement of native resident or migratory wildlife species or with established native resident or migratory wildlife corridor, or impede the use of native wildlife nursery sites.	**LTS**	No mitigation is required.	**LTS**
Impact BI-13b Construction at HPS Phase II and construction of the Yosemite Slough bridge would not interfere substantially with the movement of native resident or migratory wildlife species or with established native resident or migratory wildlife corridors, but it could impede the use of native wildlife nursery sites.	**PS**	**MM BI-5b.1** through **MM BI-5b.4** would apply to this impact.	**LTS/M**
Impact BI-14a Construction at Candlestick Point would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**PS**	**MM BI-14a** Preservation and Replacement of Significant Trees, and Preservation and Planting of Street Trees. Construction activities outside of the Department of Public Works (DPW) jurisdiction could result in the disturbance or removal of a large number of trees. To minimize this impact, the following measures shall be implemented by the Project Applicant in these areas: 1. Avoidance of the removal of trees that meet the size specifications of significant trees in the Public Works Code Article 16 shall occur to the maximum extent feasible, and any such trees that are removed shall be replaced at a minimum of 1:1 (1 impacted:1 replaced). The species used for replacement shall be consistent with DPW recommendations. 2. Street trees shall be planted in all new development areas. The species, size, and locations shall be consistent with the requirements specified in Planning Code Section 143, including, but not limited to, the following: a) The street trees installed shall be a minimum of one 24-inch box tree for each 20 feet of frontage of the property along each street or alley, with any remaining fraction of 10 feet or more of frontage requiring an additional tree. Such trees shall be located either within a setback area on the lot or within the public right-of-way along such lot. b) The species of trees selected shall be suitable for the site, and, in the case of trees installed in the public right-of-way, the species and locations shall be subject to the approval by the DPW. Procedures	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		and other requirements for the installation, maintenance, and protection of trees in the public right-of-way shall be as set forth in Public Works Code Article 16. 3. If a significant tree or street tree will not be removed, but construction activities will occur within the dripline of such trees, a Tree Protection Plan shall be prepared by an International Society of Arboriculture (ISA) certified arborist, in accordance with the Urban Forestry Ordinance. This plan shall be submitted to the Planning Department for review and approval prior to issuance of a demolition or building permit. The Tree Protection Plan shall include measures to protect all parts of a tree from disturbance during construction, and may include the following: a) A site plan with tree species, trunk location, trunk diameter at breast height, and the canopy dripline area within development b) The use of protective fencing to establish an area to be left undisturbed during construction c) Protection specifications, including construction specifications such as boring instead of trenching for utility lines, or tree specifications such as drainage, fertilization, or irrigation measures d) Pruning specifications, if needed, to preserve the health of the tree and allow construction to proceed Implementation of **MM BI-7b** would be beneficial to protected trees.	
Impact BI-14b Construction at HPS Phase II and Yosemite Slough bridge would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**PS**	**MM BI-14a** would apply to this impact. Implementation of **MM BI-7b** would be beneficial to protected trees.	**LTS/M**
Impact BI-15a Construction within the shoreline or Bay at Candlestick Point would not result in the disturbance of contaminated soil or the re-suspension of contaminated sediments.	**NI**	No mitigation is required.	**NI**
Impact BI-15b Construction within the shoreline or Bay at HPS Phase II would not result in the disturbance of contaminated soil or the re-suspension of contaminated sediments.	**PS**	**MM HZ-10b**, **MM HY-1a.1**, and **MM HY-1a.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-16a Implementation of the Project at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS or interfere substantially with the movement of any native resident or migratory fish, or impede the use of native wildlife nursery sites.	**LTS**	No mitigation is required. Implementation of **MM BI-7b** would be beneficial to terrestrial biological resources.	**LTS**
Impact BI-16b Implementation of the Project at HPS Phase II, including operation of the proposed marina, would not have a substantial adverse effect, either directly or through habitat modifications, on aquatic species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS or interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	**LTS**	No mitigation is required. Implementation of **MM BI-7b** would be beneficial to terrestrial biological resources.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-17a Implementation of the Project at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on nesting American peregrine falcons, identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**
Impact BI-17b Implementation of the Project at HPS Phase II would not have a substantial adverse effect, either directly or through habitat modifications, on nesting American peregrine falcons, identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS.	**NI**	No mitigation is required.	**NI**
Impact BI-18a Implementation of the Project at Candlestick Point would not have a substantial adverse effect, either directly or through habitat modifications, on aquatic species identified as a candidate, sensitive, or special-status in local or regional plans, policies, or regulations, or by the CDFG or USFWS, or have a substantial adverse effect on designated EFH, a sensitive natural community identified in local or regional plans, policies, and regulations or by the NMFS.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-18b Implementation of the marina in HPS Phase II would require routine maintenance dredging of the marina, which could remove habitat or generate substantial increases in turbidity within the marina, but would not have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status in local or regional plans, policies, or regulations, or by the CDFG or USFWS, or have a substantial adverse effect on designated EFH, a sensitive natural community identified in local or regional plans, policies, and regulations or by the NMFS.	**PS**	**MM BI-18b.1** Maintenance Dredging and Turbidity Minimization Measures for the Operation of the Marina. Maintenance dredging for the marina could remove or generate sediment plumes that could impact special-status species, their habitats, and Essential Fish Habitat (EFH). To minimize this effect, the following measures shall be implemented by the Project Applicant: 1. Conduct a detailed survey for native oysters in all suitable substrates within the marina, which includes the area between the land and breakwaters, after construction of the new breakwaters. This survey shall be conducted by a qualified oyster biologist at low tides that expose the maximum amount of substrate possible. Surveys can be conducted at any time of year, but late summer and early fall are optimal because newly settled oysters are detectable. This survey shall occur before any construction within the proposed marina location takes place to establish a baseline condition. If few or no oysters are observed on hard substrates that would remain in place after dredging, no further mitigation is required. 2. If oysters are found at densities at or above 90 oysters per square meter[9] on suitable oyster-settlement substrates that would be removed or in areas where dredging sediment could settle out onto the oysters, a detailed sediment plume modeling study of the proposed marina operation shall be conducted to determine if the operations and maintenance of the marina would generate a substantial plume of sediment. This model shall include the local bathymetry and sediment information, tidal data, and detailed marina information (number and types of boats, etc). The model shall be prepared by a qualified harbor engineer (as approved by the City/Agency) with direct experience in this type of work within San Francisco Bay, prior to issuance of any permits for the construction of features directly associated with the marina. A report documenting modeling methods, input data, assumptions, results, and implications for increased rates of sedimentation shall be prepared and provided to NMFS during the USACE-directed Section 7 and EFH consultation for the marina. If the model demonstrates minimal sediment resuspension that would settle out before reaching sensitive habitats, no further mitigation is required. 3. If the sediment plume reaches sensitive shoreline habitats (substrates that support native oysters), compensatory mitigation shall be provided by the Project Applicant at a ratio recommended by NMFS for the type of habitat adversely affected. The Project Applicant shall retain a qualified oyster biologist (as approved by the City/Agency) to develop an Oyster Restoration Plan that shall be reviewed and approved by the City/Agency. This Plan shall include site selection, substrate installation, and monitoring procedures, and include the following components (unless otherwise modified by NMFS): ■ A suitable site for installation of replacement substrate would be one with adequate daily tidal flow, a location that would not be affected by maintenance dredging or other routine marina maintenance activities, and one that is lacking in appropriate settlement substrate. A location outside of the new breakwaters or in association with any eelgrass mitigation sites would be appropriate.	**LTS/M**

[9] MACTEC Engineering and Consulting, Inc. 2008. *Oyster Point Marina Olympia Oyster Surveys Pre- and Post-Dredging February 2008, Oyster Point Marina, South San Francisco, California*. Prepared for PBS&J; Obernolte. 2009. Personal communication between MACTEC and PBS&J.

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		■ Although oysters would settle on a variety of materials, the most appropriate for restoration purposes is oyster shell. This is typically installed by placing the shell into mesh bags that can then be placed in piles on the seafloor of the mitigation site. Enough shell shall be installed under the guidance of a qualified oyster biologist to make up for the loss attributable to the Project. Mitigation shall occur after construction of all in-water elements of the Project within HPS Phase II. ■ The restoration site shall be monitored on a regular basis by a qualified oyster biologist for a minimum of two years, or until success criteria are achieved if they are not achieved within two years. Monitoring shall involve routine checks (bi-monthly during the winter and monthly during the spring and summer) to evaluate settlement, growth, and survival on the mitigation site. Success shall be determined to have been achieved when settlement and survival rates for oysters are not statistically significantly different between the mitigation site and either populations being impacted (if data are available) or nearby established populations (i.e., Oyster Point Marina). **MM BI-18b.2** Implement BMPs to Reduce Impacts of Dredging To Water Quality. BMPs established in Appendix I of the Long-Term Management Strategy (LTMS) for management of disposal of dredge material in San Francisco Bay are designed specifically to minimize spread of contaminants Long-Term Management Strategy (LTMS) outside of dredge areas. All of these elements of the LTMS shall be applied to any proposed dredging or construction activities associated with the Project unless otherwise modified by the USACE, BCDC, or SFRWQCB in permit conditions associated with the proposed dredging activities associated with this Project (same as MM BI-19b.2).	
Impact BI-19a Implementation of the Project at Candlestick Point would not result in impacts to aquatic organisms through the re-suspension of contaminated sediments.	**NI**	No mitigation is required.	**NI**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-19b Implementation of the marina in HPS Phase II would not have a substantial adverse effect, either directly or through habitat modifications, on sensitive aquatic species, identified as candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFG or USFWS, or have a substantial adverse effect on designated EFH, a sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFG or USFWS, or have a substantial effect on predators that prey on contaminated species or feed on contaminated substrates as a result of routine maintenance dredging or could generate routine increases in turbidity within the marina that would result in the re-suspension of contaminated sediments.	**PS**	**MM BI-19b.1** Work Windows to Reduce Maintenance Dredging Impacts to Fish during Operation of the Marina. According to the Long-Term Management Strategy (LTMS), dredging Projects that occur during the designated work windows do not need to consult with NMFS under the federal *Endangered Species Act* (FESA).[10] The window in which dredging is allowed for the protection of steelhead in the central Bay is June 1 to November 30. The spawning season for the Pacific herring is March 1 to November 30.[11] Therefore, the window that shall be applied to minimize impacts to sensitive fish species (during which dredging activities cannot occur) is March 1 to November 30. **MM BI-19b.2** Implement BMPs to Reduce Impacts of Dredging To Water Quality. BMPs established in Appendix I of the Long-Term Management Strategy (LTMS) are designed specifically to minimize spread of contaminants outside of dredge areas. All of these elements of the LTMS shall be applied to any proposed dredging or construction activities associated with the Project unless otherwise modified by the USACE, BCDC, or the San Francisco Bay Regional Water Quality Control Board in permit conditions associated with the proposed dredging activities associated with this Project (same as MM BI-18b.2).	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-20a Implementation of the Project at Candlestick Point would not interfere substantially with the movement of resident or migratory bird species by increasing collision hazards and the amount of artificial lighting.	**PS**	**MM BI-20a.1** Lighting Measures to Reduce Impacts to Birds. During design of any building greater than 100 feet tall, the Project Applicant and architect shall consult with a qualified biologist experienced with bird strikes and building/lighting design issues (as approved by the City/Agency) to identify lighting-related measures to minimize the effects of the building's lighting on birds. Such measures, which may include the following and/or other measures, will be incorporated into the building's design and operation. ■ Use strobe or flashing lights in place of continuously burning lights for obstruction lighting. Use flashing white lights rather than continuous light, red light, or rotating beams. ■ Install shields onto light sources not necessary for air traffic to direct light towards the ground. ■ Extinguish all exterior lighting (i.e., rooftop floods, perimeter spots) not required for public safety. ■ When interior or exterior lights must be left on at night, the developer and/or operator of the buildings shall examine and adopt alternatives to bright, all-night, floor-wide lighting, which may include: > Installing motion-sensitive lighting. > Using desk lamps and task lighting. > Reprogramming timers. > Use of lower-intensity lighting. ■ Windows or window treatments that reduce transmission of light out of the building will be implemented to the extent feasible. ■ Educational materials will be provided to building occupants encouraging them to minimize light transmission from windows, especially during peak spring and fall migratory periods, by turning off unnecessary lighting and/or closing drapes and blinds at night. ■ A report of the lighting alternatives considered and adopted shall be provided to the City/Agency for review and approval prior to construction. The City/Agency shall ensure that lighting-related measures to reduce the risk of bird collisions have been incorporated into the design of such buildings to the extent practicable. **MM BI-20a.2** Building Design Measures to Minimize Bird Strike Risk. During design of any building greater than 100 feet tall, the Project Applicant and architect will consult with a qualified biologist experienced with bird strikes and building/lighting design issues (as approved by the City/Agency) to identify measures related to the external appearance of the building to minimize the risk of bird strikes. Such measures, which may include the following and/or other measures, will be incorporated into the building's design. ■ Use non-reflective tinted glass. ■ Use window films to make windows visible to birds from the outside. ■ Use external surfaces/designs that "break up" reflective surfaces. ■ Place bird attractants, such as bird feeders and baths, at least 3 feet and preferably 30 feet or more from windows in order to reduce collision mortality.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		A report of the design measures considered and adopted shall be provided to the City/Agency for review and approval prior to construction. The City/Agency shall ensure that building design-related measures to reduce the risk of bird collisions have been incorporated to the extent practicable.	
Impact BI-20b Implementation of the Project at HPS Phase II would not interfere substantially with the movement of resident or migratory bird species by increasing collision hazards and the amount of artificial lighting.	**PS**	**MM BI-20a.1** and **MM BI-20a.2** would apply to this impact.	**LTS/M**
Impact BI-21a Implementation of the Project at Candlestick Point would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**PS**	**MM BI-14a** would apply to this impact.	**LTS/M**
Impact BI-21b Implementation of the Project at HPS Phase II would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**PS**	**MM BI-14a** would apply to this impact.	**LTS/M**
Impact BI-22 Implementation of the Project would not have a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, by the CDFG, USFWS, or NMFS.	**PS**	**MM BI-4a.1, MM BI-4a.2, MM BI-5b.1** through **MM BI-5b.4, MM BI-6a.1, MM BI-6a.2, MM BI-6b, MM BI-7b, MM BI-9b, MM BI-18b.1**, and **MM BI-18b.2** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact BI-23 Implementation of the Project would not have a substantial adverse effect on sensitive natural communities identified in local or regional plans, policies, or regulations by the CDFG, USFWS, or NMFS.	**PS**	**MM BI-5b.1** through **MI-BI-5b.4**, **MM BI-12a.1, MM BI-12a.2, MM BI-12b.1, MM BI-12b.2, MM BI-18b.1**, **MM BI-18b.2**, **MM BI-19b.1**, and **MM BI-19b.2** would apply to this impact.	**LTS/M**
Impact BI-24 Implementation of the Project would not have a substantial adverse effect on federally protected wetlands and other waters as defined by Section 404 of the *Clean Water Act* (including, but not limited to, marsh, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.	**PS**	**MM BI-4a.1** and **MM BI-4a.2** would apply to this impact.	**LTS/M**
Impact BI-25 Implementation of the Project would not interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery site.	**PS**	**MM BI-5b.1** through **MM BI-5b.4, MM BI-20a.1,** and **MM BI-20a.2** would apply to this impact.	**LTS/M**
Impact BI-26 Implementation of the Project would not conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	**PS**	**MM BI-14a** would apply to this impact. Implementation of **MM BI-7b** would be beneficial to protected trees.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
		SECTION III.O (PUBLIC SERVICES)	
Impact PS-1 Construction activities associated with the Project would not result in a need for new or physically altered facilities in order to maintain acceptable service ratios, response times, or other performance objectives for police protection.	**PS**	**MM PS-1** Site Security Measures During Construction. During site preparation and in advance of construction of individual buildings, fencing, screening, and security lighting shall be provided by the Project Applicant. During non-construction hours the site must be secured and locked, and ample security lighting shall be provided. **MM TR-1** would also apply to this impact.	**LTS/M**
Impact PS-2 Implementation of the Project would not result in a need for new or physically altered facilities beyond those included as part of this Project in order to maintain acceptable service ratios, response times, or other performance objectives for police protection.	**Varies**	Refer to Section III.D (Transportation and Circulation), Section III.H (Air Quality), Section III.I (Noise), Section III.J (Cultural Resources) Section III.K (Hazards and Hazardous Materials), and Section III.M (Hydrology and Water Quality) for the specific significance conclusions and mitigation measures for construction-related effects.	**Varies**
Impact PS-3 Construction activities associated with the Project would not result in a need for new or physically altered facilities in order to maintain acceptable response times for fire protection and emergency medical services.	**PS**	**MM TR-1** would apply to this impact.	**LTS/M**
Impact PS-4 Implementation of the Project would not result in a need for new or physically altered facilities beyond those included as part of this Project in order to maintain acceptable response times for fire protection and emergency medical services.	**Varies**	Refer to Section III.D (Transportation and Circulation), Section III.H (Air Quality), Section III.I (Noise), Section III.J (Cultural Resources) Section III.K (Hazards and Hazardous Materials), and Section III.M (Hydrology and Water Quality) for the specific significance conclusions and mitigation measures for construction-related effects.	**Varies**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact PS-5 Construction activities associated with the Project would not affect the provision of school services by decreasing access to school services.	**NI**	No mitigation is required.	**NI**
Impact PS-6 New students associated with implementation of the Project would not require new or expanded school facilities, the construction of which could result in substantial adverse impacts.	**LTS**	No mitigation is required.	**LTS**
Impact PS-7 Construction activities associated with the Project would not affect provision of school services by decreasing access to library services.	**NI**	No mitigation is required.	**NI**
Impact PS-8 Implementation of the Project would not result in an increase in demand for library services that is not met by existing library facilities in the vicinity that have been expanded or updated.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.P (RECREATION)	
Impact RE-1 Construction of the parks, recreational uses, and open space proposed by the Project would not result in substantial adverse physical environmental impacts beyond those analyzed and disclosed in this EIR.	**Varies**	Refer to Section III.D (Transportation and Circulation), Section III.H (Air Quality), Section III.I (Noise), Section III.J (Cultural Resources and Paleontological Resources) Section III.K (Hazards and Hazardous Materials), and Section III.M (Hydrology and Water Quality) for the specific significance conclusions and mitigation measures for construction-related effects.	**Varies**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact RE-2 Implementation of the Project would not increase the use of existing parks and recreational facilities that would cause the substantial physical deterioration of the facilities to occur or to be accelerated, nor would it result in the need for, new or physically altered park or recreational facilities.	**PS**	**MM RE-2** Phasing of parkland with respect to residential and/or employment generating uses. Development of the Project and associated parkland shall generally proceed in four phases, as illustrated by Figure II-16 (Proposed Site Preparation Schedule) of Chapter II (Project Description) of this EIR. To ensure that within each phase parks and population increase substantially concurrently, development shall be scheduled such that adequate parkland is constructed and operational when residential and employment-generating uses are occupied. The following standards shall be met: ■ No project development shall be granted a temporary certificate of occupancy if the City determines that the new population associated with that development would result in a parkland-to-population ratio within the Project site lower than 5.5 acres per 1,000 residents/population, as calculated by the Agency. ■ For the purposes of this mitigation measure, in order for a park to be considered in the parkland-to-population ratio, the Agency must determine that within 12 months of the issuance of the temporary certificate of occupancy, it will be fully constructed and operational, and, if applicable, operation and maintenance funding will be provided to the Agency.	**LTS/M**
● **Impact RE-3** Implementation of the Project would decrease the size of CPSRA but would not, overall, have an adverse effect on the recreational opportunities offered by that park, nor would it substantially adversely affect windsurfing opportunities at the Project site.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.Q (UTILITIES)	
Impact UT-1 Implementation of the Project would not require water supplies in excess of existing entitlements or result in the need for new or expanded entitlements.	**LTS**	No mitigation is required.	**LTS**
● **Impact UT-2** Implementation of the Project would not require or result in the construction of new or expanded water treatment facilities. The Project would require the expansion of an auxiliary water conveyance system to provide adequate water supply for firefighting to the Project site.	**PS**	**MM UT-2** Auxiliary Water Supply System. Prior to issuance of occupancy permits, as part of the Infrastructure Plan to be approved, the Project Applicant shall construct an Auxiliary Water Supply System (AWSS) loop within Candlestick Point to connect to the City's planned extension of the off-site system off-site on Gilman Street from Ingalls Street to Candlestick Point. The Project Applicant shall construct an additional AWSS loop on HPS Phase II to connect to the existing system at Earl Street and Innes Avenue and at Palou and Griffith Avenues, with looped service along Spear Avenue/Crisp Road.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact UT-3 Implementation of the Project would not require expansion of existing off-site wastewater conveyance or treatment facilities.	**PS**	**MM UT-3a** would apply to this impact.	**LTS/M**
Impact UT-3a Implementation of the Project at Candlestick Point would not require expansion of existing off-site wastewater conveyance facilities.	**PS**	**MM UT-3a** Wet-Weather Wastewater Handling. Prior to approval of the Project's wastewater infrastructure construction documents for any new development, the Project Applicant shall demonstrate to the San Francisco Public Utilities Commission (SFPUC), in writing, that there will be no net increase in wastewater discharges during wet-weather conditions from within the Project Area boundary to the Bayside System compared to pre-Project discharges. This may be accomplished through a variety of means, including, but not limited to: ■ Temporary on-site retention or detention of flows to the system ■ Separation of all or a portion of the stormwater and wastewater system at Candlestick Point	**LTS/M**
Impact UT-3b Implementation of the Project at HPS Phase II would not require expansion of existing off-site wastewater conveyance facilities.	**PS**	**MM UT-3a** would apply to this impact.	**LTS/M**
Impact UT-4 Implementation of the Project would not exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board.	**LTS**	No mitigation is required.	**LTS**
Impact UT-5 Construction activities associated with the Project, including demolition of existing facilities, would not generate construction-related solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-5a** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact UT-5a Construction at Candlestick Point, including demolition of existing facilities, would not generate construction-related solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-5a** Construction Waste Diversion Plan. The Project Applicant shall submit a Construction Waste Diversion Plan to the Director of the San Francisco Department of the Environment demonstrating a plan to divert at least 75 percent of or more of the total construction and demolition debris produced as the result of the Project (such as wood, metal, concrete, asphalt, and sheetrock) from landfill interment, which is required by the City's Green Building Ordinance. The Plan shall be submitted and approved by the Director of the San Francisco Department of the Environment before the issuance of building permits. This Plan shall include (1) identification of how much material resulting from demolition of existing facilities could be reused on site (e.g., existing asphalt and concrete could be removed, crushed, reconditioned, and reused as base material for new roadways and parking lots); (2) the extent to which materials could be sorted on site (e.g., through piecemeal demolition of selected facilities to extract recyclable materials), (3) the amount of material that would be transported to an off-site location for separation; and (4) the amount of materials that cannot be reused or recycled and would be interred at a landfill, such as the Altamont Landfill in Livermore.	**LTS/M**
Impact UT-5b Construction at HPS Phase II, including demolition of existing facilities, would not generate construction-related solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-5a** would apply to this impact.	**LTS/M**
Impact UT-6 Construction activities associated with the Project would not require the disposal of hazardous wastes such as lead-based paint, asbestos, and contaminated soils that would exceed the capacity of transport, storage, and disposal facilities permitted to treat such waste.	**LTS**	No mitigation is required.	**LTS**
Impact UT-6a Construction at Candlestick Point would not require the disposal of hazardous wastes such as lead-based paint, asbestos, and contaminated soils that would exceed the capacity of transport, storage, and disposal facilities permitted to treat such waste.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact UT-6b Construction at HPS Phase II would not require the disposal of hazardous wastes such as lead-based paint, asbestos, and contaminated soils that would exceed the capacity of transport, storage, and disposal facilities permitted to treat such waste.	**LTS**	No mitigation is required.	**LTS**
Impact UT-7 Implementation of the Project would not generate solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-7a** and **MM UT-7a-1** would apply to this impact.	**LTS/M**
Impact UT-7a Implementation of the Project at Candlestick Point would not generate solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-7a** Site Waste Management Plan. The Project Applicant shall prepare a Site Waste Management Plan (SWMP) in cooperation with the Agency to describe the methods by which the Project shall minimize waste generation not otherwise covered by existing City regulatory policies, with the goal of achieving a diversion rate of at least 72 percent, consistent with the City's existing diversion rate in 2008. The SWMP shall be submitted to the Department of Environment (DOE) for approval prior to the issuance of the first development permit for the Project.	**LTS/M**
Impact UT-7b Implementation of the Project at HPS Phase II would not generate solid waste that would exceed the capacity of landfills serving the City and County of San Francisco.	**PS**	**MM UT-7a** would apply to this impact.	**LTS/M**
Impact UT-8 Implementation of the Project would not generate hazardous waste that would exceed the permitted capacity of transport, storage, and disposal facilities authorized to treat such waste.	**LTS**	No mitigation is required.	**LTS**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures

Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact UT-8a Implementation of the Project at Candlestick Point would not generate hazardous waste that would exceed the permitted capacity of transport, storage, and disposal facilities authorized to treat such waste.	**LTS**	No mitigation is required.	**LTS**
Impact UT-8b Implementation of the Project at HPS Phase II would not generate hazardous waste that would exceed the permitted capacity of transport, storage, and disposal facilities authorized to treat such waste.	**LTS**	No mitigation is required.	**LTS**
Impact UT-9 Implementation of the Project would comply with federal, state, and local statutes and regulations related to solid waste.	**PS**	**MM UT-5a, MM UT-7a.1**, and **MM UT-7a.2** would apply to this impact.	**LTS/M**
Impact UT-10 Implementation of the Project would not require extension of dry utility infrastructure that would exceed the capacity of the services providing such utilities.	**LTS**	No mitigation is required.	**LTS**
		SECTION III.R (ENERGY)	
Impact ME-1 Construction activities associated with the Project would not result in the use of large amounts of energy, or use energy in a wasteful manner.	**LTS**	No mitigation is required.	**LTS**
Impact ME-2 Buildings constructed by the Project would not use large amounts of electricity in a wasteful manner.	**PS**	**MM GC-2, MM GC -3**, and **MM GC-4** would apply to this impact.	**LTS/M**

Table ES-2 Summary of Environmental Effects and Project Requirements/Mitigation Measures			
Impact(s)	*Level of Significance Prior to Mitigation*	*Mitigation Measure(s) and/or Project Requirements*	*Level of Significance After Mitigation*
Impact ME-3 Buildings constructed by the Project would not use large amounts of natural gas in a wasteful manner.	**PS**	**MM GC-2** and **MM GC-3** would apply to this impact.	**LTS/M**
Impact ME-4 Vehicle trips associated with the Project would not use large amounts of energy in a wasteful manner.	**PS**	**MM TR-1** through **MM TR-5** would apply to this impact.	**LTS/M**
		SECTION III.S (GREENHOUSE GAS EMISSIONS)	
Impact GC-1 The Project would not result in a substantial contribution to global climate change by increasing GHG emissions in a manner that conflicts with the state goal of reducing GHG emissions in California to 1990 levels by 2020 (e.g., a substantial contribution to global climate change) or conflicts with San Francisco's Climate Action Plan by impeding implementation of the local GHG reduction goals established by the San Francisco 2008 Greenhouse Gas Reduction Ordinance.	**PS**	**MM GC-1** Plant up to 10,000 net new trees at the Project site and in the community. **MM GC-2** Exceed the 2008 Standards for Title 24 Part 6 energy efficiency standards for homes and businesses would by at least 15 percent. **MM GC-3** Install ENERGY STAR appliances, where appliances are offered by homebuilders. **MM GC-4** Use light emitting diode (LED) based energy efficient street lighting.	**LTS/M**

NI = No Impact

CHAPTER IV Project Variants IV-1
IV.A Introduction IV-1
IV.B Variant 1: R&D Variant (No Stadium—Additional Research & Development) IV-6
IV.B.1 Overview IV-6
IV.B.2 Project Objectives IV-6
IV.B.3 Characteristics IV-6
IV.B.4 Potential Environmental Effects IV-14
IV.C Variant 2: Housing Variant (No Stadium—Relocation of Housing) IV-73
IV.C.1 Overview IV-73
IV.C.2 Project Objectives IV-74
IV.C.3 Characteristics IV-76
IV.C.4 Potential Environmental Effects IV-83

IV.Ca Variant 2A: Housing/R&D Variant (No Stadium—Relocation of Housing; Additional R&D) IV-140
IV.Ca.1 Overview IV-140
IV.Ca.2 Project Objectives IV-143
IV.Ca.3 Characteristics IV-143
IV.Ca.4 Potential Environmental Effects IV-147
IV.D Variant 3: Candlestick Point Tower Variants IV-173
IV.D.1 Overview IV-173
IV.D.2 Project Objectives IV-179
IV.D.3 Characteristics IV-179
IV.D.4 Potential Environmental Effects IV-180
IV.E Variant 4: Utilities Variant IV-231
IV.E.1 Overview IV-231
IV.E.2 Project Objectives IV-231
IV.E.3 Characteristics IV-231
IV.E.4 Potential Environmental Effects IV-237
IV.F Variant 5: San Francisco 49ers and Oakland Raiders Shared Stadium at Hunters Point Shipyard IV-266
IV.F.1 Overview IV-266
IV.F.2 Project Objectives IV-266
IV.F.3 Characteristics IV-266
IV.F.4 Potential Environmental Effects IV-266

CHAPTER V Other CEQA Considerations V-1
V.A Introduction V-1
V.B Significant Environmental Effects of the Project V-1
V.C Significant Environmental Effects That Cannot Be Avoided If the Project Is Implemented V-1
V.D Significant Irreversible Environmental Effects V-4
V.E Effects Not Found to Be Significant V-9
V.F Irreversible Damage V-10
V.G Direct or Indirect Economic or Population Growth V-10
V.H Urban Decay V-14

CHAPTER VI Alternatives VI-1
VI.A Introduction VI-1
VI.A.1 Legislative Framework VI-1
VI.A.2 Analytic Method VI-2
VI.A.3 Project Objectives VI-3
VI.B Description of Alternatives to the Project VI-3
VI.C Analysis of Project Alternatives VI-6
VI.C.1 Alternative 1: No Project VI-7
VI.C.2 Alternative 2: CP-HPS Phase II Development Plan; No Yosemite Slough Bridge VI-29
VI.C.3 Alternative 3: Reduced CP-HPS Phase II Development; San Francisco 49ers Stay at Existing Candlestick Park Stadium; Limited State Parks Agreement; Yosemite Slough Bridge Serving Only Transit, Bicycles, and Pedestrians VI-59
VI.C.4 Alternative 4: Reduced CP-HPS Phase II Development; Historic Preservation; No HPS Phase II Stadium, Marina, or Yosemite Slough Bridge VI-91

VI.C.4a Subalternative 4A: CP-HPS Phase II Development Plan with Historic Preservation VI-124
VI.C.5 Alternative 5: Reduced CP-HPS Phase II Development; No HPS Phase II Stadium, State Parks Agreement, or Yosemite Slough Bridge VI-132
VI.D Environmentally Superior Alternative VI-164
VI.D.1 Alternatives Considered But Eliminated from Further Analysis in the EIR VI-164
VI.E Comparison of Alternatives VI-177

CHAPTER VII Report Preparers and Persons Consulted VII-1
VII.A Lead Agencies VII-1
VII.B Other City Agencies VII-1
VII.C EIR Consultants VII-2
VII.D Project Sponsor VII-4
VII.E Project Attorney VII-5
VII.F Agency Attorney VII-5
VII.G Project Design Team VII-5
VII.H Project Transportation Consultant VII-6

EIR Appendices

Appendix A Notice of Preparation (NOP) and NOP Comments
Appendix A1 PBS&J, Analysis of Project Development Schedule Modifications and Environmental Impact Report, April 10, 2010
Appendix A2 PBS&J, Analysis of Revised Development Schedule Compared to the Noise Impacts Analyzed in the Draft EIR, March 25, 2010
Appendix A3 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Revised Project Phasing, March 23, 2010
Appendix A4 Fehr & Peers, Roadway and Transit Phasing Plan, March 17, 2010
Appendix A5 ENVIRON, Updated Project Phasing Effect on Air Quality and Climate Change Analyses Candlestick Point–Hunters Point Shipyard Phase II Development Plan, April 26, 2010
Appendix B Bayview Jobs, Parks, and Housing Initiative (Proposition G), November 20, 2007
Appendix C1 PBS&J Environmental Justice Report, November 2009
Appendix C2 Rahaim, John, SF Planning Director to Carlin, Michael, SFPUC: Projections of Growth by 2030, July 9, 2009
Appendix D CHS Consulting, Fehr & Peers, LCW Consulting Candlestick Point–Hunters Point Shipyard Phase II Development Plan Transportation Study, November 4, 2009
Appendix D1 Fehr & Peers, CP HPS Phase II Developmental Plan Transportation Study—Transit Delay Analysis Erratum, April 2010
Appendix E There is no appendix associated with Section III.E
Appendix F There is no appendix associated with Section III.F
Appendix G Cermak Peterka Petersen Pedestrian Wind Assessment, March 10, 2008
Appendix H1 PBS&J Air Quality Model Input/Output, July 2009
Appendix H2 MACTEC Construction Workers and Equipment Resources, October 1, 2009
Appendix H3 ENVIRON, Ambient Air Quality and Human Health Risk Assessment, May 2010 [Main Text and Attachment IV Only]

- Appendix H4 ENVIRON, Community Hazards and San Francisco Health Code Article 38 Analyses Candlestick Point–Hunters Point Shipyard Phase II Redevelopment Project, May 2010
- Appendix I1 Wilson Ihrig San Francisco 49ers Stadium Operational Noise Study, October 15, 2009
- Appendix I2 PBS&J Short-Term Noise Measurements, May 20, 2009
- Appendix I3 PBS&J Traffic Noise Model Output, October 6, 2009
- Appendix J Page & Turnbull Secretary's Standards Evaluation of Proposed Treatments for Dry Docks 2, 3, and 4, October 5, 2009
- Appendix J1 CIRCA, Historic Context Statement, July 2009
- Appendix J2 CIRCA, Historic Resources Survey, October 2009
- Appendix J3 CIRCA, Historic Resources Evaluation for Candlestick, April 2010
- Appendix J4 CIRCA, Rarity of HPS Military/Industrial Buildings, April 2010
- Appendix K There is no appendix associated with Section III.K
- Appendix L ENGEO Preliminary Geotechnical Report Hunters Point Shipyard Phase II and Candlestick Point, May 21, 2009
- Appendix M1 PBS&J and Baseline Stormwater Runoff Calculations, November 2009
- Appendix M2 BASELINE Water Quality Data Analysis, November 2009
- Appendix N1 PBS&J Candlestick Point/Hunters Point Shipyard Project Biological Resources Technical Report, December 2008, Updated November 2009
- Appendix N2 MACTEC, Yosemite Slough Bridge Drawings—Stadium and Non-Stadium Options
- Appendix N3 Draft Parks, Open Space, and Habitat Concept Plan, November 2009
- Appendix N4 H.T. Harvey & Associates Candlestick Point/Hunters Point Shipyard Tree Survey, October 16, 2009
- Appendix O There is no appendix associated with Section III.O
- Appendix P1 ESA Potential Wind Conditions at Executive Park Development, March 10, 2009
- Appendix P2 Senate Bill 792 Tidelands and submerged lands: City and County of San Francisco: Hunters Point Naval Shipyard and Candlestick Point, October 11, 2009
- Appendix Q1 PBS&J SFPUC Water Supply Assessment for the Proposed Candlestick Point–Hunters Point Shipyard Phase II Project, October 27, 2009
- Appendix Q2 Arup, Amendment to Water Demand Memorandum #16—Variant 2A (Housing/R&D Variant), April 28, 2010
- Appendix Q3 Hydroconsult Engineers Hydrologic Modeling to Determine Potential Water Quality Impacts, October 19, 2009
- Appendix R There is no appendix associated with Section III.R
- Appendix S ENVIRON Climate Change Technical Report Candlestick Point Hunters Point Shipyard Phase II, October 22, 2009
- Appendix T1 CP/HP Distict Heating and Cooling Description, Revised August 20, 2009
- Appendix T2 ARUP MBR Decentralized Wastewater Treatment EIR Description, August 19, 2009
- Appendix T3 ARUP CP-HPII EIR Write-Up Automated Waste Collection System, September 3, 2009
- Appendix T4 ENVIRON, Updated Air Quality Analysis Candlestick Point–Hunters Point Shipyard Phase II Development Plan—Updated Variants 2A and 3 (Tower Variant D), Alternative 2, and Subalternative 4A, April 26, 2010
- Appendix T5 ENVIRON, Updated Greenhouse Gas Emissions Calculation for Candlestick Point–Hunters Point Shipyard Phase II Development Plan—Variants 2A and 3 (Tower Variant D), Alternative 2, and Subalternative 4A, March 12, 2010
- Appendix T6 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Project Variant 2A, March 15, 2010
- Appendix T7 LCW Consulting, CP HPS Phase II Development Plan Transportation Study—Subalternative 4A, April 8, 2010
- Appendix U CBRE Candlestick Point–Hunters Point Shipyard Phase II Development Plan Secondary Land Use Effects, October 2009
- Appendix V1 Page & Turnbull Hunters Point Shipyard Feasibility Study, Revised September 9, 2009
- Appendix V2 CBRE Proposed Hunters Point Shipyard Phase II Redevelopment—Parcel C Financial Feasibility Analysis of Historic Reuse Options, October 30, 2009

CHAPTER I Introduction

This chapter provides a broad overview of the Candlestick Point–Hunters Point Shipyard Phase II Development Plan Project (Project), in the City and County of San Francisco (City); summarizes the San Francisco Planning Department (Planning Department) and the San Francisco Redevelopment Agency (Agency) planning context for the Project site and surrounding area, including the previous environmental reviews undertaken in connection with related City and Agency plans and approvals; identifies the purpose of the Environmental Impact Report (EIR); summarizes the environmental review process under the *California Environmental Quality Act* (CEQA); and outlines the content of this Environmental Impact Report.

As required by CEQA, this EIR serves to (1) assess the expected direct, indirect, and cumulative impacts of the Project's physical development; (2) identify means of avoiding, minimizing, and/or mitigating potential significant adverse environmental impacts; and (3) evaluate a reasonable range of alternatives to the Project, including the No Project Alternative.

I.A PROJECT OVERVIEW

Overall, the Project would include new plans for the Candlestick Point and Hunters Point Shipyard areas of San Francisco. A detailed description of the Project is provided in Chapter II (Project Description).

The Project proposed by the Project Applicant, Lennar Urban, is a large-scale, mixed-use development proposal for the Candlestick Point and Hunters Point Shipyard Phase II areas of the City. The Project includes a new stadium for the San Francisco 49ers National Football League (NFL) team. The Project encompasses an approximately 702-acre area east of United States Highway 101 (US-101) in the southeast area of the City and occupies the area from India Basin to the approximate western edge of Candlestick Point at Candlestick Cove. This EIR provides a project-level analysis of the environmental impacts of the Project.

I.B HISTORY OF PLANNING PROCESS

I.B.1 Introduction

Over the past three decades, various planning and development activities and associated environmental reviews have been undertaken for the Bayview Hunters Point (BVHP) neighborhood, including Candlestick Point and Hunters Point Shipyard (HPS). This overview explains the context for the development and planning activities proposed for the Project, which are described in detail in Chapter II of this EIR.

The Project is located in two Redevelopment Project Areas governed by two redevelopment plans: the HPS Redevelopment Plan and the BVHP Redevelopment Plan. The HPS Redevelopment Plan includes policies and development controls for the HPS Phase II portion of the Project site, and the BVHP Redevelopment Plan, which addresses the Candlestick Point portion of the Project site. The *San Francisco General Plan* (General Plan) also includes policies pertaining to the Bayview Hunters Point neighborhood.

Additionally, a voter initiative approved in June 2008 (Proposition G) adopted a comprehensive set of development policies and objectives for the Project.

The Project includes amendments of the BVHP Redevelopment Plan and the HPS Redevelopment Plan and Design for Development,[12] as well as revisions to the General Plan, *Planning Code*, and Zoning Map. Chapter II and Section III.B (Land Use and Plans) of this EIR describe the proposed amendments in greater detail.

I.B.2 Redevelopment Plans

Hunters Point Shipyard Redevelopment Plan

HPS served as a working naval shipyard from 1941 to 1974 to provide construction and maintenance support for United States Navy (Navy) ships. After World War II (WWII), HPS served as a submarine maintenance and repair facility and was the site of the Naval Radiological Defense Laboratory. The Navy officially closed the shipyard in 1974, and in 1976, entered into a long-term lease with Triple A Machine Shop, who controlled most of the property until 1986 when the Navy reclaimed the property. In 1989, the US Environmental Protection Agency (EPA) placed HPS on the National Priority List under the federal *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA) because of the presence of hazardous materials resulting from past shipyard operations and the operations of the commercial machine shop. In 1991, the Navy, EPA, the California Department of Toxic Substances Control (DTSC), and the San Francisco Bay Area Regional Water Quality Control Board (RWQCB) entered into a Federal Facilities Agreement (FFA) that established a procedural framework and schedule for investigating and remediating conditions at HPS. Additionally, in 1991, HPS was selected and approved for closure and disposition by the Base Realignment and Closure (BRAC) Commission. Operational base closure occurred in April 1994.

In 1997, following an extensive community-led planning effort, the Board of Supervisors approved the HPS Redevelopment Plan (Ordinance No. 285-97). The HPS Redevelopment Plan calls for redevelopment of HPS with a mix of uses, including residential, mixed use, industrial, research and development, maritime industrial, cultural and educational, and open space/recreational. In 1999, the Agency entered into an Exclusive Negotiations Agreement (ENA) with Lennar Urban to prepare a specific development plan to implement the HPS Redevelopment Plan and negotiate transaction documents for the conveyance, management, and redevelopment of HPS. As required by CEQA for base closure actions, the San Francisco Planning Commission (Planning Commission), the San Francisco Redevelopment Agency Commission (Agency Commission), and the San Francisco Board of Supervisors (Board of Supervisors) prepared and certified the Hunters Point Shipyard Reuse Plan Final EIR (Case No. 1994.061E) on February 8, 2000.[13] The Final EIR analyzed the closure and disposal of HPS by the Navy and the proposed Reuse Plan (i.e., the HPS Redevelopment Plan) for the site.

---

[12] The 1997 HPS Redevelopment Plan establishes the land use standards for development in the Redevelopment Project Area. The 2004 Design for Development document outlines the design objectives, development standards, and urban design guidelines for projects developed in the Redevelopment Project Area.

[13] On June 16, 2000, the Navy issued the *Final Environmental Impact Statement (EIS) for Disposal and Reuse of Hunters Point Shipyard* pursuant to the *National Environmental Policy Act*. The Navy published the Record of Decision for the EIS in the Federal Register on November 20, 2000. The Navy is preparing a Supplemental EIS analyzing the proposed changes to

In 2003, the Agency Commission and the Navy entered into a Conveyance Agreement setting out the terms and conditions for transferring HPS to the Agency. The Conveyance Agreement envisioned that the Navy would transfer the property in phases as the Navy completed its environmental remediation. The Agency and Lennar Urban agreed that development would be phased to correspond to the receipt of parcels from the Navy, and that the parties would enter into a series of disposition and development agreements (DDAs) and related transaction documents to govern each phase of development.

On December 2, 2003, the Agency Commission approved and authorized the execution of the first set of transaction documents with Lennar Urban, including the HPS Phase I Disposition and Development Agreement (Phase I DDA) for a portion of HPS identified as Parcel A-Prime and Parcel B-Prime. In connection with the approval of the Phase I DDA, the City prepared an Addendum to the Hunters Point Shipyard Reuse Plan Final EIR (Addendum No. 1, Case No. 2003.0241E). Addendum No. 1 analyzed certain revisions to the development program reviewed in the Final EIR, including changes in the location and mix of uses, height increases, and updated and detailed information about the development design. The Phase I development program included 1,600 residential units, commercial space, community-serving facilities, an Interim African Marketplace, research and development/office space, support retail space, and necessary infrastructure improvements.

In accordance with Navy procedures for complying with CERCLA, the Navy issued a Finding of Suitability to Transfer (FOST) for Parcel A-Prime in October 2004, a document indicating that the Navy found the property met the CERCLA requirements for transfer. The EPA, DTSC, and the RWQCB concurred with this conclusion, along with the City's Department of Public Health, and the Agency accepted the title in December 2004. On April 5, 2005, the Agency transferred the portions of Parcel A-Prime to be privately developed to Lennar Urban to construct the infrastructure improvements required under the Phase I DDA.

Subsequently, the transfer of Parcel B-Prime from the Navy to the Agency was delayed. As a result, on October 17, 2006, the Agency Commission approved an amendment to the Phase I DDA to remove Parcel B-Prime from the Phase I development and to shift the entitled residential units from Parcel B-Prime to Parcel A-Prime. Addendum No. 2 to the Hunters Point Shipyard Reuse Plan Final EIR analyzed those development plan revisions. Additionally, Addendum No. 2 analyzed a variety of changes to the Design for Development standards, which were approved in 2004, such as dwelling unit density standards, height and bulk limits, off-street loading, lot sizes, street design, and other similar topics. The approved development plan for Phase I includes infrastructure, approximately 1,600 residential units, and 132,000 square feet of commercial space on approximately 75 acres.

In May 2007, the Agency and Lennar Urban amended and restated the ENA (referred to as the Phase II ENA) setting forth the terms and conditions under which the Agency and Lennar Urban would negotiate one or more DDAs and related transaction documents for the remainder of HPS and Candlestick Point. The portions of HPS that are not included in Phase I remain under the jurisdiction of the Navy and are referred to in this EIR as Phase II. HPS Phase II and Candlestick Point collectively form the Project site.

---

the reuse plan reflected in the Project covered in this EIR. The Draft Supplemental EIS is expected to be published in 2010.

Bayview Hunters Point Redevelopment Plan (formerly the Hunters Point Redevelopment Plan)

The Hunters Point Redevelopment Plan (HPRP) was adopted in 1969 and amended in 1994 and 2006. The original plan encompassed 137 acres that were formerly occupied by wartime housing. The original HPRP's goals included creating a mixed-income neighborhood through construction of new single- and multi-family affordable housing (for renters and owners), new community facilities, parks, schools, new streets, and utilities.

In 1997, Agency staff began working with the Bayview Hunters Point Project Area Committee (PAC) on the development of the Bayview Hunters Point Community Revitalization Concept Plan (Concept Plan). In November 2000, the PAC approved the Concept Plan, which serves as a vision statement for the community to guide the redevelopment planning process. The Concept Plan contains goals and objectives for revitalization of the area. This planning effort led to the 2006 amendment of the HPRP.

The 2006 amendment of the HPRP provided the implementation tools to meet many of the goals included in the Concept Plan. This amendment renamed the plan the Bayview Hunters Point Redevelopment Plan (Ordinance No. 113-06). The amendment also added 1,438 acres of the BVHP Survey Area, or Project Area B, to the existing 137-acre Project Area (Project Area A). The resulting BVHP Redevelopment Project Area consists of 1,575 acres. The primary redevelopment programs of the BVHP Redevelopment Plan include an Economic Development Program, Affordable Housing Program, and a Community Enhancements Program. Due to the large size and the diversity of Bayview Hunters Point, the BVHP Redevelopment Project Area is divided into seven Economic Development Activity Nodes. The Candlestick Point portion of the Project site is within the Candlestick Point Activity Node. The Alice Griffith public housing site, also included in the Project site, is within the South Basin Activity Node. The BVHP Redevelopment Plan is supported by the Bayview Hunters Point Redevelopment Projects and Rezoning Final EIR (BVHP Final EIR, Case No. 1996.546E), certified by the Agency Commission and the Planning Commission in March 2006.

I.B.3 The San Francisco General Plan

Bayview Hunters Point Area Plan

The Bayview Hunters Point Area Plan (formerly, the South Bayshore Area Plan) is an element and area plan of the General Plan. It covers the southeastern section of the City, bounded by Cesar Chavez Street to the north, US-101 to the west, the San Francisco Bay to the east, and the San Francisco county line to the south, exclusive of HPS. Candlestick Point is within the geographic boundaries of the BVHP Area Plan. In March 2006, the Planning Commission adopted amendments to the BVHP Area Plan that reflect themes and goals included in the Concept Plan prepared by the Agency and the BVHP PAC for the Bayview Hunters Point area.

The BVHP Area Plan supports revitalization efforts in Bayview Hunters Point. It contains policies and objectives addressing Land Use, Transportation, Housing, Commerce, Industry, Recreation and Open Space, Urban Design, Community Facilities and Services, and Public Safety.

Propositions

Propositions D and F—San Francisco 49ers Stadium Development Retail/Entertainment Center

In June 1997, San Francisco voters adopted two measures—Proposition D and Proposition F—providing for the development of a new state-of-the-art stadium for the San Francisco 49ers football team and an entertainment/retail shopping center at Candlestick Point. Proposition F amended the General Plan, *Planning Code*, and Zoning Map, and established the Candlestick Point Special Use District to accommodate the development of a stadium suitable for professional football and a shopping and entertainment center with open space and related parking facilities as principal uses, as well as other conditional uses, such as residential, subject to the approval of the Planning Commission. Proposition D authorized the City to use lease financing to borrow up to $100 million toward building a new stadium at Candlestick Point.

In late 2006, the San Francisco 49ers decided that the proposed stadium did not meet their needs. A site for a new stadium at Hunters Point Shipyard was identified and pursuant to a February 2007 Board of Supervisors approved resolution urging the Agency to work with the City to amend its exclusive negotiating agreement with Lennar to combine the Candlestick Point and the Hunter Point Shipyard redevelopment projects, the Agency's ENA with Lennar Urban to develop Hunters Point Shipyard was amended to include Candlestick Point as one integrated Project. In May 2007, the Board of Supervisors and the Mayor endorsed a Conceptual Framework for the planning and development of the Project site, which included HPS Phase II and Candlestick Point.

Proposition P (approved by the voters of San Francisco on November 7, 2000) called upon the Navy to remediate HPS to the highest levels practical to ensure flexible reuse of the property. The Board of Supervisors subsequently passed Resolution 634-01, adopting Proposition P as official City policy and urging the Navy and USEPA to take actions to implement Proposition P. The Resolution (1) recognizes that the unrestricted cleanup standard called for in Proposition P identifies a cleanup level acceptable to the community; (2) urges the Navy and FFA regulatory agencies not to rely on barriers to protect future occupants and the public from exposure to pollution, unless other remedies are technically infeasible, and (3) urges the Navy to clean up the Shipyard in a manner fully consistent with the Reuse Plan and with remedies that do not make implementation of the Reuse Plan economically infeasible.

Proposition P states a desired result that the Navy and regulators achieve in carrying out the cleanup of the Shipyard. Proposition P and the subsequent Board resolution are not directly applicable to the Project because the Navy cleanup, and decisions made by the regulators about the cleanup, is not part of the Project, Adoption and implementation of the Project would not be inconsistent with, and would not change, the City's stated desire that the Navy clean up HPS in a manner that allows flexible reuse, does not rely on barriers to protect the public from exposure unless other remedies are technically infeasible, is consistent with the Reuse Plan and does not render the Reuse Plan economically infeasible to implement. Proposition P is a general statement of policy and addresses the type of clean-up remedy that the Navy should select and the regulators should approve for HPS. The ROD for a parcel sets forth the selected remedy. Under the early transfers envisioned at the Shipyard, all radiological cleanup will be completed and RODs issued. The Navy already has issued RODs for Parcels B, D-1, UC-1, UC-2, and G. Further, the Navy already has conducted substantial remediation. Thus, by the time the Navy offers parcels being

considered for early transfer to the Agency (with concurrence of USEPA and the Governor of California) the remedy already will have been selected and significant remediation completed. In the case of the first early transfer being considered—for Parcels B and G, the Navy also will have prepared (and the regulators will have approved) the remedial design documents.

Proposition G

In June 2008, and in response to the Conceptual Framework, the San Francisco voters approved Proposition G, which is called the Bayview Jobs, Parks, and Housing Initiative (refer to Appendix B [Proposition G]). Proposition G repealed Propositions D and F. Proposition F had established a special use district for the Project site, whereas Proposition G proposed that new zoning be established along with a land use program. Proposition G also established City policy to encourage, subject to public input and the environmental review process, the timely development of Candlestick Point and HPS with a mixed-use project including *(i)* over 300 acres of public park and open space improvements; *(ii)* approximately 10,000 homes for sale or rent; *(iii)* about 700,000 square feet of retail uses; *(iv)* about 2,150,000 square feet of "green" office, science and technology, research and development, and industrial uses; *(v)* a possible arena or other public performance site; *(vi)* a site in HPS for a new stadium if the San Francisco 49ers and the City determine in a timely manner that the stadium is feasible; and *(vii)* additional "green" office, science and technology, research and development, and industrial space, and/or additional housing if a new stadium is not built.

Proposition G established City policy that the integrated mixed-use project must be consistent with the following objectives:

- The integrated development should reunify Candlestick Point and HPS with the larger BVHP neighborhood and should protect the character of the Bayview for its existing residents.
- The integrated development should produce tangible community benefits for the BVHP neighborhood and the City.
- The integrated development should include substantial new housing in a mix of rental and for-sale units, both affordable and market-rate, and encourage the rebuilding of Alice Griffith Public Housing.
- The integrated development should incorporate environmental sustainability concepts and practices.
- The integrated development should encourage the San Francisco 49ers—an important source of civic pride—to remain in San Francisco by providing a world-class site for a new waterfront stadium and supporting infrastructure.
- The integrated development should be financially sound, with or without a new stadium.

All of the objectives of Proposition G and the Project are discussed further in Chapter II.

I.C PURPOSE OF THE EIR

This EIR has been prepared by the Agency and the City (Planning Department) as co-lead agencies for the Project, in conformance with the substantive and procedural requirements of CEQA and the CEQA

Guidelines (as amended through 2007),[14] Agency CEQA guidelines, Chapter 31 of the *San Francisco Administrative Code*, and Planning Department CEQA guidelines. In accordance with *Public Resources Code* (PRC) Section 21002.1, the purpose of this EIR is to identify the significant environmental impacts of the Project, to identify alternatives to the Project, and to indicate the manner in which those significant effects could be mitigated or avoided. As defined in CEQA Guidelines Section 15382, a "significant effect on the environment" is:

> … a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

This EIR evaluates the development Project's environmental effects at a project level of detail and examines all phases of the Project, including planning, construction, and operation, as well as the direct, indirect, and cumulative impacts that might result. The Candlestick Point-Hunters Point Shipyard Phase II EIR is a Redevelopment Plan EIR pursuant to CEQA Guidelines Section 15180 and a project EIR pursuant to CEQA Guidelines Section 15161. The CEQA "Project" includes the proposed Candlestick Point-Hunters Point Shipyard Phase II Development project, the proposed amendments of the Bayview Hunters Point and Hunters Point Shipyard Redevelopment Plans, and the proposed amendments of the San Francisco *General Plan* and the San Francisco *Planning Code*.

It is anticipated that each discretionary approval related to the implementation of the Project would rely on this EIR and would not require preparation of subsequent environmental documentation, unless otherwise required by CEQA pursuant to PRC Section 21166 and CEQA Guidelines Sections 15162 through 15164. Anticipated approvals for the Project are included in Chapter II.

As stated in Section 15121(a) of the CEQA Guidelines, an EIR is an "informational document" intended to inform the Board of Supervisors, Agency Commission, Planning Commission, other public agencies with discretionary authority over aspects of the Project, the general public, the local community, and other organizations, entities, and interested persons of the scope of the Project, significant environmental effects of the Project, possible measures to avoid or minimize the significant effects, and a reasonable range of feasible alternatives to the Project. The Agency and the City must consider the information in this EIR and make certain findings with respect to each significant effect identified in this EIR. The Agency and the City will use the information in the EIR, along with other information available through the public review processes, to determine whether to approve, modify, or disapprove the Project, or a Project alternative, and to specify applicable environmental mitigation measures as part of the Project approvals.

This EIR has been prepared in accordance with CEQA (PRC Section 21000 et seq.), the CEQA Guidelines (*California Code of Regulations*, Title 14, Section 15000 et seq.), and the City's and Agency's local CEQA procedures. The determination that the Agency and the City are the "lead agencies" is made in accordance with Section 15367 of the CEQA Guidelines, which defines the lead agency as the public agency with the principal responsibility for carrying out or approving a project and conducting the environmental review.

[14] *California Environmental Quality Act*, (*Pub. Res. Code* Sec. 21000 et seq.) and the CEQA Guidelines (*Cal. Code Regs.* Sec. 15000 et seq.).

As provided in both CEQA and the CEQA Guidelines, public agencies are charged with the duty to substantially lessen or avoid significant environmental effects where feasible for projects subject to CEQA (refer to PRC Section 21004, CEQA Guidelines Sections 15002(a)(3) and 15021(a)(2)). In discharging this duty, the public agency has an obligation to balance a variety of public objectives, taking into account economic, environmental, and social issues. The EIR is an informational document that informs public agency decision-makers and the general public of the significant environmental effects and the ways in which those impacts can be reduced to less-than-significant levels, either through the imposition of mitigation measures or through the implementation of specific alternatives to the project as proposed. In a practical sense, EIRs function as a technique for fact-finding, allowing an applicant (e.g., Lennar Urban), the public, and agency staff an opportunity to collectively review and evaluate baseline conditions and project impacts through a process of full disclosure. Additionally, the EIR provides the primary source of environmental information for the lead agency to consider when exercising any permitting authority or approval power directly related to implementation of a Project.

I.D ENVIRONMENTAL REVIEW PROCESS

Lennar Urban filed an Environmental Evaluation application (EE application) with the Planning Department on August 27, 2007. The filing of the EE application initiated the environmental review process as outlined below. The EIR process provides an opportunity for the public to review and comment upon the Project's potential environmental effects and to further inform the environmental analysis. As a first step in complying with the procedural requirements of CEQA, the Notice of Preparation (NOP) process was used to determine whether any aspect of the Project, either individually or cumulatively, may cause a significant effect on the environment and, if so, to narrow the focus (or scope) of the environmental analysis.

The Agency and City filed the NOP with the California Office of Planning and Research, State Clearinghouse, as an indication that an EIR would be prepared. In turn, the State Clearinghouse distributed the NOP to public agencies and interested parties for a 30-day public review period. The purpose of the public review period was to solicit comments on the scope and content of the environmental analysis contained in the Draft EIR. In addition, in order to solicit further comments on the scope and content of the environmental analysis to be included in the EIR, the Agency and City held two public scoping meetings.

I.D.1 Notice of Preparation and Summary of Comments

The Agency and the City distributed the NOP on August 31, 2007, announcing its intent to prepare and distribute an EIR (refer to Appendix A [Notice of Preparation (NOP) and NOP Comments]). The NOP was distributed to responsible or trustee agencies in accordance with Section 15082 of the CEQA Guidelines. In addition, the NOP was also sent to organizations, companies, and/or individuals that the Agency and the City believed might have an interest in the Project. A copy of the NOP is included in Appendix A1 to this EIR. The NOP included the India Basin Shoreline, which would be evaluated on a programmatic basis, as part of the Project; however, since publication of the NOP, the Agency and the City decided to remove the India Basin Shoreline area from the Project and will analyze development in that area as part of a separate EIR.

In response to the NOP, nine comment letters were submitted to the City by public agencies, organizations, and individuals. The NOP comment letters are summarized below:

- **California Department of Transportation (Caltrans)** provided summary comments pertaining to traffic volume and congestion on the State Highway System and recommended that a traffic impact analysis be prepared.
- **California Public Utilities Commission (CPUC)** provided comments identifying CPUC as a responsible agency if new at-grade rail crossings were proposed. The letter suggested that the unused railroad tracks leading to the Shipyard be removed as mitigation for development in the area.
- **California Department of Parks and Recreation** provided summary comments for the analysis of the Project in relation to the Candlestick Point State Recreation Area (CPSRA) and consistency with the adopted CPSRA General Plan. The comments also addressed public access to the shoreline, hazardous materials, proposed transportation improvements, and stormwater.
- **San Francisco Bay Conservation and Development Commission (BCDC)** provided a comment regarding BCDC's jurisdiction over the Project, including the 100-foot BCDC jurisdictional band and the BCDC priority use areas identified in the Bay Plan. The Bay Plan identifies HPS as a "Port priority" use area and Candlestick Point as "Waterfront Park" and "Beach" priority areas.
- **The Bay Trail Project** provided summary comments on the proposed extension of the Bay Trail. The Bay Trail Project is a nonprofit organization administered by the Association of Bay Area Governments and is responsible for implementation of the Bay Trail Plan. The comments addressed consistency of the proposed Bay Trail improvements with the Bay Trail Plan and the relationship of the trail with proposed transportation improvements.
- **City of Brisbane** provided comments regarding the characterization of the US-101/Geneva/Harney interchange and Geneva Avenue extension and analysis of the Project in relation to future transportation improvements necessary to serve the Project.
- **Literacy for Environmental Justice** provided comments regarding the cleanup of the HPS, and stated that such actions must be to residential standards.
- **Arc Ecology** provided comments regarding Project alternatives, social and economic impacts, and the level of environmental review that was proposed for the Project. Additional concerns focused on the content of the NOP.
- An **individual** resident in Bayview Hunters Point provided comments regarding accessibility to the waterfront, aesthetics and neighborhood character of the waterfront area, and traffic.

The Agency and the City held two public scoping meetings for the EIR, on September 17, 2007, and September 25, 2007. The scoping meetings provided the public and affected governmental agencies with an opportunity to present environmental concerns regarding the Project. Agencies or interested persons that did not respond during the NOP public review period or the Scoping Meetings will have an opportunity to comment during the public review period for the EIR, as well as at scheduled hearings on the Project. The NOP and the NOP comment letters are included in Appendix A.

The Draft EIR has considered the CEQA-related concerns listed above, as well as other concerns raised through the scoping process. These issues are addressed in Chapter III (Environmental Setting, Impacts, and Mitigation Measures).

I.D.2 Public Review of the Draft EIR

In accordance with CEQA, the CEQA Guidelines, Chapter 31 of the *San Francisco Administrative Code*, and the Notice of Preparation, the EIR reviews the potential environmental effects of the Project in Section III.B through Section III.T of Chapter III of the EIR, which includes:

- Land Use and Plans (Section III.B)
- Population, Housing, and Employment (Section III.C)
- Transportation and Circulation (Section III.D)
- Aesthetics (Section III.E)
- Shadows (Section III.F)
- Wind (Section III.G)
- Air Quality (Section III.H)
- Noise (Section III.I)
- Cultural and Paleontological Resources (Section III.J)
- Hazards and Hazardous Materials (Section III.K)
- Geology and Soils (Section III.L)
- Hydrology and Water Quality (Section III.M)
- Biological Resources (Section III.N)
- Public Services (Section III.O)
- Recreation (Section III.P)
- Utilities (Section III.Q)
- Energy (Section III.R)
- Greenhouse Gas Emissions (Section III.S)

This EIR evaluates the direct, indirect, and cumulative impacts resulting from planning, construction, and operation of the Project in accordance with the provisions set forth in CEQA and the CEQA Guidelines. Also, in preparing the EIR, pertinent City policies and guidelines, existing EIRs, and background documents prepared by the City or the Applicant were evaluated for applicability to the Project and used, where appropriate. References are provided throughout this EIR as footnotes.

- Following publication of the Draft EIR, there was a public review and comment period to solicit public comment on the information presented in the Draft EIR. The public review period was originally scheduled from November 12, 2009, through December 28, 2009. Additionally, the Agency Commission and the Planning Commission held public hearings on this Draft EIR. The first Agency Commission hearing was held on December 15, 2009, in Room 416. At the conclusion of that hearing, a second Agency Commission hearing was scheduled for January 5, 2010. In addition, the Agency Commission voted to extend the comment period to January 12, 2010. The Planning Commission hearing was held on December 17, 2009, in Room 400 and the Planning Commission concurred with the Agency Commission's decision to extend the comment period to January 12, 2010. Both hearing rooms are located in City Hall, Dr. Carlton B. Goodlett Place, beginning at 1:30 P.M. or later (call (415) 588-6422 the week of the hearing for a recorded message giving a more specific time).

In addition, readers are invited to submit written comments on the Draft EIR. Written comments should be submitted to:

Stanley Muraoka
Environmental Review Officer
San Francisco Redevelopment Agency
One South Van Ness Avenue, Fifth Floor
San Francisco, CA 94103

or

Bill Wycko
Environmental Review Officer
City and County of San Francisco
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103

The documents referenced in this Draft EIR are available for public review by appointment at the San Francisco Redevelopment Agency, One South Van Ness Avenue, Fifth Floor, San Francisco, CA, 94103, or at the City Planning Department, 1650 Mission Street, Fourth Floor, San Francisco, CA, 94103. The EIR will be posted for public review at http://www.sfplanning.org and www.sfgov.org/sfra.

I.D.3 Final EIR and EIR Certification

Following the close of the public review and comment period, the Agency and the City will prepare and publish a document titled "Comments and Responses," which will contain a summary of all written and recorded oral comments on this Draft EIR and written responses to those comments, along with copies of the letters received, a transcript of the public hearings, and any necessary revisions to the EIR. This Draft EIR and the Comments and Responses document will constitute the Final EIR. The Agency Commission and the Planning Commission, in an advertised public meeting(s), will consider the documents and then, if found adequate, certify the Final EIR as completed in compliance with CEQA and the CEQA Guidelines.

I.D.4 CEQA Findings for Project Approval

Where a certified EIR identifies significant environmental effects, CEQA Guidelines Sections 15091 and 15092 require the adoption of findings prior to approval of a project. According to PRC Section 21081, the Lead Agency must make specific Findings of Fact (Findings) before approving a Project for which a Final EIR has been certified that identifies one or more significant effects on the environment that may result from that Project. The purpose of the Findings is to establish the connection between the contents of the Final EIR and the action of the Lead Agency with regard to approval of the Project, if the Lead Agency approves the Project. Prior to approval of a Project, one of three findings must be made, as required by PRC Sections 21081 and 15091 of the CEQA Guidelines:

- Changes or alterations have been required in, or incorporated into, the project that avoid or substantially lessen the significant environmental effect as identified in the Final EIR
- Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency
- Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the Final EIR

If the Agency and City were to approve the Project, despite significant impacts identified in the Final EIR that cannot be mitigated, if any, the Agency and City must state in writing the reasons for its actions, under CEQA Guidelines, Section 15093. Those findings, called a Statement of Overriding Considerations, must be supported by substantial evidence in the record, and are used to explain the specific reasons why the benefits of a Project make its unavoidable environmental effects acceptable.

I.D.5 Mitigation Monitoring and Reporting Program

At the time of project approval, CEQA and the CEQA Guidelines require lead agencies to adopt a reporting and mitigation monitoring program, which it has adopted or made a condition of project approval in order to mitigate or avoid significant effects on the environment. (CEQA Section 21081.6; CEQA Guidelines Section 15097) This Draft EIR identifies and presents mitigation measures that would form the basis of such a monitoring and reporting program. Any measures adopted by the Agency and City as conditions for approval of the Project would be included in the Mitigation Monitoring and Reporting Program (MMRP).

I.E ORGANIZATION OF THE EIR

This EIR has been organized for ease of use and reference. To help the reader locate information of particular interest, a brief summary of the contents of the EIR include:

- **Summary**—The Summary provides a brief Project Description, a synopsis of Project objectives, and a summary table of Project impacts and mitigation measures. The Summary also presents Project alternatives and variants and their comparative environmental effects.
- **Chapter I (Introduction)**—The Introduction provides an historical overview of the planning context for the Project, the purpose of the EIR, a summary of the environmental and public review process, and a brief outline of this document's organization.
- **Chapter II (Project Description)**—The Project Description provides a detailed description of the Project, including its location, the existing site land use characteristics and history, Project objectives, Project components and characteristics, including the land use plan, green building concepts, parks and open space plan, transportation and infrastructure improvements, and community benefits. The Project Description also includes the development schedule (including anticipated construction activities), and approval requirements (or intended uses of the EIR), and technical, economic, and environmental characteristics of the Project.
- **Chapter III (Environmental Setting, Impacts, and Mitigation Measures)**—This chapter provides analysis for the nineteen topics previously identified. Each environmental topic contains a description of the environmental setting (or existing conditions), regulatory framework, and project-level and cumulative impacts. Each impact discussion includes the significance criteria used to determine the nature or magnitude of environmental impacts, significance conclusions, and feasible mitigation measures that would avoid, minimize, or mitigate significant or potentially significant environmental impacts, if required.
- **Chapter IV (Project Variants)**—This chapter describes six variants to the Project. These variants are also evaluated at a project-level in this chapter as follows:
  - > Variant 1: San Francisco 49ers move outside the project area (no football stadium constructed at HPS Phase II)—Research and Development Variant

- > Variant 2: San Francisco 49ers move outside the project area (no football stadium constructed at HPS Phase II)—Housing Variant
- > Variant 2A: San Francisco 49ers move outside the Project area (no football stadium constructed at HPS Phase II)—Housing/R&D Variant
- > Variant 3 (Tower Variants 3A, 3B, and 3C: Four Candlestick Point tower variants would have the same land use program and overall description as with the Project, but would have different locations, massings, and heights for residential towers at Candlestick Point.
- > Variant 4: A utilities variant would include an automated solid waste collection system, decentralized wastewater treatment, and district energy.
- > Variant 5: Shared stadium where both the San Francisco 49ers and Oakland Raiders would play at the stadium at HPS Phase II

- **Chapter V (Other CEQA Issues)**—As required by Section 15126.2 of the CEQA Guidelines, this chapter summarizes significant and unavoidable environmental impacts, irreversible changes to the environment, and growth-inducing impacts of the Project. This chapter also addresses agricultural resources and mineral resources, which are "Effects Not Found to Be Significant." In addition, this chapter also addresses secondary land use effects, including urban decay.
- **Chapter VI (Alternatives)**—This chapter analyzes alternatives to the Project, including the required No-Project Alternative, compares their environmental effects to those of the Project, and identifies the environmentally superior alternative. Alternatives evaluated in this chapter include the following:
  - > Alternative 1: No Project
  - > Alternative 2: CP-HPS Phase II Development Plan, HPS Phase II Stadium, State Parks Agreement, and without the Yosemite Slough Bridge
  - > Alternative 3: Reduced CP-HPS Phase II Development, San Francisco 49ers Stay at Existing Candlestick Park Stadium, with Limited State Parks Agreement, and Yosemite Slough Bridge Serving Only Transit, Bicycles, and Pedestrians
  - > Alternative 4: Reduced CP-HPS Phase II Development, Historic Preservation, No HPS Phase II Stadium, Marina, or Yosemite Slough Bridge
    - ○ Subalternative 4A: CP-HPS Phase II Development Plan with Historic Preservation
  - > Alternative 5: Reduced CP-HPS Phase II Development, No HPS Phase II Stadium, No State Parks Agreement, and Without the Yosemite Slough Bridge
- **Chapter VII (EIR Preparers and Persons and Organizations Contacted)**—This chapter identifies the individuals responsible for the preparation of this EIR, as well as the persons and organizations contacted during preparation of the EIR.
- **Chapter VIII (Acronyms/Abbreviations and Glossary)**—This chapter provides definitions for the acronyms and abbreviations that are used throughout the EIR. It also provides definitions for key words or phrases used throughout the EIR.
- **Appendices**—The technical appendices to the EIR, which include studies completed in support of the EIR, are bound under separate cover.

[This page is intentionally left blank.]

CHAPTER II **Project Description**

II.A PROJECT OVERVIEW

The Candlestick Point–Hunters Point Shipyard Phase II Development Plan Project (Project) is located on approximately 702-acre area east of US-101 in the southeast area of the City and County of San Francisco (City). It occupies the waterfront area from south of India Basin to Candlestick Cove. Figure II-1 (Project Location) illustrates the regional location of the Project and the location of the Project within the City.

The Project proposed by Lennar Urban includes a mixed-use community with a wide range of residential, retail, office, research and development, civic and community uses, and parks and recreational open space. A major component would be a new stadium for the San Francisco 49ers National Football League (NFL) team. Additionally, new transportation and utility infrastructure would serve the Project including a bridge across Yosemite Slough. The description of the Project is organized under two major sub-components: Candlestick Point (CP) and Hunters Point Shipyard Phase II (HPS Phase II).

II.B PROJECT LOCATION

II.B.1 Regional Location

Candlestick Point and HPS Phase II are located on approximately 702 acres in the southeastern portion of San Francisco; taken together, they are bordered by major features such as India Basin on the north; the Executive Park area and San Mateo County line on the south; Bayview Hill, the BVHP neighborhood, Yosemite Slough, and Hunters Point Hill on the west; and San Francisco Bay on the north and the east. Figure II-2 (Project Site and Context) illustrates the Project boundaries. Table II-1 (Project Site Areas) presents the acreage of the Project site.

Table II-1 Project Site Areas

Development Area	*Acres*
Candlestick Point	281
Hunters Point Shipyard Phase II	421
Total	***702***

SOURCE: Lennar Urban, 2009.
Candlestick Point includes the approximately 120.2-acre Candlestick Point State Recreation Area.

II.B.2 Candlestick Point

Candlestick Point is immediately east of Executive Park, with the BVHP neighborhood to the north, HPS Phase II to the northeast, and the Candlestick Point State Recreation Area (CPSRA) along the Bay frontage generally to the east, as shown in Figure II-2. Candlestick Point is generally bounded by Hawes Street to the northwest and Harney Way to the southwest, and the Candlestick Cove and South Basin areas of the Bay area to the south and east, respectively.

FIGURE II-2

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROJECT SITE AND CONTEXT

II.B.3 Hunters Point Shipyard Phase II

HPS Phase II is located to the southeast of the Bayview Hunters Point (BVHP) neighborhood. As shown in Figure II-2, the HPS Phase II portion of the Project site is generally bounded by San Francisco Bay to the north, east, and south. The south end of the western boundary extends from Yosemite Slough along Arelious Walker Drive to approximately Crisp Road[29] where the boundary is adjacent to the HPS Phase I site. The northernmost end of HPS Phase II is contiguous with Earl Street.

II.C PROJECT SETTING

II.C.1 Candlestick Point

The Candlestick Point portion of the Project site comprises approximately 281 acres. Current land uses in Candlestick Point include Candlestick Park stadium, owned by the City and County of San Francisco and leased by the San Francisco 49ers, and associated parking lots and access roadways. The stadium and parking lot areas immediately surrounding the stadium are under the jurisdiction of the San Francisco Recreation and Park Department. Additional parking is provided on adjacent CPSRA. Candlestick Point also includes the Alice Griffith public housing site (refer to Figure II-2).

The Project site includes several privately owned parcels near Gilman Avenue and Arelious Walker Drive, north of the stadium, and on Jamestown Avenue. The area is primarily vacant and used for stadium parking. A recreational vehicle park occupies a portion of the site on Gilman Avenue. Approximately 1 acre along Harney Way is also included in the Project.

Approximately 120 acres of the 154-acre CPSRA are also included within this portion of the Project site; the CPSRA forms the south and east shoreline boundary. On the southern portion of the CPSRA, existing improvements to the CPSRA include plantings, pathways, a beach, fishing piers, picnic areas, parking, and restrooms. The remaining CPSRA area includes gravel lots used as parking for the 49ers on game day, piles of rubble and debris, and unimproved areas. Some of the rubble and debris has been ground up and used for trails. Refer to Section III.P (Recreation) for a detailed description of the existing conditions at the CPSRA.

II.C.2 Hunters Point Shipyard Phase II

HPS Phase II comprises 421 acres (dry land) on Navy Parcels A, B, C, D, E, and G, as described in the Introduction.

HPS Phase II currently contains many structures associated with ship repair, piers, dry-docks, ancillary storage, administrative, and other former Navy uses, largely from the World War II era. Most structures are vacant. Several former Navy buildings are currently leased and occupied. Current tenants at HPS Phase II include approximately 300 artists located in studios on Parcels A and B, and a San Francisco Police Department (SFPD) facility on Parcel D-1 in Building 606. The artists on Parcel B are located in

[29] Background documents relevant to this Project variously use the term Crisp Road or Crisp Avenue; irrespective of the use of Road or Avenue, the text and/or graphics are referring to that section of road that travels from Revere Avenue to Spear Avenue.

Buildings 103, 104, 115, 116, 117, and 125, and the artists on Parcel A are located in Buildings 101 and 110. The artists' work includes painting, sculpting, ceramics, and photography. Twice a year the artist community hosts an "Open Studios" for the general public to both view and purchase artwork.[30]

II.D PROJECT OBJECTIVES

Project objectives are identified to both describe the underlying purpose of the Project and to guide the selection of potential Project alternatives. CEQA Guidelines Section 15126.6(a) requires that an EIR "describe a reasonable range of alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives but would avoid or substantially lessen any of the significant effects of the project." Typically, project objectives represent a combination of both the Lead Agency and the developer's intent and purpose in moving forward with the project.

In May 2007, the Board of Supervisors and the Mayor approved a resolution endorsing a Conceptual Framework for the integrated planning of both Hunters Point Shipyard and Candlestick Point. The Conceptual Framework was the result of a long planning process undertaken by the City and County of San Francisco, acting by and through the Mayor's Office of Economic and Workforce Development, the Redevelopment Agency of the City and County of San Francisco, and Lennar Urban.

The City's overarching goal for the Project is to revitalize the BVHP community by providing increased business and employment opportunities; housing options at a range of affordability levels; improved public recreation and open space amenities; an integrated transportation, transit, and infrastructure plan; and other economic and public benefits, all of which would collectively have no net negative impact on the City's General Fund.

Subsequently, and in response to the Conceptual Framework, the San Francisco voters approved Proposition G in June 2008, which is called the Bayview Jobs, Parks, and Housing Initiative ("the Initiative"). Proposition G repealed Proposition F, which had established a special use district for the Project site; instead, Proposition G proposed that new zoning be established along with a land use program (included as Appendix B [Proposition G] to this EIR). The Initiative states that the Project must be consistent with the following objectives, which are also identified in this EIR as the Project's objectives:

1. The integrated development should produce tangible community benefits for the Bayview and the City, and in so doing should:
   - Improve the CPSRA to enhance public access to the waterfront and enjoyment of the Bay.
   - Create new public recreational and public open spaces in the CP-HPS Development Plan.
   - Preserve the shoreline of the CP-HPS Development Plan site primarily for public park and public open space uses, including an extension of the Bay Trail along the waterfront.
   - Create a range of job and economic development opportunities for local, economically disadvantaged individuals and business enterprises, particularly for residents and businesses located in the Bayview.
   - Provide neighborhood-serving retail.
   - Subsidize the creation of permanent space in the Shipyard for the existing artists.

[30] The Point, America's Largest Artist Colony Website. http://www.thepointart.com (accessed July 18, 2009).

- Transform the contaminated portions of the Shipyard Property into economically productive uses or public open space, as appropriate.
- Implement the CP-HPS Development Plan with public benefits, whether or not the 49ers decide to remain in San Francisco, including developing alternate uses for the stadium site on the Shipyard Property that are consistent with the overall CP-HPS Development Plan objectives.

2. The integrated development should re-connect Candlestick Point and the Hunters Point Shipyard site with the larger BVHP neighborhood and should maintain the character of the Bayview for its existing residents, and in so doing should:
   - Foster the creation of strong commercial, institutional, cultural and urban design ties between the development on Candlestick Point and the Hunters Point Shipyard and the Bayview in particular and the City in general.
   - Provide automobile, public transportation, and pedestrian connections between the Shipyard, Candlestick Point, and the larger BVHP neighborhood.
   - Create substantial affordable housing, jobs, and commercial opportunities for existing Bayview residents and businesses.
3. The integrated development should include substantial new housing in a mix of rental and for-sale units, both affordable and market-rate, and encourages the rebuilding of Alice Griffith Housing, and in so doing should:
   - Provide new affordable housing that is targeted to the lower income levels of the Bayview population, including new units that are suitable for families, seniors, and young adults.
   - Include housing at levels dense enough to create a distinctive urban form and at levels sufficient to make the CP-HPS Development Plan financially viable; attract and sustain neighborhood retail services and cultural amenities; create an appealing walkable urban environment served by transit; help pay for transportation and other infrastructure improvements; and achieve economic and public benefits for the Bayview in particular and the City generally.
   - Upon consultation with Alice Griffith Housing residents and the receipt of all required governmental approvals, rebuild Alice Griffith Housing to provide one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area.
   - Include a mix of stacked flats, attached townhomes and—in appropriately selected locations—low-rise, mid-rise, and high-rise towers, to help assure the economic feasibility of the development and provide a varied urban form.
4. The integrated development should incorporate environmental sustainability concepts and practices, and in so doing should:
   - Apply sustainability principles in the design and development of public open spaces, recreation facilities, and infrastructure including wastewater, storm water, utility, and transportation systems.
   - Incorporate green building construction practices.
   - Include energy efficiency and the use of renewable energy.
   - Encourage green development projects, such as green office, research and development, or industrial projects, including a green technology, biotechnology, or digital media campus.

5. The integrated development should encourage the 49ers—an important source of civic pride—to remain in San Francisco by providing a world-class site for a new waterfront stadium and necessary infrastructure, and in so doing should:
   - Provide the parking necessary to operate the stadium.
   - Provide the necessary transportation infrastructure, including automobile, public transit and pedestrian connections between Candlestick Point, Hunters Point Shipyard, and the larger BVHP neighborhood, to facilitate the efficient handling of game day traffic.
6. The integrated development should be fiscally prudent, with or without a new stadium, and in so doing should:
   - Minimize any adverse impact on the General Fund relating to the development of the Project Site by relying to the extent feasible on the development to be self-sufficient.
   - Encourage substantial private capital investment.

II.E PROJECT CHARACTERISTICS

This section describes the Project's development characteristics. In summary, the Project proposes development of 10,500 residential units with an associated population of 24,465 residents; 885,000 gsf of retail; 150,000 gsf of office; 2.5 million gsf of Research & Development (R&D) uses; a 220-room, 150,000-gsf hotel; 255,000 gsf of artist studio space and an arts center; 100,000 gsf of community services; 240 acres of new parks, sports fields, and waterfront recreation areas, as well as 97 acres of new and improved State parkland; a 69,000-seat 49ers stadium; and a 10,000-seat performance arena. The permanent employee population associated with the Project would be 10,730.

In addition, a 300-slip marina would be provided. Shoreline improvements would also be provided to stabilize the shoreline. The Project would include structured and on-street parking and various infrastructure improvements to support the development.

Table II-2 (Existing and Proposed Uses) identifies the existing and proposed land uses on the Project site, while Table II-3 (Proposed Land Use) provides detailed information about the specific land uses at each of the Candlestick Park and Hunters Point Shipyard Phase II sites.

II.E.1 Land Use Plan

The Project would consist of nine districts: five in Candlestick Point and four in HPS Phase II (refer to Figure II-3 [Proposed Districts]).[31] A variety of land uses are proposed. Table II-3 presents the overall land use distribution and Figure II-4 (Proposed Land Use Plan) illustrates the land use plan. Figure II-5 (Proposed Maximum Building Heights) identifies the maximum height that could be constructed. The maximum heights are intentionally high to provide a conservative (worst-case) scenario for the EIR analysis. Actual building heights would be controlled through Redevelopment Plan documents to minimize shading impacts, among other considerations.

[31] The boundaries of "districts" in the HPS Phase II area do not correspond with the boundaries of the five areas designated Parcels A through E by the Navy.

Table II-2 Existing and Proposed Uses

	Existing Uses	*Existing Uses to Be Retained*	*Proposed Uses*	*Total*
Residential (units)				
Public Housing	256	256[a]	0	256
Market-rate	0	0	7,155	7,155
Affordable and below-market	0	0	3,089	3,089
Subtotal Residential	*256*	*256*	*10,244*	*10,500*

Subtotal Parks and Open Space	*120.2*	*91.0*	*245.4*	*336.4*

SOURCE: Lennar, 2009

a. The Project would replace these units.

b. The SFPD leases space on Parcel D-1 in Building 606 as a crime laboratory. Available at: http://www.sfgov.org/site/police_index.asp?id=21356. Building 606 would be demolished.

c. Approximately 300 artists have studios on HPS Phase II. The Project would retain these uses, with approximately 225,000 gsf of new and renovated artists' studios and 30,000 gsf art center uses.

d. Approximately 59.7 acres of the 91.6 acres would be dual-use sports field complex and multi-use lawn as well as stadium parking for 12 game days and 20 other stadium events.

Table II-3 Proposed Land Use

Land Use		*Candlestick Point*	*Hunters Point Shipyard Phase II*	*Total*
Residential				
Residential Density Range I (15 to 75 units per acre)		750	680	1,430
Residential Density Range II (50 to 125 units per acre)		3,215	1,415	4,630

SOURCE: Lennar Urban, 2009.

a. Research & Development includes office, laboratory, and light industrial uses.

b. A site for a fire station could be provided on R&D land not explicitly dedicated to community facilities. Community facilities parcels are intended to provide the existing Bayview Hunters Point community and the future Project community with dedicated land for uses designed to provide, preserve, and leverage such critical local resources as social services, education, the arts and other community services, including public safety facilities such as fire and police stations and facilities for the benefit of senior citizens. Community facilities may be provided that cumulatively exceed 100,000 square feet. If so, the Project contemplates an equal reduction in retail and/or R&D and/or office use. Total uses would not exceed those amounts identified in this table.

c. On Game Day, an additional 3,750 parking spaces on HPS and 1,000 parking spaces on CP will be dedicated to the 49ers.

FIGURE II-5

PROPOSED MAXIMUM BUILDING HEIGHTS

Section II.E.1 (Land Use Plan) describes the land uses and urban design components of the Project. Section II.E.2 (Parks and Open Space) describes the proposed parks and recreation areas; including the CPSRA; and proposed habitat restoration. Section II.E.3 (Transportation Improvements) describes the transportation network, proposed residential and commercial parking, and bicycle and pedestrian circulation. Section II.E.4 (Infrastructure Plan) describes utility infrastructure improvements. Section II.E.5 (Community Benefits) describes the affordable and below-market housing program, education, and employment and training benefits to the Bayview community. Section II.E.6 (Green Building Concepts) describes the various sustainability and/or green building concepts that would be incorporated into the Project design.

The following provides a detailed discussion of each of the land use types described by Table II-3.

- **Residential:** The Project would consist of 10,500 for-sale and rental residential units, including approximately 7,155 market-rate units and approximately 3,345 affordable and below-market units. The homes would range in size from studios to four bedrooms. Housing types include two- and three-story townhomes over parking, four- to seven-story low-rise flats over podium parking, eight- to 21-story mid-rise flats, and 22- to 42-story high-rise towers. Depending on their location, the lower floors of all residential building types (other than townhomes) could include commercial uses, as well as community services.
  - Residential Density Range I (15 to 75 units per net acre[32]): Housing types would typically include townhomes, low-rise flats and lofts
  - Residential Density Range II (50 to 125 units per net acre): Housing types would typically include low-rise flats, and lofts
  - Residential Density Range III (100 to 175 units per net acre): Housing types would typically include low and mid-rise flats, or low-rise flats and high-rise buildings
  - Residential Density Range IV (175 to 285 units per net acre): Housing types would typically include low-rise and mid-rise flats and high-rise buildings
- **Regional Retail:** A regional retail center of up to 635,000 gross square feet (gsf) is proposed on Candlestick Point. Retailers could include a variety of general merchandise, apparel, furniture and home furnishings, food service and restaurants, and entertainment related businesses to serve the regional market. Community services may also be allowed on sites designated for regional retail uses.
- **Neighborhood Retail:** Neighborhood retail sites are designated at both Candlestick Point and Hunters Point Shipyard, and in addition, small-scale neighborhood retail uses could be established throughout the Project site depending on demand. Up to 250,000 gsf of neighborhood retail could include convenience goods (e.g., food, drugs and groceries) and personal services (e.g., laundry, dry cleaning, barbering, and shoe repair) for daily needs of the immediate neighborhood. This could also include a fire station site and/or other community services.
- **Office:** Up to 150,000 gsf of office uses on Candlestick Point could include but not be limited to professional offices, real estate offices, financial services, and community services.
- **Research and Development:** Hunters Point Shipyard Phase II would be the site of up to 2,500,000 gsf of a possible wide range of office, laboratory, and light industrial uses including, but not limited to, emerging industries and technologies such as green technology and biotechnology. This could also include a fire station site.

[32] The density ranges are measured against net acres on a block-by-block basis.

- **Hotel:** A 220-room hotel is proposed at Candlestick Point.
- **Artists' Studios/Arts Center:** Up to 225,000 gsf of artists' studios and accessory neighborhood retail is proposed on Hunters Point Shipyard and 30,000 gsf would be dedicated for the construction of an arts center.
- **Community Services:** Community serving uses are proposed at sites on both Candlestick Point (50,000 gsf) and HPS Phase II (50,000 gsf). Proposed uses include a fire station on 0.5 acre at HPS Phase II and 6,000 square feet for police facilities. In addition, uses may include, but are not necessarily limited to, healthcare, day-care, senior centers, library, recreation centers, and community centers. Facilities may be provided that cumulatively exceed 100,000 square feet. If so, the Project contemplates an equal reduction in retail and/or research and development and/or office use.
- **Parks and Open Space:** The Project would include an estimated 239.7 acres of new public parks, sports fields, and new open space at the Project site. The 59.7 acres of the Dual-Use Sports Field Complex and Multi-Use Lawn would also be used as stadium parking for 12 game days and 20 other stadium events per year. The CPSRA would be improved on 96.7 acres.
- **Stadium:** A 69,000-seat stadium is proposed for the San Francisco 49ers and up to 20 additional events per year including but not limited to college bowl games, motor-cross, concerts, and antique shows.
- **Marina:** A 300-slip marina is proposed at Hunters Point Shipyard. A marina could include utilities at each slip and a sewage pump-out. Landside amenities could include a classroom facility to teach sailing, restrooms, and showers.
- **Performance Venue/Arena:** A 10,000-seat venue for theatre productions, concerts, speaking engagements, educational events, or sporting events is proposed at Candlestick Point. Approximately 150 events at about 50 percent capacity could occur each year.
- **Parking:** Parking would be provided as structured parking for residential uses, as structured and on-street parking for commercial uses, for dedicated stadium use, and as general parking.

Candlestick Point

Development on Candlestick Point would include demolition and replacement of 256 public housing units, demolition of the 70,207-seat 49ers stadium, and a net reduction of 23.5 acres of CPSRA land.

Candlestick Point would consist of five districts encompassing approximately 110 net acres. Table II-4 (Candlestick Point Proposed Land Use Summary) presents the land use distribution for Candlestick Point and Figure II-4 illustrates the proposed Candlestick Point land use plan. Site preparation at Candlestick Point would involve demolition activities including removal of Candlestick Park stadium. Section II.F.2 (Site Preparation) provides additional information regarding site preparation activities at Candlestick Point.

Table II-4 Candlestick Point Proposed Land Use Summary

District	*Net Acres*[a]	*Number of Residential Units*[b]	*Density*	*Regional Retail (gsf)*	*Neighborhood Retail (gsf)*	*Hotel (gsf)*	*Office (gsf)*	*Arena (gsf)*	*Community Services (gsf)*	*Total Commercial (gsf)*	*Parks (acres)*

SOURCE: Lennar Urban, 2009.

a. Net Acreage excludes the street network within the district. Also note that CPSRA area includes 120.2 acres.

b. 750 Residential Density Range I (15 to 75 units per net acre)
3,215 Residential Density Range II (50 to 125 units per net acre)
2,445 Residential Density Range III (100 to 175 units per net acre)
1,440 Residential Density Range IV (175 to 285 units per net acre)
7,850 Total Units

c. This includes approximately 1.0 acre of community services area.

Alice Griffith

Development in the Alice Griffith district would include up to 1,210 new homes on approximately 20 net acres and include redevelopment of the San Francisco Housing Authority (SFHA) Alice Griffith public housing site along with development of adjacent non-SFHA property. Housing would include one-for-one replacement of 256 public housing units currently on the site, and 954 market-rate and below-market for-sale and rental units. Residential uses are proposed at Densities I and II with maximum building heights up to 65 feet. The homes would include townhomes, stacked townhomes, and four- to five-story stacked flats. A new 1.4-acre Alice Griffith Neighborhood Park would extend for several blocks near the center of the neighborhood parallel with Egbert Avenue (refer to Figure II-4). Redevelopment of the Alice Griffith public housing site would proceed in phases and would not displace existing residents. The initial phases would develop current vacant portions of the Alice Griffith district, and existing residents would then occupy public housing replacement units before demolition of existing structures in subsequent phases.

Existing 256 public housing units would be demolished on the existing SFHA site and 844 new homes would be constructed in their place along with neighborhood serving retail and services, open space and new streets. The 844 new homes would include a mix of market-rate, affordable and below-market rental and homeownership and public housing replacement units.

Candlestick Point North

Candlestick Point North district would include 3,070 residential units, community services, neighborhood retail uses, and neighborhood parks on approximately 32 net acres (refer to Figure II-4).[33] Residential uses are proposed at Densities II, and III, and include townhomes, low- and mid-rise flats, and five towers from 170 feet to 270 feet. The ground floors of the residential units along the southern edge of the district have been designated for up to 70,000 gsf of neighborhood retail uses. A site for 50,000 gsf of Community Facilities is also included in this district. As described below, Candlestick Point North would include a 3.1-acre Candlestick Point Neighborhood Park in the center of the district and 2.5-acre Bayview Gardens/Wedge Park along its southeastern edge.

Jamestown

The Jamestown district would include 325 residential units on the west side of Jamestown Avenue on approximately 7 net acres (refer to Figure II-4). The Jamestown district would include units at residential Density I on the north end of the district, with a maximum height up to 65 feet. The southern portion of the district would have residential uses at Density Range II with a maximum height up to 85 feet.

Candlestick Point Center

Candlestick Point Center district would include regional retail, office, hotel, entertainment, and residential uses at the west end of Candlestick Point on approximately 21 net acres, on three large blocks (refer to Figure II-4).

[33] The number of residential units in each district may be adjusted depending on market demand; however, the sum totals of housing units for Candlestick Point will not exceed 7,850 units.

The proposed 635,000 gsf of regional retail is anticipated to include entertainment uses such as a movie theatre and clubs with live music, restaurants, a hotel, and large format retail lined with smaller stores fronting onto the neighborhood streets. The Center would also include a 75,000 gsf, 10,000-seat performance venue/arena that would be used for performing arts, dance, sporting events, and music. Most events would take place on weekday evenings and weekends. The Center would have about 150,000 gsf of office uses on the floors above the retail and entertainment uses (refer to Figure II-4). Candlestick Point Center would include 275 residential units at Density Range I along the perimeter of the blocks, above base floors containing commercial uses and parking areas. The 150,000 gsf, 220-room hotel would be at the western edge of the district.

Candlestick Point Center would include buildings up to 65 and 85 feet in height (refer to Figure II-5). Parking structures would be interior to blocks and consist of up to four floors including up to one sub-grade level.

Candlestick Point South

Candlestick Point South district would include residential and retail development on approximately 26 net acres (refer to Figure II-4). The district would provide approximately 2,970 residential units and 55,000 gsf of neighborhood retail space. Neighborhood retail uses would be within the lower floors of buildings facing Candlestick Point Center district.

Residential uses would include Density Ranges I though IV. Two residential towers on the south half of the district would have maximum heights up to 370 feet. An additional residential tower on the south half of the district would be up to 420 feet tall. The north half of the district would have three residential towers, one with maximum height up to 270 feet and two with maximum heights up to 320 feet (refer to Figure II-5). Residential uses at Density Range I would be along the south and southeast portions of the district adjacent to parks and open space areas. As described below, Candlestick Point South would include a 1.1-acre Mini-Wedge Park bisecting the district from east to west (refer to Figure II-4).

■ Hunters Point Shipyard Phase II

Development on HPS Phase II would include demolition and replacement of studios for approximately 300 artists. In addition, all of the vacant, and some leased, Navy buildings would be demolished, with the exception of historic Drydocks Nos. 2 and 3 and Buildings 140, 204, 205, 207, and 208 as discussed in Section III.J (Cultural and Paleontological Resources).

HPS Phase II would consist of four districts on approximately 76 net acres: Hunters Point Shipyard North, Hunters Point Shipyard Village Center, Research and Development, and Hunters Point Shipyard South. Table II-5 (Hunters Point Shipyard Phase II Proposed Land Use Summary) presents the land use summary for HPS Phase II and Figure II-4 illustrates the proposed HPS Phase II land use plan. (Table II-5 does not include the stadium use.) Development of Hunters Point Shipyard South includes the new stadium and related open space and parking facilities. Site preparation of HPS Phase II would involve demolition and abatement activities including removal of existing structures and infrastructure. Section II.F.2 (Site Preparation) provides additional information regarding site preparation activities at HPS Phase II.

Table II-5 Hunters Point Shipyard Phase II Proposed Land Use Summary

District	*Net Acres*[a]	*Dwelling Units*[b]	*Density*	*Neighborhood Retail (gsf)*	*Artist Space (gsf)*	*R & D (gsf)*	*Community Services (gsf)*[c]	*Total Commercial (gsf)*	*Football Stadium (Seats)*	*City Parks (acres)*

SOURCE: Lennar Urban, 2009

a. Net Acreage excludes the street network.

b. 680 Residential Density Range I (15 to 75 units per net acre)
1,415 Residential Density Range II (50 to 125 units per net acre)
265 Residential Density Range III (100 to 175 units per net acre)
290 Residential Density Range IV (175 to 285 units per net acre)
2,650 Total Units

c. These uses would be constructed on 5.3 acres in HPS Phase II.

Hunters Point Shipyard North

The HPS North district would include residential and neighborhood retail uses on approximately 27 net acres.[34] A new street grid would create approximately 10 blocks (refer to Figure II-4). The district would include 2,085 residential units. The majority of residential uses would be at Density Ranges I, II, III, and IV with maximum heights ranging from 40 to 85 feet. One residential tower at Density Range IV with a maximum height up to 370 feet would be at the southeast corner of the district, adjacent to HPS Village Center. As described below, the district would include the 12.8-acre Northside Park, and 25,000 gsf of neighborhood retail uses.

Hunters Point Shipyard Village Center

The HPS Village Center district would include redevelopment of the existing artist studios, and new residential and neighborhood retail uses with development on approximately 7.6 net acres (refer to Figure II-4). The existing artist studio space throughout HPS Phase II is approximately 225,000 gsf and is located in Shipyard Buildings 101, 103, 104, 110, 115, 116, 117, and 125. With the exception of Building 101, those existing buildings would be demolished. New studios in a renovated Building 101 and other new buildings, including an Art Center, would provide space dedicated for artists and arts-related uses of 255,000 gsf. New buildings would have a height limit of up to 65 feet. The Village Center would provide about 25,000 gsf of neighborhood retail uses and 125 residential units at Density Range I along the southeast edge of the district. The residential space would be located above the retail uses in a building with a height limit up to 65 feet (refer to Figure II-5). As described below, the Hunters Point Village Center district would also include the 15.6-acre Heritage Park.

Research and Development

The research and development (R&D) district would include 2,000,000 gsf of research and development, office, and light industrial space, which would be marketed to attract emerging technologies—with a particular focus on green technology businesses. A grid street pattern would create approximately 10 blocks with development covering approximately 26 net acres (refer to Figure II-4).

The R&D district would also include approximately 440 residential units at Density Ranges I and II near the west end of the district. The R&D district would include about 75,000 gsf of neighborhood retail uses east of the retail uses of HPS Village Center district. Maximum heights of the retail with residential above buildings would be 65 feet and at Density Range II, with the exception of one high-rise tower in the north west at 270 feet. Structures in the center of the district would range from 85 to 105 feet tall. Parking structures would be internal to a block. As described below, the 29.5-acre Waterfront Promenade would begin at HPS North district and continue along the edge of the R&D district and Village Center district and terminate at HPS South district.

[34] The number of residential units in each district may be adjusted depending on market demand; however, the sum totals of housing units for Hunters Point Shipyard will not exceed 2,650 units.

Hunters Point Shipyard South

The HPS South district would include 500,000 gsf of R&D space, office, and light industrial uses on approximately 15 net acres. These uses could be located north of Crisp Road, northwest of the proposed new stadium. Maximum heights of the R&D structures would be 85 feet. In addition, this district would include 50,000 gsf of community service uses located on three sites along Crisp Road to the north and west of the stadium. HPS South district would be the site of a new 69,000-seat San Francisco 49ers stadium. The stadium would include about 1,860,000 gsf, with seating, ramps and stairs, team offices and administrative space, food service and retail areas, and access facilities for stadium visitors, players, and staff on 17.4 acres. The stadium would be five levels on the north, east, and south sides, and nine levels on the west (referred to as the Suite Tower). The top row of seating would be at an elevation of approximately 156 feet above the playing field; the top of the stadium light towers would be at an approximate elevation of 192 feet. The event level of the stadium would include the playing field, locker rooms, main commissary, grounds keeping facilities, operations space (including management, janitorial, and security), loading docks, and facilities for other support functions. Press facilities would be located on the top level on the west side of the stadium. The box-office, 49ers team store, stadium offices, and other stadium-related commercial space would be on the ground level of the west side. Figure II-6 (49ers Stadium Conceptual Design Plan) and Figure II-7 (49ers Stadium Conceptual Elevations) illustrate the proposed stadium.

National Football League teams typically play half of all pre-season and regular season games at home. In one season, the San Francisco 49ers could play up to two pre-season, eight regular season, and two post-season games at home.[35] The preseason begins in August and the regular season extends through December. In addition to pre-season and regular season games, there is also a possibility that the 49ers would host up to two post-season games each year. It would also be likely that San Francisco would be asked to host a Super Bowl game. The Super Bowl is considered an extraordinary event and would likely occur in San Francisco approximately once every five to 10 years. In addition to San Francisco 49ers football, other major events could occur at the stadium, including college football games, soccer games, concerts, festivals, antique and car shows, or other events. These additional events would be limited to 20 total occurrences per year.

The parking areas surrounding the 49ers Stadium would serve stadium-related events. The Dual-Use Sports Field Complex and Multi-Use Lawn adjacent to the proposed stadium and permanent parking areas would serve as recreation and athletic fields when not used as parking for stadium events. The surface of the fields would be seeded grass above top soil with synthetic fibers and other base materials to support vehicle parking. The permanent parking area and dual-use areas would provide approximately 12,665 parking spaces for games and events.[36] When not needed for games or events, the dual-use areas would be available to serve recreation and related events.

[35] Each NFL team typically plays four preseason games. The NFL has a 17-week regular season. Each season, all NFL teams have one bye week (week off) where the team does not play. Therefore, each team plays 16 regular season games during the 17-week period.

[36] An additional 3,750 parking spaces are available for evening and weekend stadium events on the R&D sites.

FIGURE II-7

Candlestick Point — Hunters Point Shipyard Phase II EIR

49ERS STADIUM CONCEPTUAL ELEVATIONS

Hunters Point Shipyard Piers, Drydocks, and Waterside Uses

Piers and Drydocks

The Shipyard currently includes seven piers and six drydocks along the shoreline (refer to Figure II-2). As part of the base closure and conveyance process described in Chapter I (Introduction), the Navy will remove Piers B and C and timber portions (concrete walls would remain) of Drydocks 5, 6, and 7 prior to conveyance of HPS Phase II to the City and County of San Francisco. Drydocks 2 and 3 and four supporting buildings (Buildings 140, 204, 205, and 207) were previously identified as historic resources eligible for listing in the National Register of Historic Places.[37] Heritage Park is proposed at Drydocks 2 and 3 and would display interpretive elements related to the history of HPS. Drydocks 4, 5, 6 and 7 and the Re-Gunning Pier and crane would remain. Piers 1, 2, and 3 consist of long, narrow concrete piers in the southeastern portion of HPS Phase II. These pier structures would remain in place, but portions of the pier would be removed to prevent public access for safety reasons. The Re-Gunning Pier would be reconfigured for wildlife habitat uses. Some pier areas would require cleaning and repaving. The North and South Piers would be the sites of the proposed marina, discussed below.

Marina

The Project would include an approximately 300-slip marina along the east shoreline of HPS Phase II, north of the Re-Gunning Pier (refer to Figure II-4). The marina slips are proposed along the North and South Piers.

The marina would include up to 300 slips accessed by a series of gangways and floating docks. Guide piles would horizontally restrain the floating docks. Each slip would include potable water, electrical, cable television, and telephone connections. The marina would provide sewage pump-out stations at each slip or at a central pull-up station. Landside improvements adjacent to the marina could include parking, restroom facilities, a classroom to teach sailing, and a harbormaster's office.

The marina would require installation of two breakwaters approximately 1,300 to 1,650 feet in total length, split up into two to three sections (ranging between 300 and 650 feet in length).[38]The breakwaters would create two 10.7- to 11.3-acre basins. The footprint of the breakwaters will cover approximately 0.05 to
- 0.1 acre of bay bottom. The existing North and South piers would remain and provide protection to the marina basins by acting as breakwaters. Breakwaters would be constructed using concrete sheet pile supported by batter piles and installed using water-based equipment.

The current water depths of up to 16 feet of the proposed marina basin would be adequate for recreation craft, and the basin would not require initial dredging. However, maintenance dredging would be required in the future to maintain adequate clearance.

[38] Devick, Christopher, Moffat-Nichol email to Therese Brekke of Lennar Urban and Terri Vitar of PBS&J regarding length of marina breakwater, dated July 23, 2009.

II.E.2 Parks and Open Space Plan

Figure II-8 (Existing and Approved Parks and Open Space) illustrates the locations of various existing parks and open space on the Project site and in the nearby vicinity, including the CPSRA.

The Project would involve the creation of new parks and recreational opportunities, provide park improvements, and create new access to the shoreline. New parks would include destination parks, neighborhood parks, a sports field complex and multi-use lawn, the waterfront promenade, the waterfront recreation area, and the extension of the Bay Trail through the Project site. Approximately 10,000 net new trees would be planted at the Project site and in the community, along with shrubs and native habitat restoration. A detailed description of the proposed new and improved parks, including improvements to the CPSRA, is provided in Section III.P (Recreation), while a description of the Applicant's Draft Parks, Open Space, and Habitat Concept Plan is discussed in Section III.N (Biological Resources).

In total approximately 336.4 acres of open space would be provided (this includes a net reduction of 23.5 acres of CPSRA). Candlestick Point would include approximately 104.8 acres of parks and open space, including the CPSRA, and HPS Phase II would include approximately 231.6 acres of parks and open space.

Table II-6 (Proposed Parks and Open Space) presents the proposed park and open space in the Project. Figure II-9 (Proposed Parks and Open Space) illustrates the location of the proposed parks and open space and changes to the CPSRA. A brief description of the CPSRA, new parks and open space facilities, and the Bay Trail is provided below.

Candlestick Point State Recreation Area

The Project includes the reconfiguration of the boundaries of CPSRA, as well as park improvements and an ongoing source of funding for park operation and maintenance. Table II-7 (Candlestick Point Proposed State Parks Reconfiguration) presents the proposed acreage of the areas proposed to be added to or removed from the Park, as identified by Senate Bill 792 (SB 792). SB 792 was signed by the Governor on October 11, 2009, and is codified as Chapter 203 of the Statutes of 2009. SB 792 repeals the *Hunters Point Shipyard Conversion Act of 2002*, the *Hunters Point Shipyard Public Trust Exchange Act*, and *Public Resources Code* Section 5006.8, and consolidates the key provisions of those statutes into a statute covering both the Candlestick Point area and HPS. The statute authorizes a reconfiguration of CPSRA coupled with improvements within the park and the provision of an ongoing source of park operation and maintenance funding. The proposed reconfiguration would remove about 29.2 acres from the current boundaries of CPSRA to be used for urban development, but would add about 5.7 acres not currently included in the CPSRA to The Neck, The Heart of the Park, and The Last Port areas of the CPSRA. In total, the area of the CPSRA (excluding the Yosemite Slough) would decrease by about 23.5 acres at the Candlestick Point site, from 120.2 acres to 96.7 acres.

Area removed from State Park land	(29.2)
Area added to State Park land	5.7
Proposed State Park land at Candlestick Point	96.7

SOURCE: Lennar Urban, 2009.

The current *Candlestick Point State Recreation Area General Plan* was approved in 1978 and amended in 1987 and directs the long-range development and management of the recreation area.[39] Prior to construction of park improvements, the California Department of Parks and Recreation (CDPR) must undertake a public planning process and complete an update to the general plan.

- Consistent with the current CPSRA General Plan and the CDPR mission, after Project development, the CPSRA would primarily contain areas of passive uses and minimal formal landscaping. The portion of the park that is currently undeveloped or used for Candlestick Park stadium parking would be substantially improved as part of the Project to enhance overall park aesthetics and landscape ecology; reconnect visitors to the bay shoreline; and provide direct access to the bay for swimming, fishing, kayaking, and windsurfing. Proposed Project improvements include revegetation and landscaping, shoreline restoration and stabilization, infrastructure improvements (such as trails, pathways, and visitor facilities), a biofiltration pond to cleanse stormwater, the provision of habitat and opportunities for environmental education, 'Eco-Gardens,' and salt-marsh restoration. Although there would be a net decrease in the total area of the CPSRA, the recreational value of the new land and the improvements the area's overall value would increase.

The proposed improvement of the CPSRA would complete a continuous publicly accessible shoreline from Candlestick Point to HPS Phase II. Figure II-8 illustrates the locations of the current CPSRA, and Figure II-10 (Proposed CPSRA Reconfiguration) shows the proposed areas that would be added or removed. As shown in Figure II-9, the CPSRA open space would provide connections with other Project open space. CPSRA lands, whether improved or new, would be subject to the jurisdiction of the CDPR. Refer to Section III.P (Recreation) for a detailed discussion of the CPSRA.

New Parks

Overall, the Project would provide a substantial increase in the amount of developed, useable, high- quality parks, recreational facilities, and open space within the Project site. The Project would create a continuous network of interconnected recreational opportunities, promoting the use of the existing parks, such as the CPSRA, as well as the 239.7 acres of new parks, sports fields, and active urban recreation uses. The Project would provide a network of pedestrian and bike pathways that would connect Project uses to the adjacent neighborhoods and would ensure unrestricted public access to the parks and open space on the Project

[39] Department of Parks and Recreation, Candlestick Point State Recreation Area General Plan, (State Park and Recreation Commission Approval, November 1978, amended May 1987), March 1988.

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED CPSRA RECONFIGURATION

FIGURE II-10

site and the Bay shoreline. Enhanced connectivity of on-site and off-site facilities and new neighborhood parks would allow integration of new and existing facilities into the citywide park network. The proposed bicycle and pedestrian pathways would facilitate dispersal of future demand, which would help to reduce the potential for localized physical deterioration. The improved connectivity would also direct regional users to proposed "destination" parks, parks designed to accommodate regional demand. In addition, the Project would provide a continuous series of waterfront parks from the northernmost part of HPS Phase II to the southernmost part of Candlestick Point.

In addition, proposed recreational facilities, such as paved athletic courts, plazas, and picnic areas, would also support a large number of users within a relatively small area. Recreational facilities proposed for the Project site also include a Sports Field Complex that would provide soccer/football, baseball, and volleyball fields, as well as warm-up fields, restrooms, and food concessions. The parking area for the Sports Field Complex would support parking during stadium events, but would be covered with specially engineered soils and turf to allow dual-use of the parking lot for athletic fields. Recreational facilities would also include a mix of active and passive areas of open lawns, dog runs, play areas, community gardens, and court games. Moreover, improved park facilities would provide a waterfront promenade, ecological open space areas, concessions, restrooms, and other uses that would allow the site to support a large service population.

The discussion below identifies the specific new facilities that are planned within Candlestick Point and HPS Phase II. These facilities are also identified in Table II-6, above, and shown on Figure II-9. Some features, such as the Bay Trail improvements, span both areas of the Project site.

Candlestick Point

Candlestick Point would include an extensive network of parks, ranging from the CPSRA to smaller parks distributed throughout the neighborhood. The Candlestick Point parks would be connected to other neighborhoods and open spaces by way of pedestrian-friendly green streets.

- The 1.4-acre Alice Griffith Neighborhood Park would extend for several blocks near the center of the neighborhood as an extension of Egbert Avenue.
- Candlestick Point North would include a 3.1-acre Candlestick Point Neighborhood Park in the center of the district.
- The Bayview Gardens/Wedge Park (2.5 acres) would serve as the 'commons' for the Candlestick Point development and link the residences to the CPSRA through an expansive view corridor. Specific programming would include an ecological garden, a main plaza, passive lawns, bioswale stormwater retention, and tot lots.
- The 1.1-acre Mini-Wedge Park in the Candlestick Point South district would serve as a primary connector between Candlestick Point and the CPSRA beach area.

These parks would be connected to other neighborhoods and open spaces within the community by way of pedestrian-friendly green streets.

Other Parks and Open Space

- Boulevard Parks within the Project site. A hybrid of street and park, the Boulevard Park Streets bring broad fingers of green space into the urban neighborhoods, linking interior parks with bay- front parks. These streets have a strong pedestrian scale and quality, and serve as public 'front yards' for

the neighborhoods. Broad landscaped medians or sidewalks (30-40' wide) are designed as mini-parks with garden seating areas. Boulevard Parks link the Alice Griffith and Central Candlestick communities with the CPSRA.

- Hillside Parks and Open Space within the Project site. The hillside parks and open space include the eastern 'tail' of Bayview Park and other hillside areas below Jamestown Road. The steeper areas and the flatter portion of Bayview Hill would be maintained in a more natural state.
- Yosemite Slough. While not located within the Project site, the Yosemite Slough is located directly adjacent to the Project site and is planned for restoration by the California State Parks and the California State Parks Foundation. The restoration will focus on providing new wetland habitat and environmental education opportunities. The proposed Yosemite Slough bridge would cross a small portion of the CPSRA on the southern side of the slough and pass along the edge of the eastern boundary of the CPSRA on the north side.

HPS Phase II

As with Candlestick Point, HPS Phase II would also include an extensive network of parks distributed throughout this portion of the Project site.

- Northside Park (12.8 acres), which would be located on the north shore of HPS Phase II, would offer a full suite of passive and active uses. The most active park uses are located at the southwestern portion of the park. This area includes community gardens, basketball, tennis, and volleyball courts and shade pavilion, children's playground, and restroom. The open-air African Marketplace would form an east-west promenade crossing the park, with looped pathways around the multi-use lawns providing additional multi-use space. To the northeast, the park takes on a more natural and passive character, with picnic/barbeque areas and shade shelters, and waterfront pathways.
- The Waterfront Promenade (29.5 acres) begins at the northern edge of the site and continues along the shoreline until terminating at the Waterfront Recreation Area described below. The promenade would provide evidence of the historic qualities of the industrial waterfront, which would be incorporated into tree bisques, seating areas, lawn panels, artworks, and interpretive gardens.
- Heritage Park (15.6 acres) would retain and reuse historic resources and materials as much as possible while utilizing modern design with industrial character. Children's play areas and areas of open lawn would be provided.
- Grasslands Ecology Park at Parcel E (44.9 acres) would contain native Eco-Gardens, passive lawns, native grasslands, windbreak groves, and landforms offering views of the bay and shoreline habitats. Site features could include group picnic areas, overlooks, a visitor/interpretive center, restrooms, and parking.
- Grasslands Ecology Park at E-2 (37.2 acres) would provide an open space area that includes picnic areas, grassy bird watching knolls, and overlooks. This passive recreation park would focus on views toward the Yosemite Slough Wetland Restoration area and provide opportunities for environmental education. The 44.9-acre Grasslands Ecology Park at Parcel E and the 37.2-acre Grasslands Ecology Park at Parcel E-2 on HPS Phase II are contiguous to CPSRA and may be offered to the CDPR by the Agency.
- The Sports Field Complex would include soccer/football, baseball, and volleyball fields, as well as warm-up fields, restrooms, and food concessions. The Sports Field Complex would be used for sporting events during day- and night-time hours. The surface of the fields would be seeded grass above top soil with synthetic fibers and other base materials to support vehicle parking and tailgating for 49ers fans on game days. To prevent rutting and damage to the fields, the design will employ a fiber-reinforcement system that is incorporated into fast-draining, sandy soils.

- A Multi-Use Lawn area would provide event-day parking for events at the stadium. At other times, this large open space would provide for informal recreational activities, sporting, and other events as needed.
- The Waterfront Recreation Area would provide a flexible waterfront open space focused on small boat access could include education and interpretive facilities focused on San Francisco Bay.

The Sports Field Complex and the Multi-Use Lawn both surround the proposed 49ers Stadium, providing parking for stadium-related events, as well as open space that would support a range of recreational activities, as described above. The surface of the fields would be seeded grass above top soil with synthetic fibers and other base materials to support vehicle parking.

Other Parks and Open Space

- Boulevard Parks within the Project site. A hybrid of street and park, the Boulevard Park Streets bring broad fingers of green space into the urban neighborhoods, linking interior parks with bay- front parks. These streets have a strong pedestrian scale and quality, and serve as public 'front yards' for the neighborhoods. Broad landscaped medians or sidewalks (30-40' wide) are designed as mini-parks with garden seating areas. Boulevard Park Streets connect the Hunters Point Hilltop community with Waterfront Park.
- Hillside Parks and Open Space Connection. A relatively small portion of the Hillside Park and Open Space located within HPS Phase II north of Crisp Road would provide a connection to the existing Hillside Parks and Open Space constructed in the Hunters Point Phase I project.
- Historic Landmark and Bay Naturalized Landscape within the Project site. The landmark Re-Gunning Crane will be retained, providing a dramatic juxtaposition of the site's industrial history with the resurgence of nature at the Bay's edge. Trails and boardwalks would lead to overlook points providing visitors with opportunities to view Bay wildlife.

Summary

Overall, the Project would provide a substantial increase in the amount of developed, useable, high- quality parks, recreational facilities, and open space within the Project site. The Project would create a continuous network of interconnected recreational opportunities, promoting the use of the existing parks, such as the CPSRA, as well as the 239.7 acres of new parks, sports fields, and active urban recreation uses. The Project would provide a network of pedestrian and bike pathways that would connect Project uses to the adjacent neighborhoods and would ensure unrestricted public access to the parks and open space on the Project site and the Bay shoreline. Enhanced connectivity of on-site and off-site facilities and new neighborhood parks would allow integration of new and existing facilities into the citywide park network. The proposed bicycle and pedestrian pathways would facilitate dispersal of future demand, which would help to reduce the potential for localized physical deterioration. The improved connectivity would also direct regional users to proposed "destination" parks, parks designed to accommodate regional demand. In addition, the Project would provide a continuous series of waterfront parks from the northernmost part of HPS Phase II to the southernmost part of Candlestick Point.

In addition, proposed recreational facilities, such as paved athletic courts, plazas, and picnic areas, would also support a large number of users within a relatively small area. Recreational facilities proposed for the Project site also include a Sports Field Complex that would provide soccer/football, baseball, and volleyball fields, as well as warm-up fields, restrooms, and food concessions. The parking area for the Sports Field Complex would support parking during stadium events, but would be covered with specially engineered

soils and turf to allow dual-use of the parking lot for athletic fields. Recreational facilities would also include a mix of active and passive areas of open lawns, dog runs, play areas, community gardens, and court games. Moreover, improved park facilities would provide a waterfront promenade, ecological open space areas, concessions, restrooms, and other uses that would allow the site to support a large service population.

The Bay Trail

The Bay Trail is a planned recreational corridor that, when complete, will encircle San Francisco Bay and San Pablo Bay with a continuous 500-mile network of bicycling and hiking trails. The Project would include the construction of the Bay Trail in the southeastern portion of San Francisco and ultimately connect to the existing trail along the India Basin shoreline. Trail improvements would include a pedestrian and bicycle trail along the shoreline with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/US-101 interchange, through the CPSRA, Yosemite Slough, and HPS Phase II shoreline to India Basin. The Bay Trail would be incorporated into the design of the parks described above. Figure II-9 illustrates the proposed Bay Trail.

Ecological Enhancement of Parks and Open Space Areas

The Project would provide opportunities for enhancing the ecological functions and values of the parks and open space areas. The following ecological enhancement measure would be implemented in open space areas outside the CPSRA. At the CPSRA, ecological enhancements would be identified during the CDPR public planning process and CPSRA general plan update described above and could include the enlisted measures or other measures. The Project would implement these measures in open space areas outside the CPSRA. Refer also to Section III.N (Biological Resources).

- **Control of non-native invasive species**—Non-native species would be removed during initial habitat enhancement efforts. Monitoring and ongoing removal/control would be implemented to ensure against the re-establishment and spread of these species on the site.
- **Incorporation of grasslands**—Native grasslands would be established on the site to support associated wildlife species.
- **Increase in tree/shrub cover**—Trees and shrubs would be planted throughout the Project site. Native vegetation would be favored, however, site-appropriate non-native trees and shrubs would also be considered.
- **Maintenance of habitat connectivity**—Parks and open space areas would be designed and maintained to maintain connectivity for less mobile animals including mammals, reptiles, and amphibians. Examples include maintenance of a vegetated band along the shoreline, and planting of vegetative cover that provides refuge for dispersing animals.
- **Creation of stormwater wetlands**—Stormwater treatment wetlands and biofiltration ponds would be incorporated into open space areas and would serve the dual functions of treating runoff while providing habitat for a variety of wildlife species.
- **Maintenance of refuge areas for waterbirds**—Park and open space facilities would create areas for waterbirds to roost at high tide that are somewhat removed from trails or other shoreline access points for humans. In addition, removal of landside portions of the three piers in the southeastern corner of HPS Phase II would prevent mammals from accessing those piers. The piers would be left in place to provide roosting sites for gulls, cormorants, pelicans, and terns.

- **Provision of nest boxes**—Nest boxes for birds would be placed in appropriate locations throughout parks and open space areas.

II.E.3 Transportation Improvements

The proposed Transportation Plan would serve travel needs of future residents, employees, and visitors at the Project. The Transportation Plan presents goals, principles, and strategies to fulfill the transportation and related sustainability objectives of the Project (refer to Section II.D [Project Objectives]). Major Transportation Plan principles include integration of new transportation networks with existing systems, and integrating land use patterns with multimodal street networks that would facilitate walking and cycling for internal trips and transit for trips of greater distance. The goals, principles, and strategies of the Transportation Plan would be supported by investment in infrastructure and services that would provide multiple alternatives to private auto travel. Some of the transportation improvements would require property acquisition.

Section III.D (Transportation and Circulation) describes the Transportation Plan in further detail; with a summary below.

Transportation Demand Management Plan

A Transportation Demand Management Plan (TDM) would be implemented to reduce automobile and light truck vehicle miles travelled and encourage residents, employees, and visitors to use alternative modes of travel, such as transit, walking, and bicycling. In addition, the TDM plan would include measures to reduce the demand for travel during peak times. The TDM plan would include the following strategies.

- **Transportation Coordinator and Website.** An on-site Transportation Coordinator would provide residents, employers, employees, and visitors with information regarding available transportation alternatives. The Transportation Coordinator would be responsible for implementing, monitoring, and improving the measures of the TDM plan. A website would include transportation-related data and real-time transit information
- **Employee TDM Programs.** Employers of 20 or more employees in the Project site would be required to participate in TDM programs that would encourage the use of transit and facilitate walking and bicycling by their employees.
- **Carpool/Vanpools.** The TDM would offer carpool and vanpool services. Designated spaces in parking facilities would be provided free to vanpools. The transit centers would have designated signed areas for informal carpooling.
- **Carshare Services.** Local carshare organizations would provide carshare vehicles throughout the Project site. Carshare services allow members to use vehicles when needed, paying based on how much they drive.
- **Other Strategies**
  - > Homeowner's dues would include the cost of transit passes for all households
  - > Information outreach would be provided to residents, employees and visitors on transit options Residential parking would be "unbundled" and sold or leased separately from the residential units
  - > Non-residential parking charges would vary according to market rates

> Exclusive bike lanes and frequent bus rapid transit (BRT) service would operate in dedicated lanes and with signal priority

> Regular periodic monitoring of Transportation Demand Management programs intended to encourage transit use and other alternative modes would be required, to measure effectiveness and to adjust programs to improve effectiveness

Roadway Network

The proposed street network would extend the existing grid of the adjacent BVHP neighborhood into the Project site. The internal street network would be composed of seven types of streets consistent with and classified by the *San Francisco Better Streets Plan* (Draft for Public Review, June 2008), including: Commercial Throughway; Residential Throughway, Neighborhood Commercial Street, Neighborhood Residential Street, Parkway, Park Edge Street and Alley. The proposed street network, including proposed off-site improvements, is illustrated in Figure II-11 (Proposed Street Network).

Roadway Improvements

The Project would improve existing roadways to serve Candlestick Point and Hunters Point Shipyard Phase II and surrounding Bayview and Hunters Point neighborhoods. Improvements would be within the Project boundaries, and off site as shown in Figure II-12 (Proposed Roadway Improvements).

Proposed roadway improvements, shown on Figure II-12 would include the following:

1. **Harney Way widening.** The existing four-lane Harney Way would be widened to the north and south of its existing alignment, and would be rebuilt to contain between two and three travel lanes in each direction, turn pockets, two BRT-only lanes, Class I and Class II bicycle facilities, new sidewalks, as well as landscaped area. Initially, the roadway would be rebuilt as a new five-lane roadway (with right-of-way reserved for additional lane(s) to be built in the future as needed for increased traffic levels). A Class II bicycle lane would be provided on the north side of the roadway, and a Class I bicycle path would be provided on the south side of the roadway. Two exclusive Bus Rapid Transit (BRT)[40] lanes would be constructed adjacent to the roadway on its north side. After games at the new 49ers stadium, left turns would be prohibited at the two Harney Way intersections with Thomas Mellon Drive and Executive Park Boulevard for a period to allow for the configuration of the roadway to change to four westbound auto lanes and one eastbound auto lane. Under the final configuration, a portion of the landscaped area installed as part of the initial widening would be rebuilt to provide lanes from the proposed Harney Interchange east to Arelious Walker Drive, if necessary.
2. **New roadway through Candlestick Point.** A new five-lane arterial roadway generally following the current alignment of Giants Drive and Arelious Walker Drive would serve Candlestick Point, with upgraded sidewalks, curb ramps, and street lights. The roadway would have a 13-foot-wide median to accommodate 11-foot-wide left-turn lanes at major intersections. The roadway would include new traffic signals at the intersections of Harney Way and Jamestown, Ingerson, Gilman, and Carroll Avenues.

[40] Bus Rapid Transit (BRT) is an integrated system of facilities, services, and amenities that collectively improves the speed, reliability, and identity of bus rapid transit. BRT combines stations, vehicles, services, running ways (e.g., curb bus lanes, median busways, mixed-flow lanes), and Intelligent Transportation Systems (ITS) elements into an integrated system.

FIGURE II-12 Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED ROADWAY IMPROVEMENTS

3. **New and improved roadways on Crisp Road, Griffith Street, Thomas Avenue, Ingalls Street, and Arelious Walker Drive.** A four-lane roadway would connect Hunters Point to Candlestick Point. The roadway would begin at Hunters Point with the extension of Crisp Road to Griffith Street at Palou Avenue. The roadway would then continue on Griffith Street to Thomas Avenue and then on Thomas Avenue to Ingalls Street where it would proceed along Ingalls Street to Carroll Avenue. The new section of Crisp Road, Griffith Street, and Thomas Avenue would include four auto lanes and sidewalks, with on-street parking on Thomas Avenue. Ingalls Street would remain an industrial mixed-use street with two auto lanes and parking and loading zones on its northern and southern sides. The width of sidewalks on the portion of Ingalls Street from Carroll Avenue to Yosemite Avenue would be decreased to be consistent with the sidewalks north of Yosemite Avenue to accommodate this change. A new traffic signal would be installed at the intersection of Thomas Avenue and Ingalls Street. The Project also proposes to connect Arelious Walker Drive to Crisp Road.
4. **Streetscape improvements.** Innes, Palou, and Gilman Avenues would serve as primary access corridors from the north for pedestrians, bicyclists, transit vehicles, and automobiles. Streetscape improvements, extending to Third Street on Palou and Gilman Avenues, and to Jennings Street on Innes Avenue, would include street trees, sidewalk plantings, furnishings, and paving treatments. Ingerson and Jamestown Avenues would be repaved and restriped from the Project site to Third Street.
5. **Yosemite Slough Bridge.** A new Yosemite Slough bridge would extend Arelious Walker Drive from Candlestick Point to Hunters Point Shipyard. The 81-foot-wide, seven-lane bridge would cross the slough at its narrowest point and would primarily function for transit, bicycle, and pedestrian use. Figure II-12 illustrates the bridge location. The bridge and its approach streets would have two dedicated 11-foot-wide BRT lanes and a separate 12-foot-wide Class I bicycle and pedestrian facility, which would be open at all times. The bridge would also have a 40-foot-wide greenway, which would be converted to four peak direction auto travel lanes on 49ers game days only. Those four lanes would be open on game days to vehicle traffic in the peak direction of travel. The roadway would be planted with grass and would serve as an open space amenity on all non-game days. Two-foot-tall barriers would separate the BRT lanes from the bicycle/pedestrian plaza and the vehicle lanes. The greenway would be designed to function as a stormwater treatment control facility for the auto travel lanes. Runoff from the BRT lanes would also be routed to the greenway and/or to land-based stormwater treatment facilities, in accordance with the City's requirements for stormwater treatment.

   The 81-foot-wide span across Yosemite Slough would be approximately 902 feet long with abutments on the north and south ends connecting the bridge to land. Eight piers, with two columns each, would support the bridge. The columns of the three southernmost piers would rest on bedrock. Ten sets of steel piles would be driven to support the columns of the five piers to the north. Section II.F.2 (Site Preparation) provides additional information regarding bridge construction. The bridge footings on either side of Yosemite Slough would require removal of portions of parkland from the CPSRA (red hatched areas). On the north side of the slough, this would result in 0.8 acre, and on the south side of the slough it would be part of 2.6 acres, that would be reconfigured. The bridge footings on the north side of the slough are located at the eastern edge of the park boundary. On the south end of the slough, the area removed for bridge footings would impinge approximately 300 feet or less (270 feet) through the CPSRA. On the south side, the bridge would extend Arelious Walker Drive through a portion of the CPSRA.

   Section III.D describes the bridge design further. Section III.E (Aesthetics) includes visual simulations of the bridge.
6. **Transportation Management System.** A transportation management system would be implemented for use during 49ers Game Days and special events held at the stadium. The system

would include the installation and coordination of signals at over 30 intersections in the Project and surrounding area using fiber-optic technology. Several variable message signs and lane use control signals would be installed on roadways with reversible lanes. Variable message signs would convey messages to Game Day or event patrons in private vehicles. A traffic control center near the 49ers Stadium would operate the system, connected to the larger SFMTA program.

Transit Services

Supported by Project revenues and infrastructure, the San Francisco Municipal Transportation Agency proposes the following transit services:

- Extending existing Muni bus routes to better serve the Project site
- Increasing frequencies on existing routes to provide more capacity
- Complementing existing routes with new transit facilities and routes that would serve the Project's proposed land use program and transit demand
- Connecting to regional transit with BRT

The Transportation Plan would propose new direct transit service to serve employment trips to and from downtown San Francisco. Connections to the regional transit network (BART and Caltrain) would serve employment centers in the South Bay. The proposed transit improvements are illustrated in Figure II-13 (Proposed Transit Improvements) and described below:

A. **Extended bus routes and new bus routes.** Existing Muni routes 24-Divisadero, 44-O-Shaughnessy, and 48-Quintara-24th Street would be extended to HPS Phase II; route 29 would terminate at Candlestick Point. Service frequencies on these lines would be increased. New Downtown Express routes would connect both Candlestick Point and HPS Phase II with the Financial District.

B. **Harney/Geneva BRT/Transit Preferential Street.** The Harney Way/Geneva Avenue corridor would have exclusive bus and BRT lanes between Hunters Point Transit Center and Bayshore Boulevard, through Candlestick Point and the Bayshore Caltrain Station.

C. **Hunters Point Transit Center.** Hunters Point Transit Center would serve HPS North and Hunters Point Village Center districts. The transit center would have approximately ten bus bays. Most bus lines serving HPS Phase II would terminate at the transit center.

D. **Bus Rapid Transit Stops.** BRT stops would be at Hunters Point Shipyard Transit Center, at three locations within Candlestick Point, and at two intermediate locations.

E. **Palou Avenue Transit Preferential Street.** One Muni line (24-Divisadero) would be extended along Palou Avenue to serve Hunters Point Shipyard Transit Center. Transit-priority technology would be installed on Palou Avenue including installation of new traffic signals. This would improve transit travel times and reliability on the 24-Divisadero and also the 23-Monterey and 44-O'Shaughnessy, which would continue to operate on Palou Avenue.

Many of the proposed transit lines would include transit priority systems, with roadway sensors that would detect approaching transit vehicles and would alter signal timing to improve transit efficiency.

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED TRANSIT IMPROVEMENTS

FIGURE II-13

Bicycle Circulation

Bicycle routes would provide connections within the Project site, to the surrounding neighborhoods, and to other parts of the City. Bicycle routes would be located along major roadways, consistent with City guidelines and adopted bicycle plans. As noted above, the Bay Trail, which would accommodate bicycle travel, would be extended along the entire Project waterfront. Secure bicycle parking would be provided in each commercial parking facility and residential garages (Table II-8 [Proposed Bicycle Parking and Shower and Locker Facilities]). New buildings with at least 10,000 gsf of office and community uses would provide locker and shower facilities. Figure II-14 (Proposed Bicycle Routes) illustrates the proposed bicycle route network. Bicycle facilities are described as Class I, which is a separated bicycle path or multi-use trail; Class II, which is a bicycle lane; and Class III, which is a bicycle route.

Table II-8 Proposed Bicycle Parking and Shower and Locker Facilities

Use or Activity	*Parking or Facility*	*Size of Project*
Residential	One Class 1 bicycle space per 2 units	Up to 50 units
	25 Class 1 bicycle spaces plus 1 Class 1 space for every 4 units over 50	Over 50 units
Medical, Office, Institutional, R&D, Theater, Hotel, Artist Space, and Community Use	Three bicycle spaces	10,000 and 20,000 gsf
	Six bicycle spaces	20,001 and 50,000 gsf
	12 bicycle spaces	Greater Than 50,000
Retail, Eating and Drinking Use	Three bicycle spaces	25,000 and 50,000 gsf
	Six bicycle spaces	50,001 and 100,000 gsf
	12 bicycle spaces	Greater Than 100,000
Structured Parking	One secure bicycle space per 20 auto spaces	< 500 parking spaces
	25 bicycle spaces plus 1 additional space for every 20 auto spaces over 500, up to a maximum of 100 bicycle spaces	500 parking spaces or more
Medical, Office, Institutional, R&D, Theater, Artist Space, and Community Use	One shower, two clothes lockers	10,000 and 20,000 gsf
	Two showers, four clothes lockers	20,001 and 50,000 gsf
	Four showers, eight clothes lockers	Greater Than 50,000
Retail, Eating and Drinking Use	One shower, two clothes lockers Two showers, four clothes lockers Four showers, eight clothes lockers	25,000 and 50,000 gsf
		50,001 and 100,000 gsf
		Greater Than 100,000

SOURCE: Lennar Urban, August 2009.
Hotel, residential, and live/work are excluded from shower/locker requirements.

Pedestrian Circulation

The Project pedestrian network, together with its land use design, would encourage walking as a primary mode of transportation within the Project site. Pedestrian facilities, such as sidewalk and multi-use pathways would allow access to transit facilities and to shopping, schools, and recreation. The interior roadway network would include traffic calming features to facilitate safe pedestrian travel. The streets would be designed to accommodate multi-modal travel, with curb extensions, corner extensions (or bulb- outs), raised crosswalks, comprehensive signage, street trees, narrow roadway lanes, and short blocks and other features to slow vehicle traffic. All pedestrian facilities would meet *Americans with Disabilities Act* (ADA) standards for accessibility and would be designed to conform to San Francisco's "Better Streets Plan" whenever possible.

PBS&J 10.30.09 08068 | JCS | 09

Candlestick Point — Hunters Point Shipyard Phase II EIR

FIGURE II-14

PROPOSED BICYCLE ROUTES

Parking

Parking would accommodate residents, employees, and visitors. Table II-9 (Maximum Proposed Parking) and Figure II-15 (Project Parking Supply) present the proposed parking rates and distribution of residential and commercial parking. Residential parking would be provided at a ratio of one space per unit. However, residential parking would be "unbundled" and each parking space sold or leased separately from an individual residential unit. The sale and lease rates would be set at fair market value, which would vary according to market pressures in the City. Commercial and visitor-serving land uses would be served by on- and off-street parking. All commercial parking facilities would be paid parking, with measures to discourage single-occupant automobile use, such as designation of preferred parking areas for bicycles, carpools, vanpools, and carshare vehicles. The performance venue/arena would share parking with proposed retail uses.

Table II-9 Maximum Proposed Parking

Use or Activity	*Hunters Point Shipyard Phase II*	*Candlestick Point*
Residential	1 for each dwelling unit	1 for each dwelling unit
Retail (Neighborhood Commercial)	3 for each 1,000 sf of occupied floor area where the floor area exceeds 5,000 sf	0
Retail (Regional)	—	2.7 for each 1,000 sf of occupied floor area where the occupied floor area exceeds 5,000 sf
Office	—	1 for each 1,000 sf of occupied floor area
R&D	1.3 for each 1,000 sf of occupied floor area[a]	—
Theater	—	1 for each 8 seats
Hotel	—	0.25 for each guest rooms
Stadium or Sports Arena	—	1 for each 15 seats, if shared
Artist Space	1 for each 2,000 sf of occupied floor area	—
Community Uses (TBD)	1 for each 2,000 sf of occupied floor area	1 for each 2,000 sf of occupied floor area

a. To achieve game day parking requirements if the 49ers stadium is constructed at Hunters Point Shipyard Phase II, R&D for Crisp Road only would be increased to 1.8.

Loading

The Project's loading program would facilitate access to freight vehicles (commercial delivery and moving trucks) and passenger vehicles (private vehicles, vans, and shuttles), while reducing conflicts with other transportation modes, particularly pedestrians. On-street loading spaces would serve as short-term parking near building entrances to meet the needs of disabled individuals, other visitors, and for commercial deliveries. The Redevelopment Plan documents would provide standards for the location and management of on-street loading spaces, including specific designation of street frontage at building entrances as short-term loading zones. On-street loading would be prohibited along BRT routes.

Parcel	Residential	Commercial	General	Stadium			Total
	Structure	Structure/ Off-Street	On-Street	Structure	Surface	Street	
CANDLESTICK POINT (CP)							
Alice Griffith / Jamestown	1,535	0	450	0	0	0	1,985

PBS&J 10.30.09 08068 | JCS | 09

FIGURE II-15

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROJECT PARKING SUPPLY

Proposed off-street loading spaces would be based on the land use and the gross floor area, as shown in Table II-3. Table II-10 (Proposed Off-Street Loading Program) presents the guidelines for the proposed off-street loading program. Standards in the Redevelopment Plan documents would apply to the location and design of off-street loading spaces including consolidation of loading to minimize curb-cuts and driveways, no off-street loading curb-cuts on BRT routes or local streets with bicycle lanes, shared openings with parking facilities, and single loading facilities to serve multiple uses.

Table II-10 Proposed Off-Street Loading Program

Land Use	*Size of Use*	*Number of Spaces*
Retail, Wholesale, Manufacturing, Live/Work	0 to 10,000 sf	0
	10,001 to 60,000 sf	1
	60,001 to 100,000 sf	2
	> 100,000 sf	3 plus 1 for each additional 80,000 sf
All other uses (including residential)	0 to 100,000 sf	0
	100,001 to 200,000 sf	1
	200,001 to 500,000 sf	2
	> 500,000 sf	3 plus 1 for each additional 400,000 sf

SOURCE: Lennar Urban, 2009

II.E.4 Infrastructure Plan

The Infrastructure Plan would include a low-pressure water system, a reclaimed water system, an Auxiliary Water Supply System (AWSS), and separate sanitary sewer and storm drainage facilities. Trenches throughout the Project site would accommodate electrical, communication, and gas utilities. These systems are generally described below.

Low-Pressure Water System

The low-pressure water system would provide potable and fire protection water. The Project site is currently served by the City's low-pressure water system from the University Mound Reservoir. A preliminary water distribution model prepared for the Project indicated the need for increased flow capacity from the City water distribution system to meet the required system performance criteria under maximum day plus fire flow demand conditions. The Project could potentially include off-site improvements to convey additional flow to the Candlestick Point Project site from the University Mound pressure zone transmission mains on Third Street. The potential off-site improvements would involve upsizing existing pipelines within the rights-of-way on streets between Third Street and the project site. Low Pressure Water System Master Plans (LPW Master Plans) are being developed for Candlestick Point and HPS Phase II. The LPW Master Plans are anticipated to be completed by March 2010 and will identify the need for off-site improvements as well as the routing and scheduling of the construction of these improvements to meet the system performance criteria for the project.

Reclaimed Water System

The Project would provide a network of reclaimed-water mains for dual plumbing[41] in commercial buildings and for irrigation of landscaped areas. Reclaimed water mains would be connected to the potable water system until a source of reclaimed water is developed by the City and delivered to the Project site.

Auxiliary Water Supply System

The AWSS is a separate and distinct water supply system for fire protection purposes only. Candlestick Point and HPS Phase II are not currently served by the AWSS. Currently, there is a planned extension of the AWSS on Gilman Street from Ingalls Street to Candlestick Point. The Project would connect to this extension and provide an AWSS loop within Candlestick Point. At HPS Phase II, the AWSS would be connected to the existing AWSS system at the intersection of Earl Street and Innes Avenue and at the Palou Avenue and Griffith Avenue intersection with a looped service along Spear Avenue/Crisp Road.

Sanitary Sewer

A combined storm sewer system serves most of San Francisco, where stormwater, along with residential and commercial sewage, is directed to treatment plants prior to being released to the San Francisco Bay or Pacific Ocean. The Project's separated sanitary sewer system would convey wastewater from Candlestick Point by gravity flow to the Gilman Avenue combined sewer, which flows to the Southeast Water Pollution Control Plant (SWPCP). The Project's separated sanitary sewer system would convey wastewater from Hunters Point Shipyard Phase II via pump stations to the Hunters Point Sewer Tunnel at Palou Avenue and Griffith Avenue and on to the SWPCP. A portion of the wastewater from Hunters Point Shipyard Phase II site may be directed to existing combined sewer lines located in Innes Avenue at Earl Street. As described below, the Project would have separated stormwater drainage systems.

Storm Drainage/Water Quality

The storm drainage system would handle stormwater by three methods; the particular method employed for any individual storm event would depend on the magnitude of the event. These methods include (1) treated storm flows; (2) a 5-year storm piped system; and (3) overland flow. The storm drainage system would be separated from the sanitary sewer system to reduce wet weather flows to the SWPCP.

On-site treatment would handle the majority of the stormwater generated by typical rainfall events (1.17-year storm). Examples of on-site treatment could include vegetated swales, flow-through planter boxes, permeable pavement, green rooftops, and rainwater cisterns. Larger rainfall events up to a five-year storm would be handled within the rights-of-way of every street in the Project site. Examples of these stormwater facilities include vegetated buffer strips, flow-through planter boxes, bioretention facilities, pervious surfaces, and subsurface detention vaults. Bioretention basins would also be constructed within parks and open space. Most stormwater runoff from up to a five-year storm event would be treated before it enters the storm drains allowing the system to discharge directly to San Francisco Bay without further management. Stormwater from larger storm events would be routed to the Bay by overland flow along a

[41] Dual plumbing refers to a system of separated water and wastewater lines.

network of street gutters and roadways. The overland flow stormwater system would fully contain a 100-year storm event. Also refer to Section III.M (Hydrology and Water Quality).

Joint Trenches

The joint trench systems for the Candlestick Point and Hunters Point Shipyard Phase II development plans will be based on the same criteria. The joint trench includes electrical, communications and gas utilities. A joint trench network will be developed for each development site. Major and minor joint trenches will be routed through the street network to provide power, communications, and gas facilities to the development areas.

II.E.5 Community Benefits

The Project includes funding, facilities, and programs intended to benefit the BVHP community. In addition to the improvements provided as part of the proposed development, such as new parks, transit and roadway improvements, artist replacement space and other public facilities, the Project provides funding for additional community benefits including workforce development, jobs, education, and community health and wellness programs. These community benefits, each of which would be more completely set forth in a Disposition and Development Agreement (DDA) between the Agency and the Project Applicant, are further described below.

Affordable Housing

The Affordable Housing Plan would provide for the development of approximately 3,345 affordable and below-market housing units on the project site. These housing units would include a variety of unit types, sizes, and structures, and a wide range of affordability levels subject to necessary governmental approvals. The Project would include the redevelopment of the Alice Griffith public housing site. To accommodate the needs of families, market rate, affordable, and below-market housing units would average 2.5 bedrooms (excluding those specifically offered to senior or disabled residents).

Community First Housing Fund

The Community First Housing Fund would assist qualifying residents in the purchase of market rate homes in District 10.[42]

Education

The Project includes contributions toward a scholarship fund to support educational opportunities for youth and adults up to 30 years old and education enhancements within the community, which may include new facilities or upgrades to existing education resources. The use of these funds will be determined through a community-based process that includes the San Francisco Unified School District.

[42] Bayview Hunters Point and Hunters Point Shipyard are within Supervisorial District 10 in the City and County of San Francisco.

Space within the Project would be dedicated to the provision of library services to supplement the expanded Bayview branch of the San Francisco Public Library (SFPL), including a reading room and automated book-lending machines integrated into community retail and public facilities.

Community Health and Wellness

The Project would provide funding to be used to create a center focused on the health and well-being of children, youth, and their families. The center will be developed and implemented in conjunction with the San Francisco District Attorney's Office, the San Francisco Department of Public Health, and others with expertise in the field.

Business Development/Community Asset Building

The Project includes a workforce development program designed to create a gateway to career development for residents of District 10 and construction assistance program to ensure that contractors from the BVHP area are given the opportunity to obtain needed insurance and technical assistance.

Parcels can be reserved for development with local developers or builders, including for-profit or non-profit organizations that either do business in and have a primary address in the BVHP area, or are owned with at least 50 percent ownership interest by an individual or individuals residing in the BVHP area. A Community Brokers/Realtors program would provide qualified community brokers and realtors with a referral fee for referring buyers of market rate homes, and providing advance access to homes in the Project to such brokers. Specialized programs include space for "business incubation" to jump-start the location and development of innovative business, including cleantech, greentech, biotech, arts and digital media, and space for an International African Marketplace for the display and sale of arts, crafts, clothing, books, and other goods. In addition to these programs, a 0.5 percent fee calculated on the gross sales price of all residential market rate homes will be paid directly into the Hunters Point Shipyard Fund. The use of these funds will be determined in coming months through a continued dialogue with the Hunters Point Shipyard Citizens Advisory Committee (CAC), the PAC, and the BVHP community.

II.E.6 Green Building Concepts

The Project would comply with all applicable provisions of the City's Green Building Ordinance, which is contained in Chapter 13c of the San Francisco Building Code, and would provide recycling, composting, and trash facilities as required by the City's specifications. The Project has set an energy efficiency performance target of 15 percent below the energy efficiency standards articulated in Title 24, Part 6 of the 2008 *California Code of Regulations* (CCR). Lennar Urban would include measures such as high performance glazing, efficient lighting, daylighting, shading, envelope optimization, reflective roofs, and natural ventilation in the Project design. ENERGY STAR appliances are proposed for all new residential units. In addition, Lennar Urban could also implement renewable energy strategies, such as the use of photovoltaic cells to provide electricity; the use of solar thermal energy to provide space cooling with the use of absorption systems; and/or water for space heating and domestic water systems.

Lennar Urban has also voluntarily committed to constructing all Project buildings to the LEED® for Neighborhood Development Gold standard based on the Pilot Version of the rating system released in

June 2007.[43] Following the 2007 LEED® ND Pilot Program rating system, preliminary analysis indicates the Project could achieve approximately 63 points, which is in the LEED® ND Gold range, through strategies including but not limited to the following:

- Compact, infill development (including 90 percent of the new buildings fronting on public streets or open space)
- Enhanced habitat values
- Brownfield remediation and urban reuse
- Close proximity to transit and bicycle networks (75 percent of all development would be within ¼-mile walk to a transit stop and Class I, II, and III bikeways provide connections throughout the site and to the greater Bayview community)
- Urban design that promotes walking and discourages driving
- Diversity of land uses and housing types
- Affordable housing that supports a community of mixed ages and income
- Community participation in the community planning and design
- Compliance with the San Francisco Green Building Ordinance
- ENERGY STAR compliance to be documented by a Home Energy Rating System (HERS)
- Unbundled parking
- Drought tolerant plant species and the use of efficient irrigation systems such as drip irrigation, moisture sensors, and weather data-based controllers
- Tree-lined streets throughout the development and streetscape improvements extending from the Project Site to Third Avenue along Gilman and Palou
- Access to public space and recreational amenities through the creation of parks and playfields
- Efficient use of water and the potential use of recycled water for non-potable water uses such as irrigation, toilets, vehicle washing
- Progressive stormwater management to retain and treat stormwater on site and/or in adjacent areas

II.F DEVELOPMENT SCHEDULE

- It is anticipated that the Project would be constructed over time beginning in 2011 with full build-out by 2031, which represents an approximately 20-year construction period. Figure II-16 (Proposed Site Preparation Schedule) illustrates the site preparation sequence that precedes building construction. Figure II-17 (Proposed Building and Parks Construction Schedule) illustrates the building construction sequence.

  During construction, three basic types of activities would be expected (e.g., abatement and demolition; site preparation and earthwork/grading; and building construction). Some activities could occur simultaneously.

[43] Since the initial release of this standard, the rating system has undergone two public comment periods, and several credit requirements have changed. The LEED® ND rating system is currently being finalized for formal release by the US Green Building Council.

Candlestick Point — Hunters Point Shipyard Phase II EIR

FIGURE II-17

PROPOSED BUILDING AND PARKS CONSTRUCTION SCHEDULE

II.F.1 Abatement and Demolition

- Demolition of existing structures within the Project site would occur from 2011 to 2028. As the majority of development would occur on HPS Phase II during the first phase by 2019, most demolition would initially occur in that area of the Project site. In Candlestick Point, demolition of Alice Griffith housing would also occur in the first phase. The estimated quantity of demolition debris is presented in Table II-11 (Estimated Demolition Debris).

Table II-11 Estimated Demolition Debris

	Concrete[a] (tons)	*Wood[b] (tons)*	*Steel[c] (tons)*	*Misc. Debris[d,e] (tons)*	*Total[f] (tons)*
Candlestick Point					
Building Demolition	212,361	26,611	104,250	55,150	398,372
Road Demolition	2,021	0	33	24,255	26,309
Subtotal	*214,382*	*26,611*	*104,283*	*79,405*	*424,681*
Hunters Point Shipyard Phase II					
Building Demolition	179,652	137,572	74,480	86,119	477,823
Road Demolition	36,950	0	0	32,331	69,281
Subtotal	*216,602*	*137,572*	*74,480*	*118,450*	*547,104*
Total	***430,984***	***164,183***	***178,763***	***197,855***	***971,785***

SOURCE: Lennar Urban, 2009.

a. Concrete debris can be sized and recycled on site as pipe bedding or road base
b. Wood debris can be chipped and composted.
c. Scrap steel can be recycled off site.
d. Miscellaneous debris including glass, asphalt, plastic, etc would be transported and disposed of at a local landfill.
e. Asphalt included in Miscellaneous Debris may be recycled.
f. Quantity estimates are approximate. Pre-demolition surveys need to be performed to confirm size of structures and building material types.

Demolition activities would result in construction debris generated by the removal of structures, roads, and infrastructure. In total, approximately 971,787 tons of construction debris would be generated, including 424,681 tons from Candlestick Point and 547,104 tons from HPS Phase II. Most of the construction debris (45 percent) would consist of concrete, with the remaining debris consisting of wood (17 percent), steel (18 percent), and other miscellaneous debris (20 percent). It is assumed that the concrete debris would be recycled on site as pipe bedding or road base; the wood debris would be chipped and sent to the local landfill for disposal; and the steel would be recycled off site for other uses.

Candlestick Point

Demolition activities at Candlestick Point would include demolition of the existing Candlestick Park Stadium, associated parking lots, existing infrastructure, and structures on adjacent properties to be acquired, as well as demolition of the Alice Griffith public housing. Minor utilities would be abandoned in place or removed if they would interfere with installation of new infrastructure. Those include existing small-diameter combined sewer, the CPSRA sewer force main, storm drainage facilities, and low-pressure water main. Lennar Urban would be responsible for all demolition at Candlestick Point.

■ Hunters Point Shipyard Phase II

Demolition activities at HPS Phase II would include removal of structures and infrastructure. The Navy would remove Piers B and C and Drydocks 5, 6, and 7 and in addition demolish five buildings due to radiological concerns, prior to the transfer of HPS Phase II to the City. Lennar Urban would demolish all other buildings proposed for removal. As necessary, lead and asbestos abatement would occur in buildings prior to demolition. Existing infrastructure would be demolished to allow the construction of the new infrastructure. The Navy would remove most stormwater and sewer lines prior to transfer. Lennar Urban would remove existing surface improvements such as asphalt and concrete pavement, concrete sidewalk and other surface improvements.

II.F.2 Site Preparation and Earthwork/Grading

Major earthwork would be required at both Candlestick Point and HPS Phase II. An Earthwork Quantity Analysis was prepared to plan utilization and assignment of earthwork for all phases of development. Project grading requirements are summarized in Table II-12 (Summary of Project Site Grading Requirements) and described below.

Table II-12 Summary of Project Site Grading Requirements

	Candlestick Point (cubic yards)	*Hunters Point High Grade (cubic yards)*
Development Areas		
Excavation	1,111,000	82,500
Import Fill (Export from CP)	N/A	596,000
Import Fill	N/A	1,108,000
Trench Backfill (Utilities)	77,900	227,900
Navy cap (Area Less Open Space Areas)a	—	485,000
Open Space Areas		
Excavation	156,000	
Import Fill (Export from CP)		127,000
Import Fill		487,300
Navy cap (Open Space Areas)a		321,000
Excess Material when Completed	450,000	

SOURCE: Lennar Urban, 2009.

Crusted concrete from demolition activities estimated at 430,984 cubic yards will be used to reduce the imported fill quantities shown.

a. The "Navy cap" noted above refers to "cutting off an exposure pathway." In the context of the Parcel B Record of Decision, the soil remedy for IR sites 7/18 is referred to as a "cap," and the soil remedy for the remainder of the parcel is referred to as a "cover." The term "cover" as used in this EIR refers to a remedy requiring that the surface covers being installed (or remaining in place) to support the development (e.g. building slabs, pavement for roads, concrete for sidewalks, soil or grass for landscaped areas), meet certain specifications of thickness and be maintained to prevent breaches. The term "cap" as used in this EIR refers to a remedy requiring the installation of a surface specifically engineered to be placed on top of an area of known or suspected residual contamination (typically a landfill); the surface may be asphalt, concrete, or soil, but is generally more robust than a "cover" remedy, includes a "demarcation layer" of some sorts, is often accompanied with methane recovery or monitoring equipment, and more intensive operation and maintenance requirements than a "cover" remedy.

Depending on a number of factors, some soil would be transported off site for disposal and some soil may be transported on site. Development of the project's infrastructure would then follow, which would include streets, storm drains, collection and conveyance systems for water, sewer, and stormwater, and distribution systems for gas, electricity, and telephones.

Site preparation for the new 49ers stadium would occur during the first phase of construction. The existing Candlestick Park stadium would be maintained in service while the new 49ers stadium is built.

Candlestick Point

The estimate of earthwork grading requirements for Candlestick Point was based on a profile along the edge of development, which allows for overland flow and piped storm drainage flow. All earthwork is assumed to be used on site for Project grading and for grading improvements to the State Park land, or is exported to HPS Phase II. Hunters Point Shipyard soil shall not be used for grading adjustments within CPSRA. Table II-12 indicates the use and assignment of earthwork for all phases of development.

Hunters Point Shipyard Phase II

The estimate of earthwork grading requirements for HPS Phase II was based on a profile along the edge of development of Parcels B and C, which allows for overland flow and piped storm drainage flow. Earthwork at the 49ers stadium location and parking lot would be raised and graded by providing 5 feet of embankment over existing ground surface. This allows for buried pipeline with limited penetration of the existing soil. There would be some excavation on site. The material would be imported from Candlestick Point or other off-site sources.

Yosemite Slough Bridge

Construction of Yosemite Slough bridge would include: radiological excavations along the boundary of Parcel E to clear the HPS Phase II bridge approach from radiological restrictions; bridge and revetment construction; and construction of the streets leading to the bridge. In order to access the bridge construction site from the north (HPS Phase II), Parcel E radiological excavation must be completed first. Once completed, construction of the northern abutment, footings and piers would begin, as would construction of the bridge approaches from the south (Candlestick Point). Revetment construction to protect the shoreline parallel with each abutment would follow pier construction. The construction of footings and piers would require cofferdams for access to those specific sites. The bridge footings on either side of Yosemite Slough would require removal of portions of parkland from the CPSRA (red hatched areas). On the north side of the slough, this would result in 0.8 acre, and on the south side of the slough it would be part of 2.6 acres, that would be reconfigured. The bridge footings on the north side of the slough are located at the eastern edge of the park boundary. On the south end of the slough, the area removed for bridge footings would impinge approximately 300 feet or less (270 feet) through the CPSRA. On the south side, the bridge would extend Arelious Walker Drive through a portion of the CPSRA. Construction materials would be transported to the construction area from the South bay or by barge from the East bay. Deliveries of exceptional size (i.e., extra long or wide bridge construction components, equipment or materials) would be scheduled during hours with minimal traffic and coordinated with Caltrans authorities as appropriate.[44]

[44] MACTEC, *Work Program for the Construction of Yosemite Slough Bridge*, June 17, 2009.

Shoreline Improvements

The shoreline along the project boundary consists of a variety of edge conditions, many of which need to be improved to reduce erosion, provide public access, protect against present and future coastal flooding due to rising sea levels, and extend the life of the structural edges. There are several distinct types of edge conditions along the project shoreline[45] including piers, wharves, bulkheads, revetments, and natural shoreline consisting of sandy beaches and vegetated marsh. Piers and wharves are the structures that extend out over the water, bulkheads are vertical seawall structures, and revetments are sloped riprap or concrete protected edges.

The Project would repair and improve the existing shoreline edge at Candlestick Point and HPS Phase II. The proposed improvements are based on an assessment of the condition of the existing shoreline, which included analysis of the potential for coastal flooding and provided recommendations to reduce potential effects of storm-induced flooding and ongoing sea level rise. A subsequent investigation[46] provided more detailed information on existing shoreline conditions at the Project site, which permitted refinement of the recommended shoreline improvements.

Improvements to the shoreline along Candlestick Point would include the placement of additional (rock) riprap to improve the flood protection function of the existing riprap shoreline edge, the creation of a sandy recreational beach at the mid-point of the Wind Meadow reach along the Eastern Shoreline; and the creation of new tidal habitat in several locations. The creation or expansion of beaches or tidal habitat will be determined during the public general plan process for the CPSRA.

Along some areas of the HPS Phase II shoreline, piers and wharves have deteriorated due to structure age and lack of maintenance and near-shore settlement has occurred. Repairs of existing HPS Phase II shoreline structures vary based on type of edge and include repair of piles and deck, concrete crack repairs and rock buttresses along base of the drydocks, removal of upper portion of fill along bulkheads, and rip-rap placement. Several piers and drydocks would be modified by the removal of short section of piers and/or bulkheads (near the shore) to preclude public access, thereby creating opportunities for waterbirds to roost on the retained portions of these structures. In addition, some of the shoreline improvements associated with HPS Phase II include transforming the revetment edge in wave-protected reaches to a more natural looking shoreline by placing suitable fill to cover the revetment that would be constructed by the Navy, which may include Articulated Concrete Block (ACB) mats and/or marsh soils. Shoreline wave berms may be included along the southwest facing shoreline at the bayward end of the ACB mats.

Table II-13 (Summary of Shoreline Improvements at the Project Site) summarizes the proposed shoreline improvements within the Project site, while Table II-14 (Description of Existing Shoreline Conditions and Proposed Improvement Concepts) provides more detail regarding shoreline conditions and improvements.

SOURCE: Moffatt & Nichol, Draft Hunters Point Shoreline Structures Assessment, September 2009.

At some locations, poor condition of existing shoreline features may require an alternate improvement.

a. Alternate improvement: remove or retain but add landscaping to deter public access and provide open space/habitat
b. Alternate improvement: remove and replace with concrete or steel bulkhead
c. Alternate improvement: remove and replace with concrete or steel bulkhead
d. These numbers represent an average estimated change in the shoreline at the specified location. A positive number indicates an increase in the shoreline (bay fill); and a negative number indicates a decrease in the shoreline (creation of bay).

Repair Descriptions:

Deck: Remove and replace deteriorated deck materials

Piles: Limit corrosion by wrapping or encasing piles in concrete and/or improve structural integrity by welding additional steel plates to the piles

Walls: Patch spalls, exposed and corroded reinforcing bars, or broken concrete. Add weep holes (to equalize pressure). As needed, install new sheet piles behind existing wall to form new wall (and remove existing wall).

Riprap: Place additional riprap (e.g., boulders) in the same location as existing riprap.

Modification Descriptions:

Remove: Remove deteriorated piers, pilings, and deck

Remove Portion: Remove a portion of pier near shoreline (to preclude public access)

Slope Top of Wall: Remove the top portion of a wall (e.g., 10–15 feet) and slope back top of wall at approximate slope of 2H:1V

New Buttress: Install new underwater rock and/or sand buttress at base of wall to improve structural stability of adjacent wall. Additional analysis will be required to determine the need for a buttress at some locations.

Sandy Beach: Slope back surface at approximate slope of 6H:1V to create sandy beach for recreational purposes

Tidal Habitat: Take advantage of sloped surface (or reduce slope where needed) to install aquatic plants and create new tidally-exposed habitat

Change in Shoreline Location: approximate change (in feet) in the location of shoreline (compared to existing conditions) which would result from proposed shoreline improvements.

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
North Shore	Grasslands South, Bayview Gardens North, Last Rubble	Waterfront Recreation	The slope protection on the north portion of the segment is a mixture of concrete rubble, rock riprap, and brick. The slope protection varies in size from cobbles to 4 feet in diameter. The north shoreline shows two small areas of unprotected shoreline that are fronted by exposed mud flats and vegetation.	Improve the present riprap edge along the shoreline to required elevations (placing riprap) to remain consistent with the present configuration. At the two reaches where opportunities exist for a natural edge, lay back the slope at a flatter configuration and plant marsh plantings.
East Shore	Last Rubble, Heart of the Park	Waterfront Recreation	The eastern shoreline is mainly riprap protected, except for one small sandy beach area built as a demonstration project by Art Ecology, a local community group. Burrowing from ground squirrels and other rodents was noted along the eastern, unprotected portions of this segment.	Improve the present riprap edge along the shoreline to required elevations (placing riprap) to remain consistent with the present configuration. At the mid-point of the Wind Meadow reach, construct a sandy recreational beach by laying the slope back at a 6H:1V or flatter configuration.
South Shore	Point, Heart of the Park, Neck, Last Port	Waterfront Recreation	The slope protection on the south portion of the Candlestick segment is primarily rock riprap. The slope protection varies in size from 1 to 4 feet in diameter. Along the majority of the south-facing shoreline, active erosion was observed in the higher portions of the embankment.	Improve the present riprap edge along the shoreline to required elevations (placing riprap) to remain consistent with the present configuration.
B	Drydocks 5 to 7	Northside Park/ Waterfront Promenade	The portion of shoreline west of the submarine drydocks (Drydocks 5, 6, 7) is an embankment protected by riprap, with some sandy pocket beach areas in the sheltered coves. This segment is part of the Navy's proposed remediation action, and is therefore not included in the analysis. The submarine drydocks consist of three slipways (Drydocks 5, 6, and 7) with concrete bulkheads on either side of each slipway. The portion between adjacent bulkheads consists of timber pile-supported deck. Portions of this segment are part of the Navy's remediation action, wherein the timber structures will be demolished and any contaminated sediments at the bottom of the drydocks will be dredged by the Navy. The remaining portions (shoreline and concrete structures perpendicular to shoreline) are part of the Redevelopment project.	This portion of shoreline will be improved to a riprap revetment by the Navy. The Navy will demolish the timber portions of the drydocks, and excavate any contaminated sediments. As part of the redevelopment project, the following improvements are envisioned: ■ Concrete bulkheads will be left in place but disconnected from the shoreline by demolishing the sections near the shoreline to prevent public access to the walls for safety reasons ■ For slope stability reasons, a rock buttress will be placed along the quay-wall extending from the bottom of the docks to about mid-tide level elevation (to be determined after geotechnical studies are complete) ■ Weep-holes will be constructed in the quay-wall above low tide elevation to relieve the loading from the backfill along the shoreline

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
	Wharf—Berths 55 to 61	Waterfront Promenade	The wharf at berths 55-61 is approximately 1,100 ft long. Berths 55, 56, 57, and 58 are located along two piers perpendicular to the wharf and constructed of timber decking and supported by timber piles. The pier for berths 59 and 60 (located just to the east of Berths 57 and 58) no longer exists. The wharf is a reinforced concrete structure and the timber piers are connected to the concrete wharf. Each bent is supported by four 4-ft-diameter concrete-filled caissons, the bents are spaced at 40 ft on center. The deck is a reinforced concrete slab supported by reinforced concrete beams and a deck elevation of +13.25 ft MLLW. The record drawings indicate precast beams and cast in place deck slab with a thickness of 14 inches. Based on drawing information found, the Design Live Load for this wharf is 600 pounds per square foot (psf). Furthermore, it is also designed for a truck crane loading of 21,000 lbs. per wheel (truck crane with 6 wheels). The riprap slope protection underneath the wharf is a minimum 2 ft thick based on the drawings and has a slope of 1.5 horizontal to 1 vertical (1.5H:1V). <u>Riprap-Protected Slope East of Berth 55 (Heritage Park)</u> This segment of shoreline is protected by concrete debris and riprap, and is part of the Navy's remediation action. Therefore, it is not included in the analysis.	The wharf at Berths 55 through 61 will need to be repaired and upgraded so that it can be used as a promenade for public access. Proposed repairs are: ■ Repairs to the 4-ft diameter steel caisson piles, which could range from limiting ongoing corrosion by wrapping or encasing the piles in concrete, to structural retrofit of piles by welding additional steel plates to the piles ■ Repairs to the reinforced concrete beams and deck slab including spall repair using shotcrete, grout, and/or epoxy injections. <u>Riprap Protected Slope East of Berth 55 (Heritage Park)</u> This portion of shoreline will be improved to a riprap revetment by the Navy.
C	Drydock 3	Heritage Park	Drydock 3 is a reinforced concrete structure with concrete sidewalls. The cross-section of the drydock varies from trapezoidal to rectangular, and the bottom surface is reinforced concrete. The concrete sidewalls vary between smooth-surfaced and stepped, depending on location and elevation. The concrete steps at some places of the concrete sidewalls apparently provided operational access during drydocking.	The drydock is proposed to remain at its current configuration but with the following modifications: ■ Add weep holes on the sidewall to reduce pressure behind it. These weep holes shall be located above the lowest tide and shall extend to near the top of the drydock walls ■ Add rock or sand buttress on the face of the drydock walls at the bottom. This will result in additional passive resistance with the intent of increasing slope stability ■ Patching all exposed spalls, replacement of reinforcing bars if necessary, epoxy material injection to cracks, and filling any holes and/or depressions.

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
	Wharf—Drydocks 2 & 3	Heritage Park	There is a timber pile-supported wharf designated as Wharf No. 2 located between Drydock No. 2 and 3. The deck framing consist of 4 x 12 timber planks, 4 x 14 stringers, and 14 x 14 timber pile caps. The supporting timber piles are spaced at 10 ft maximum. The deck elevation is indicated on the drawings as +12.0 ft MLLW.	This portion of shoreline will be removed by the Navy.
	Drydock 2	Heritage Park	Drydock 2 is very similar to Drydock 3 but smaller (shorter and shallower).	Drydock 2 is similar to Drydock 3 and the repairs described above shall be applied here too.
	Wharf—Berths 1& 2	Waterfront Promenade[a]	The wharf along Berths 1 and 2 is about 1000 ft long and 40 ft wide, and is backed by a concrete bulkhead along the shoreline. It is a reinforced concrete structure consisting of reinforced cast in place deck slab 8-inch thick, 16-inch wide x 36-inch deep beams, 2.5 ft wide x 5 ft deep girders, 4 ft wide x 6.5 ft deep pile caps, and 3 ft diameter concrete-filled steel cylindrical piles. There is a steel (wide-flange section) batter pile connected to the pile cap on the inboard side of the wharf. The batter piles are spaced at 6.25 ft. and the cylindrical piles are spaced at 25 ft on center. The deck elevation is indicated as +12.0 ft MLLW and has a rail track that runs parallel to the face of the wharf. The reviewed drawings indicate a design live load of 600 psf, 15-ton capacity Re-gunning crane, and 25-ton locomotive.	The wharf structure can be repaired and left in its present configuration. Recommended repairs include: ■ Construct a new sheet pile bulkhead behind the existing steel bulkhead because it has very likely corroded to a point past its serviceable life. The new sheet piles will be driven and tied back to form the new shoreline location. ■ Inspect the pile-supported wharf portion of the structure and assess structural integrity of the deck and piles. If the structure is determined to be adequate, or repairable to current codes with relatively minor repairs, conduct the repairs for continued use as a waterfront promenade for public use. If the investigation finds the structure to be significantly deficient or expensive to repair, it will be demolished or left in place with appropriate landscaping improvements that will deter public access and yet serve as open-space.
	Berths 3 to 5	Waterfront Promenade	The shoreline along Berths 3 and 4 is about 1100 ft long. It is constructed as a filled-in quay-wall 58 ft wide using timber cribs and filled with bank run rock fill. The top is at elevation +12.0 ft MLLW. The timber crib wall is founded on a 5 ft thick sand blanket and 18-inch sand piles spaced at 20 ft on centers. The facing of the wharf is a reinforced concrete wall anchored to the timber cribbing. Timber fenders are attached to the concrete wall (at the top), which extend below the MLLW line. The shoreline along Berth 5 is about 400 ft long. It was constructed exactly the same as the quay-wall along Berths 3 and 4.	Based on visual observations and engineering judgment, it is likely that the structure can be repaired and left in its present configuration. Recommended repairs would include the following: ■ Remove the upper portions (10 to 15 ft) of the concrete wall facing including the timber cribbing and bank run rock fill. The facing shall be sloped back at a 2H:1V slope and protected with rock facing to provide a more natural-looking surface without any additional bayfill and related impacts. ■ Patching all exposed spalls, replacement of reinforcing bars if necessary, epoxy material injection to cracks, and filling any holes and/or depressions.

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
	Berths 6 to 9	Waterfront Promenade[b]	The shoreline along Berths 6 through 9 is a 120 ft wide structure, 1000 ft long. Its construction is similar to the wharf for Berths 3 and 4 as filled-in quay-wall. The top is at elevation +12.0 ft MLLW. It is constructed using timber cribs extending the full width and height of the pier and filled with bank run rock fill. The timber crib wall is founded on a 5 ft thick sand blanket underneath a variable thickness bank run rock blanket. The facing of the wharves on each side of the pier is a reinforced concrete wall anchored to the timber cribbing and extends the full height of the pier. Timber fenders are attached to the concrete wall (at the top), which extend below the MLLW line. There are rail tracks along each side and parallel to the face of the pier.	Since this is the same type of construction as for Berths 3 and 4, the recommended modifications are the same. Refer to the description above. However, if additional investigations indicate that the timber cribs have been attacked by marine borers and are beyond repair, the repairs would be more extensive and may include complete demolition of the pier and replacement with a concrete or steel sheetpile bulkhead to serve as wave protection for the proposed marina in its lee.
	Drydock 4	Waterfront Promenade	Drydock 4 is a reinforced concrete structure with concrete sidewalls. The cross section of the drydock varies in trapezoidal shapes – the entrance has steeper sloping walls compared to the main drydock with flatter sloping walls. It is larger compared to Drydocks 2 and 3.	Since this is the same type of construction as for Drydocks 2 and 3, the recommended modifications are the same.
D	Berths 10 through 13	Waterfront Promenade[c]	The shoreline along Berths 10 through 13 was constructed in exactly the same manner as for Berths 6 through 9 (timber crib structure).	Since this is the same type of construction as for Berths 3 and 4, the recommended modifications are the same (see description above). However, if additional investigations indicate that the timber cribs have been attacked by marine borers and are beyond repair, the repairs would be more extensive and may include complete demolition of the pier and replacement with a concrete or steel sheetpile bulkhead to serve as wave protection for the proposed marina in its lee.

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
	Berths 14; Berths 16 to 20	Waterfront Promenade	The shoreline along Berth 14 was constructed exactly the same as for Berths 3 through 5 (timber crib structure). The shoreline along Berths 16 through 20 is a quay-wall type filled-in structure. The pier was designated by the navy as the Regunning Pier. It is 400 ft wide and about 1650 ft long on the north side and about 1000 ft on the south side. The quay wall around the pier is a cellular type cofferdam using steel sheet piles with semi-circular shaped facing (in plan). Each cell is about 31 ft x 65 ft in plan with the sheet piles varying in lengths from 64 ft to 76 ft. The longer piles are along the exterior portion of each cell which represents the wall of the pier. The shorter piles are the "tie back" piles buried within the pier. The cells are filled with hydraulic sand fill. At the outer edge of the cells near the top of the pier, the cells are filled with "Quarry run chips and fines" 9.5 ft thick 5 ft wide at the top and 15 ft wide at the bottom according to the drawings. The rest of the pier is filled with sand or selected bank run fill. Refer to Figure D4 for a typical section of the pier cellular wall and details of its upper portion. The top of the pier is at elevation +12 ft MLLW. Along the edges, there is a 1.5 ft thick concrete cap on top of the steel sheet piles which provides a straight edge for the pier facing. Timber fenders are installed along the face of the pier for berthing. The top is surfaced with a concrete pavement and asphalt-wearing surface. There are rail tracks on top of the pier. At this pier, there is a large overhead crane rated at 450 tons. The crane is supported by steel-framed towers and the foundation for the towers is supported by steel H-shaped piles (14HP89). There are four towers. Each tower is supported by four legs. The foundation for each leg has thirty H-shaped steel piles. The foundation for this crane is independent from the pier cellular wall system. Various sections of the sheet pile wall are dilapidated or sheared off above the water line. The shoreline supported by the sheet pile wall is eroding and failing in locations where the sheet pile wall has been undermined.	<u>Berth 14 (Waterfront Promenade)</u> Since this is the same type of construction as for Berths 3 and 4, the recommended modifications are the same. Refer to the description above. <u>Berths 16 through 20 (Wildlife Habitat)</u> Visual observations of advanced corrosion and deterioration indicate that the steel sheetpile cellular bulkhead, that provides the shoreline facing for the pier, is beyond repair. The improvement options that could be implemented include replacing the bulkhead with a riprap edge or replacing it with a natural shoreline edge. Since the proposed land use is wildlife habitat, the recommended modification is as follows: ■ Lay back the upper portion of the slope by saw-cutting the concrete deck at some distance from the shoreline and removing the sand fill at a 5H:1V slope (or gentler) ■ Cutting the steel sheet piles at about mid-height (approximately low tide) or even lower ■ Placing a coarse sand layer over the excavated slope to serve as substrate for grasses and other plants ■ Constructing a boardwalk along the centerline of the smaller peninsula created as described above

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
	Berths 15, 21, 22, & 29	Waterfront Promenade	The shoreline along Berths 15, 21, 22, and 29 are very similar in construction to the pier for berths 16 through 20 (described above). The wharf facing is a cellular type quay wall consisting of steel sheet piles with the cell filled with hydraulic sand fill. Each cell is 31 ft along the face of the wharf and about 65 ft wide. These berths do not have a concrete cap on top of the steel sheet piles.	Berth 15 (Waterfront Promenade) Visual observations of advanced corrosion and deterioration indicate that the steel sheetpile cellular bulkhead, that provides the shoreline facing for the pier, is beyond repair. The recommended improvement is to remove the upper portion (10 to 15 ft) of the sheetpile wall and sand fill behind it. The facing shall be sloped back at a 2H:1V slope and protected with rock facing to provide a more natural-looking surface without any additional bayfill and related impacts.
	Berths 23 to 28	Wildlife Habitat	The shoreline in this segment consists of a concrete pile-supported pier which is deteriorating. No active reuse is envisioned for the pier, and it will provide habitat for shorebirds.	Since the pier is very likely beyond its serviceable life, the recommended improvement is to detach it from shore and let it convert to a habitat for shorebirds that already use it. The detachment will prevent public access to this unstable pier, as well as raptors from accessing the habitat.
E	Berths 30 to 35	Wildlife Habitat	The shoreline in this segment consists of a concrete pile-supported pier which is deteriorating. No active reuse is envisioned for the pier, and it will provide habitat for shorebirds.	Since this is the same shoreline configuration (pier) as for Berths 23 through 28, the recommended modifications are the same (see description above).
	Berth 36	Grasslands Ecology Park	The shoreline in this segment is very similar in construction to Berth 29 (described above). The wharf facing is a cellular type quay wall consisting of steel sheet piles with the cell filled with hydraulic sand fill. Each cell is 31 ft along the face of the wharf and about 65 ft wide. The berth does not have a concrete cap on top of the steel sheet piles.	Since this is the same type of construction as for Berth 15, the recommended modifications are the same (see description above).
	Berth 37 to 42; Natural Edge/Riprap	Wildlife Habitat	The shoreline in this segment consists of a concrete pile-supported pier which is deteriorating. No active reuse is envisioned for the pier, and it will provide habitat for shorebirds. Riprap Protected Slope (Grasslands Ecology Park) The portion of shoreline west of Berth 36 is an embankment protected by a combination of riprap and concrete debris. Slope protection varies significantly in size from small rock and bricks, 4 to 8 inches in size, to large 4' blocks of concrete debris. This segment is part of the Navy's proposed remediation action, and is therefore not included in the analysis.	Since this is the same shoreline configuration (pier) as for Berths 23 through 28, the recommended modifications are the same (see description above). Riprap Protected Slope (Grasslands Ecology Park) This portion of shoreline will be improved to a riprap revetment by the Navy. However, the presence of vegetation and marshlands in this reach implies that there may be an opportunity to enhance this segment to a more natural marsh / mudflat edge. The recommended improvements include placing a suitable substrate in front of the revetment constructed by the Navy, and seeding it (or allowing natural propagation) with marsh plants.

Table II-14 Description of Existing Shoreline Conditions and Proposed Improvement Concepts

Parcel or Area	*Location*	*Proposed Use*	*Existing Shoreline Conditions*	*Proposed Improvement Concepts*
E2	Natural Edge/Riprap	Grasslands Ecology Park	The shoreline along Parcel E-2 is an unprotected natural shoreline with some debris (broken concrete, broken bricks and random pieces of rock) lining the edges, as well as beach-fronted, unprotected slopes. Similar to Parcel E, this segment of the project shoreline is characterized by slopes protected by riprap or concrete debris, as well as beach-fronted, unprotected slopes. The shoreline shows areas of erosion as well as areas of vegetation/habitat growth within the intertidal zone. Slope protection, where it exists, consists of small rock and bricks, 4 to 8 inches in size.	This portion of shoreline will be improved to a riprap revetment by the Navy. However, the presence of vegetation and marshlands in this reach implies that there may be an opportunity to enhance this segment to a more natural marsh / mudflat edge. The recommended improvements include placing a suitable substrate in front of the revetment constructed by the Navy, and seeding it (or allowing natural propagation) with marsh plants.

Figure II-18 (Shoreline Improvements within Agency Jurisdiction [Below High Tide Elevation]) identifies the areas where the lateral extent of shoreline may increase or decrease relative to the high tide elevation with the conceptual shoreline improvements. Figure II-19 (Shoreline Structures Recommended Work Map) and Figure II-20 (Natural Shoreline Recommended Work Map) show the type of shoreline treatment that will occur within the Project site; these figures also illustrate the specific locations of the various berths, drydocks, piers, and shorelines that are referenced in Table II-14 (in terms of conceptual improvements).

The proposed improvements would repair in place the existing shoreline edge or modify the location of the shoreline in one of the following ways: (1) the removal of the upper portion of a seawall or bulkhead structure (e.g., 10–15 feet) and the creation of a sloped surface (with an approximate slope of 2:1) in the intertidal and above tidal zones; and (2) the creation of a sandy beach (with an approximately slope of 6:1), which would provide recreational access to the Bay or serve as roosting habitat depending on location. The creation of the sloped surface at the top of selected locations would generally result in the shoreline being relocated between 3 feet and 20 feet landward at HPS Phase II. In addition, because of advanced corrosion and deterioration at the Re-gunning Pier (Berths 16 to 20), a natural shoreline edge would be created, which would result in the landward relocation of the shoreline edge by approximately 60 feet. The creation of sandy beaches and mudflats at Candlestick Point would result in the shoreline being located approximately 3.6 feet to 7.6 feet bayward due to placement of appropriate substrate for these improvements. The net effect of the proposed shoreline improvements would be to increase the land surface area by approximately 0.42 acre at Candlestick Point and reduce the land surface area by approximately 8.51 acres at HPS Phase II. The creation of new nearshore habitat in the form of mudflats, sandy beaches, and sloped tidally inundated areas are discussed more fully in Section III.N (Biological Resources).

In addition to shoreline improvement features and to reduce the impact of rising sea levels (Sea Level Rise [SLR]) that could adversely affect the Project site, the Project includes modification of the land surface through grading and importation of fill. These modifications would raise the surface elevation of low-lying areas, including portions of both the Candlestick Point and HPS Phase II areas, as discussed more fully in Section III.M (Hydrology and Water Quality).

Sea Level Rise

Rising sea levels is an ongoing phenomenon, which needs to be accounted for in the planning process to prevent future flooding or loss of infrastructure due to shoreline erosion. Planning for SLR includes three separate components (1) designing the perimeter to be flexible enough that crest elevations could be increased to prevent overtopping, (2) designing the development areas to be high enough that flooding would not occur around dwellings should the perimeter not function adequately, (3) designing the storm drainage system to be flexible enough that higher water levels would not result in overland flooding. It is obvious that while the perimeter and storm drain system could be upgraded over time, habitable structures cannot be raised.

There is no current guidance or policy establishing numeric values for development projects along the Bay edge. The Federal Emergency Management Agency (FEMA) maps flood zones based on present day rainfall and tidal conditions, but regional and local agencies have taken a more proactive approach in reviewing development proposals because of the public infrastructure element that they would be responsible for.

FIGURE II-20

Candlestick Point — Hunters Point Shipyard Phase II EIR

NATURAL SHORELINE RECOMMENDED WORK MAP

A project specific SLR study was undertaken[33] to develop planning and design guidance through the various phases of the project. The study was based on an exhaustive review of the literature, recent guidance from regional agencies, and knowledge of coastal processes of San Francisco Bay. The literature on SLR estimates varies widely, from an observed value of 8 inches per century (historical measurements) to 33 inches per century (Intergovernmental Panel on Climate Change [IPCC] maximum estimate). News articles and semi-empirical studies (Rahmstorf 2007) based in part on recent measurements of ice cap melt, have stated that the increase in SLR over the next 100 years could be much higher than those estimated by IPCC. Even among projections considered plausible, albeit high, by the CALFED Independent Science Board, a SLR of 36 inches would not occur until about 2075 to 2080 and by about 2100 the SLR could reach 55 inches. However, sea level observations since the publication date of the ice cap melt studies, although not conclusive to establish a new trend in SLR, do not show the accelerated SLR trajectory predicted by some of the reports.[34]

Project design for SLR meets both near term (2050) and long-range (2080) objectives; and in addition, incorporates an adaptive management strategy to address sea level rise for the most conservative estimates at 2100 and beyond. Since building structures are generally "immovable," whereas a perimeter and/or storm drain system can be adapted to keep up with changing sea levels, each was designed to a specific planning horizon as described below.

Development Design

For building structures, a 36-inch SLR allowance plus a freeboard of 6 inches was selected as the design criteria to use for design and construction. Per the most conservative rate of SLR (Rahmstorf, 2007 which includes ice-cap melt estimate), a SLR of 36 inches would not occur until about 2080,[35] which would be approximately 50 years beyond the last phase of construction for the project. Ongoing measurements of SLR from the scientific community would be incorporated into Monitoring and Adaptive Management Plans, administered by a Geologic Hazard Abatement District (GHAD) or other entity with similar funding responsibility.[36] This entity would guide the decision-making process for implementation of future improvements, such as raising the perimeter. The proposed Monitoring and Adaptive Management Plan for the project would have the appropriate language that specifies management actions that would need to occur should SLR exceed 36 inches. Should the SLR exceed 36 inches, the proposed project-specific funding mechanism (GHAD or similar) would pay for improvements.

Perimeter and Storm System Design

For the perimeter system, it is not practical to build a high wall around the project for a design condition that may not happen for several decades. At the same time, it is not prudent to build to present sea level conditions and keep raising it as sea levels rise. Therefore, an interim sea level rise estimate for the year

[36] Moffatt & Nichol, *Hunters Point Shoreline Structures Assessment*, October 2009.

2050, as put forth by BCDC and the State Coastal Conservancy,[37] was selected as the design criteria to use for design and construction. That sea level is 16 inches higher than the present, which will ensure that adaptive management construction activities are not triggered until at least the year 2050. In addition, the shoreline and public access improvements have been designed with a development setback to allow any future increases in elevation to accommodate higher SLR values, should they occur.

For the storm drain system, the same approach as the perimeter system described above was adopted. This will avoid installing pumps and other appurtenances at the present time, when they are not needed, while still ensuring that an adaptation strategy and a funding mechanism exists for future management actions.

Figure II-21 (Flood Zones [Existing and with a 36-Inch Sea Level Rise]) shows the existing flood zone and the flood zone with a 36-inch SLR scenario. With the proposed project improvements at the time of construction, the flood zone would be reduced to that shown in Figure II-22 (Flood Zones [With Project]).

Figure II-23 (HPS Shoreline Section [Berths 55 to 60; Waterfront Promenade]), Figure II-24 (HPS Shoreline Section [Berths 3–5; Marina]), Figure II-25 (HPS Shoreline Section [Berths 16–20; Re-Gunning Pier]), and Figure II-26 (HPS Shoreline Section [Grasslands Ecology Park]) show typical sections along the edge of the proposed development. Figure II-27 (Candlestick Point Section [The Neck Area of the CPSRA]) shows proposed shoreline improvements at "The Neck" area of the CPSRA.

Building Construction

The Project would include a variety of land uses, such as residential, retail, office, research and development, hotel, artists' studios/art center, community services, parks and open space, football stadium, marina, performance venue, and associated parking. Building construction would include development of new buildings as well as planting of new landscaping, the application of architectural coatings on buildings, and paving of roadways and walkways (although these two activities would not occur simultaneously).

Controlled Rock Fragmentation

Different densities or hardness of rock exist at Candlestick Point: Franciscan Sandstone and Shale at the Alice Griffith Housing site and Franciscan Chert, Sandstone, Shale and Greenstone near Jamestown Avenue.[38] Harder areas of bedrock may require alternative techniques for removal such as controlled rock fragmentation. Controlled rock fragmentation technologies include pulse plasma rock fragmentation (PPRF), controlled foam or hydraulic injection, and controlled blasting. In some scenarios it may be necessary to utilize a combination of these techniques. Controlled blasting can typically be performed at noise levels below typical building demolition levels (80–100 dBA).

Current estimates indicate 98,000 cubic yards (CY) of rock near Jamestown Avenue may need to be removed using controlled rock fragmentation. To accomplish this within the 8-month demolition/grading time period, controlled rock fragmentation removing 12,000 CY each month will need to occur.

FIGURE II-27

Candlestick Point — Hunters Point Shipyard Phase II EIR

CANDLESTICK POINT SECTION (THE NECK AREA OF THE CPSRA)

Current estimates indicate approximately 42,000 CY of hard rock exists within three areas of Alice Griffith. For estimation purposes, it is assumed that each area may contain a third of this volume, or 14,000 CY of rock, that may need to be removed using controlled rock fragmentation. Removal of 14,000 CY of rock could potentially be completed within 6 weeks utilizing three events, each event producing approximately 4,500 CY, with a two-week period between events for set up and excavation. The three events within Alice Griffith would occur sequentially; approximately 17 weeks would be needed for these events at Alice Griffith. Figure II-16 identifies the location of controlled rock fragmentation. Table II-15 (Building Construction Completion Dates) presents the timeline for the proposed building construction for the Project.

Candlestick Point

Building construction at Candlestick Point would coincide with completion of the utilities and roadways for each district. Building construction would begin in the Alice Griffith district. The second major phase of development would construct the Candlestick North district. Development of CP Center District and the Harney Way improvements would occur in Phase 3, and, finally, CP South and major shoreline improvements would be completed in Phase 4. Development in Candlestick Point would begin in 2012 and would conclude in 2031.

■ Hunters Point Shipyard Phase II

At Hunters Point Shipyard, new development would begin with the construction of the 49ers stadium, scheduled for completion during the 2014–2017 time period. Hunters Point North residential development and the mixed-use, neighborhood retail and residential development at Hunters Point Village Central District would begin in the first Major Phase and is planned for completion by 2023. Build-out of the Shipyard Research and Development Park is planned by 2027.

■ Parks and Open Space

In general, parks and open space would be developed at the same time as adjacent building construction (Figure II-17).

II.F.3 Construction Equipment

Site earthwork and grading activities would typically be performed using standard construction equipment, such as excavators, loaders, tractors, compactors, crushers, graders, and water trucks. Import fills and export material would be loaded and transported using loaders, standard size haul trucks, and barges. Site earthwork and grading activities would be planned to match yearly site development phasing. Typically, work would be performed during normal workdays and hours.

■ Candlestick Point

Construction activities in Candlestick Point would occur from 2012 through 2031.[39] Off-site roadway, utility, and shoreline improvements would be constructed beginning in 2013 and would align with vertical development. The number of construction workers on the site on any given day would vary from a low of 70 during the final stages of vertical development to a maximum of 328 workers during the peak years of development. The number of truck trips on any given day would vary from a low of 8 truck trips to a maximum of 96 during site preparation at Alice Griffith. The number of on-site equipment would be about 68 pieces during the height of construction activity.

■ Hunters Point Shipyard Phase II

Construction activities in HPS Phase II would occur from 2011 through 2031.[40] Off-site roadway, utility, and shoreline improvements would be constructed beginning in 2013 and would align with vertical development. The number of construction workers on the site on any given day would vary from a low of 15 workers during the final stage of vertical development to a maximum of 455 workers during the peak years of development. The number of truck trips on any given day would vary from a low of 4 to 8 trucks trips to a maximum of 288 truck trips primarily during the peak year of grading and infrastructure development. The number of on-site equipment would be about 65 pieces during the height of construction activity.

[39] Construction schedules may vary if the SF 49ers elect to renew their lease at the current stadium site until 2017 and potentially, an additional 5 years until 2023.
[40] Ibid.

II.G APPROVAL REQUIREMENTS

Consistent with the intended uses of the EIR, implementation of the Project would require multiple approvals from City, regional, state, and federal agencies. Table II-16 (Major Project Approvals) presents the major approval requirements.

Table II-16 Major Project Approvals

CITY AND COUNTY SAN FRANCISCO APPROVAL PROCESS AND PERMITS

Redevelopment Agency Commission

- Certifies the Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and a mitigation monitoring and reporting program
- Reports to the Board of Supervisors on the amendments to Redevelopment Plans
- Approves amendments to the Hunters Point Shipyard Redevelopment Plan and approves amendments to the Hunters Point Shipyard Design for Development
- Approves amendments to the Bayview Hunters Point Redevelopment Plan and approves a Design for Development for Candlestick Point
- Approves land transfer agreements with the Navy, City, and State agencies
- Approves land transfer agreements with Port Commission, State Lands Commission, and California Department of Parks and Recreation (CDPR)
- Approves Disposition and Development Agreements and Owner Participation Agreements

Port Commission

- Approves land transfer agreements with Agency, State Lands Commission, and CDPR

Planning Commission

- Certifies the Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and mitigation monitoring and reporting program
- Approves shadow determinations/impacts
- Adopts amendments to the General Plan to accommodate the Project and to find the amendments for the Hunters Point Shipyard Redevelopment Plan and Bayview Hunters Point Redevelopment Plan in conformity with the General Plan
- Adopts resolution recommending to the Board of Supervisors approval of amendments to the *Planning Code*/Zoning Maps for the Project
- Authorizes cooperative agreement with Redevelopment Agency

Board of Supervisors

- Affirms certification of Final EIR
- Adopts CEQA findings, a statement of overriding considerations, and a mitigation monitoring and reporting program
- Approves General Plan amendments
- Approves amendments to the Hunters Point Shipyard Redevelopment Plan and the Bayview Hunters Point Redevelopment Plan
- Approves amendments to the *Planning Code*/Zoning Maps
- Approves other necessary code amendments
- Approves a Joint Facilities Agreement and Tax Allocation Agreements with the Redevelopment Agency
- Approves land transfer agreements

San Francisco Public Utilities Commission

- Approves Project infrastructure for water, sewer, stormwater, and electricity

Department of Building Inspection

- Approves Project construction-related permits.

Table II-16 Major Project Approvals

Department of Public Works

- Approves subdivision maps, public improvements, and infrastructure

Department of Public Health

- Recommends ordinance to Board related to oversight of environmental controls; oversees compliance with environmental controls

Municipal Transportation Authority

- Approves transit improvements

Department of Recreation and Parks

- Approves land transfers
- Recommends to Planning Commission shadow determinations/impacts

Art Commission

- Approves public art and the design of public structures on City property

San Francisco Housing Authority

- Approves replacement of Alice Griffith public housing

REGIONAL, STATE, AND FEDERAL APPROVALS

Bay Conservation and Development Commission

- Approves amendments of the Bay Plan and Seaport Plan
- Approves permits for activities within BCDC's jurisdiction, including the proposed Yosemite Slough bridge
- Reviews Project land use plan for federal consistency under the Coastal Zone Management Act for activities not previously authorized in Consistency Determination No. CN 1-99

State Lands Commission

- Approves public trust land agreement

California Department of Parks and Recreation

- Approves agreement for the reconfiguration of Candlestick Point State Recreation Area
- Approves General Plan Amendment for the reconfiguration of Candlestick Point State Recreation Area

California Department of Transportation

- Approves any necessary encroachment permits for the Project roadway improvements

Regional Water Quality Control Board

- Approves Section 401 water quality certification

Bay Area Air Quality Management District

- Approves any necessary air quality permits for individual uses

Navy

- Authorizes the execution of necessary transactional documents with the Redevelopment Agency to transfer property at Hunters Point Shipyard for the development of the Project

US Army Corps of Engineers

- Approves permit for fill related to the Yosemite Slough bridge, shoreline improvements, and other activities.
- Consults with USFWS or NMFS regarding federally listed species prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to Section 7 of federal ESA
- Consults with NMFS regarding pile-driving and harbor seal and California sea lion prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to *Marine Mammal Protection Act*
- Consults with NMFS regarding modifying designated EFH prior to carrying out its discretionary authority under Section 404 of the CWA, pursuant to the *Magnuson-Stevens Act*

Table II-16 Major Project Approvals

Department of the Interior
■ Approves conversion of portions of Candlestick Point State Recreation Area reconfiguration improved with Land and Water Conservation Fund grants
US Coast Guard
■ Issues determination regarding vessel navigability for the Yosemite Slough bridge
US Department of Housing and Urban Development
■ Approves land transfer agreements involving Alice Griffith public housing site and funding approvals

SOURCE: Agency, Planning Department.

This Table is not intended to provide an exhaustive or exclusive list of the numerous public agency approvals that may be necessary to carry out the Project over its 20-year build-out. Instead, the Table provides a list of the major land use entitlements and related approvals anticipated from local and State agencies that may rely on this EIR. It is also anticipated that other permit and transactional approvals will be necessary as these major entitlements are implemented and that the approving public agencies, to the extent required by law, will rely on this EIR, in accordance with the requirements of CEQA and the CEQA Guidelines, in granting such approvals. This Table also lists federal agencies that would have jurisdiction over certain aspects of the Project.

II.G.1 General Plan Amendments, Planning Code Amendments, Redevelopment Plan Amendments

Implementation of the Project includes amendments to the *Bayview Hunters Point Redevelopment Plan* adopted in 2006 and the *Hunters Point Shipyard Redevelopment Plan* adopted in 1997.

Following certification of the EIR, the Redevelopment Plan Amendments will be considered by the Agency and by the Board of Supervisors. Adoption of the Redevelopment Plan Amendments would enable the Agency to (1) use redevelopment funds or financing mechanisms to remedy the blight that now characterizes the Project Areas; and (2) establish land use standards to allow and control development of the Project Areas.

In addition, adoption of the Project would include amendment of some components of the *San Francisco General Plan* to ensure consistency with the Redevelopment Plan Amendments; however, the General Plan contains a number of elements with most objectives, policies, and principles that are relevant to the Project that would not require any changes.

II.G.2 Disposition and Development Agreement

The DDA would allow and govern the physical construction of each element of the Project and establish and govern the relationship between the Agency and the Project Applicant regarding acquisition, ownership, assembly of a Project site, and financing, construction, ownership, and operation of Project improvements.

II.G.3 Design for Development

Design for Development documents (D4D) that would apply in each of the redevelopment plan areas would be among the implementing documents of the Redevelopment Plans. The Redevelopment Plan documents would set forth policies and principles for urban design within the Project site. The Redevelopment Plan documents would provide design standards, such as height, bulk, and density parameters that would apply to the Project.

The Redevelopment Plan documents would largely function as the *San Francisco Planning Code* for the Project site. Section II.G (Approval Requirements) provides additional information on Project implementation steps.

II.G.4 Project Plans

The following project plans will be approved and become binding at the time the Disposition and Development Agreement is approved:

Sustainability Plan. The Sustainability Plan details the goals and strategies that the Project will employ to achieve sustainability targets in seven focus areas that span the economic, social and environmental aspects of sustainability: economic vitality and affordability, community identity and cohesion, public well-being, safety and quality of life, accessibility and transportation, resource efficiency, ecology and advanced Information and communications technology.

Infrastructure Plan. The Infrastructure Plan includes grading plans for sea level rise, and plans for the low-pressure and high-pressure water distribution system, reclaimed water distribution, separated sanitary sewer collection, separated storm drain collection, low impact development strategies for stormwater management, and joint trench systems for electrical, communications and gas utilities.

Transportation Plan. The Transportation Plan describes the Project's Transportation Demand Management program (e.g., car pools, car sharing, transit passes, and "unbundled parking"), new and extended transit services, and on and off-site street network improvements.

Parks, Open Space, and Habitat Concept Plan. The Parks, Open Space, and Habitat Concept Plan describes the vision and guiding principles for Project parks, open space and habitat restoration. Included are descriptions of both passive and active recreational opportunities, an ecological program to restore native habitats, and cultural programming to highlight Shipyard's maritime heritage. Design guidelines for improvements including, trails, furnishings, and public art would also be included.

II.H TECHNICAL, ECONOMIC, AND ENVIRONMENTAL CHARACTERISTICS

The Project's technical characteristics are described in Section II.E (Project Characteristics). The site's environmental characteristics, including the environmental setting and anticipated environmental impacts, are described in Chapter III (Environmental Setting, Impacts, and Mitigation Measures). The Project would bring economic benefits to the City including an expanded economic base and additional sources of employment, as well as needed housing for all income levels. The Project would generate up to 10,730 employment positions. Approximately 3,476 new employees would be associated with Candlestick Point, and primarily with the regional retail uses. Approximately 7,254 new employees would be associated with HPS Phase II, and primarily with the R&D uses. The 350 jobs associated with the new 49ers stadium are mostly relocated from Candlestick Point to HPS Phase II.

In addition, construction employees would also be needed to construct the Project. The number of construction employees would vary depending upon the phase of construction, but would range from 83

workers at the commencement of construction activities to approximately 617 workers during2015, the most labor-intensive phases of construction. An additional discussion of the economic characteristics of the site is provided in Section III.C (Population, Employment, and Housing) and Section V (Growth Inducement, and Secondary Land Use Effects).

CHAPTER III Environmental Setting, Impacts, and Mitigation Measures

III.A INTRODUCTION TO ANALYSIS

Section III.B through Section III.S of Chapter III of this EIR contain a discussion of the potential environmental impacts of implementation of the Candlestick Point–Hunters Point Shipyard Phase II Development Plan Project, including information related to existing site conditions, analyses of the type and magnitude of Project-level and cumulative environmental impacts, and feasible mitigation measures that would reduce or avoid identified significant adverse environmental impacts.

III.A.1 Comments Received on the Notice of Preparation

During the 30-day public review period for the NOP, which began on August 31, 2007, and ended on September 29, 2007, comment letters were received from public agencies and individuals, as further discussed in Chapter I (Introduction) of this EIR. Additional comments were also received during the September 17, 2007, and September 25, 2007, scoping meetings. The NOP, the NOP comment letters, and scoping meeting minutes are included in Appendix A (Notice of Preparation and NOP Comments) of this EIR and were considered in the EIR analyses.

III.A.2 Scope of the EIR

The environmental analyses are presented in the following order:

- Land Use and Plans (Section III.B)
- Population, Housing, and Employment (Section III.C)
- Transportation and Circulation (Section III.D)
- Aesthetics (Section III.E)
- Shadows (Section III.F)
- Wind (Section III.G)
- Air Quality (Section III.H)
- Noise (Section III.I)
- Cultural and Paleontological Resources (Section III.J)
- Hazards and Hazardous Materials (Section III.K)
- Geology and Soils (Section III.L)
- Hydrology and Water Quality (Section III.M)
- Biological Resources (Section III.N)
- Public Services (Section III.O)
- Recreation (Section III.P)
- Utilities (Section III.Q)
- Energy (Section III.R)
- Greenhouse Gas Emissions (Section III.S)

All impacts associated with agricultural resources and mineral resources have been determined to be "Effects Not Found to Be Significant" according to Section 15128 of the CEQA Guidelines, and are briefly discussed in Chapter V (Other CEQA Issues) of this EIR.

III.A.3 Format of the Environmental Analysis

Each environmental topic in Section III.B through Section III.S of the EIR presents a project-level analysis of the Project's direct and indirect environmental impacts on the environment. Each section includes an introduction, a description of the environmental setting, the regulatory framework, Project- level impacts and proposed mitigation measures, and cumulative impacts. The impact sections include an analysis of the overall impacts of the Project, as well as an analysis of the Project impacts within the two geographically distinct portions of the Project (i.e., Candlestick Point and Hunters Point Shipyard Phase II). Construction and/or operation of shoreline improvements, the marina, Yosemite Slough bridge, or transportation improvements are typically discussed separately, unless there is a reason to discuss them with the Candlestick Point or Hunters Point Shipyard Phase II analyses.

The organization of each of Section III.B through Section III.S follows the outline below:

Introduction

The Introduction provides a brief description of the types of impacts that are analyzed in the section. For sections that are lengthy or analytically complex, an introductory overview of the format and structure of the section is presented.

Environmental Setting

As required by Section 15125(a) of the CEQA Guidelines, the Environmental Setting includes a description of the existing conditions at the Project site and/or in the vicinity of the Project site that provide the "baseline condition" against which Project-related impacts are compared. While the baseline condition is generally the physical conditions that existed at the time the NOP is published, which was August 2007, there may be reasons why a different baseline condition should be used for the analysis. For example, the baseline condition for transportation/traffic, air quality, and noise is the date(s) the traffic counts were taken, while the baseline condition for biological resources is the last date of the field surveys. Each section describes the baseline condition for that particular analysis.

Regulatory Framework

The regulatory framework provides a discussion of federal, state, and local regulations, plans, policies, and/or laws that are directly relevant to the environmental topic being analyzed.

Impacts and Mitigation

The impacts and mitigation discussion is divided into the following subsections, as described below.

Significance Criteria

The impact significance criteria used in this EIR are based on San Francisco Planning Department Major Environmental Analysis (MEA) and San Francisco Redevelopment Agency guidance regarding the environmental effects to be considered significant. This guidance is, in turn, based upon Appendix G to the CEQA Guidelines and MEA's Initial Study checklist, with some modifications. In cases where potential environmental issues associated with the Project are identified, but are not clearly addressed by the guidance listed above, additional impact significance criteria are presented. The significance criteria used for each environmental topic/resource are presented at the beginning of the impact discussion in each section of Chapter III of this EIR.

Analytic Method

This subsection identifies the methodology used to analyze potential environmental impacts for each environmental topic under the identified significance criteria. Some evaluations (such as for air quality, traffic, and noise) are quantitative, while others, such as for visual quality and urban design, are qualitative.

Construction and Operational Impacts and Mitigation Measures

This subsection describes the potential direct and/or indirect environmental impacts of the Project and, based on the significance criteria, determines the significance of each environmental impact. Project design features, such as green or sustainability features, that avoid or minimize adverse impacts on the environment are included as part of the Project analyzed in each impact discussion. As previously mentioned, the environmental impacts are described for the Project as a whole, and for the two geographically distinct portions of the Project (e.g., Candlestick Point or Hunters Point Shipyard). Where impacts could occur as a result of construction of the Yosemite Slough bridge, the marina, or the shoreline improvements, those impacts may be discussed separately. In some instances, the analyses for Candlestick Point and Hunters Point Shipyard Phase II are similar, and, therefore, are discussed together as the Project, and are not differentiated by area. (The section provided below, entitled "Analysis Format," provides a visual example of how the analysis is presented in the EIR.)

Each impact is summarized in an "impact statement" that is separately numbered, coincides with an identified significance criterion, and is followed by a detailed discussion. The impact statement also identifies the level of significance after implementation of all feasible mitigation measures. This format is designed to assist the reader in quickly identifying the subject and conclusion of the impact analyses.

The impact statements reflect whether the impact is caused by construction of the Project; implementation of the Project (meaning the conditions that would exist after the Project were constructed, which is generally related to the development pattern); or operation of the Project (reflecting conditions that would exist during actual operational activities, such as additional motor vehicle trips that would be generated by the Project). In a few instances, the impact statement is factual, such as "The Project would conform to the current regional air quality plan." In all cases, the impact statement reflects the condition that would result after the implementation of all of the identified mitigation measures.

A single criterion may have more than one "type" of impact that is analyzed. As an example, in Section III.N (Biological Resources), there is a significance criterion that relates to potential impacts to

sensitive species or habitats. Under that significance criterion, several types of impacts are analyzed in separate impact discussions, such as impacts to wetlands and impacts to individual sensitive species.

The geographic scope of the impact analyses varies depending upon the specific environmental issue being analyzed. Where the impact analysis identifies significant adverse environmental effects that could be reduced or avoided through implementation of a mitigation measure, the measure is presented after the relevant impact discussion. Mitigation measures identify specific and measurable actions that could be taken to reduce potentially significant environmental impacts.

Project impacts are also assessed in light of existing regulatory requirements that could serve to mitigate potential impacts. The effectiveness of existing regulations to mitigate potential impacts is often affected by discretionary requirements, site characteristics, and project features and design-level considerations that are not yet detailed. Because there is some discretion in how these regulations can be applied, for some impacts, these requirements are included as mitigation measures to outline the specific process by which the Project will comply with these regulations.

Mitigation measures identify the parties responsible for implementation, a timeframe for implementation, and any applicable public agency approval, oversight, or monitoring that may be required. Mitigation measures would usually be implemented by the Project Applicant, with oversight by one or more public agencies, unless indicated otherwise.

This subsection concludes with a statement regarding whether the impact, after implementation of the mitigation measures and/or compliance with existing local, State, and federal laws and regulations, would remain significant or be reduced to a less-than-significant level.

The Draft EIR uses the following terms to describe the level of significance of impacts identified during the course of the environmental analysis:

- **Significant Impact (S)**—A "significant effect" is defined by Section 15382 of the CEQA Guidelines as "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment … [but] may be considered in determining whether the physical change is significant." As defined in this EIR, a significant impact exceeds the defined significance criteria and will result in significant and unavoidable impacts, either with or without feasible mitigation. If there are no feasible mitigation measures to reduce the impact, including compliance with existing local, State, and federal laws and regulations, it is considered significant and unavoidable (SU) at the conclusion of the analysis. If there are feasible mitigation measures to reduce the impact, including compliance with existing local, State, and federal laws and regulations, it is considered significant and unavoidable with mitigation (SU/M) at the conclusion of the analysis.
- **Potentially Significant Impact (PS)**—Impact that could exceed the defined significance criteria, but can be eliminated or reduced to a less-than-significant level through implementation of the identified mitigation measures.
- **Less-Than-Significant Impact (LTS)**—Impact that does not exceed the defined significance criteria or would be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and federal laws and regulations.

- **No Impact (NI)**—No adverse changes (or impacts) to the environment are expected.
- **Significant and Unavoidable Impact (SU)**—Impact that exceeds the defined significance criteria and cannot be eliminated or reduced to a less-than-significant level through compliance with existing local, State, and federal laws and regulations and/or implementation of all feasible mitigation measures.
- **Significant and Unavoidable Impact with Mitigation (SU/M)**—Impact that exceeds the defined significance criteria and can be reduced through compliance with existing local, State, and federal laws and regulations and/or implementation of all feasible mitigation measures, but cannot be reduced to a less-than-significant level.
- **Less-Than-Significant Impact with Mitigation (LTS/M)**—Impact that is reduced to a less-than-significant level through implementation of the identified mitigation measures.

- This EIR evaluates the direct, indirect, and cumulative impacts resulting from planning, construction, and operation of the Project, including impacts that occur on site or off site. Since publication of the Draft EIR, the development was revised to begin one to two years later, with the completion of building construction in 2031 (rather than 2029) and full occupancy by 2032. Appendices A1 through A5 provide substantiation that the change in phasing does not alter the conclusions of this EIR.

Analysis Format

The impact number and the subject matter of the analysis is first presented in a banner to clearly indicate what is being discussed. Following that, there are usually three impact statements and related impact discussions. Using the following example as a guide, the first one addresses Candlestick Point (i.e., Impact PH-2a), the second addresses HPS Phase II (i.e., Impact PH-2b), and the third addresses the impact of the Project (i.e., Impact PH-2), which is the combined impact of Candlestick Point and HPS Phase II. Where impacts could occur as a result of construction of the Yosemite Slough bridge, the marina, or the shoreline improvements, those impacts are usually discussed separately, resulting in four or more impact discussions, which would be numbered Impact PH-2c, Impact PH-2d, and Impact PH-2e, using the numbering sequence of the following example. In these cases, the impacts are still summarized with a combined impact of the Project. One exception to this general format is in Section III.N, where Project impacts are presented after the discussion of individual impacts at Candlestick Point and HPS Phase II. Project impacts begin with Impact BI-22 and conclude with Impact BI-26.

The following is an example of how the impact analysis is usually presented:

Impact PH-2: Population Growth

Impact of Candlestick Point

Impact PH-2a **Operation of the development at Candlestick Point would induce direct and indirect population growth, but this growth would not be considered substantial. (Less than Significant) *[Criterion C.a]***

Impact Discussion

Impact of Hunters Point Shipyard Phase II

Impact PH-2b **Operation of the development at HPS Phase II would induce direct and indirect population growth, but this growth would not be considered substantial. (Less than Significant) *[Criterion C.a]***

Impact Discussion

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact PH-2 **Operation of the Project would induce direct and indirect population growth, but this growth would not be considered substantial. (Less than Significant) *[Criterion C.a]***

Impact Discussion

As previously noted, in some instances, the analyses for Candlestick Point and Hunters Point Shipyard Phase II are similar, and, therefore, are discussed together as the Project; in these cases, the analysis is not differentiated by area. The following is an example of how the impact analysis is presented in these situations:

Impact AE-1: Effect on a Scenic Vista or Scenic Resources

Impact AE-1 **Construction activities associated with the Project would not have a substantial adverse effect on a scenic vista or scenic resources. (Less than Significant) *[Criteria E.a and E.b]***

Impact Discussion

Cumulative Impacts

CEQA requires that EIRs discuss a project's potential contributions to cumulative impacts, in addition to project-specific impacts. Section 15130(a)(1) of the CEQA Guidelines states that a "cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts." Other projects include past, present, and reasonably probable future projects.

Section 15130(b)(1) of the CEQA Guidelines states that the approach to the cumulative impact analysis may be based on either of the following approaches, or a combination thereof:

- A list of past, present, and probable future projects producing related or cumulative impacts
- A summary of projections contained in an adopted general plan or related planning document designed to evaluate regional or areawide conditions

For the purposes of this EIR, the analysis of the potential for the Project's incremental effects to be cumulatively considerable is based upon a list of related projects identified by the City and neighboring jurisdictions and/or on full implementation of the City's General Plan and/or other planning documents, depending upon the specific impact being analyzed. For example, the cumulative analysis for the Traffic Study (which is the basis for many of the cumulative analyses in this document) uses the San Francisco

County Transportation Authority (SFCTA) travel demand forecasting model, which projects general background growth based on Association of Bay Area Governments (ABAG) projections and is consistent with buildout of the City's General Plan. The Traffic Study specifically updated the background growth assumptions based on information regarding a number of major related projects, including (Figure III.A-1 [Cumulative Development in the Project Vicinity]):

- India Baseline Shoreline
- Hunters Point Shipyard Phase I
- Hunters View
- Jamestown
- Executive Park
- Brisbane Baylands
- Cow Palace
- Visitacion Valley/Schlage Lock

- A comprehensive list of all related projects included in background growth assumptions for the traffic, air quality, and noise analyses can be found in the Traffic Report, which is included as Appendix D (Transportation Study) to this EIR. For other issue areas, the Yosemite Slough Restoration Project was also included as a related project.

The geographic scope of the cumulative impact analyses and the specific related projects that are included in the analyses may also vary depending on the specific environmental issue being analyzed. Each technical section of this EIR designates the cumulative context for each cumulative impact analysis.

The EIR presents a cumulative impact analysis only where the Project's incremental effect would result in a less-than-significant, less-than-significant with mitigation, significant and unavoidable, or significant and unavoidable with mitigation, cumulative impact.

CEQA requires that an EIR discuss cumulative impacts to determine whether they are significant. If the cumulative impact is significant, the Project's incremental effects must be analyzed to determine if the Project's contribution to the cumulative impact is cumulatively considerable. In accordance with Section 15065(a)(3) of the CEQA Guidelines, this determination is based on an assessment of the Project's incremental effects viewed in combination with the effects of past, present, and probable future related projects. The existence of a currently existing significant cumulative impact does not necessarily mean that the Project's contribution to that impact must be significant. Instead, a Project's contribution to a significant cumulative impact is significant only if its contribution is cumulatively considerable.

CEQA recognizes that the analysis of cumulative impacts need not be as detailed as the analysis of project-level impacts, but instead should "be guided by the standards of practicality and reasonableness" (Section 15130(b) of the CEQA Guidelines). The discussion of cumulative impacts must reflect the severity of the impacts and the likelihood of their occurrence; however, the discussion need not be as detailed as the discussion of environmental impacts attributable to the Project alone.

FIGURE III.A-1

Candlestick Point — Hunters Point Shipyard Phase II EIR

CUMULATIVE DEVELOPMENT IN THE PROJECT VICINITY

SECTION III.B LAND USE AND PLANS

III.B.1 Introduction

In accordance with CEQA Guidelines Section 15125(d), this section provides a summary of the plans, policies, and regulations of the City and County of San Francisco, and regional, state, and federal agencies that have policy and regulatory control over the Candlestick Point - Hunters Point Shipyard Phase II Development Plan Project site. For informational purposes, this section also describes citywide planning initiatives and programs that continue to shape the Project's underlying goals and implementation strategies. Policy conflicts do not, in and of themselves, indicate a significant environmental effect within the meaning of CEQA. The *San Francisco General Plan* contains many policies that may address different goals. To the extent that physical environmental impacts may result from such conflicts, such impacts are analyzed in this EIR in specific topical sections such as Section III.I (Noise), Section III.H (Air Quality), and Section III.D (Transportation and Circulation). For example, policies that direct new development away from ecologically sensitive areas are discussed in Section III.N (Biological Resources), while policies that limit location of sensitive uses in areas with high noise and air emissions, are discussed in Section III.I, and Section III.H, respectively.

The majority of the Project site is within two Redevelopment Project Areas governed by the Hunters Point Shipyard Redevelopment Plan and the Bayview Hunters Point Redevelopment Plan. The Project's proposed amendments to the Redevelopment Plans would be reviewed by the Planning Commission for consistency with the General Plan and approved by the Agency Commission and the Board of Supervisors.

This section examines the potential for the Project to (1) physically divide an established community; (2) conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including, but not limited to a general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or (3) have a substantial adverse impact on the existing character of the vicinity. This analysis also addresses the consistency of the Project to the relevant land use plans, policies and regulations. Any potential conflict not identified in this environmental document would be considered in that context, and would not alter the physical environmental effects of the Project, which are analyzed in this EIR.

The potential for the Project to contribute to secondary land use effects, such as adverse effects on retail uses beyond the Project site, are discussed in Chapter V (Other CEQA Considerations). This section evaluates the potential for both project-level and cumulative environmental impacts.

III.B.2 Setting

■ Existing Land Use Context

Regional

The Project site is composed of Candlestick Point and HPS Phase II. Figure II-1 (Project Location) indicates the location of the Project within the City and County of San Francisco. As shown, the Project

site is on the southern waterfront in the southeastern portion of the City, approximately four miles south of the City's downtown. West of the Project site, major transportation corridors include United States Highway 101 (US-101), Interstate 280 (I-280), Third Street, and Bayshore Boulevard. The Caltrain corridor which travels between the Fourth and Townsend terminal and the Peninsula to the south runs in a north/south direction approximately one mile west of the Project vicinity (to the west of Third Street).

To the north are the City's Eastern Neighborhoods: the Mission District, Potrero Hill, the Central Waterfront, Showplace Square, and South of Market. Similar to the Bayview Hunters Point neighborhood, many of those neighborhoods include a mix of industrial, residential, and commercial uses. Figure III.B-1 (Existing Land Use) illustrates the land uses in the Project vicinity.

To the west of the Project site are US-101 and the Bernal Heights, Portola, Excelsior, and Visitacion Valley neighborhoods. Uses in these neighborhoods consist primarily of moderate density, single-family homes with some multi-family homes and neighborhood-serving commercial uses. Bayview Hill is a notable topographic feature that is located west of the Candlestick Point portion of the Project site. It contains open space area and creates a sense of separation between Candlestick and the neighborhoods to the west. Hunters Point Hill is also a notable topographic feature, and is located just west of the Hunters Point portion of the Project site, although it is smaller than Bayview Hill. Hunters Point Hill is primarily developed with multi-family residential uses with some institutional and social services.

To the south of the Project site, also west of US-101 and south of the City and County of San Francisco/San Mateo County line, are the cities of Brisbane and Daly City. Uses within these cities largely mirror neighboring residential uses in San Francisco. The area contains the Cow Palace exhibition hall and Sunset Scavenger waste collection and recycling center.

The City of Brisbane contains an industrial corridor, bounded on the west by Bayshore Boulevard and on the east by US-101. Brisbane Baylands is the site of a former sanitary landfill (that closed in 1967) and former railroad facilities. The landfill has continued in operation as a repository for clean fill materials from construction sites in the region and for recycling of sand, dirt, gravel, and other construction materials. Other uses in the Baylands include building supply businesses, lumberyards, the Kinder Morgan Energy tank farm, and the Bayshore Sanitary Sewer pump station. San Bruno Mountain State Park, immediately west and south of Brisbane, is a 2,326-acre park that encompasses San Bruno Mountain, the northernmost peak in the Santa Cruz Mountain Range.

Local

The Project site is part of the larger Bayview Hunters Point neighborhood, an area characterized by well-established residential neighborhoods, commercial uses, and industrial areas. Existing land uses in this neighborhood are described below by type of use: commercial/retail, civic and institutional, residential, industrial, and open space and recreation.

Candlestick Point — Hunters Point Shipyard Phase II EIR

FIGURE III.B-1

EXISTING LAND USE

Commercial and retail uses are distributed throughout the neighborhood. Third Street, which includes neighborhood-serving retail shops and other commercial businesses, is the central north/south corridor through the community. This corridor includes a variety of shops, eating establishments, cleaners, beauty supply stores, hardware stores, groceries, and liquor stores. Bayview Plaza near Evans Avenue provides a cluster of retail uses, including a Walgreens, a copy shop, several restaurants, and offices. Along Bayshore Boulevard and in proximity to the I-280 and US-101 freeways in the northern part of the neighborhood are a number of auto-oriented retail uses, including large-scale commercial uses with off-street parking frontages, home improvement businesses, and fast food establishments.

A number of civic, institutional, religious, and social service uses are also centered on Third Street. Such uses include the Bayview Opera House and Plaza at Third and Oakdale, a central feature of the Bayview Hunters Point community; Bayview Hunters Point Multipurpose Senior Center; the Southeast Health Center; the Anna E. Waden Library; and the Southeast Community Facility, which houses a City College campus and a job training and career program and is a site for community meetings and civic events. Other institutional and social services, including the Bayview YMCA, are found on Hunters Point Hill.

Residential neighborhoods in the Bayview Hunters Point neighborhood are east and west of Third Street from US-101 to HPS. A majority of the existing residential uses are single-family units. However, there are older multi-family units distributed on the lower slopes of Bayview Hill and new multi-family units along Jamestown Avenue, Williams Avenue, and Innes Avenue. Mixed-use developments, including multi-family housing, are also being developed along the Third Street corridor. In addition, much of the residential development on Hunters Point Hill consists of multi-family housing units.

Industrial uses are found in the northern portion of the Bayview Hunters Point neighborhood, west and east of Third Street. This area includes many production, distribution, and repair (PDR) uses and mixed-use development. Immediately west of Third Street and south of the Islais Creek Channel, large industrial uses, such as regional moving and storage companies and wholesale distributors are intermingled with a range of small, local businesses, such as auto parts distributors and bulk mail assembly services. The San Francisco Produce District is in this area.

Light industrial and PDR uses occupy the South Basin industrial area surrounding Yosemite Slough, extending west to US-101. The South Basin industrial area contains a variety of small-scale industrial uses, such as auto repair shops, food distributors, bulk warehouses, and recycling facilities. The India Basin Industrial Park, to the northwest of India Basin and HPS and south of the Islais Creek Channel, includes a major distribution facility for the US Postal Service, light industrial, commercial service and multimedia businesses, and some retail businesses located at Bayview Plaza at the southeast corner of Third Street and Evans Avenue. Vacant parcels and buildings are distributed throughout all of the identified industrial areas.

Public open space is distributed throughout the neighborhood in public parks and open space and recreation areas along the Bay shoreline. Open space uses include the Islais Creek Promenade, Heron's Head Park, India Basin Shoreline Park, developed and undeveloped portions of the Candlestick Point State Recreation Area (CPSRA) around the eastern perimeter of Yosemite Slough, and Gilman Park on Gilman Avenue at Griffith Street. The San Francisco Recreation and Park Department owns the shoreline of "India Basin Flats" or Acosta Parcels (formerly known as the Ferrari Brothers property), a vacant property located near Earl and Innes Streets. The Bayview Playground and Martin Luther King Jr. Pool are on Third Street

between Armstrong and Carroll Avenues. Coleman Playground is on Mendell Avenue between Fairfax and Hudson Avenues. The Joseph Lee Recreation Center is on Drummond Avenue between Mendell and Lane Avenues. Bayview Park is west of Candlestick Point on Bayview Hill. Silver Terrace Playground is on Silver and Ledyard; and Palou-Phelps Open Space is on Palou. Open space on Hunters Point Hill includes Hilltop Park (currently undergoing reconstruction), Adam Rogers Park, Shoreview Park, and Innes Court Park and Hillpoint Park in HPS Phase I.

Project Site—Surrounding Uses

Candlestick Point

Land uses immediately surrounding Candlestick Point are varied. North of Carroll Avenue are light industrial uses such as metal fabrication and distribution facilities. West of Hawes Street and west and south of Candlestick Park, the predominant land use is single-family residential, with new multi-family residential units being constructed south of Jamestown Avenue, and townhomes, apartments, and condominium projects at Executive Park and other locations. At present, the existing development at Executive Park consists of three office buildings with associated parking and two residential buildings containing 128 units. Three other residential buildings, containing 176 units, are near completion. In addition, as of September 2009, nine residential buildings are under construction including a 107-unit building, as well as several other smaller townhouse buildings. Bayview Hill Park, a 19-acre natural habitat park, is west of Candlestick Park. To the east and south of the Candlestick Point site are the waters of the San Francisco Bay.

Hunters Point Shipyard Phase II

San Francisco Bay borders HPS Phase II on the south, east, and north. To the west, India Basin contains light industrial and some residential uses along Innes Avenue. The area adjacent to the HPS Phase II site to the southwest contains multi-family housing and single-family attached units. Milton Meyer Recreation Center, west of HPS Phase II, is a multi-purpose facility with game courts and an indoor gym used for afterschool programs, arts and crafts, indoor games, and other training activities. Uses in the area immediately surrounding the HPS Phase II site, such as industrial uses on Crisp Road, historically provided a buffer between the HPS Phase II site activities and nearby residential uses. Large setbacks and street blocks and a lack of pedestrian amenities were designed to discourage traffic near the HPS.

As discussed in Chapter II (Project Description), HPS Phase II is adjacent to HPS Phase I which is under construction. The HPS Phase II site surrounds the HPS Phase I development area, a 63-acre site, to the north, east, and south.

Project Site—Existing Uses

Candlestick Point

Candlestick Point consists of 281 acres generally bounded by Hawes Street to the northwest, Candlestick Cove and the San Francisco Bay to the south, Jamestown Avenue to the southwest, and South Basin to the east. The site includes residential uses, public open space, and the Candlestick Park stadium. Figure III.B-1 shows existing generalized land uses at the Project site and in the nearby vicinity.

The 256-unit Alice Griffith public housing site is bounded by Gilman Avenue on the south, Hawes Street on the west, Carroll Avenue on the north and Arelious Walker Drive on the east.

The most prominent land use in the Candlestick Point site is the Candlestick Park Stadium and associated parking areas, used by the San Francisco 49ers. Privately owned parking lots are adjacent to Candlestick Park parking lots. The vacant, undeveloped lots on Jamestown Avenue are used for overflow stadium parking. The San Francisco Candlestick RV Park, a private, 165-space RV site, fronts on Gilman Avenue west of the CPSRA. The remainder of the Candlestick Point site consists of the CPSRA. The entire CPSRA is 154 acres, and consists of approximately 120 acres within the Project site and 34 acres outside the Project site, near the Yosemite Slough area just west of Arelious Walker Drive and north of Carroll Avenue. Of the 120 acres of the CPSRA located within the Project boundary, about one-third have been developed for parkland uses. The developed land is mostly along the shoreline, and includes a network of paved and dirt paths, restrooms, picnic facilities, two fishing piers, paved lookout points, and an unused boat launch facility.

Access to most of the site is limited to an arterial loop road (Gilman Avenue/Jamestown Avenue/Bill Walsh Way/Ingerson Avenue) that encircles the Candlestick Park stadium and parking lot. Gilman Avenue and Hawes Street provide access to the Alice Griffith public housing complex. However, most non-arterial streets from the residential neighborhoods and industrial areas to the west of Candlestick Point reach a dead end before entering the site. Streets within the Alice Griffith public housing complex are internally oriented, and for the most part, do not connect to surrounding streets. In addition, Bayview Hill creates a physical barrier to the south, limiting access from this direction, except at Harney Way. The lack of street connectivity, combined with the site's large, barren parcels, lack of sidewalks, and low level of on-site activity, make Candlestick Point relatively unwelcoming to pedestrian traffic.

Hunters Point Shipyard Phase II

HPS Phase II, which is 421 acres, contains many structures associated with ship repair, storage and trucking, light manufacturing, construction storage and shops, laboratories, scrap metal recycling, administrative, and other former Navy uses dating largely from the World War II era.[41] Several former Navy buildings are currently leased and occupied as artist studios by approximately 300 tenant-artists; two buildings are leased for woodworking and picture framing. HPS Phase II also includes drydocks, piers and wharves, as well as repair berths. The entire HPS Phase II site is currently under the jurisdiction of the Navy.

Primary access to the southern portion of the site is provided by Crisp Road, Spear Avenue, and Fischer Avenue. Innes Avenue, Galvez Avenue, and Robinson Street provide access to the northern portion of the site. Historically, access to the site was controlled for safety and security reasons, and most of the site remains fenced off, prohibiting public access from surrounding neighborhoods. Like Candlestick Point, the HPS Phase II site lacks pedestrian amenities, such as sidewalks.

[41] City of San Francisco, *Hunters Point Shipyard Reuse Final EIR*, June 2000, p. 3-38.

Plans and Policies

Federal

Coastal Zone Management

The authority to evaluate projects conducted, funded, or permitted by the Federal government is granted to coastal states through the *Federal Coastal Zone Management Act* (CZMA) of 1972, 16 USC § 3501 et seq., as amended. Under the CZMA, any Federal projects or activities must be consistent to the maximum extent practicable with the provisions of federally approved state coastal plans, 16 USC 1456, CZMA § 307(c)(1). The coastal management plan for the east side of San Francisco consists of the McAteer-Petris Act, California *Public Resources Code* (PRC) Section 66600 et seq., the Bay Plan (Bay Conservation and Development Commission [BCDC], 1969, revised 1997), the Seaport Plan (BCDC and MTC, 1996), and local management programs. Under the approved coastal management program, 55 acres (22 ha) in the southeast portion of HPS are designated as a port priority use area in the Bay Area Seaport Plan, which is further described below.

For the Hunters Point Shipyard Reuse Plan, the Navy submitted a consistency determination to BCDC on January 12, 1999. The BCDC issued a Letter of Agreement for Consistency Determination Number CN1-99 on March 8, 1999. This letter is reproduced in Appendix B of the Final EIR for the Hunters Point Shipyard Reuse, February 8, 2000. Prior to HPS disposal, the Navy would obtain any further consistency determinations necessary for the amended Reuse Plan. Following HPS disposal, projects within BCDC's jurisdiction may require BCDC permits.

State

The Public Trust

The "public trust" is a legal doctrine that governs the use of tide and submerged lands, including former tide and submerged lands that have been filled. Public trust lands are required to be used for public trust purposes, which include navigation, fisheries, waterborne commerce, natural resource protection, and water-related uses that attract the public to use and enjoy the waterfront.[42] In addition, public trust lands generally may not be sold into private ownership. However, under limited circumstances, the California Legislature may authorize by statute the termination of the trust. Typically, this requires an exchange of lands, in which lands of equal or greater value and usefulness are added to the trust.

Upon statehood, California became owner of the tide and submerged lands within its boundaries by virtue of its sovereignty. Some of these lands were conveyed into private ownership prior to the enactment of a state constitutional prohibition on alienation of tidelands (Cal. Const., Art. X, Sec. 3). Other lands were granted, in trust, to the local jurisdictions in which they are located. The remainder are held by the state. Today, the California State Lands Commission holds title to all un-granted tide and submerged lands in California and monitors all grants by the California Legislature of tide and submerged lands to cities and counties.[43]

[42] California State Lands Commission, Public Trust Policy.
http://www.slc.ca.gov/Policy_Statements/Public_Trust/Public_Trust_Policy.pdf (accessed online July 23, 2009).
[43] California Public Resources Code, Division 6.

Most of the historic tide and submerged lands within San Francisco's city limits have been granted by the state, either to private parties or to the City and other public agencies. Courts have held that certain grants to private parties terminated the trust in the granted lands; other private grants, however, remain subject to a public trust easement, restricting the use of those lands. Lands granted to public entities such as the City are generally subject to the public trust, and are also subject to any additional terms and conditions provided in the granting statute (often called the "statutory trust"). In San Francisco, a number of grants of tidelands to the City were made over the years, the most substantial being the 1968 Burton Act, which granted all of the tide and submerged lands that were still held by the State at that time. The Burton Act did not include lands that were then in federal ownership, such as Hunters Point Shipyard. The State Lands Commission, in cooperation with the California Attorney General, monitors granted lands for compliance with the public trust and the applicable granting statutes.

Candlestick Point Public Trust Lands

Large parts of the Project area are filled tide and submerged lands. In the mid 1800s, many of those lands were conveyed into private ownership, filled, and freed of the trust. However, certain lands—primarily areas reserved as future streets and railroad rights-of-way—remained subject to the trust. In 1958 the Legislature authorized the sale of a portion of these lands to the City for the purposes of building the Candlestick Park stadium. The 1958 Act, Chapter 2 of the Statutes of the First Extraordinary Session (1958 Act) terminated the public trust on the transferred land, but required that these lands be used only for purposes of general statewide interest. Pursuant to the 1958 Act,[44] the City acquired the lands free of the trust and constructed the Candlestick Park stadium.

The remaining public trust lands within Candlestick Point were granted to the City pursuant to the Burton Act. Following the establishment of the CPSRA, the City conveyed the Burton Act lands within the park back to the State. Those lands are now held by the State Lands Commission and leased to the California Department of Parks and Recreation (CDPR). Outside the CPSRA, public trust lands continue to be held by the City, acting by and through the Port of San Francisco, under the Burton Act.

In 1998, Section 5006.8 of the California PRC was amended in connection with an earlier proposal for the replacement of Candlestick Park stadium. That statute authorized the Director of Parks and Recreation and the State Lands Commission (Commission) to enter into trust exchange and other agreements to convey to the City property held by the CDPR and the Commission to be used for permanent public parking for the Candlestick Park stadium replacement project.

Hunters Point Shipyard Phase II Public Trust Lands

The HPS site is also largely composed of former tide and submerged lands. Substantial portions of these lands were conveyed by the State into private ownership in the 1800s. In 1939, the Navy began acquiring lands for purposes of constructing and operating HPS, primarily through condemnation. This title history has given rise to substantial legal uncertainty as to the present status of the public trust on the HPS lands.

HPS was closed in 1974, and the federal Base Realignment and Closure Act subsequently authorized the Navy to convey the HPS lands to the City or to a local reuse authority approved by the City. The San

[44] Section 3 of Chapter 2 of the Statutes of California, 1958.

Francisco Redevelopment Agency is the approved local reuse authority for the shipyard. Pursuant to a 2004 conveyance agreement with the Agency, the Navy has conveyed a portion of the shipyard to the Agency and has agreed to transfer the remainder to the Agency following hazardous materials remediation.

In anticipation of this transfer, the *Hunters Point Shipyard Conversion Act of 2002* granted to the Agency, in trust, all of the State's right, title, and interest in the HPS lands upon their conveyance out of federal ownership.

The *Hunters Point Shipyard Public Trust Exchange Act* was enacted in 2003. It authorized and approved an exchange by the Agency of public trust lands within HPS when conveyed by the Navy, whereby trust lands that met specified criteria in this Act and that were not useful for public trust purposes could be freed from the public trust and conveyed into private ownership, provided that certain other lands that are not now public trust lands and that are useful for public trust purposes were made subject to the public trust through a land exchange. Any exchange under this Act requires the approval of the California State Lands Commission.

Senate Bill 792

Senate Bill 792 (SB 792) was signed by the Governor on October 11, 2009, and is codified as Chapter 203 of the Statutes of 2009. SB 792 repeals the *Hunters Point Shipyard Conversion Act of 2002,* the *Hunters Point Shipyard Public Trust Exchange Act*, and PRC Section 5006.8, and consolidates the key provisions of those statutes into a statute covering both the Candlestick Point area and HPS. The statute authorizes a reconfiguration of CPSRA coupled with improvements within the park and the provision of an ongoing source of park operation and maintenance funding. The proposed reconfiguration would remove about 29.2 acres from the current boundaries of CPSRA to be used for urban development, but would add about 5.7 acres not currently included in the CPSRA to The Neck, The Heart of the Park, and The Last Port areas of the CPSRA. These additional acres would widen the park at in an area where the CPSRA boundary currently runs very close to the shoreline, creating a very narrow "pinch point" in the park. The additional acreage would thus create a buffer between development and the shoreline and improve the recreational value of this section of the park. In total, the area of the CPSRA (excluding the Yosemite Slough) would decrease by about 23.5 acres at the Candlestick Point site, from 120.2 acres to 96.7 acres.

Project Consistency: The Project includes both trust consistent and trust inconsistent uses; they will be distributed consistent with the final Trust map approved in Senate Bill 792. A trust exchange agreement will be approved as part of the Project consistent with the final Trust map. Negotiations with the CSLC are ongoing.

California Department of Parks and Recreation (California State Parks)

Candlestick Point State Recreation Area General Plan

The California Park and Recreation Commission classified Candlestick Point as a State Recreation Area in April 1977.[45] The area is of statewide significance because it is the first unit of the California State Parks System developed with the goal of bringing California State Parks System values into an urban setting. The CPSRA site was comprised mostly of landfills around Candlestick Point and Yosemite Slough created during the 1940s in connection with the construction of HPS and adjacent industrial sites.

[45] Department of Parks and Recreation, *Candlestick Point State Recreation Area General Plan*, State Park and Recreation Commission Approval, November 1978, amended May 1987, March 1988.

As required by PRC Section 5002.2 and Section 4332 Title 14 of the *California Administration Code*, the *Candlestick Point State Recreation Area General Plan* (CPSRA General Plan) was approved by the California State Parks System in 1978 and amended in 1987.[46,47] The CPSRA General Plan provides general guidelines and identifies conceptual land uses, facilities, and park improvements within the CPSRA. The CPSRA General Plan addresses enhanced appreciation of the natural resources of the Bay, public access to the Bay shoreline, expanded visitor activities such as picnicking, camping, boating, hiking, bicycling, cultural resource and nature education, and public involvement of local residents in park planning and decision making. The 1987 amendments provided emphasis on windsurfing activity, and year-round access (including during football and baseball[48] seasons) for recreational users by new roads and ferry service.

The CDPR administers the CPSRA. The CPSRA comprises about 154 acres of improved and unimproved recreation and open space, including about 120 acres along the eastern and southern perimeter of Candlestick Point, and about 34 acres along the northern and southern perimeter of Yosemite Slough. Figure III.B-1 illustrates the existing CPSRA land within the Project site. The Yosemite Slough portion of the CPSRA is not part of the Project site.

The CPSRA General Plan includes a Resource Element that addresses cultural and historic resources, a Land Use Element, a Facilities Element, and an Operations Element. Conceptual land uses and facilities are shown on the CPSRA General Plan Land Use and Facilities map. The CPSRA General Plan also provides conceptual design guidelines. The CPSRA General Plan is still current and remains applicable until such time as it is amended. An amendment process is presently underway.

The Facilities Element lists the following types of recreational uses for the park: trails (hiking, jogging, and bicycling), group picnic areas, family picnic areas, group campgrounds, fishing piers, wind surfing facilities, a sand beach, a quiet area in the southeastern point, scenic overlooks, and a cultural program center. Maritime facilities proposed in the CPSRA General Plan include a non-powered boat/wind surfing rental facility; a boating center for boat classes and education; a boat access facility that includes a four-lane launching ramp; a

- 251-space parking area for car-boat trailers; a boat service station; and a ferry landing. A family dinner restaurant and family picnic rest stop are proposed for the Last Port area to the west of Hermit's Cove, off Harney Way.

The facilities and land uses called for in the current CPSRA General Plan have only been partly realized. Current uses in the park include hiking, limited bicycling, day use picnicking, group picnicking, jogging, nature viewing, three sand beaches, undeveloped windsurfing, two piers used by fishermen, and three

- restroom buildings. The park also includes a park staff/maintenance facility, 275 parking spaces for the developed portion of the park and a community garden. However, substantial portions (73 acres) of the park remain undeveloped (refer to Section III.P [Recreation]). Of this, approximately 40 acres of the park are used for parking for football games and other events at Candlestick Park.

The CPSRA General Plan identifies a list of uses that the community wished to develop. This was the extent of land planning as no definitive site plan was established. However, uses described in the CPSRA

[46] Department of Parks and Recreation, *Candlestick Point State Recreation Area General Plan*, State Park and Recreation Commission Approval, November 1978, amended May 1987, March 1988.
[47] Department of Parks and Recreation, *Candlestick Point State Recreation Area General Plan*, State Park and Recreation Commission Approval, November 1978, amended May 1987, March 1988.
[48] Baseball is no longer played at Candlestick Park stadium.

General Plan that have not been realized or developed include campgrounds, windsurfing or non-powered boating rental facilities, boating centers, motorized boat access facilities or four lane boat ramps, ferry landings, family restaurants or family group rest stops at Harney Way, or boat service centers. However, there is a boat trailer parking area that is not used for boating activities.[49]

The on-going CPSRA General Plan Amendment process would evaluate previously recommended uses and determine future uses and facilities to serve the local and statewide visitor to the park.

State Recreation Area Boundary Designation

Lands within the designated boundaries of CPSRA can only be used for state park purposes. As discussed above, SB 792 repealed former PRC Section 5006.8, which had authorized CDPR to transfer CPSRA lands out of the park as part of the previously proposed stadium replacement project. In its place, SB 792 authorizes an agreement between the CDPR and the City or the Agency to reconfigure the boundaries of the CPSRA, subject to a number of statutory conditions, including substantial conformance with a park boundary diagram set forth in the statute. In exchange for lands removed from CPSRA, the State must receive consideration in form of lands to be added to the park, the construction of new park improvements, and the provision of an ongoing source of funding for park operation and maintenance. The agreement must be approved by the Director of Parks and Recreation following adoption of written findings. Following approval of an agreement, the Director is authorized to revise the CPSRA boundaries to conform to the agreement. Table III.P-2 (Candlestick Point State Parks Land Exchange) and Figure III.P-2 (Proposed Parks and Open Space) present the proposed areas to be added to and removed from the park. The lands proposed to be removed from the CPSRA cannot be developed with non-park uses unless and until the Director has approved an agreement consistent with SB 792, and has modified the boundaries of the CPSRA accordingly.

Project Consistency: Consistent with the goals and objectives of the CPSRA General Plan, the Project would develop recreational resources, including parks, picnic areas, shade shelters, ; tidal marsh restoration; park ranger station/visitor's center, a meadow, a bio-filtration pond, and a restaurant/café at The Last Rubble; pedestrian pathways, upgraded restrooms, overlooks, an interpretive amphitheater, parking, and a windsurf/kayak launch at Heart of the Park, The Point, and The Neck; swimming, kayaking, and windsurfing at The Last Port. The Project also would connect the Bay Trail through the Project site resulting in 9.6 miles of continuous public access through a diversity of natural and historic environments. The Project's passive and active recreation areas that would be accessed along the Bay Trail would encourage a longer stay than walking or bicycling would occasion.

The Project proposes an agreement between the CDPR and the City or the Agency to reconfigure the boundaries of the CPSRA. Along with a reconfiguration of CPSRA, the Project includes improvements within the park, and the provision of an on-going source of park operation and maintenance funding. The proposed reconfiguration would remove 29.2 acres from the current boundaries of CPSRA to be used for urban development. 5.7 acres not currently included in the CPSRA would be added. In total, the area of the CPSRA would decrease at the Candlestick Point site from 120.2 to 96.7 acres. Table III.P-2 (Candlestick Point State Parks Land Agreement), in Section III.P, presents the proposed acreage of the

[49] Communication with Steve Bachman, California Department of Parks & Recreation, Senior Park & Recreation Specialist. September 16, 2009.

areas to be added, and removed, from the CPSRA. A more detailed discussion on the CPSRA reconfiguration and proposed uses is also provided in Section III.P.

The proposed reconfiguration of the CPSRA is consistent with the diagram set forth in SB 792. In addition, although there would be a decrease in the total area of the CPSRA, Project would result in an overall benefit to the CPSRA. Two-thirds of the park that is currently unused or underutilized, or that is used for Candlestick Park stadium parking would be substantially improved to enhance overall park aesthetics and landscape ecology; reconnect visitors to the Bay shoreline; and provide direct access to the Bay for swimming, fishing, kayaking, and windsurfing. Proposed improvements include shoreline restoration and stabilization, a bio-filtration pond to cleanse stormwater, the provision of habitat and opportunities for environmental education, 'Eco-Gardens,' and salt-marsh restoration (refer to Section III.P [Recreation]).

Pursuant to SB 792, no CPSRA General Plan amendment is required for the reconfiguration of the recreation area. However, before new facilities would be developed, a CPSRA General Plan amendment would be required to reflect the boundary changes and the proposed new uses that would be located on lands following the reconfiguration. The proposed improvements described in Draft EIR Section III.P (Recreation) will be reviewed by the CDPR as an option for the development of CPSRA. To the extent that the final improvements to the reconfigured CPSRA would be inconsistent with the CPSRA General Plan, these improvements would be addressed through the State Parks General Plan amendment process.

Regional

Bay Conservation and Development Commission

San Francisco Bay Plan

The *San Francisco Bay Plan* (Bay Plan) was prepared by the Bay Conservation and Development Commission (BCDC) from 1965 through 1969 in accordance with the *McAteer-Petris Act* (California *Government Code* Sections 66600–66682). It guides the protection and use of San Francisco Bay and its shoreline. Under the *McAteer-Petris Act*, BCDC has the authority to issue or deny permits for the placement of fill, extraction of materials, or substantial changes in use of land, water, or structures within its jurisdiction, and to enforce policies aimed at protecting the Bay and its shoreline.

BCDC's permit authority over the Bay itself, which is below the mean high tide line, relates primarily to Bay fill, which can be approved by the Commission only for certain water-oriented uses or for improving shoreline appearance or public access to the Bay, and when there is no alternative upland location for the proposed use. In order for BCDC to approve a permit, the project must be consistent with the *McAteer-Petris Act* and the Bay Plan (including any Special Area Plan; refer to discussion below). BCDC's jurisdiction over the Bay shoreline is limited to a 100-foot-wide "shoreline band" extending inland from the mean high tide line and areas that are subject to tidal action from the south end of the Bay to the Golden Gate (Point Bonita-Point Lobos) and Sacramento River line. BCDC also has jurisdiction over other areas of the Bay not within the 100-foot shoreline band including salt ponds, managed wetlands, and certain waterways.[50]

[50] Certain waterways include all or portions of Plummer Creek in Alameda County, Coyote Creek in Alameda and Santa Clara Counties, Redwood Creek in San Mateo County, Tolay Creek in Sonoma County, Petaluma River in Marin and Sonoma Counties, and Napa River, Sonoma Creek and Corte Madera Creek in Marin County. Source: San Francisco Bay Plan.

To minimize future pressures for Bay fill, the Bay Plan Maps designate shoreline "Priority Use Areas" that should be reserved for regionally important, water-oriented uses needing or historically located on shoreline sites, such as ports, water-related industry, water-related recreation, airports, and wildlife refuges. The Bay Plan Maps also contain policies that generally specify uses and other criteria for the use and development of each designated site. The Project site is shown on Bay Plan Map 5, Central Bay.

Figure III.B-2 (San Francisco Bay Plan Land Use Designations) illustrates the San Francisco Bay Plan Land Use Designations for the Project site. The Plan maps are not intended to specifically delineate the Commission's jurisdiction to areas of the Bay. As shown on Figure III.B-2, the San Francisco Bay Plan Map 5 (Central Bay) designates a portion of the Hunters Point Shipyard area as a "Port" Priority Use Area, while a portion of the Candlestick Point area is designated as "Waterfront Park/Beach" Priority Use Area. The Bay Plan Map 5 notes indicate that CPDR and San Francisco are cooperatively developing plans for CPSRA improvements along the north shore of Candlestick Point and the Yosemite Slough area. Further, that San Francisco is planning to develop a large community park along the south shore of Hunters Point Naval Shipyard that would connect with CPSRA, coordinated with redevelopment of the stadium area and the shipyard. The Bay Plan Map 5 policies for CPSRA identify that some fill may be needed. The policies call for preserving the CPSRA for fishing, camping, picnicking, windsurfing, hiking, and viewing opportunities, as well as a potential water trail camping site. The Bay Plan Map 5 policies for South Basin identify that some fill may be needed in the inlet west of proposed freeway. Finally, for the Hunters Point area, the policies refer to the Seaport Plan and call for developing a shoreline park integrated with the CPSRA, consistent with the San Francisco redevelopment plan. Further there is the potential for a water trail camping site; and that some fill may be needed.

- The Bay Plan also includes design policies related to waterfront development so as to enhance the visual quality of development around the Bay. Design policies that are applicable to the proposed Project are set forth in Section III.E (Aesthetics). The proposed Project is a high-quality urban development that integrates substantial open space, pedestrian pathways, and shoreline improvements and would redevelop an underutilized, primarily vacant, or deteriorated site. The Bay Plan indicates that "uses such as parking lots and industrial structures, which neither visually complement the Bay nor take advantage of a waterfront location, should be phased out or upgraded by normal market forces." The Project has been designed to preserve view corridors. The Project would connect the existing street grid in an orientation that would allow an uninterrupted view toward the Bay from numerous area streets. Project towers have been situated in zones that would allow the provision of view corridors. Numerous open space areas and waterfront pedestrian pathways would provide expansive viewing opportunities as well. Buildings and structures have been designed to be complementary to the surroundings. Parking structures are not proposed for shoreline areas. The proposed bridge would be low in height and would connect two urban areas, relating to the adjacent developed and to-be-redeveloped land uses. The proposed bridge would provide unique viewing opportunities that are not currently available. The bridge would not substantially obstruct views of the Bay or affect the visual dominance of the hills around the Bay. The Project has been developed in conformance with the BCDC's Public Access Design Guidelines. Therefore, the Project would be consistent with the design policies of the Bay Plan.

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.B-2

Candlestick Point — Hunters Point Shipyard Phase II EIR

SAN FRANCISCO BAY PLAN LAND USE DESIGNATIONS

Project Consistency: Bay Plan Map 5 (Central Bay) contained in the Bay Plan that pertains to the Project site, designates the Hunters Point area as "Port" Priority Use Area while a portion of the Candlestick Point area is designated as "Waterfront Park/Beach" Priority Use Area (Figure III.B-2). The relationship of the HPS Phase II portion of the Project to the "Port" Priority Use Area designation in the Bay Plan is discussed under the *San Francisco Bay Area Seaport Plan*. The Project proposes open space and recreational uses in the designated "Port" Priority Use area. The HPS Phase II component of the Project is compatible with the objectives and policies of the Bay Plan as a whole. The "Port" Priority Use designation is not a policy designed to reduce or avoid environmental impacts. Implementation of the Project would require an amendment to the Bay Plan because it proposes public and recreation uses that are different than the "Port" Priority Use Area designation.

The Project is consistent with the intent of the Bay Plan as it relates to the Candlestick Point area. The Project would provide park improvements, and on-going funding for park operation and maintenance. The ultimate configuration of improvements to various areas of the CPSRA would be determined by the CDPR but the Project would not preclude a water trail camping site or fishing, windsurfing, hiking and viewing opportunities. The inclusion of the Yosemite Slough bridge would not conflict with the Bay Plan's policy regarding additional bridges over the Bay, which aims to preserve the visual impact of the large expanse of the Bay. Expansive views of the Bay would remain from numerous vantage points, even with inclusion of the bridge over the neck of the slough.

The Project is also consistent with the Bay Plan policies to minimize Bay fill and to preserve the shoreline for uses that are regionally important, water-oriented uses needing or historically located on shoreline sites, such as ports, water-related industry, water-related recreation, airports, and wildlife refuges. The Project involves minimal filling associated with the Yosemite Slough bridge, a marina and improvement of the existing shoreline, waterfront bulkhead, piers and seawall structures. The Project includes improved access to the shoreline through shoreline improvements, open spaces and a waterfront promenade. Due to a proposed change in use for the HPS Phase II component of the Plan from the land use designation in the Bay Plan, the Project would require an amendment to the Bay Plan as a component of the entitlement action. Following such amendment, the Project would be consistent with the Bay Plan.

Bay Area Seaport Plan

The *San Francisco Bay Area Seaport Plan* (Seaport Plan) is a joint planning effort by BCDC and the Metropolitan Transportation Commission (MTC).[51] The Seaport Plan was adopted in 1996 and last amended in 2003. The Seaport Plan constitutes the maritime element of MTC's Regional Transportation Plan (refer to Section III.D), and is incorporated into BCDC's San Francisco Bay Plan, where it is the basis of the Bay Plan port policies. The Seaport Plan contains policies for future Bay Area maritime development, based on projected future needs for marine terminals. The shoreline areas designated in the Seaport Plan for Port of San Francisco use mirror the Port use designations in the Bay Plan.

The Seaport Plan assigns a "Port" use designation to an area within HPS Phase II. Bay Plan policies accompanying the Port use designation at Hunters Point state that 55 acres designated south of Manseau Street "should remain designated for port priority use and future development of two breakbulk

[51] Bay Conservation and Development Commission and Metropolitan Transportation Commission, *San Francisco Bay Area Seaport Plan*, April 1996 as amended through February 20, 2003.

berths."[52,53] Findings of the Seaport Plan note that the area most likely for marine terminal development includes Drydock 4, South Pier, the Re-gunning Pier, and the waterfront area along South Basin. However, the Port contracted CBRE Consulting and Martin Associates to update a 2001 study "Maritime Cargo Market and Warehouse Analysis."[54] The report identifies the Port of San Francisco as the only breakbulk facility in the Bay Area, annual cargo peaked in 2006 with 250,000 tons, and declined to 150,000 tons of cargo in 2007. Breakbulk at Pier 80 is primarily imported steel which is sensitive to the world economy. The report suggests that Pier 80 marketing efforts diversify from breakbulk into wind turbine components, autos, and fruit. The analysis suggests that the demand for breakbulk facilities is not greater than its current or projected availability. This indicates that policies for breakbulk cargo port priority uses for HPS Phase II may no longer reflect the current economic climate and realistic land use options.

Project Consistency: The Project is inconsistent with two policies that designate the Project site as having 55 acres remaining for port priority use and future development of two breakbulk berths.

The Project proposes a mixture of land uses on the HPS Phase II site that include a wide range of residential, retail, office, research and development, civic and community, and parks and recreational open space uses. A stadium and marina facilities are also proposed. However, port uses are not proposed for the Project. Findings of the Seaport Plan note that the area most likely for marine terminal development includes Drydock 4, South Pier, the Re-gunning Pier, and the waterfront area along South Basin. The Project's proposed marina is within this general location.

The Project would be inconsistent with the Seaport Plan, but not inconsistent with policies designed to reduce or avoid environmental impacts. Implementation of the Project would require an amendment to the Seaport Plan that references the Project site as a component of the entitlement action. Following amendment of the Seaport Plan, the Project would be consistent with the Seaport Plan.

Association of Bay Area Governments (ABAG)

ABAG is the comprehensive planning agency for the San Francisco Bay region. ABAG's mission is to strengthen cooperation and coordination among local governments. In doing so, ABAG addresses social, environmental, and economic issues that transcend local borders. ABAG has adopted the San Francisco Bay Trail Plan, which is discussed below, and is responsible for preparing the Regional Housing Allocation Plan and developing population and employment projections, both of which are further discussed in Section III.C (Population, Employment, and Housing).

San Francisco Bay Trail Plan

California Senate Bill 100 (SB 100) authorized the ABAG to "develop and adopt a plan ... for a continuous recreational corridor which will extend around the perimeter of San Francisco and San Pablo bays."[55] ABAG adopted the *San Francisco Bay Trail Plan* (Bay Trail Plan) in 1989 and administers it throughout the Bay region. The Bay Trail is a multipurpose recreational trail that, when complete, would encircle San

[52] *San Francisco Bay Area Seaport Plan*, p. 42, 1996.
[53] Break-bulk cargo is a shipping term for any loose material that must be loaded individually, not in shipping containers or in bulk as with oil or grain.
[54] CBRE Consulting and Martin Associates. "Maritime Cargo Market and Warehouse Analysis" February 2009.
[55] Association of Bay Area Governments (ABAG), *San Francisco Bay Trail Plan*, July 1989.

Francisco and San Pablo Bays with a continuous 400-mile network of bicycling and hiking trails. It would connect the shoreline of all nine Bay Area counties, link 47 cities, and cross the major bridges in the region. To date, approximately 290 miles of the alignment have been completed.[56]

The policies of the Bay Trail Plan emphasize siting and developing trails that: connect to existing park and recreation facilities; link to existing and proposed transportation systems; and avoid impacts on environmentally sensitive areas. Specific policies of the Plan address trail alignment, trail design, and environmental protection. Bay Trail Plan policies and design guidelines are intended to complement adopted regulations and guidelines of local jurisdictions and agencies.

The 2005 Gap Analysis Study prepared by ABAG, for the entire Bay Trail area, attempted to identify the remaining gaps in the Bay Trail system, classify the gaps by phase, county and benefit ranking, develop cost estimates for individual gap completion, identify strategies and actions to overcome gaps, and present an overall cost and timeframe for completion of the Bay Trail system.

Within the Project site, the 2005 Gap Analysis Study proposes to connect existing Bay Trail segments that are located north and south of the Project site by extending the trail along the waterfront of the Candlestick Point Recreation Area and through the Project site along HPS. The proposed trail would then connect to the existing trail north of the Project site along the India Basin shoreline.

The Gap Analysis Study also proposes an alternate, inland connection that is partially within the Project site, with the proposed trail traveling east along Gilman Avenue with the Project site, continuing north along Third Street that would ultimately connect to the existing waterfront portion of the trail near the India Basin via Yosemite Avenue/Carroll Avenue and Cargo Way.[57]

The Project would include the construction of the Bay Trail throughout the Project area, and support the proposed waterfront trail connection route within the Gap Analysis Study area, whereby the existing trail south of the Project area would ultimately connect to the existing northern trail along the India Basin shoreline. The Bay Trail would be accessible for pedestrians and bicyclists with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/US-101 interchange, through the CPSRA, Yosemite Slough, and HPS Phase II shoreline to India Basin. Refer to Figure III.B-3 (Existing San Francisco Bay Trail Plan Route).

Bay Trail policies and design guidelines are intended to complement, rather than supplant the adopted regulations and guidelines of local managing agencies. Policies that are applicable to the Project site related to trail alignment, rather than specific land use recommendations, are discussed within Section III.P of this EIR.

The land use objectives and policies of the Bay Plan that are relevant to the Project are contained in Part II (Objectives), Part IV (Development of the Bay and Shoreline: Findings and Policies), and within Part V: The Plan Maps. These policies and the associated consistency analysis related to the Project are listed and discussed in Table III.B-1 (Goals, Policies, and Objectives Analysis for Applicable Land Use Plans).

SOURCE: San Francisco Bay Trail Plan; PBS&J, 2010.

PBS&J 04.19.10 02056 | JCS | 10

Candlestick Point — Hunters Point Shipyard Phase II EIR

EXISTING SAN FRANCISCO BAY TRAIL PLAN ROUTE

FIGURE III.B-3

Project Consistency: The Bay Trail - San Francisco Peninsula Map illustrates the Bay Trail as an off-street path from Harney Way north around the CPSRA, and as a planned future trail around South Basin, Yosemite Slough, and through HPS. Refer to Figure III.B-3. As the Project site exists today, public access along the shoreline is not continuous, as the Bay Trail currently ends near Gilman Avenue within Candlestick Point and picks up again north of the Project site near India Basin. Much of the shoreline along the HPS property and portions of Candlestick Point are not accessible to the public.

As shown on Figure II-14 (Proposed Bicycle Routes), the Project would include the construction of the Bay Trail throughout the Project, and would ultimately connect to the existing trail along the India Basin shoreline. Trail improvements would include a pedestrian and bicycle trail along the shoreline with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/US-101 interchange, through the CPSRA, Yosemite Slough, and HPS Phase II shoreline to India Basin. The Bay Trail would be incorporated into the design of the parks facilities.

As shown on Figure III.B-3, the planned trail improvements for the Project site within the Bay Trail Plan around the northern portion of Candlestick Park and through the Hunters Point Phase II portions of the Project site are noted as "Planned Bay Trail—Future Route Not Developed." The Project would implement these planned changes by providing a continuous connection throughout the shoreline of the Project site. While the alignment of the Bay Trail within the Project site is not exactly as proposed in the Bay Trail Plan, it supports the aim of the Bay Trail Map, which is to provide a continuous link throughout the property and the Bay and provide additional links to park and recreational facilities. The Project not only supports this goal but it would also provide a pathway that is an improvement over the alignment indicated on the Bay Trail Plan; the Project proposes a Bay Trail alignment immediately adjacent to the shoreline as opposed to the slightly inland location within the HPS proposed on the Bay Trail Plan.

Overall, the Project is generally consistent with the Bay Trail Plan; however, it proposes an alignment for the Bay Trail that differs from the alignment reflected in the Bay Trail Plan. Implementation of the Project would require an amendment to the Bay Trail Plan to accommodate the new, improved alignment. Following such amendment, the Project would be consistent with the Bay Trail Plan.

Local

City of San Francisco General Plan

The *City of San Francisco General Plan* (General Plan), adopted by the Planning Commission and the Board of Supervisors, is both a strategic and long-term document, broad in scope and specific in nature. The General Plan is the embodiment of the City's collective vision for the future of San Francisco, and is comprised of a series of elements, each of which deal with a particular topic, that applies citywide. The General Plan contains the following elements: Air Quality, Arts, Commerce and Industry, Community Facilities, Community Safety, Environmental Protection, Housing, Recreation and Open Space, Transportation, and Urban Design. Objectives and Policies from these General Plan Elements are discussed in the respective Chapters of EIR that deal with the related topics. The San Francisco General Plan does not include a separate Land Use Element, rather, land use policies are dispersed throughout the other elements of the General Plan, as well as in the various Area Plans of the document.

The Area Plans identify specific localized goals and objectives for a neighborhood or district of the City, including the *Bayview Hunters Point Area Plan*. The Candlestick Point portion of the Project site currently within the BVHP Redevelopment Project Area is specifically addressed in the BVHP Area Plan. The BVHP Area Plan guides the future development of the Bayview Hunters Point district. The General Plan addresses land use at the Shipyard by reference to the HPS Redevelopment Plan.

Bayview Hunters Point Area Plan

The BVHP Area Plan is an adopted component of the *San Francisco General Plan* that serves as a guide to the future development of the BVHP community. This plan, based on many years of continued citizen input, seeks to provide guidelines for realizing BVHP's growth potential in a manner that is in the best interest of the local residents and the City as a whole. The BVHP Area Plan was updated in 2006 at the same time the BVHP Redevelopment Plan was revised to include Area B. The BVHP Area Plan includes sections on Land Use, Transportation, Housing, Industry, Urban Design, Recreation and Open Space, Community Facilities and Services, and Public Safety and Energy. Hunters Point Shipyard Phase II is generally not within the boundary of this Area Plan, though it is included in some of the BVHP Area Plan's objectives, policies, and discussions. The BVHP Area Plan was amended in 2006 during proceedings regarding the BHVP Redevelopment Plan.

Themes discussed throughout the BVHP Area Plan deal with the need to provide economic development and jobs, particularly for the local population; eliminating health and environmental hazards including reducing land use conflicts; providing additional housing, particularly affordable housing; providing additional recreation, open space, and public service facilities, and better addressing transportation deficiencies by offering a wider range of transportation options.

Project Consistency: The Project is consistent with the BVHP Area Plan in the following manner: New development would provide needed economic development both through construction jobs and approximately 10,730 permanent jobs (at both Candlestick Point and Hunters Point Shipyard Phase II) in a wide variety of fields and job types. The Project's programming would designate approximately 32 percent of the Project housing as below market rate for various income levels and housing types. Also as part of the affordable housing program, the existing Alice Griffith public housing would be reconstructed replacing the existing units one-to-one. The Project would offer a wide range of recreational and open space opportunities. The Project would change the boundary of the CPRSRA by removing approximately 29.2 acres and adding approximately 5.7 acres. The Project would also improve the CPSRA and provide funding for park maintenance.

Because the BVHP Area Plan was last updated in 2006, before the Project was initiated, discussions and figures dealing with Candlestick Point and its periphery don't reflect the land use programming reflected in this Project. Figure 4 of the BVHP Area Plan, "Generalized Land Use" designates properties within the Project site as "Candlestick Point Special Use District." Figure 5 of the BVHP Area Plan, "Candlestick Point Perimeter Proposed Revitalization Area," calls for stadium, commercial, parking, open space, and residential uses. With the exception of the stadium and the addition of a performance venue, the Project proposes uses that are consistent with this plan, including a mix of residential, retail, office, commercial, parks, and open space. However, the Project proposes a different development pattern that is consistent with the creation of an urban community.

Implementation of the Project includes amendments to the BVHP Area Plan, including amendments to most of the Plans' maps and minor text edits to ensure discussions of Candlestick Point are not out of date. A Sub-Area Plan of the BVHP Area Plan may also be created for Candlestick Point to further reflect the objectives and goals of this project for Candlestick Point.

The majority of the Project site is the Hunters Point Shipyard and the Bayview Hunters Point Redevelopment Project Areas. Both the Hunters Point Shipyard and Bayview Hunters Point Redevelopment Plans include land use designations to guide development. For areas within the Project site, but outside of the Redevelopment Project Areas, the General Plan provides the land use designations. The General Plan and the Redevelopment Plans are designed to be consistent with each other. The Redevelopment Plans, and consistency of the Project with the Redevelopment Plans, are further addressed below.

Proposition G

Proposition G, which is called the Bayview Jobs, Parks, and Housing Initiative (refer to Appendix B) was approved by San Francisco voters in June 2008. As discussed in this EIR in Chapter I (Introduction), and Chapter II, Proposition G encourages development of Candlestick Point and HPS with a mixed-use project including park and open space improvements, approximately 10,000 homes for sale or rent, about 700,000 gsf of retail uses, about 2,150,000 gsf of "green" office, science and technology, research and development, and industrial uses, an arena, and a site for a new San Francisco 49ers stadium.

Proposition G states that the Project should achieve the following objectives pertaining to population, housing, and employment:

- Create a range of job and economic development opportunities for local, economically disadvantaged individuals and business enterprises, particularly for residents and businesses located in the Bayview.
- Create substantial affordable housing, jobs, and commercial opportunities for existing Bayview residents and businesses.
- Include substantial new housing in a mix of rental and for-sale units, both affordable and market-rate, and include the rebuilding of Alice Griffith Housing.
- Provide new affordable housing that is targeted to the lower income levels of the Bayview population, including new units that are suitable for families, seniors, and young adults.
- Include housing at levels dense enough to create a distinctive urban form and at levels sufficient to make the Project financially viable; attract and sustain neighborhood retail services and cultural amenities; create an appealing walkable urban environment served by transit; help pay for transportation and other infrastructure improvements; and achieve economic and public benefits for the Bayview in particular and the City generally.
- Upon consultation with Alice Griffith Housing residents and the receipt of all required governmental approvals, rebuild Alice Griffith Housing to provide one-for-one replacement units targeted to the same income levels as those of the existing residents and ensure that eligible Alice Griffith Housing residents have the opportunity to move to the new, upgraded units directly from their existing Alice Griffith Housing units without having to relocate to any other area.
- Include a mix of stacked flats, attached town homes and—in appropriately selected locations—low-rise, mid-rise and high-rise towers, to help ensure the economic feasibility of the development and provide a varied urban form.

Proposition G also permits the sale, conveyance, or lease for non-recreational purposes of any of the parkland that is under the jurisdiction of the San Francisco Recreation and Parks Commission and located within the boundary of Candlestick Point, including the property currently used in connection with the existing stadium and related parking areas. In addition, Proposition G allowed the construction, maintenance, and use for non-recreational purposes of any structure on such property. Proposition G repealed Propositions D and F. Proposition G proposed that new zoning be established along with a land use program for Candlestick Point and HPS. The Project would be consistent with Proposition G and proposes to amend the existing zoning to be consistent with Proposition G.

San Francisco Redevelopment Plans

The Agency has adopted two redevelopment plans for the Bayview Hunters Point area. The Agency exercises planning and regulatory control over designated redevelopment areas through adoption and implementation of redevelopment plans. The *Bayview Hunters Point Redevelopment Plan* currently governs development in the Candlestick Point portion of the Project site, while the existing *Hunters Point Shipyard Redevelopment Plan* governs the HPS Phase II portion of the Project site.

Bayview Hunters Point Redevelopment Plan (formerly the Hunters Point Redevelopment Plan)

The San Francisco Board of Supervisors adopted the BVHP Redevelopment Plan in 2006. (Refer to Chapter I for history of the planning efforts leading to adoption of this Plan.) The BVHP Redevelopment Plan is an amendment of the *Hunters Point Redevelopment Plan*, established in 1969.

In 1997, Agency staff began working with the Bayview Hunters Point Project Area Committee (PAC) on the development of the *Bayview Hunters Point Community Revitalization Concept Plan* (Concept Plan). In November 2000, the PAC approved the Concept Plan, which serves as a vision statement for the community to guide the redevelopment planning process. The Concept Plan contains goals and objectives for revitalization of the area. This planning effort led to the 2006 amendment of the *Hunters Point Redevelopment Plan* and BVHP Redevelopment Plan.

This amendment renamed the plan the *Bayview Hunters Point Redevelopment Plan* (refer to Figure III.B-4 [Bayview Hunters Point Redevelopment Plan Land Use Designations]). The primary redevelopment programs of the BVHP Redevelopment Plan include an Economic Development Program, Affordable Housing Program, and a Community Enhancements Program.

The land use designations within the BVHP Redevelopment Plan applicable to the Project are described below.

- **Residential.** Permitted uses are residential land uses ranging from single-family homes to multi-family developments of a moderate scale. Compatible related uses are also permitted such as local-serving businesses, family childcare facilities, small professional offices, home occupations, and recreation facilities.
- **Stadium/Mall Special Use District.** Land uses permitted in this District consist of a stadium use and a proposed mall pursuant to Proposition F passed by the voters in 1997. The land uses permitted in this District were designed to be consistent with the now repealed Proposition F, which provided for a stadium/mall.

PBS&J 10.31.09 08068 | JCS | 09

Candlestick Point — Hunters Point Shipyard Phase II EIR

FIGURE III.B-4

BAYVIEW HUNTERS POINT REDEVELOPMENT PLAN LAND USE DESIGNATIONS

Due to the large size and the diversity of Bayview Hunters Point, the BVHP Redevelopment Project Area is divided into seven Economic Development Activity Nodes. Land within the Project site is within the Candlestick Point and South Basin Activity Nodes.

Policies contained in the BVHP Redevelopment Plan for these Activity Nodes that are relevant to the Project site are listed below.

Candlestick Point Activity Node

The Candlestick Point portion of the Project site is within the Candlestick Point Activity Node.

- Assist with the development of a new San Francisco 49ers football stadium and commercial project consistent with Propositions D and F, approved by San Francisco voters on June 3, 1997.
- Create community and regional destinations and gathering places—including a restored and redeveloped Yosemite Slough on CPSRA land.

The Project would include cultural facilities such as community facilities, parks and a performance venue/arena that would be used for performing arts, dance, sporting events, and music. These facilities would complement the existing cultural resources in the surrounding area.

The Project proposes to construct a new Yosemite Slough bridge for automobiles, pedestrians, and bicyclists that would connect Candlestick Point to HPS. Although the construction of the Yosemite Slough bridge would change this area, it would not detract from its use in the CPSRA or its biological and other resource utility (refer to Section III.P and Section III.N).

South Basin Activity Node

The portion of the Project in the South Basin Activity Node Designation is the Alice Griffith housing site, which is designated for residential use. The Project would redevelop the Alice Griffith site and include one-for-one replacement of the 256 public housing units.

Policies relevant to the Project site are listed below.

- Promote transit-oriented development adjacent to Third Street, with residential units, including affordable housing units, in appropriate locations.
- Encourage the development of industrial and large-scale commercial space on properties zoned for light industrial uses.
- Create buffer land use zones between residential and industrial uses to minimize potential adverse environmental health impacts and other land use conflicts.
- Promote locally owned businesses and local entrepreneurs.
- Promote retail growth focused on neighborhood-serving businesses that meet the basic shopping needs of the community.
- An eco-industrial park in the southeast portion of the district, with defined truck routes linking the Shipyard and the freeway.
- Protect historic residential neighborhoods, with a range of new infill housing and transit-oriented mixed-use development focused around light rail stations.
- Renovate Housing Authority projects.

Project Consistency: The Project is generally consistent with the BVHP Redevelopment Plan. The proposed residential land use for the Alice Griffith district within the Project site would be consistent with the residential land use category within the BVHP Redevelopment Plan.

The BVHP Redevelopment Plan's use designations for other sections of Candlestick Point reflect Proposition D and Proposition F (approved by the voters in 1997) intentions, which were to provide for the development of a new state-of-the-art stadium for the San Francisco 49ers football team and an entertainment/retail shopping center at Candlestick Point that includes open space areas. However, since 2006 when the BVHP Redevelopment Plan was adopted, Proposition G was passed and the San Francisco 49ers have indicated that the stadium at Candlestick Point did not meet their needs. The mix of land uses proposed for Candlestick Point under the Project would include a mix of residential, retail, office, commercial, parks, open space, and a performance venue. It would not be consistent with the use designations in the BVHP Redevelopment Plan, which call for a stadium/mall development. In May 2007, the Redevelopment Commission, Board of Supervisors, and the Mayor endorsed a Conceptual Framework for the integrated planning and development of the Project, with a potential stadium site located at HPS. The Project reflects the changes in economic and political climate that have occurred since adoption of the BVHP Redevelopment Plan.

The Project includes amendments to the existing BVHP Redevelopment Plan to change the land use designation for Stadium/Mall Special Use District and associated descriptions under the Candlestick Park Activity node. The amendments would be consistent with the proposed development.

Hunters Point Shipyard Redevelopment Plan

In July 1997, the Board of Supervisors, by Ordinance No. 285-97, adopted the HPS Redevelopment Plan for the revitalization of HPS.[58] (Refer to Chapter I for a detailed discussion of the Disposition and Development Agreement and additional history of the HPS planning process.)

The HPS Redevelopment Plan contemplates development of a range of uses under the broad categories of industrial, research and development, mixed use, cultural and educational, residential, and open space. The HPS Redevelopment Plan divides the shipyard into five development parcels, Parcels A through E. Parcel F, which comprises approximately 440 acres of submerged land in the Bay was not proposed for development in the HPS Redevelopment Plan.[59,60]

Phase I development of the shipyard is currently underway on Parcel A-Prime. It includes approximately 1,600 residential units and neighborhood retail and community serving uses on 75 acres. The Phase I

[58] San Francisco Redevelopment Agency, *Redevelopment Plan for the Hunters Point Shipyard Redevelopment Project*, July 14, 1997.
[59] In 1992, the HPS was divided into six separate parcels, known as Parcels A, B, C, D, E, and F. These parcels correspond to the Navy's plan to phase remediation of hazardous materials on the HPS on a parcel-by-parcel basis.
[60] In accordance with procedures for transfer of Navy property, the Agency accepted title to Parcel A-Prime in December 2004. In April 2005, the Agency transferred the portions of Parcel A-Prime to be privately developed to Lennar Urban to construct the infrastructure improvements required under the Phase I DDA. Subsequently, the transfer of Parcel B-Prime from the Navy to the Agency was delayed. As a result, on October 17, 2006, the Agency Commission approved an amendment to the Phase I DDA to remove Parcel B-Prime from the Phase 1 development and to shift the entitled residential units from Parcel B-Prime to Parcel A-Prime. The revised Design for Development standards for Parcel A-Prime address dwelling unit density standards, height and bulk limits, off-street loading, lot sizes, street design, and other similar topics.

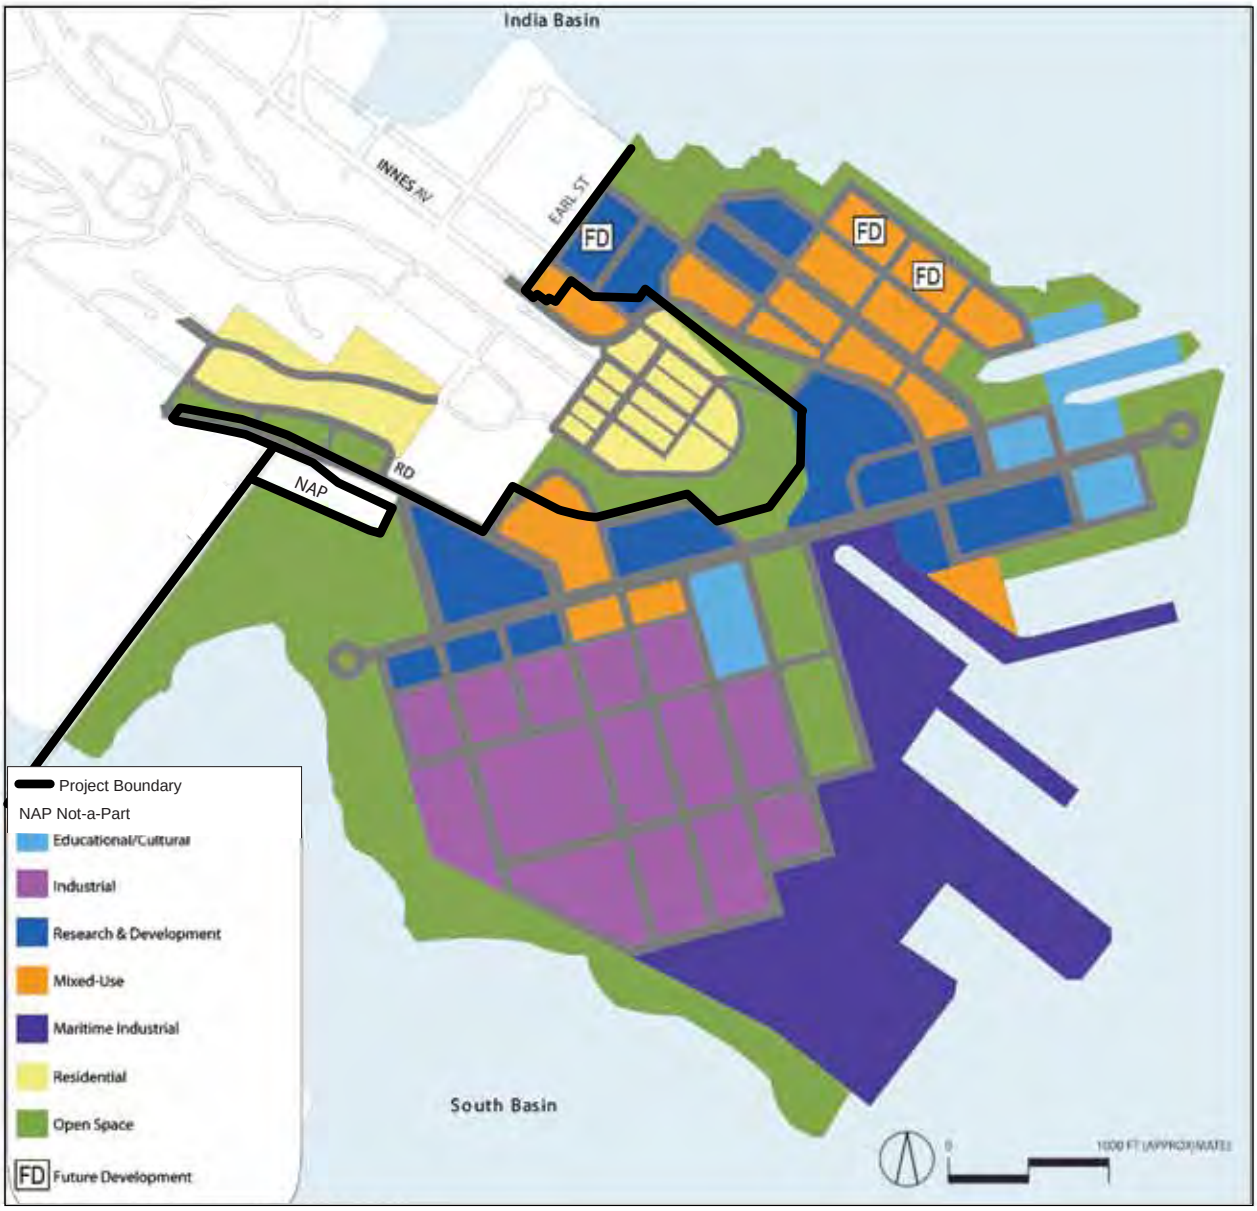
development is not part of the Project (refer to Figure III.B-5 [Hunters Point Shipyard Redevelopment Plan Land Use Designations]).

The HPS Redevelopment Plan includes the following Land Use Designations relating to the HPS Phase II site.

- **Industrial**—Light industrial including the following similar uses: manufacturing, processing, assembly of products, trucking, wholesale, printing and publishing, auto-related services, motion picture production, warehousing and distribution, and artist and artisan studios.
- **Research and Development**—Firms engaged in the manufacture, processing, or assembly of products including surgical and medical appliances and supplies, diagnostic substances, electronic equipment and instruments, data processing and telecommunication services, artists/artisan studios, and live-work spaces.
- **Mixed Use**—Artist's studios and live work spaces, residential, galleries, recording studios, business and arts services, real estate and insurance offices, hotels and conference facilities, and local-serving retail sales.
- **Cultural and Educational**—Education and training facilities, museums, theatres, specialty retail, restaurants, galleries, conference facilities, and artist's studios.
- **Residential**—Mixed income housing, single- and multi-family residential development of approximately 800 to 1,300 dwelling units.
- **Open Space**—Active and passive recreation, plazas and promenades, wetland restoration, and ancillary commercial uses.
- **Maritime Industrial**—Shipping terminals and berths, cargo and equipment warehouses, ship repair, maritime training facilities, and similar maritime related industrial uses.

The land uses that are proposed in the Project for HPS Phase II are discussed below.

- **Residential**—The Project provides for residential areas that would accommodate up to 2,650 residential units, but would eliminate the HPS Redevelopment Plan live-work designation. The areas designated for residential use would also allow neighborhood retail and community facilities. The Project would allow residential uses in areas where the HPS Redevelopment Plan provides for mixed-use and research and development.
- **Neighborhood Retail**—The Project provides for 125,000 gsf of neighborhood retail uses. In addition, the area designated for neighborhood retail use would allow for community facilities, residential, and up to 255,000 gsf of artist studios and Artist Education Center. Neighborhood retail designation would be located in areas where the HPS Redevelopment Plan provides for mixed-use and research and development.
- **Research and Development**—The Project provides for up to 2,500,000 gsf of research and development uses defined to include office, laboratory uses, and light industrial. Areas designated for research and development would also allow community facilities, neighborhood retail, artist studios, and the artist education center. The research and development designation would be located in areas where the HPS Redevelopment Plan provides for cultural and educational, research and development, mixed-use, and open space.
- **Community Facilities**—The Project provides for up to 50,000 gsf of community services and facilities. The community facilities designation would be located in areas the HPS Redevelopment Plan designates for open space and research and development.



SOURCE: Hunters Point Shipyard Redevelopment Plan, PBS&J, 2009.

PBS&J 10.31.09 08068 | JCS | 09

Candlestick Point — Hunters Point Shipyard Phase II EIR

FIGURE III.B-5

HUNTERS POINT SHIPYARD REDEVELOPMENT PLAN LAND USE DESIGNATIONS

- **Parks and Open Space**—The Project includes 231.6 acres of open space and parklands in HPS Phase II. The parks and open space designation would be located in areas that the HPS Redevelopment Plan designates for parks and open space, maritime industrial, industrial, mixed use, research and development, and cultural and educational.
- **Football Stadium**—The Project includes a 69,000-seat football stadium. The football stadium designation would be located in areas the HPS Redevelopment Plan designates for cultural and educational, open space, mixed use, and industrial.

Project Consistency: The HPS Redevelopment Plan included provisions for each general land use type proposed for the Project site except the stadium, but in a different development pattern, as illustrated by Figure III.B-5 and Figure III.B-6 (Proposed Land Use Plan). Maritime industrial uses that are designated in the HPS Redevelopment Plan are not provided for as part of the Project. Unlike the HPS Redevelopment Plan, the Project would identify the maximum allowable square footage of development permitted for each category. The development standards in the HPS Redevelopment Plan were limited to height restrictions, the number of buildings that could be constructed, and the number of residential units.

The Project provides for a total of 2,650 residential units; the HPS Redevelopment Plan provided for approximately 800 to 1,300 residential units, plus additional live-work units.

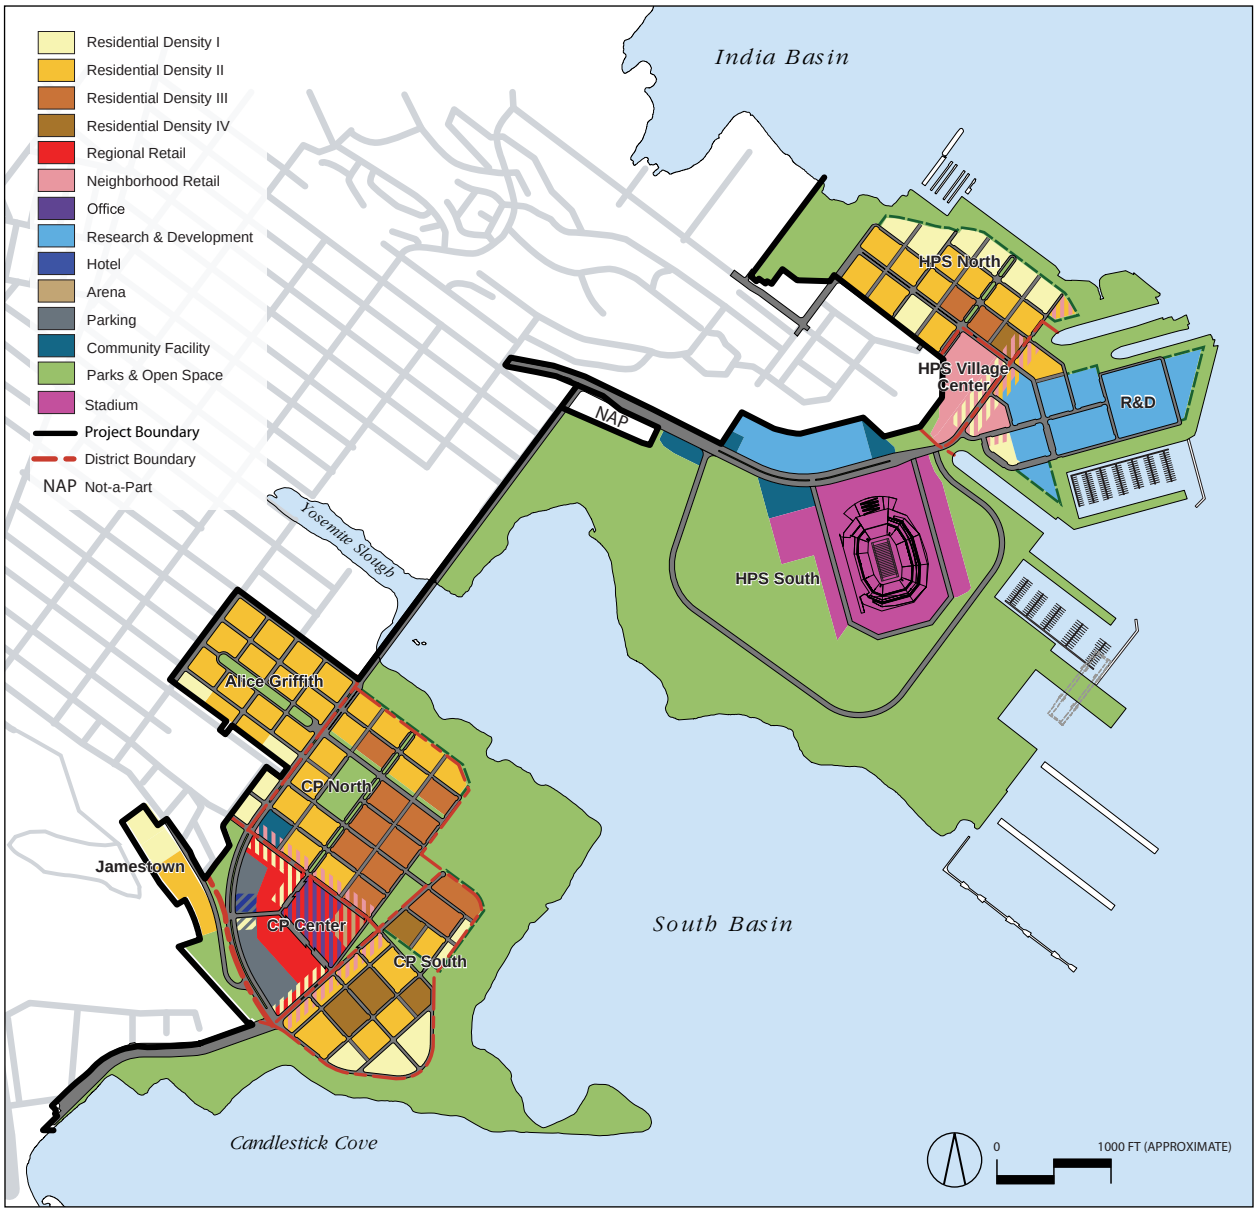
As discussed under Impact LU-2, the Project is consistent with the policies contained in the HPS Redevelopment Plan. The Project is not consistent with some of the Land Use Designations for the HPS Phase II site and standards and intensity of uses identified within the HPS Redevelopment Plan. The Project includes amendments to the existing HPS Redevelopment Plan, which would be consistent with the proposal development.

San Francisco Planning Code

The *San Francisco Planning Code* regulates development in the City by prescribing the permitted uses and development standards consistent with the land use designation and policies in the San Francisco General Plan.

Zoning in San Francisco generally consists of two layers of districts. Use Districts are the base zoning districts that prescribe which land uses are permitted and most development standards (except height and bulk). Height and Bulk Districts are mapped separately from the Use District and prescribe the height and bulk of buildings. On top of the Use Districts and Height and Bulk District, Special Use Districts (SUDs) are mapped in some instances to address particular issues for targeted areas; SUDs provide controls that supersede some or all of the underlying Use District to meet certain goals.

The current zoning of the Candlestick Point portion of the Project site is mostly Public (P), which permits public uses and facilities. The P Zoning at Candlestick Point includes most of CPSRA, Candlestick Park stadium and its parking areas. Alice Griffith is zoned RM-1 (Residential, Mixed – Low Density). This district accommodates a mix of residential housing types (i.e., houses and apartments) at a density ratio of one unit for every 800 square feet of lot area. The area bordered by Arelious Walker, Egbert Avenue, Donahue Street, and Gilman Avenue is largely zoned M-1 (Light Industrial), which allows a wide range of uses. Some outlying portions of the CPSRA have remnant zoning of RH-1(D) (Residential, House, Single-Family detached) and M-2 (Heavy Industrial). The San Francisco Zoning Maps refer to the Hunters Point Shipyard Redevelopment Plan for the Use Districts for Hunters Point Shipyard.



SOURCE: Lennar Urban, 2009.

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.B-6 Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED LAND USE PLAN

There are two portions of the Project site that are outside of the BVHP Redevelopment Project Area and HPS Redevelopment Project Area. One portion bordering Harney Way is currently zoned P to the south of Harney Way (and within the CPSRA) and C-2 to the north of Harney Way. Harney Way is proposed to be widened in this location, which would change the use of a portion of the CPSRA and the C-2 designated area. The other portion is south of Crisp Road and north of the end of Arelious Walker Drive and it is zoned M-2 and P. The Project proposes to connect Arelious Walker Drive to Crisp Road in this area.

While there are currently no Special Use Districts designated in either area, Candlestick Point recently included a Candlestick Point Special Use District. The SUD was put in place by Proposition F in 1997 to specifically accommodate a new football stadium and retail and entertainment development. As discussed above under Proposition G, the voters removed the SUD as a part of the measure, with the expectation that new zoning would be created to accommodate the program described therein and which is the Project analyzed in this EIR.

In November 1986, the voters of San Francisco approved Proposition M, the Accountable Planning Initiative, which added Section 101.1 to the City *Planning Code* to establish eight Priority Policies. These policies, and the sections of this Environmental Evaluation addressing the environmental issues associated with the policies are (1) preservation and enhancement of neighborhood-serving retail uses (Section III.B); (2) protection of neighborhood character (Section III.B); (3) preservation and enhancement of affordable housing (Section III.C with regard to housing supply and displacement issues); (4) discouragement of commuter automobiles (Section III.D); (5) protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership (Section III.B); (6) maximization of earthquake preparedness (Section III.L [Geology and Soils]); (7) landmark and historic building preservation (Section III.J [Cultural Resources and Paleontological Resources]); and (8) protection of open space (Section III.F [Shadows] and Section III.P).

Prior to issuing a permit for any project that requires an Initial Study under CEQA, and prior to issuing a permit for any demolition, conversion, or change of use, and prior to taking any action that requires a finding of consistency with the General Plan, Section 101.1 requires that the City find that the proposed project or legislation would be consistent with the Priority Policies. As noted above, the consistency of the Project with the environmental topics associated with the Priority Policies is discussed in Chapter III (Environmental Setting, Impacts, and Mitigation Measures) of this EIR. The case report and approval motions for the Project would contain the Planning Department's comprehensive Project analysis and findings regarding consistency of the Project with the Priority Policies.

Project Consistency: The Project is not consistent with the existing zoning at Candlestick Point as it would not accommodate high-density residential, retail and office uses at the locations contemplated. The proposed reconfiguration of the CPSRA does not match the existing boundary of the "P" Districts at Candlestick Point. As noted above, Hunters Point Shipyard does not have any zoning under the *Planning Code*. As part of the Project, a new Special Use District would be created at Candlestick Point. The Special Use District would largely supersede the underlying zoning described above and refer to Redevelopment Plan documents in regards to allowed uses and development controls. A new Height and Bulk District would also be created for Candlestick Point that would lay out general parameters for allowed heights but would also refer to Redevelopment Plan documents for specific height and bulk limits and requirements at a more localized level.

For HPS Phase II, a base Use District would established for the sake of Planning Code mapping. Like Candlestick Point, a new Special Use District and a new Height and Bulk District would be created for the area. The SUD would largely supersede the new underlying Use District zoning and would refer to the BVHP Redevelopment Plan documents; the Height and Bulk District would similarly lay out general parameters for allowed heights but would also refer to the BVHP Redevelopment Plan documents for specific height and bulk limits and requirements at a more localized basis. The Project would be consistent with the *San Francisco Planning Code* once amended.

The Sustainability Plan

In 1993, the San Francisco Board of Supervisors established the Commission on San Francisco's Environment, charged with, among other things, drafting and implementing a plan for San Francisco's long-term environmental sustainability. The notion of sustainability is based on the United Nations definition that "a sustainable society meets the needs of the present without sacrificing the ability of future generations and non-human forms of life to meet their own needs." The Sustainability Plan for San Francisco was a result of community collaboration with the intent of establishing sustainable development as a fundamental goal of municipal public policy.

The Sustainability Plan is divided into fifteen topic areas, ten that address specific environmental issues (air quality; biodiversity; energy, climate change and ozone depletion; food and agriculture; hazardous materials; human health; parks, open spaces, and streetscapes; solid waste; transportation; and water and wastewater), and five that are broader in scope and cover many issues (economy and economic development, environmental justice, municipal expenditures, public information and education, and risk management). Additionally, the Sustainability Plan contains indicators designed to create a base of objective information on local conditions and to illustrate trends toward or away from sustainability. Although the Sustainability Plan became official City policy in July 1997, the Board of Supervisors has not committed the City to perform all of the actions addressed in the plan. The Sustainability Plan serves as a blueprint, with many of its individual proposals requiring further development and public comment.

Project Consistency: The Project contains a number of features that would respond to policies articulated in the Sustainability Plan, including:

- Provide neighborhood-serving retail.
- Provide automobile, public transportation, and pedestrian connections between the Shipyard, Candlestick Point, and the larger BVHP neighborhood.
- The urban design of the Project would reduce its footprint and allow for transportation and open space corridors.
- Integrate land use patterns with multimodal street networks that would facilitate walking and cycling for internal trips and transit for trips of greater distance.
- Extend existing Muni routes to better serve the Project site and area; increase frequencies on existing routes to provide more capacity; and complement those existing routes with new transit facilities and routes that would serve the Project's proposed land use program and transit demand.
- The Project is a redevelopment project and would not result in the conversion of any new land to settlement.
- Plant up to 10,000 net new trees at the Project site and in the community.

- Exceed the 2008 Standards for Title 24 Part 6 energy efficiency standards for homes and businesses by at least 15 percent.
- Install ENERGY STAR[61] appliances, where appliances are offered by homebuilders.
- Use energy efficient street lighting.

III.B.3 Regulatory Framework

Federal

Refer to subsection III.B.2 (Setting) regarding the application of the *Coastal Zone Management Act*.

State

Refer to Section III.B.2 (Setting) regarding the application of the CPSRA General Plan and SB 792 to the implementation of the Project.

Regional

Refer to Section III.B.2 regarding the application of the San Francisco Bay Plan, the San Francisco Bay Trail Plan, and the Bay Area Seaport Plan to the implementation of the Project.

Local

Refer to Section III.B.2 regarding the application of the San Francisco General Plan, Bayview Hunters Point Area Plan, Bayview Hunters Point Redevelopment Plan, Hunters Point Shipyard Redevelopment Plan, *San Francisco Planning Code*, the Sustainability Plan, and the Accountable Planning Initiative to the implementation of the Project.

III.B.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to land use and plans, but generally consider that implementation of the Project would have significant impacts if it were to:

B.a Physically divide an established community

B.b Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect

B.c Have a substantial adverse impact on the existing character of the vicinity

[61] The term ENERGY STAR is capitalized as is the convention used by the United States Environmental Protection Agency and Department of Energy.

Analytic Method

The analysis compares land use conditions at full build-out of the Project against the existing land use environment, on the ground, as of the date of publication of the NOP. The Project would be built out by the year 2031, with full occupancy occurring in 2032. Changes in land use character at Project build-out are described and assessed according to the significance criteria listed above.

The analysis considers whether the Project would contribute to physical division of an established community by constructing physical barriers or obstacles to circulation that would restrict existing patterns of movement between the Project site and the Bayview Hunters Point neighborhood. The Project's contribution to the continuity of the existing land use and circulation patterns is also considered in this analysis.

The analysis of the Project's effect on existing land use character includes consideration of the character of proposed development relative to the existing land use context. An adverse effect would occur if a new use were placed next to an incompatible existing use, such that the basic function of either the existing use or the new use would be impaired. For example, if a residential use were located next to a factory with toxic air emissions, either or both uses would be unable to function as intended.

The analysis also discusses whether the Project would be consistent with applicable land use plans and policies that were adopted for the purpose of avoiding or mitigating an environmental impact. Land use policies are policies that pertain to the type, location, and physical form of new development.

CEQA Guidelines section 15125(d) states, "The EIR shall discuss any inconsistencies between a proposed project and applicable general plans and regional plans." The Plans and Policies section of this EIR section includes a comprehensive discussion of the relationship of the Project, including the proposed Plan amendments and Planning Code changes, with the San Francisco General Plan, Redevelopment Plans, and with pertinent regional plans.

Additionally, the Project's potential contribution to cumulative land use impacts are evaluated in the context of existing, proposed, and reasonably foreseeable future development expected in the Project vicinity.

Construction Impacts

There are no construction impacts with respect to Land Use and Plans.

Operational Impacts

Impact LU-1: Physical Division of an Established Community

Impact LU-1 **Implementation of the Project would not physically divide an established community. (No Impact) *[Criterion B.a]***

Candlestick Point

Currently the Candlestick Point site contains Candlestick Park Stadium, parking areas, and a number of large, vacant parcels. Pedestrian access to the CPSRA and the San Francisco Bay from surrounding land uses is limited. Most non-arterial streets from the residential neighborhoods to the west of Candlestick

Point reach a dead end before entering the site. In addition, Bayview Hill creates a physical barrier to the south, limiting access from this direction, except at Harney Way. The lack of street connectivity, combined with the site's large, barren parcels, lack of sidewalks, and low level of on-site activity, make Candlestick Point relatively unwelcoming to pedestrian traffic.

The existing Alice Griffith housing site is gated off from surrounding uses, and there are no neighborhood-serving retail uses or community uses at Candlestick Point. There is existing multi-family residential development on Jamestown Avenue.

The Project would develop new districts, with a new street grid pattern, medium- to high-density residential uses, regional and neighborhood retail uses, a hotel, and arena uses. The Project would include new open space within Candlestick Point districts and would improve the CPSRA areas. The street pattern, open space network, and pedestrian facilities are specifically planned to facilitate connections between developed areas of Candlestick Point and the CPSRA, other BVHP neighborhoods, and HPS Phase II. The Yosemite Slough bridge would provide pedestrian, bicycle, and transit routes between Candlestick Point and HPS Phase II.

A number of roads separate the existing public open space from the rest of Candlestick Point; including Harney Way, Jamestown Avenue, Hunters Point Expressway, Gilman Avenue, Fitzgerald Avenue, Arelious Walker Drive, and Carroll Avenue. The Project would improve Harney Way as a major roadway serving Candlestick Point by widening it and providing new capacity for both autos and other modes of transportation. Following Project implementation, Harney Way would include two additional lanes for dedicated Bus Rapid Transit use, a new left-hand turn/multi-directional lane, potentially one new travel lane, and new bikeways, but would not create a new separation between existing residential or commercial areas and other uses within Candlestick Point. The Project would also have pedestrian facilities that would allow for safe access across Harney Way. Thus, the Harney Way improvements would enhance access within Candlestick Point and between Candlestick Point and other areas, including the HPS Phase II and Executive Park, for existing and future residents and visitors. Consequently, these improvements would not divide an existing community.

The Alice Griffith Public Housing site would be redeveloped with a mix of replacement public housing, affordable housing, below-market rate housing, and market-rate housing that would integrate the street pattern of the existing BVHP neighborhood and the Candlestick Point street pattern.

The Jamestown Avenue district would replace vacant lots with market rate housing at heights of 65 and 85 feet that are consistent with other development on Jamestown Avenue; thus building on and maintaining the existing character of this area.

- There are five blocks with privately owned parcels on Candlestick Point that the Applicant seeks to acquire for the development, including one on Jamestown Avenue (currently vacant) in the Jamestown District and four contiguous blocks (currently vacant or developed with an RV park) in the Candlestick Point North District. If these private parcels are not acquired by the Applicant, they would be permitted under the BVHP Redevelopment Plan and the Planning Code to develop via an Owner Participation Agreement (OPA) in a manner that is consistent with the BVHP Redevelopment Plan or would be allowed to operate as an existing non-conforming use. For those parcels that are currently developed, or for any of the parcels if they develop via an OPA, that development would be included in the overall total development that would occur on the Project site. The total amount of development would not change; that is, the Applicant's development on

the remaining portion of the site plus any development under separate OPAs as envisioned under the Project would result in the same overall development level as proposed by the Applicant.

The Project would include new public gathering spaces and neighborhood-oriented commercial uses that would serve residents throughout the Bayview Hunters Point neighborhood, including the existing residents of Alice Griffith Public Housing and Jamestown Avenue. The existing block pattern would be extended towards the Bay, and multi-modal (pedestrian, bicycle, transit and automobile) circulation improvements would improve connectivity between Candlestick Point and neighboring communities (refer to Figure II-9 [Proposed Parks and Open Space] through Figure II-13 [Proposed Transit Improvements], respectively). Proposed circulation improvements include installation of sidewalks and other pedestrian improvements along existing streets between Candlestick Point and HPS Phase II, new bicycle lanes, rerouting of bus service to the HPS Phase II site, traffic calming features, a bridge across Yosemite Slough, and a waterfront pedestrian and bicycle corridor from Candlestick Point to the northeast boundary of the HPS Phase II site connecting to the trail facilities along the India Basin shoreline (refer to Candlestick Park discussion).

One of the Project's objectives is to create an integrated development that would create a cohesive development and improve connectivity between Candlestick Point and surrounding communities. The street pattern, open space network, and pedestrian facilities would be planned to facilitate connections between the Project and the surrounding community.

While Harney Way would be widened and would extend through the existing Stadium site, it would not separate existing uses. Existing development to the north of Harney Way, such as Executive Park, would still have the same relationship to the shoreline and other resources as it currently does, although Harney Way would be widened and provide an improved configuration. Existing uses would still be located to the west, north of Harney Way and new land uses within Candlestick Point South would be to the east of Harney Way. In addition, pedestrian crossings would be provided that would facilitate movement between the existing community and Candlestick Point South.

Within Candlestick Point, the Project would create a new district with no physical divisions. Although the Project would change some of the existing land uses in the area and increase the density and intensity of development, the Project would provide new parks, public gathering places and uses that would serve existing and new residents. The Project would provide new multi-model transportation connections within the Project site and to the surrounding neighborhood, and also provide new access to the Bay and Yosemite Slough.

The Project would, thus, not divide an established community at Candlestick Point; therefore, no impact would occur.

HPS Phase II

In the past, HPS operated as a secured military site and has also contained some commercial and industrial uses, with little physical connectivity to the surrounding community. Currently, artist studios are the only active uses at the HPS Phase II site. Large undeveloped parcels and vacant buildings surround these uses, isolating them from uses in the neighboring Bayview Hunters Point community. There is limited street access to the HPS Phase II site.

The Project would develop new districts, with a new grid street pattern, medium- to high-density residential uses, neighborhood retail uses, research and development uses, the 49ers Stadium, and associated parking uses at HPS Phase II. The Project also would include new open space, parks, and recreational areas throughout the HPS Phase II districts and along the shoreline. The street pattern, open space network, and pedestrian facilities would be planned to facilitate connections between the Project and the under-construction HPS Phase I development, the India Basin neighborhood, other BVHP neighborhoods, and Candlestick Point.

Proposed development at HPS Phase II would redevelop currently underutilized parcels and would extend the street grid from the surrounding neighborhood to the HPS Phase II site, providing improved connectivity between existing and proposed residential and retail uses to the west of the HPS Phase II site (refer to HPS Phase I site). Development at HPS Phase II would provide identifiable retail and community areas at the HPS Center, connected by the pedestrian, bicycle, transit, and street improvements shown in Figure II-9 through Figure II-13 in Chapter II. Proposed circulation improvements would include installation of sidewalks and other pedestrian improvements along existing streets between Candlestick Point and HPS Phase II, new bicycle lanes, rerouting of bus service to the HPS Phase II site, traffic calming features, the Yosemite Slough bridge, and a waterfront pedestrian and bicycle corridor from Candlestick Point to the northeast boundary of the HPS Phase II site connecting to the trail facilities along the India Basin shoreline.

While Innes Avenue would be repaved and restriped from Jennings Street to the Project boundary, it would not separate existing uses. The existing hillside development to the north of Innes Avenue would still have the same relationship to the shoreline and other resources with regard to Innes Avenue as it currently does, albeit in an improved configuration. Existing hillside uses would still be located to the west and south of Harney Way and the shoreline would be to the north and east of Innes Avenue, and the roadway would not be widened. In addition, pedestrian crossings would be provided that would facilitate movement between the existing hillside community and the shoreline.

Overall, the Project would improve the connectivity of this area to HPS Phase I, Candlestick Point, other surrounding neighborhoods, and other areas of the City. While the Project would change the land uses and increase the intensity of development on the site, the proposed HPS Phase II development would not divide an established community. Furthermore, development at HPS Phase II would improve and provide new pedestrian, bicycle, transit, and street connections within the Project site and to the surrounding community, and also provide new retail and community areas at the HPS Center. The Project would not divide an established community; therefore, no impact would occur.

Summary

In summary, the Project site generally includes underutilized and vacant parcels with limited access to the Bay shoreline and CPSRA. Connectivity between the Bayview Hunters Point neighborhood, Candlestick Point and HPS Phase II is limited. Large parking lots and vacant parcels at Candlestick Point separate the Bayview Hunters Point neighborhood from the Bay shoreline, and primary access roads do not include pedestrian, transit or bicycle features. Access to HPS Phase II is restricted to certain areas (those areas used for artist studios), and the area remains isolated from surrounding neighborhoods. The Project would maintain residential communities at Alice Griffith public housing and at Jamestown Avenue.

The Project proposes infill development, centered on nodes of commercial and retail activity at Candlestick Point and HPS Phase II with no physical divisions. Residential and non-residential infill around these nodes of activity would provide a more continuous land use pattern and street grid, provide new services and community amenities in the Bayview Hunters Point neighborhood, allow better access to parks and recreational facilities (which would be improved under the Project), and remove existing barriers to circulation and access. The Project would not divide an established community; therefore, no impact would occur. No mitigation is required.

Impact LU-2: Conflict with Plans, Policies, or Regulations

Impact LU-2 **Implementation of the Project would not conflict with land use plans, policies, or regulations adopted to avoid or mitigate an environmental effect. (Less than Significant) *[Criterion B.b]***

Applicable plans that direct or regulate development on the Project site include the San Francisco General Plan, Candlestick Point State Recreation Area General Plan, San Francisco Bay Plan, San Francisco Bay Trail Plan, Bay Area Seaport Plan, Bayview Hunters Point Area Plan, Bayview Hunters Point Redevelopment Plan, Hunters Point Shipyard Redevelopment Plan, and San Francisco Planning Code. San Francisco's Sustainability Plan also applies to the Project. The Project Consistency analyses in the Plans and Policies section above describe the Project's consistencies and inconsistencies with these plans; these analyses are summarized here:

The Project is consistent with San Francisco's Proposition G (2008) and contains a variety of policies that respond to the City's Sustainability Plan.

The Project is inconsistent with the port use designations in the San Francisco Bay Plan and the Bay Area Seaport Plan, because both of these plans designate parts of the Project site for port uses that would not be developed under the Project. These inconsistencies do not constitute a significant environmental impact because the port use designations were not adopted to avoid or mitigate an environmental effect. By creating parks and open space in areas previously designated for industry, the Project uses proposed for this area will have fewer environmental impacts than the port use designations in these plans. As explained above, these designations do not reflect current economic conditions affecting the maritime shipping industry in San Francisco. Amendment of these plans to bring them into line with current conditions would be required before the inconsistent aspects of the Project can be implemented. The project is generally consistent with the other goals and policies of these plans.

The Project is generally consistent with the policies and goals of the other applicable plans, including the Candlestick Point State Recreation Area General Plan, San Francisco Bay Trail Plan, San Francisco Bay Plan, City of San Francisco General Plan (including the Bayview Hunters Point Area Plan), Bayview Hunters Point Redevelopment Plan, Hunters Point Shipyard Redevelopment Plan, and City of San Francisco Planning Code. As explained in the analyses of individual plans, however, the Project is inconsistent with various land use designations contained in those plans.

Many of these inconsistencies are consequences of those plans' continued reflection of former plans for the Project site. For example, the BVHP Area Plan and Redevelopment Plan designate land on Candlestick Point for a football stadium or stadium-mall development. Similarly, the Hunters Point Shipyard

Redevelopment Plan designates large areas along the Hunters Point waterfront for industrial uses; the Project would develop these areas as parks and open space. The Project also differs from the Hunters Point Shipyard Redevelopment Plan in its development pattern of research and development, residential and other uses.

These inconsistencies would be eliminated with the proposed amendments to the relevant plans that are part of the Project, but do not reflect any impacts to the environment that the plans and policies seek to avoid. As described in connection with the Bay Plan and Seaport Plan, the designation of industrial uses along the waterfront is not a policy adopted to protect the environment, and the Project's proposals for this land represent an environmental improvement. Inconsistencies regarding the development pattern at HPS and the uses on Candlestick Point simply reflect the shifting locations of proposed uses within the site. The Project's proposed changes in the arrangement of land uses would not implicate any environmental protection objectives of the current land use designations in the redevelopment plans and other applicable land use plans; thus, the inconsistencies do not give rise to a significant impact on the environment.

Several of the plans include maps reflecting the existing boundary of Candlestick Point State Recreation Area. The Project's proposed reconfiguration of CPSRA would change that boundary, rendering it inconsistent with such maps. In several instances, the Project's inconsistencies with a plan (such as the Bay Trail Plan and the CPSRA General Plan) reflect an improvement over the current plan and would advance the plan's goals and objectives (refer to Section III.P for a discussion of proposed improvements to CPSRA).These inconsistencies are, therefore, not considered significant environmental impacts.

The Project would be inconsistent with the *San Francisco Zoning Code*'s "Public" or "P" designation for Candlestick Point. This zoning is descriptive, reflecting the site's use as CPSRA and Candlestick Park stadium. The Project would maintain CPSRA's public nature, and improve its recreational opportunities as described above. The Project would replace the stadium and other public facilities at Candlestick Park with a variety of new uses, but those facilities do not provide environmental protection or other environmental benefits. Similarly, the zoning inconsistencies related to the widening of Harney Way and the Walker-Crisp road connection do not relate to designations that protect the environment. If the Applicant is unable to acquire any or all of the privately owned parcels on Candlestick Point, the private parcels would be permitted under the BVHP Redevelopment Plan and the Planning Code to develop via an Owner Participation Agreement (OPA) in a manner that is consistent with the BVHP Redevelopment Plan, or would be allowed to operate as an existing non-conforming use. Thus, the Project's inconsistency with the P zoning is not considered a significant environmental impact.

Amending each of these plans to achieve consistency would be a part of the approval and entitlement process for the Project. Amendments of the Redevelopment Plans, General Plan, and *Planning Code* are part of the Project. The Project as approved and developed would thus be consistent with the relevant plans and policies, once amended.

Overall, the Project would have a less-than-significant environmental impact related to land use plans and policies. No mitigation is required.

Impact LU-3: Impact on Existing Land Use Character

Impact LU-3 **Implementation of the Project would not have a substantial adverse impact on the existing character of the vicinity. (Less than Significant)** ***[Criterion B.c]***

Candlestick Point

The Project would alter the land use character at Candlestick Point with new development of residential uses, regional and neighborhood retail uses, an arena, and public open space. The Project would remove Candlestick Park stadium and associated paved and unpaved parking lots; the Project would also include redevelop the existing Alice Griffith public housing site, and remove other existing uses, such as the Candlestick RV Park. The Project would extend the existing Bayview street grid and block pattern into Candlestick Point. The open space network would connect to existing CPSRA. As discussed above in Setting, State Recreation Area Boundary Designation, CPRSA lands at would be reconfigured and improved as part of the Project.

Land uses immediately surrounding Candlestick Point are varied, and include light industrial uses to the north; single-family residential, newer multi-family residential units and townhomes and apartments generally to the northwest, and Executive Park to the west. At present, the existing development at Executive Park consists of three office buildings and residential buildings; Executive Park is proposed to be redeveloped with residential uses replacing the office buildings. The scale of nearby development ranges from two-story residential structures to taller apartment and office structures.

The Project would result in a substantially different built environment compared to the existing character of the site and vicinity. The scale of development would contrast with existing patterns; Candlestick Point would include residential towers ranging from 220 feet to 420 feet in height, and regional retail and arena uses. The mixed-use pattern with the Project at Candlestick Point would transition from lower-density residential uses near existing neighborhoods to higher density residential and commercial uses. Development at Candlestick Point would have similar land uses as existing and proposed uses in Executive Park immediately to the west. With the transition in scale and uses, the extension of the existing street grid, and with the connectivity of new open space with existing shoreline open space, the Project would be compatible with surrounding land uses. The Project would not result in a substantial adverse change in the existing land use character at Candlestick Point or adjacent areas. The impact would be less than significant.

HPS Phase II

The Project would alter the land use character at HPS Phase II with new development of R&D uses, residential uses, neighborhood retail uses, a football stadium, and public open space. The Project would remove with the most of the large, vacant industrial and administrative buildings as well as develop HPS Phase II areas where buildings have already been cleared. The Project would retain certain historic structures, piers, drydocks, and the prominent Re-gunning crane. The Project would extend the existing street grid and block pattern into HPS Phase II. The open space network would connect to the shoreline to the north and south.

Land uses near HPS Phase II include the India Basin community to the north with residential and some light industrial uses. The area adjacent to the HPS Phase II site to the southwest contains multi-family

housing and single-family attached units on Hunters Point Hill. Farther west are residential neighborhoods in the Palou Avenue corridor, and industrial uses in South Basin. The scale of nearby development ranges from two-story residential structures to larger scale warehouse and light-industrial structures.

The Project would alter the land use character at HPS Phase II with new development of residential uses, regional and neighborhood retail uses, an arena, and public open space.

The Project would result in a substantially different built environment compared to the existing character of the site and vicinity. The scale of development would contrast with existing patterns; HPS Phase would include two residential towers ranging from 270 feet to 370 feet in height. The football stadium would be a large-scale public facility, with related parking and dual-use open space areas. While this would be a new land use element at HPS Phase II, it would replace the similar-scale use at Candlestick Point. The mixed-use pattern with the Project at HPS Phase II would transition from lower-density residential uses near existing neighborhoods to higher density residential and R&D uses. With the transition in scale and uses, the extension of the existing street grid, and with the connectivity of new open space with existing shoreline open space, the Project would be compatible with surrounding land uses. The Project would not result in a substantial adverse change in the existing land use character at HPS Phase II or adjacent areas. The impact would be less than significant.

Summary

The Project would alter the land use character at the Project site with new development of residential uses, R&D uses, regional and neighborhood retail uses, a football stadium, an arena, and public open space. The Project would extend the existing street grid and block pattern into HPS Phase II. The open space network would connect to the shoreline to the north and south.

This development would be considered to improve the existing land use conditions, and would not have an adverse effect on land use character of the Project site itself.

The Project would result in a substantially different built environment compared to the existing character of the site and vicinity. With the transition in scale and uses, the extension of the existing street grid, and with the connectivity of new open space with existing shoreline open space, the Project would be compatible with surrounding land uses. The Project would not result in a substantial adverse change in the existing land use character at the Project site or vicinity. The impact would be less than significant. No mitigation is required.

Cumulative Impacts

The geographic context for evaluation of cumulative impacts associated with land use changes is the surrounding areas of the Bayview Hunters Point neighborhood, including Executive Park and India Basin These areas contain a mix of land uses, including residential, commercial, and industrial. The past and present development in these areas is described in Section III.B.2, above, representing the baseline conditions for evaluation of cumulative impacts to land use. Reasonably foreseeable future development forecasts are based on projections of future growth and take into account projects in the entitlement process. Those forecasts account for other major projects currently in various stages of the approval process, including the India Basin Shoreline Plan, the Executive Park project, HPS Phase I, Jamestown,

- and Hunters View. In addition, the Yosemite Slough Restoration Project, which has been approved and would add approximately 12 acres of wetlands to the tidally influenced area of Yosemite Slough, is considered in this cumulative context. Future conditions would also account for land use changes expected through implementation of the Bayview Hunters Point Redevelopment Plan.

  Future development within those areas would result in changes to the existing land use through conversion of vacant land to developed uses or through the conversion of existing land uses. Development in those areas would also be subject to environmental and planning review that would ensure compatibility with adjacent land uses. It is anticipated that all future projects proposed in these areas would be consistent with the adopted goals, policies, and objectives of the area Plans and would improve rather than degrade the existing character of the land uses.

  The Project would result in a substantially different built environment compared to the existing character of the site and vicinity but would develop new uses that would be compatible with other development in the Project vicinity. As noted, above, the Project would increase residential and non-residential densities at the Project site and would be compatible with the existing land use character. Development patterns would include transitions from low-density residential uses to higher density residential and commercial uses. The transition in scale between adjacent neighborhoods and the Project site, and the varied range of proposed uses, would not result in a substantial adverse change in the existing land use character. Since development of cumulative projects within the defined geographic context would not result in an adverse impact on existing land use character, there would be no cumulative impact to which the Project could contribute. Therefore, the cumulative impact would be less than significant.

[This page is intentionally left blank.]

SECTION III.C POPULATION, HOUSING, AND EMPLOYMENT

III.C.1 Introduction

This section describes the existing and projected population, housing, and employment characteristics of the Project and examines the potential for the Project to (1) induce substantial unplanned population growth either directly or indirectly, or (2) displace existing housing or residents. This section evaluates the potential for both Project level and cumulative environmental impacts. The analysis in this section concludes that no potentially significant or significant environmental impacts would result from the Project; therefore, no mitigation measures are included.

Section III.C.3 (Regulatory Framework) also provides information regarding the City's affordable housing policies. However, because changes in housing affordability levels are socioeconomic effects, no significance determination is provided with respect to these issues; information pertaining to these topics is provided for informational purposes only.

Further, the Navy will be preparing a supplemental environmental assessment for the Hunters Point Shipyard Base Reuse. In Potential impacts on minority and low-income populations are addressed in Appendix C1 (Environmental Justice Report).

III.C.2 Setting

■ Population

Regional Overview

The San Francisco Bay Area has experienced an influx of population over the past several decades that is expected to continue into the foreseeable future, albeit at a more gradual rate than in past decades. The 2007 Association of Bay Area Governments (ABAG) projections estimate that there were approximately 7 million residents living in the Bay Area in 2005. Between 2000 and 2005, the regional population of the Bay Area grew by just under 1 percent per year; growth through 2030 is expected to occur at approximately this same rate,[62] adding 916,800 residents by 2030 (refer to Appendix C2 [Population Projections]).[63]

The population in the City as of January 1, 2008, was 824,525, its highest population on record.[64] In terms of population, San Francisco is the second largest city in the Bay Area, following San Jose.

Project Site

Table III.C-1 (Existing Population [2005]) presents information on the 2005 population of the Project site. For purposes of this analysis, 2005 data is used to represent baseline conditions as 2005 data is the most current data consistently available for the Project site across all population, employment, and housing indices. However, where more current data is available for the City as a whole, those data are also provided to demonstrate how conditions have changed, or remained the same, since 2005.

Table III.C-1 Existing Population (2005)

Analysis Area	*Population*	*Households*[a]	*Persons per Household*[b]
Candlestick Point	1,113[c]	292[c]	3.8
HPS Phase II	0[c,d]	0[c,d]	N/A
Project Site Total	***1,113***	***292***	***3.8***
San Francisco	783,441[e,f]	341,478[e]	2.3
San Mateo County	487,977[g]	252,648[g]	1.9

SOURCES:

a. Households are occupied units, not total units.
b. The total persons per household ratio was calculated by dividing totals in the Population column by the totals in the Households column.
c. Population and household data for the Project site are 2005 data from San Francisco County Transportation Authority, *TAZ Model Data*, 2008. These data include 256 permanent residents of the Alice Griffith Housing Complex and approximately 36 residents located within the TAZ boundaries, but outside of the Candlestick Point site. For purposes of the EIR analysis, it is assumed that 256 households are located within the Candlestick Point portion of the Project site.
d. The City uses traffic analysis zones, or TAZs, to predict population, employment, and housing trends at the local level. The TAZ boundaries do not completely coincide with Project site boundaries, which contributes to slight discrepancies in the data reported. The TAZ that includes the HPS Phase II site includes a portion of nearby Mariners Village and Morgan Heights residential neighborhoods. Housing unit and population attributable to these areas have been removed from the totals reported above, as there is currently no housing at HPS Phase II.
e. The population and households data reported for San Francisco is 2005 data provided in Memorandum from John Rahaim, Director of Planning, San Francisco Planning Department to Michael Carlin, Deputy General Manager, San Francisco Public Utilities Commissions, *Projections of Growth by 2030*, July 9, 2009.
f. The text on page III.C-2 reports that the San Francisco population was 824,525 in 2008. This table presents 2005 numbers, as 2005 data is the most current data available across all population, housing, and employment indices for the Project site.
g. Population and household data for San Mateo County is 2005 data from US Census, *2005–2007 American Community Survey*, 2005. http://factfinder.census.gov (accessed online June 12, 2009).

The existing population and household data for the Project site are taken from 2005 data from San Francisco County Transportation Authority, *TAZ Model Data (*2008), which also includes units within the TAZ boundary, but outside of the Project site. As of 2005, there were approximately 298 existing housing units within the TAZ boundary, as shown in Table III.C-1, with only 292 occupied, as shown in Table III.C-2; however, there are only 256 existing units within the Candlestick Point portion of the Project site, all of which are associated with the Alice Griffith Housing Complex. There are no households associated with the HPS Phase II portion of the Project site. For purposes of the EIR analysis, it is assumed that 256 households are located within the Candlestick Point portion of the Project site.

The 2005 population[65] at the Project site was approximately 1,113 persons,[66] about 0.14 percent of San Francisco's population in the same year. There are no existing residents at HPS Phase II. The majority of the residents at Candlestick Point live in the Alice Griffith housing complex, while a small number are residents of Jamestown Avenue.

Using the TAZ population and household data, which includes limited areas outside of the Project site, there is an average of 3.8 persons per household, 1.5 more persons than the average San Francisco household. The larger household size in comparison to other parts of the City may be due to larger housing units, occupancy above optimal housing unit capacity (overcrowding), or a combination of both factors.

The average San Francisco household size grew during the latter part of the 20th century, particularly during the 1990s as housing costs rose and forced shared rentals.[67] In the future, citywide household sizes are expected to stay relatively constant or shrink slightly as a result of changing demographic trends.[68] Factors contributing to a decrease in household size include smaller family size and lower birth rates, a greater prevalence of single-person households, longer life spans, greater geographic mobility, and greater independence for seniors. Relative to other parts of the City, the Bayview Hunters Point neighborhood experiences a higher number of residents per habitable room.[69] As new housing varying in affordability, type, and size is developed in the area, existing crowding is expected to be alleviated. The Project would provide a range of housing sizes, including studios to 4 bedrooms, and the average housing unit would be 2.5 bedrooms. As a result, the household size at the Project site is expected to decrease to 2.33 people per unit by 2030, consistent with the 2005 citywide average and the average identified in the General Plan Housing Element. A 2.3-person household size is thus used to estimate future population for the Project site.

Housing

Regional Overview

Over the course of the past several decades, the construction of housing in the region has failed to keep pace with population growth in the Bay Area. Although population growth has slowed and is predicted to continue at a relatively moderate rate through 2030, the region is still attempting to make up for housing shortages from previous growth periods. The lack of local housing options causes many Bay Area residents to seek housing in the Sacramento region and Central Valley, resulting in long commutes and significant impacts on the regional transportation system.[70]

This housing shortage is compounded in San Francisco by additional factors. San Francisco was historically developed as an employment center, which means that there are more jobs than housing units in the City. In addition, San Francisco is relatively built up, with few tracts of land available for development of new housing. Although the City does not have an adopted jobs-housing ratio target, Policy 1.9 of the Housing Element of

[65] Data for 2005 are the most current data consistently available across all population, housing, and employment indices for the Project site. Thus, 2005 is considered to be the baseline year for existing conditions.
[66] These 1,113 persons include those temporary residents at the Candlestick Point RV Park in addition to the permanent residents (256 households) at Alice Griffith Public Housing.

the San Francisco General Plan encourages new commercial developments that would generate employment to also develop housing or pay in-lieu fees through the City's Jobs-Housing Linkage Program.[71]

As shown in Table III.C-2 (Existing Housing Characteristics [2005]), below, there were approximately 346,527 housing units in San Francisco in 2005. The City had a vacancy rate of approximately 4.9 percent, and approximately 62 percent of its total housing stock consisted of rental units. In 2005, the number of households totaled 341,478, and by 2008, the number of households had risen to 344,792.[72] ABAG projections indicate that the number of households in San Francisco would increase by 0.6 percent annually through 2030, roughly the same as for projected population increases, although the household increases between 2005 and 2008 were only about 0.3 percent per year. Because the Project site is in the southeastern portion of the City, activities at the site contribute to housing demand in nearby San Mateo County communities. Table III.C-2 also shows existing housing characteristics for San Mateo County.

Table III.C-2 Existing Housing Characteristics (2005)

Analysis Area	*Housing Units (2005)*	*Vacancy Rate*[a]	*Rental Units as Percent of Total*	*Households*[b]	*Persons per Household*[b]
Candlestick Point	298	2.1%	100%	292	3.8

San Francisco	346,527[d]	4.9%	61.6%[e]	341,478[g]	2.3
San Mateo County[e,f]	266,469	5.2%	37.1%[e]	252,648	2.8

SOURCES:

a. The number of vacant units is the difference between total housing units and households (occupied units). Vacancy rates were calculated by dividing the number of vacant units by the total in the Housing Units (2005) column.
b. Household (occupied housing unit) data and persons per household for Candlestick Point are from Table III.C-1. Population and household data for the Project site are 2005 data from San Francisco County Transportation Authority, *TAZ Model Data*, 2008. These data include 256 permanent residents of the Alice Griffith Housing Complex and approximately 36 residents located within the TAZ boundaries, but outside of the Candlestick Point site. For purposes of the EIR analysis, it is assumed that 256 households are located within the Candlestick Point portion of the Project site.
c. The only existing housing units at the Project site are those at the Alice Griffith housing complex.
d. Housing unit data for San Francisco are 2005 data from ABAG, *2007 Projections*, 2006.
e. Rental unit percentages for San Francisco and San Mateo County are 2005 data from US Census, *2005–2007 American Community Survey*, 2005. http://factfinder.census.gov (accessed online June 12, 2009).
f. Housing unit data for San Mateo County are 2005 data from US Census, *2005–2007 American Community Survey*, 2005. http://factfinder.census.gov (accessed online June 12, 2009).
g. The population and households data reported for San Francisco is 2005 data provided in Memorandum from John Rahaim, Director of Planning, San Francisco Planning Department to Michael Carlin, Deputy General Manager, San Francisco Public Utilities Commissions, *Projections of Growth by 2030*, July 9, 2009.

Regional Housing Needs Plan

To respond to statewide population and household growth and to ensure the availability of affordable housing for all income groups, the State enacted *Government Code* Section 65584 in 1981, which requires each Council of Governments (COG) to periodically distribute State-identified housing needs to all jurisdictions within its region. The California Department of Housing and Community Development (HCD) is responsible for determining this regional need and for initiating the process by which each COG must then distribute its share of Statewide need to all jurisdictions within its region. This statute requires

[71] City and County of San Francisco, General Plan Housing Element, 2004.
[72] Economic and Planning Systems, Inc., *Fiscal Analysis of the Candlestick Point/Hunters Point Shipyard Redevelopment Project,* 2009.

COGs to develop a new Regional Housing Needs Plan (RHNP) every five years. In June 2008, ABAG released its RHNP, which documents the Regional Housing Needs Allocation (RHNA) for the Bay Area for the June 2007 to June 2014 planning period.[73]

Government Code Section 65584 requires that a city's share of regional housing needs include housing needs for persons at all income levels. The different income levels to be studied within the parameters of State-mandated local Housing Elements, which must be prepared by every county and city in California, are "Very Low Income," "Low Income," "Moderate Income," and "Above Moderate Income." Based on a US Department of Housing and Urban Development (HUD) formula, San Francisco's Area Median Income (AMI) in 2006 was estimated to be approximately $77,450 for a two-person household and approximately $87,100 for a three-person household.[74] San Francisco is estimated to have the income level distribution shown in Table III.C-3 (San Francisco Income Distribution).

Table III.C-3 San Francisco Income Distribution

Income Group	*Income Level*	*Income Range*[a]
Very low	≤ 50% of AMI	≤ $38,725
Low	50–80% of AMI	$38,725–$61,960
Moderate	80–120% of AMI	$61,960–$92,940
Above Moderate	> 120% of AMI	> $92,940

SOURCES: City of San Francisco, General Plan Housing Element, 2004; City and County of San Francisco, Mayor's Office of Housing, *Income Limits and Sales Price Levels for MOH Homeownership Programs*. http://www.sfgov.org/site/moh_page.asp?id=62375 (accessed August 27, 2009).

a. Based on San Francisco's AMI in 2006 of $77,450 for a two-person household.

The ABAG Policy Board established housing needs for all jurisdictions within its boundaries for the 2007 to 2014 planning period by using a "fair share" approach, based on household and job growth of the region, as well as regional income level percentages. Each jurisdiction is required by state law to incorporate its housing need numbers into an updated version of its general plan housing element. According to ABAG's RHNP, the Bay Area's overall housing need would total about 214,500 new units by June 2014.[75] The jurisdictional need of the City is estimated to be 31,193 units, or an average annual need of 4,456 new units.

Although market conditions affect the City's ability to meet the RHNA targets, the City facilitates the development of housing by providing regulatory incentives for private housing developers. If the RHNA targets are not met, the resulting competition for the limited housing supply drives the price of housing up, making it less affordable to working families. The City did not meet its RHNA targets for the 1999–2006 period. However, over 17,470 new housing units, or almost 86 percent of the housing production targets, were met.[76] During this time, the City met approximately 83 percent of its Very Low Income

San Francisco Citywide Affordable Housing Program

The San Francisco Redevelopment Agency's Citywide Tax Increment Housing Program (Housing Program) dedicates a portion of the tax increment generated through the Agency's real estate activities to the development of affordable housing. By state law, the Agency must expend at least 20 percent of its tax increment financing for the construction or preservation of affordable housing. The Agency also must produce affordable housing totaling at least 15 percent of all new units within the Redevelopment Project Areas. The Agency sets maximum incomes for all affordable units, which can vary from unit to unit and from location to location. The income limits are adjusted each year based on data provided by HUD.

Through the Housing Program, tax increment funds are committed as grants and loans to non-profit and for-profit housing organizations for the development of a range of affordable housing for San Francisco residents. Funds are committed at all stages of project development, from predevelopment, acquisition, construction, rehabilitation, to permanent financing.

The Housing Program has been in place since 1990, and is now concluding over 19 years of activity. During this period, over $428 million has been committed to creating approximately 9,628 housing units for low- and moderate-income families and individuals throughout San Francisco. Housing Program funds are generated within redevelopment project areas, but are invested in affordable housing development throughout the City, both within and outside of redevelopment project areas. Approximately half of the housing units developed under the Housing Program have been created through new construction and approximately half through rehabilitation of existing structures. Over 60 percent are family apartments and single-room occupancy residential hotels; the remainder is special needs housing and emergency shelters, as well as transitional facilities.

Project Site

As previously mentioned, the existing population and household data for the Project site are taken from 2005 data from San Francisco County Transportation Authority, *TAZ Model Data (*2008), which includes units within the TAZ boundary, but outside of the Candlestick Point site. As of 2005, there were

approximately 298 existing housing units within the TAZ boundary, as shown in Table III.C-1; however, six are vacant, resulting in a total of 292 occupied households. There are 256 existing units within the Candlestick Point portion of the Project site, all of which are associated with the Alice Griffith Housing Project. For purposes of the EIR analysis, it is assumed that 256 households are located within the Candlestick Point portion of the Project site.

The housing characteristics of the Bayview Hunters Point neighborhood differ from those of San Francisco as a whole, particularly within the Project site (including Candlestick Point and HPS Phase II). The 2000 Census, the most recent comprehensive study of housing characteristics by neighborhood,[77] reported that the Project site had a higher proportion of rental units (74 percent versus 62 percent), lower vacancy rates (1.3 percent versus 4.9 percent), and more persons per household (3.8 versus the 2.3 citywide average).[78]

Employment

Regional Overview

The Bay Area is a major employment center, with over 3.2 million jobs reported in 2005.[79] A large percentage of this employment is in San Francisco. As shown in Table III.C-5 (Existing Employment [2005]), there were approximately 553,090 jobs in the City in 2005, approximately 17 percent of the total regional employment.

At the time of the 2000 Census, about 55 percent of the workers holding jobs in San Francisco lived in the City, while the remaining 45 percent lived in other jurisdictions.[80] For this reason, the daytime population associated with local employment substantially exceeds the residential (nighttime) population. Estimated City employment for 2030 would be approximately 748,100 jobs.[81]

Project Site

Table III.C-5 presents existing employment estimates for the Project site. Existing employment at Candlestick Point is minimal, generally associated with temporary stadium staffing, property management, and oversight of the CPSRA. Employment at HPS Phase II includes professional artists, security, and environmental cleanup staff. In total, there are approximately 529 full-time equivalent staff at the Project site.

[77] Comprehensive 2005 data pertaining to housing characteristics is not available at this time.
[78] San Francisco County Transportation Authority, 2008. *TAZ Model Data* (derived from US Census Bureau, *Census 2000*, Summary File 1, Tables H3 and H5, 2000).

Table III.C-5 Existing Employment (2005)	
Analysis Area	***Total***
Candlestick Point [a,b]	213
HPS Phase II [a,c]	316
Project Site Total	***529***
San Francisco[d,e]	553,090
San Mateo County[f]	337,350

SOURCES:

a. Data for the Project site was derived from San Francisco County Transportation Authority, *TAZ Model Data*, 2008.
b. Existing jobs at Candlestick Point include property management, oversight of the CPSRA, and part-time service jobs associated with Candlestick Park. The totals assume that there are 20 events a year at the stadium and employees work approximately 6 hours per shift. Jobs at Candlestick Point are reported in full-time equivalent (FTE) numbers.
c. Jobs at HPS Phase II include contract and temporary jobs associated with cleanup activities, security, and approximately 300 professional artists. Jobs at HPS Phase II are reported in full-time equivalent (FTE) numbers.
d. The employment total for San Francisco is 2005 data from Memorandum from John Rahaim, Director of Planning, San Francisco Planning Department to Michael Carlin, Deputy General Manager, San Francisco Public Utilities Commissions, *Projections of Growth by 2030*, July 9, 2009.
e. By 2008, the number of jobs in the City rose to 576,917 according to Economic and Planning Systems, Inc., *Fiscal Analysis of the Candlestick Point–Hunters Point Shipyard Redevelopment Project*, 2009.
f. The employment total for San Mateo County is 2005 data from ABAG, *Projections 2007*, 2006.

III.C.3 Regulatory Framework

Federal

There are no federal population, housing, and employment regulations applicable to the Project.

State

There are no State population, housing, and employment regulations applicable to the Project.

Regional

There are no regional population, housing, and employment regulations applicable to the Project.

Local

San Francisco Housing Element

The 2004 Housing Element update was adopted by the San Francisco Planning Commission on May 13, 2004, and found in compliance with state housing element requirements by HCD in October of 2004. Subsequent to adoption of the 2004 Housing Element, the California Court of Appeals found that the Negative Declaration prepared in support of the 2004 Housing Element was inadequate and required the preparation of an Environmental Impact Report. Under the terms of the Writ of Mandate issued by the San Francisco Superior Court, the City may rely on the 2004 Housing Element, minus policies, objectives,

and implementation measures that were stricken as a result of the lawsuit. Such policies cannot be adopted until completion of the EIR. As required by state law, San Francisco is due for its next five-year Housing Element Update, and the Planning Department has prepared a Draft 2009 Housing Element for environmental review. In an effort to comply with the court order requiring an EIR for the 2004 Housing Element and to review the updated draft 2009 Housing Element pursuant to CEQA, the City is preparing an EIR to identify the environmental impacts resulting from the proposed objectives, policies, and implementation measures identified as part of the 2004 Housing Element Update and the draft 2009 Housing Element Update at an equal level of detail. The 2004 Housing Element, as modified by the Superior Court, contains objectives and policies that are relevant to the Project as follows:

Objective 1 To provide new housing, especially permanently affordable housing, in appropriate locations which meets identified housing needs and takes into account the demand for affordable housing created by employment demand.

- Policy 1.1 Encourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing, and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of units that are affordable to lower income households.
- Policy 1.3 Identify opportunities for housing and mixed-use districts near downtown and former industrial portions of the City.
- Policy 1.4 Locate in-fill housing on appropriate sites in established residential neighborhoods.
- Policy 1.5 Support development of affordable housing on surplus public lands.
- Policy 1.6 Create incentives for the inclusion of housing, particularly permanently affordable housing, in new commercial development projects.
- Policy 1.7 Encourage and support the construction of quality, new family housing.
- Policy 1.8 Allow new secondary units in areas where their effects can be dealt with and there is neighborhood support, especially if that housing is made permanently affordable to lower-income households.
- Policy 1.9 Require new commercial developments and higher educational institutions to meet the housing demand they generate, particularly the need for affordable housing for lower income workers and students.

Objective 2 Retain the existing supply of housing.

- Policy 3.3 Maintain and improve the condition of the existing supply of public housing.

Objective 4	Support affordable housing production by increasing site availability and capacity.	
	Policy 4.1	Actively identify and pursue opportunity sites for permanently affordable housing.
	Policy 4.2	Include affordable units in larger housing projects.
Objective 8	Ensure equal access to housing opportunities.	
	Policy 8.1	Encourage sufficient and suitable rental housing opportunities and emphasize permanently affordable rental units wherever possible.
	Policy 8.4	Encourage greater economic integration within housing projects and throughout San Francisco.
	Policy 8.9	Encourage the provision of new home ownership opportunities through new construction so that increased owner occupancy does not diminish the supply of rental housing.
Objective 9	Avoid or mitigate hardships imposed by displacement.	
	Policy 9.1	Minimize the hardships of displacement by providing essential relocation services.
	Policy 9.2	Offer displaced households the right of first refusal to occupy replacement housing units that are comparable in size, location, cost, and rent control protection.
Objective 11	In increasing the supply of housing, pursue place making and neighborhood building principles and practices to maintain San Francisco's desirable urban fabric and enhance livability in all neighborhoods.	
	Policy 11.1	Use new housing development as a means to enhance neighborhood vitality and diversity.
	Policy 11.2	Ensure housing is provided with adequate public improvements, services, and amenities.
	Policy 11.3	Encourage appropriate neighborhood-serving commercial activities in residential areas, without causing affordable housing displacement.
	Policy 11.5	Promote the construction of well-designed housing that enhances existing neighborhood character.
	Policy 11.8	Strongly encourage housing project sponsors to take full advantage of allowable building densities in their housing developments while remaining consistent with neighborhood character.
	Policy 11.9	Set allowable densities and parking standards in residential areas at levels that promote the City's overall housing objectives while respecting neighborhood scale and character.
	Policy 12.2	Support the production of well-planned housing regionwide that address regional housing needs and improve the overall quality of life in the Bay Area.

III.C.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to population, employment, and housing, but generally consider that implementation of the Project would have significant impacts if it were to:

C.a Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)

C.b Displace substantial numbers of existing housing units or create demand for additional housing, necessitating the construction of replacement housing elsewhere

C.c Displace substantial number of people, necessitating the construction of replacement housing elsewhere

Analytic Method

The analysis compares the population, housing, and employment that would result from implementation of the Project to existing conditions, which is defined as conditions in 2005. The 2005 data are used to represent baseline conditions because 2005 data are the most current data consistently available for the Project site across all population, employment, and housing indices. Table III.C-6 (Project Housing Units and Population) through Table III.C-8 (Project Construction Employment) provide the projected population, housing, and employment characteristics of the Project. The population, housing, and employment that would result from implementation of the Project are also compared against 2030 projections, either the latest year for which projections have been formulated or the closest year to Project build-out for projections which extend in 5-year increments beyond 2030.

Table III.C-6 Project Housing Units and Population

SOURCE: MACTEC, 2010.

a. Construction employment includes on-site construction, off-site roadway improvements, field management, and shoreline improvements.

The analysis considers whether the Project would contribute to substantial daytime and/or residential population growth. "Substantial" growth is defined as increases in population that are unplanned, without consideration of or planning for infrastructure, services, and housing needed to support proposed residents, employees, and visitors. As a result of the Project, direct and indirect growth would result at the Project site and in the surrounding Bayview Hunters Point neighborhood. Direct population growth at Candlestick Point would include the residents and employees who would occupy the new homes and businesses developed at the Project site, as well as temporary construction employment. Indirect growth is often defined as "leapfrog" development, development that occurs as infrastructure is expanded to previously un-served areas. Such development patterns usually occur in suburban areas adjacent to or near undeveloped lands.

The analysis also considers whether the Project would displace substantial numbers of residents or housing units. This analysis considers both temporary (construction-related) displacement, as well as permanent

displacement. Displacement of residents would be considered to occur if residents were forced to leave their homes without being provided with temporary housing, monetary compensation, or some other form of mitigation to help with the relocation process and if they were not given the right to return. Displacement of housing units would occur if housing units were demolished and replaced with an alternative land use.

Additionally, the Project's potential contribution to cumulative population, housing, and employment impacts are evaluated in the context of existing, proposed, and reasonably foreseeable future development expected in the City.

Construction Impacts

Impact PH-1: Population Growth

Impact PH-1 **Construction of the Project would not induce substantial direct population growth. (Less than Significant) *[Criterion C.a]***

There would be direct, but temporary, construction job growth at the Project site as a result of the Project. Table III.C-8 shows the average and maximum number of construction workers that would be employed during the construction period on a daily basis. Peak construction employment would occur in 2029 for Candlestick Point, with an average of 262 and a maximum of 328 workers on site in 2029. Peak construction employment for HPS Phase II would occur in 2015. During 2015, an average of 364 workers and a maximum of 455 construction workers would be employed at HPS Phase II in 2015 during the construction period.

It is anticipated that construction employees not already living in the Bayview Hunters Point neighborhood would commute from elsewhere in the Bay Area rather than relocate to the Bayview Hunters Point neighborhood for a temporary construction assignment, and construction hiring policies associated with this Project would aim to maximize hiring among local residents. Thus, development of the Project would not generate a substantial, unplanned population increase. Impacts associated with construction employment would be less than significant. No mitigation is required.

Operational impacts

Impact PH-2: Population Growth

Impact of Candlestick Point

Impact PH-2a **Operation of Candlestick Point would not induce substantial direct or indirect population growth. (Less than Significant) *[Criterion C.a]***

Direct Growth

As shown in Table III.C-6, the Project would develop approximately 10,500 housing units, of which 7,850 (approximately 75 percent) would be at Candlestick Point. Based on an average household size of 2.3 persons per unit and full occupancy of all units, population at Candlestick Point would be approximately 18,290 residents at full occupancy in 2032. The Project would also include development of new

commercial, industrial, R&D/office, and retail uses, resulting in employment of 3,478 jobs at Candlestick Point (refer to Table III.C-7). In total, the population at Candlestick Point would represent approximately 2.0 percent of the citywide population of 916,800 in 2030, while employment would represent 0.5 percent of the 748,100 jobs in 2030.

Although the Project would result in an increase in population and employment at Candlestick Point, growth in this area has long been the subject of many planning activities. The primary objective of the Project is to provide new housing and non-residential uses in support of planned redevelopment. Planning activities pertaining to Candlestick Point date to 1969, with initial adoption of the BVHP Redevelopment Plan. As discussed in Chapter I, development of Candlestick Point was also anticipated in the BVHP Area Plan, and in a series of initiatives approved by San Francisco voters (Propositions D, E and G).[82,83] The BVHP Redevelopment Plan was updated in 2005 and 2006, and uses planned for HPS Phase I under the BVHP Redevelopment Plan are currently under construction. The Project, as proposed, was developed based on the land uses, number of housing units (10,000 units total at HPS Phase II and Candlestick Point), and objectives approved by voters under Proposition G in 2008. In summary, the uses provided as part of the Project support planned growth at the Project site.

As a result of these ongoing planning activities, City service providers have been aware of, and have included future growth projections for Candlestick Point, in their long-term operations plans. Planning department population projections[84] include the population growth associated with the Project and are the basis of the San Francisco Public Utilities Commission's *Water Supply Availability Study*. In addition, the Southeast Water Pollution Control Plant has capacity to treat wastewater from the Project site.[85] The Project would provide all on-site infrastructure for connections to City mains, and would include on-site treatment of stormwater runoff. Refer to Section II.D (Project Objectives), Section III.O (Public Services), Section III.P (Recreation), Section III.Q (Utilities), and Section III.R (Energy) for further description of the Project's potential impacts on infrastructure and services. In summary, the infrastructure needed to support the level of growth anticipated under the Project was planned based on population projections that included the housing and employment associated with the Project.

Employment growth at Candlestick Point would also be considered substantial if it resulted in housing demand that would exceed planned regional housing development. Table III.C-9 (Project Housing Demand) estimates the number of housing units that would be needed to provide housing for employees of jobs created as a result of the Project. These calculations were derived from existing Census Bureau employment and U.S Department of Transportation commuting pattern data.[86] The average household would be expected to have 1.36 workers. This rate is based on the Planning Department's projection of the number of workers in the average City household in 2025 (no 2030 forecast data are available)[87]. Utilizing the rate of 1.36 workers per dwelling unit, the Project, with a total employment of 10,730 workers, would require 0.74 housing units per worker (calculated as 1 dwelling unit/1.36 workers equals the number

[82] Candlestick Point is outside the boundaries of the HPS Redevelopment Plan.
[83] Proposition G repealed Propositions D and F.
[84] Memorandum from John Rahaim, Director of Planning, San Francisco Planning Department to Michael Carlin, Deputy General Manager, San Francisco Public Utilities Commissions, *Projections of Growth by 2030*, July 9, 2009.
[85] San Francisco Public Utilities Commission, Sewer System, 2009.
[86] Census Bureau, 2009; US Department of Transportation, *Census 2000 Transportation Planning Package*, 2006.
[87] San Francisco, General Plan Housing Element, Table I-14, 2004.

of dwelling units per worker, which is 0.74). Table III.C-9 assumes that approximately 55 percent of the workers would seek housing in the City, consistent with existing commuting patterns.[88] The calculations also assume a vacancy rate of 4.7 percent,[89] which requires an add-on demand to account for the vacancy rate (see footnotes c and d in Table III.C-9, below). Based on these assumptions, the development at Candlestick Point would result in a total demand for 2,677 housing units based on employee demand. A total of 7,850 units would be provided at Candlestick Point, although 10,500 units would be provided within the entire Project site.[90]

Table III.C-9 Project Housing Demand

Analysis Area	*Project Employment[a,b]*	*Project Housing Demand, San Francisco[c]*	*Project Housing Demand, Other Communities[d]*	*Total Demand*	*Project Housing[e]*
Candlestick Point	3,476	1,472	1,205	2,677	7,850
HPS Phase II	7,254	3,072	2,514	5,586	2,650
Project Site Total	***10,730***	***4,544***	***3,719***	***8,263***	***10,500***

a. Does not include existing employment.
b. Project employment data are derived from Table III.C-7.
c. Calculated as the projected employment divided by 1.36, plus 4.7% additional housing units to account for vacancy rate, times 55% total demand in San Francisco.
d. Based on existing commuting patterns, housing demand in other communities is estimated to be 45% of total housing demand; calculated as projected employment divided by 1.36, plus 4.7% additional housing units to account for vacancy rate, times 45% total demand in other communities.
e. Employment projections are provided in Table III.C-6.

Total demand for housing at Candlestick Point would represent 1.2 percent of the total Bay Area housing need of 214,500 units (based on the RHNA targets; refer to Section III.C.2 [Setting]) projected by ABAG through 2014.[91] While the population increase associated with employment at Candlestick Point could be entirely accommodated at the Project site, it is likely that employees of the Project would elect to live elsewhere in the City or within surrounding Bay Area communities.

Based on existing commuting patterns, approximately 1,472 housing units would be required in San Francisco to meet anticipated housing demand. The 7,850 housing units that would be developed at Candlestick Point would exceed the total demand for new units within the City generated by employment at Candlestick Point. Given that a broad range of housing options of varying sizes, types, and levels of affordability would be developed at Candlestick Point and that such housing would be in close proximity to the jobs provided by the Project, it is likely that future employees at Candlestick Point would seek housing at the Project site prior to searching for housing in the surrounding Bayview Hunters Point neighborhood. However, if future employees did seek housing elsewhere in the neighborhood, the effects

[88] This assumption provides a conservative estimate of the housing demand that the Project would generate in other Bay Area communities, such as nearby cities in San Mateo County. Information pertaining to commuting trends was derived from US Department of Transportation, *Census 2000 Transportation Planning Package*, 2006.
[89] This rate is based on California Department of Finance, January 2008 Projections.
[90] It should be noted that one of the Project objectives is to provide employment opportunities for existing residents in the Bayview Hunters Point neighborhood; thus, it is anticipated that some of the future employees at Candlestick Point would include residents already living in the neighborhood. Although total housing demand could include existing households, this analysis conservatively assumes that all housing demand generated by the Project would need to be accommodated by new units.
[91] The RHNP is updated every five years and does not extend through 2030.

would not be adverse. As stated on p. 8 of the BVHP Redevelopment Plan, future development in the Bayview Hunters Point neighborhood should:

> Eliminat[e] blighting influences and correct environmental deficiencies within the Project Area, including, but not limited to, abnormally high vacancies, abandoned, deteriorated and dilapidated buildings, incompatible land uses, depreciated or stagnant property values, and inadequate or deteriorated public improvements, facilities and utilities. [92]

Persons associated with the Project seeking housing within the Bayview Hunters Point neighborhood would help to reduce the excessive vacancies identified by the BVHP Redevelopment Plan. Moreover, the housing provided at Candlestick Point would also be available to existing residents of the Bayview Hunters Point neighborhood should existing residents wish to relocate to the Project site.

A percentage of the persons employed at Candlestick Point would also be expected to commute to other communities outside of the City for various personal and socioeconomic reasons, for example, to accommodate the employment of a spouse or to maintain existing community relationships. Based on existing commuting patterns, demand for about 1,205 units would be generated in surrounding Bay Area communities by Candlestick Point development. This housing demand would be dispersed throughout the nine-county Bay Area, which would result in negligible potential increases in housing demand within the Bay Area.

Employment at Candlestick Point would not create a substantial demand for housing in the Bayview Hunters Point neighborhood, San Francisco, or the region in excess of the housing provided as part of the Project or the housing otherwise available in the Bay Area. The amount of housing provided by the Project would exceed demand generated by employees of the Project. To summarize, the need for infrastructure, public services, and housing associated with direct population growth proposed at Candlestick Point has been anticipated in ongoing local and regional planning activities. All impacts associated with direct population growth are considered less than significant for Candlestick Point. No mitigation is required.

Indirect Growth

As infrastructure, public services, roads, and other services and communities amenities are expanded, there would also be a potential for the development at Candlestick Point to generate indirect population growth. Indirect growth is often defined as "leapfrog" development, development that occurs as infrastructure is expanded to previously un-served areas. Such development patterns usually occur in suburban areas adjacent to undeveloped lands. Areas surrounding the Project site are built out, except for sites such as Executive Park or India Basin Shoreline that are currently undergoing development or are the subject of planned future development. Thus, the surrounding lands are not vulnerable to leapfrog-type development.

Infrastructure and services would be expanded to serve Candlestick Point, without significant excess capacity that might encourage additional local growth beyond that already planned for under Proposition G and under the redevelopment plans. The development at Candlestick Point would not expand infrastructure to geographic areas that were not previously served, nor would it create new transportation access to a previously inaccessible area. All impacts associated with indirect population growth are considered less than significant for Candlestick Point. No mitigation is required.

---

[92] City and County of San Francisco, Redevelopment Agency, *Bayview Hunters Point Redevelopment Plan,* p. 8, 2006.

Impact of Hunters Point Shipyard Phase II

Impact PH-2b Operation of HPS Phase II would not induce substantial direct or indirect population growth. (Less than Significant) *[Criterion C.a]*

Direct Growth

Direct population growth at HPS Phase II would include the residents and employees who would occupy the new homes and businesses developed at this site. As shown in Table III.C-6, 2,650 housing units (approximately 25 percent of the Project total) would be at HPS Phase II. The population at HPS Phase II would be approximately 6,175 residents at full occupancy in 2032. The Project would also include development of new commercial, industrial, R&D/office, and retail uses, resulting in employment of 7,252 jobs at HPS Phase II (refer to Table III.C-7). In total, the population at HPS Phase II would represent approximately 0.7 percent of the citywide population of 916,800 in 2030, while employment would represent 1.0 percent of the 748,100 jobs in 2030.

Although the Project would result in an increase in population and employment at HPS Phase II, growth in this area has long been the subject of many planning activities. The primary objective of the Project is to provide new housing and non-residential uses in support of planned redevelopment. Planning activities pertaining to HPS Phase II date to 1969, preceding closure of the HPS naval shipyard. As discussed in Chapter I, development of HPS Phase II was anticipated in the HPS Redevelopment Plan and in an initiative approved by San Francisco voters (Proposition G).[93,94] Uses planned for HPS Phase I under the HPS Redevelopment Plan are currently under construction. The Project, as proposed, was developed based on the land uses, number of housing units (approximately 10,000 units total at HPS Phase II and Candlestick Point), and objectives approved by voters under Proposition G in 2008 (Project Objectives are outlined in Section II.D). In summary, the uses provided as part of the Project support planned growth at the Project site.

As a result of these ongoing planning activities, City service providers have been aware of, and have included future growth projections for HPS Phase II, in their long-term operations plans. Planning department population projections[95] include the population growth associated with the Project and are the basis of the San Francisco Public Utilities Commission's *Water Supply Availability Study*. In addition, the Southeast Water Pollution Control Plant has capacity to treat wastewater from the Project site.[96] The Project would provide all on-site infrastructure for connections to City mains, and would include on-site treatment of stormwater runoff. Refer to Section III.O, Section III.P, Section III.Q, and Section III.R for further description of the Project's potential impacts on infrastructure and services. In summary, the infrastructure needed to support the level of growth anticipated under the Project was planned based on population projections that included the housing and employment associated with the Project.

Employment growth at HPS Phase II would also be considered substantial if it resulted in housing demand that would exceed planned regional housing development. Table III.C-9 estimates the number of housing

[93] The HPS Phase II site is outside the boundaries of the BVHP Redevelopment Plan and BVHP Area Plan.
[94] Proposition G repealed Propositions D and F.
[95] Memorandum from John Rahaim, Director of Planning, San Francisco Planning Department to Michael Carlin, Deputy General Manager, San Francisco Public Utilities Commissions, *Projections of Growth by 2030,* July 9, 2009.
[96] San Francisco Public Utilities Commission, 2009.

units that would be needed to provide housing for employees of jobs created as a result of the Project. The average household would be expected to have 1.36 workers, resulting in a need for 0.74 housing units per worker.[97] Table III.C-9 indicates that approximately 55 percent of the workers would seek housing in the City, consistent with existing commuting patterns.[98] The calculations also assume a vacancy rate of 4.7 percent.[99] Based on these assumptions, the development at HPS Phase II would result in a total demand for 5,586 housing units as a result of employment at HPS Phase II.[100]

Total demand for housing at HPS Phase II would represent 2.6 percent of the total Bay Area housing need of 214,500 units (based on the RHNA targets; refer to Section III.C.2) projected by ABAG through 2014.[101] While the population increase associated with employment at HPS Phase II could be entirely accommodated at the Project site, it is likely that employees of the Project would elect to live elsewhere in the City or within surrounding Bay Area communities.

Based on existing commuting patterns, approximately 3,072 housing units would be required in San Francisco to meet anticipated housing demand. The 2,650 housing units that would be developed at HPS Phase II would be less than the total demand for new units generated by employment at HPS Phase II; however, units being constructed at HPS Phase I and at Candlestick Point would offset HPS Phase II housing demand. Given that a broad range of housing options of varying sizes, types, and levels of affordability would be developed at HPS Phase I, HPS Phase II, and Candlestick Point, and such housing would be in close proximity to the jobs provided by the Project, it is likely that future employees at HPS Phase II would seek housing at the Project site prior to searching for housing in the surrounding Bayview Hunters Point neighborhood. However, if future employees did seek housing elsewhere in the neighborhood, the effects would not be adverse. Employees of HPS Phase II businesses seeking housing within the Bayview Hunters Point neighborhood would help to reduce the excessive vacancies identified by the BVHP Redevelopment Plan. Moreover, the housing provided at HPS Phase II would also be available to existing residents of the Bayview Hunters Point neighborhood should existing residents wish to relocate to the Project site.

A percentage of the persons employed at HPS Phase II would also be expected to commute to other communities outside of the City for various personal and socioeconomic reasons. Based on existing commuting patterns, the demand for about 2,514 units would be generated in surrounding Bay Area communities by HPS Phase II development. This housing demand would be dispersed throughout the nine-county Bay Area, which would result in negligible potential increases in housing demand within the Bay Area.

---

[97] Households per worker = 1 household/ 1.36 workers. This rate is based on the Planning Department's projection of the number of workers in the average City household in 2025 (no 2030 forecast data are available). San Francisco, General Plan Housing Element, Table I-14, 2004.

[98] This assumption provides a conservative estimate of the housing demand that the Project would generate in other Bay Area communities, such as nearby cities in San Mateo County. Information pertaining to commuting trends was derived from US Department of Transportation, *Census 2000 Transportation Planning Package*, 2006.

[99] This rate is based on California Department of Finance, January 2008 Projections.

[100] It should be noted that one of the Project objectives is to provide employment opportunities for existing residents in the Bayview Hunters Point neighborhood; thus, it is anticipated that some of the future employees at HPS Phase II would include residents already living in the neighborhood. Although total housing demand could include existing households, this analysis conservatively assumes that all housing demand generated by the Project would need to be accommodated by new units.

[101] The RHNP is updated every five years and does not extend through 2030.

It is not anticipated that employment at HPS Phase II would create a substantial demand for housing in the Bayview Hunters Point neighborhood, San Francisco, or the region in excess of the housing provided as part of the Project or the housing otherwise available in the Bay Area. To summarize, the need for infrastructure, public services, and housing associated with direct population growth proposed at HPS Phase II has been anticipated in ongoing local and regional planning activities. All impacts associated with direct population growth are considered less than significant for HPS Phase II. No mitigation is required.

Indirect Growth

As infrastructure, public services, roads, and other services and communities amenities are expanded, there would also be a potential for the development at HPS Phase II to generate indirect population growth. Indirect growth is often defined as "leapfrog" development, development that occurs as infrastructure is expanded to previously un-served or underserved areas. Such development patterns usually occur in suburban areas adjacent to undeveloped lands. Areas surrounding the Project site are built out, except for sites such as Executive Park or India Basin that are currently undergoing development or are the subject of planned future development. Thus, the surrounding lands are not vulnerable to leapfrog-type development.

Infrastructure and services would be expanded to serve HPS Phase II, without significant excess capacity that might encourage additional local growth beyond that already planned for under Proposition G and under the redevelopment plans. The development at HPS Phase II would not expand infrastructure to geographic areas that were not previously served, nor would it create new transportation access to a previously inaccessible area. All impacts associated with indirect population growth are considered less than significant for HPS Phase II. No mitigation is required.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact PH-2 Operation of the Project would not induce substantial direct or indirect population growth. (Less than Significant) *[Criterion C.a]*

The Project would develop 7,850 housing units at Candlestick Point and 2,650 units at HPS Phase II, a total of 10,500 residential units. The demand for 8,263 housing units that would be generated by the Project would be less than the total number of units provided by the Project.

The demand for housing units outside of San Francisco, conservatively assuming that 45 percent of those employed at the Project site would commute from outside of San Francisco, would be dispersed throughout the nine-county Bay Area.[102] In addition, any potential Project-related increase in housing demand in the surrounding Bayview Hunters Point neighborhood would help to fill the existing and abnormally high vacancies in the neighborhood that contribute to conditions of economic blight. The Project would provide more housing units than the demand it would generate. Therefore, the Project would create a substantial demand for housing in the Bayview Hunters Point neighborhood, San Francisco, or the region in excess of the total number of housing units provided as part of the Project.

The Project would provide infrastructure and services that would meet the needs of the residents and employees generated at the site. However, the infrastructure would not extend to previously un-served areas, allowing indirect population growth. The jobs and housing units that would be provided at the

[102] Refer to the discussion of commuting patterns in Section III.D (Transportation and Circulation).

Project site would be closely balanced (approximately 10,730 jobs and 10,500 housing units) so that neither a surplus of housing or jobs would occur, resulting in indirect residential or employment growth. As a result, the population and employment increase associated with the Project would not be substantial. The Project impact is considered less than significant. No mitigation is required.

Impact PH-3: Residential Displacement

Impact of Candlestick Point

Impact PH-3a **Implementation of the Project would not displace existing housing units and residents at Candlestick Point, necessitating the construction of new units elsewhere. (No Impact)** ***[Criteria C.b and C.c]***

The Project would demolish and replace 256 units at the Alice Griffith public housing site. There are no other housing units or residents on the Project site. Redevelopment of the Alice Griffith site would proceed in phases and would not displace existing residents. The initial phases would develop currently vacant portions of the Alice Griffith site, and existing residents would then occupy replacement public housing units before existing structures would be demolished in subsequent phases. Overall, the Project would develop a total of 1,210 units of public housing, affordable housing, below-market rate housing, and market-rate housing in the Alice Griffith district, and 3,345 units of public housing, affordable housing, and below-market rate housing overall.

Because the Project would not displace existing housing units or residents that would necessitate the construction of new units elsewhere, beyond the units already provided as part of the Project, there would be no impact. No mitigation is required.

Impact of Hunters Point Shipyard Phase II

Impact PH-3b **Implementation of the Project would not displace existing housing units or residents at HPS Phase II, necessitating the construction of new units elsewhere. (No Impact)** ***[Criteria C.b and C.c]***

There are no existing housing units at HPS Phase II. Therefore, build-out of the Project would not replace housing units with new uses, and no existing residents would be displaced. The Project would create demand for housing; however, as discussed under Impact PH-2b, such demand would not be substantial and could be accommodated by housing provided as part of the Project. Because there would be no residential displacement at HPS Phase II, development of the Project would have no impact on displacement of housing and residents at this site. No mitigation is required.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact PH-3 **The Project would not displace existing housing units or residents, necessitating the construction of new units elsewhere. (No Impact)** ***[Criteria C.b and C.c]***

As discussed under Impact PH-3a, the Project would demolish and replace 256 units at the Alice Griffith public housing site. The Project would not displace existing housing units or residents that would necessitate the construction of new units elsewhere, beyond the units already provided as part of the

Project. Further, as discussed in Impact PH-3b, there are no existing housing units at HPS Phase II. Therefore, build-out of the Project would not replace housing units with new uses, and no existing residents would be displaced. Development of the Project would have no impact on displacement of housing and residents. No mitigation is required.

Cumulative Impacts

The geographic context for the analysis of cumulative impacts to population and housing is the City and County of San Francisco. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. Reasonably foreseeable future development forecasts are based on projections of future growth and take into account projects going through the entitlement process. The geographic context for an analysis of cumulative impacts to employment would include the entire Bay Area (as represented by the ABAG Planning Area), since a substantial percentage of City population commutes to jobs outside City limits, and substantial numbers of residents of other cities in the Bay Area commute to jobs within the City. The existing employment conditions, representing past and present development in this geographic area, are presented in the setting description of regional employment.

The Planning Department routinely prepares projections for the purposes of analyzing impacts of plans and projects undergoing the environmental review process. The Planning Department recently developed projections for citywide growth expectations by 2030.[103] The projections also specifically took into account projects currently in various stages of the entitlement process, as well as Treasure Island, Park Merced projects, and the Project, the latter of which is being analyzed in this EIR. Development projections estimate an increase in 61,814 households, 133,359 persons, and 195,010 jobs from 2005 to 2030.

Population and Housing

Development of cumulative projects in the City and County of San Francisco would result in an increase in population, housing, and employment. As long as the cumulative project scenario generates cumulative population, housing, and employment conditions that are within the projections formulated by the Planning Department by 2030 and meet their share of the RHND, there would be no significant adverse impact to population, housing, and employment.

As noted, above, "substantial" growth is defined as increases in population that are unplanned, without consideration of or planning for infrastructure, services, and housing needed to support proposed residents, employees, and visitors. Development of cumulative projects could result in increases in population. Population projections estimate an increase in 133,359 City residents between 2005 and 2030, an overall increase of 17.0 percent, or approximately 0.7 percent per year. Subtracting the population increase associated with the Project, as this number has been included in the overall population projections, cumulative projects could account for up to 108,894 persons and fall within the City's projections. It is possible that cumulative projects could result in localized changes in zoning or land uses that could result in substantial direct or indirect population growth and an exceedance of City population projections. Such an impact, however, is not likely for several reasons. First, during the process of considering such projects,

[103] Correspondence from John Rahaim, Director of Planning, to SFPUC, July 9, 2009.

the City would be required to prepare an environmental review pursuant to CEQA, identify any infrastructure or service-related significant impacts and provide mitigation. Second, the City is largely built and there are few opportunities for unplanned changes in zoning or land use that would cause substantial growth. Third, the City and Agency actively engage in long-range planning efforts throughout the City, such that population growth would occur in the context of these planning activities that would consider infrastructure, public services, and housing needs. Consequently, there is no anticipated significant cumulative impact associated with population and housing growth.

Direct population growth associated with the Project would be considered "planned" growth, since this Project has been considered in the City's population planning projections. In total, the Project would represent 18.3 percent of the projected population growth in the City between 2005 and 2030. Indirect growth would include residential and employment growth in surrounding neighborhoods resulting from the expansion of infrastructure and services proposed under the Project. As stated above, such growth would only be considered substantial if it were not anticipated in local planning efforts. Infrastructure and services would be expanded to serve the Project, without significant excess capacity that might encourage additional local growth beyond that already planned for under Proposition G and under the redevelopment plans. Because this population growth has been accounted for in City projections, it would not be considered substantial. Therefore, the Project would not make a cumulatively considerable contribution to any potential cumulative impact related to substantial increases in population, and the Project's cumulative impact would be less than significant.

Housing need as identified in the 2007–2014 Housing Element Update is 31,193 units; the Project would provide approximately 10,500 dwelling units, or over one-third of the City's portion of the regional housing need. As noted in Setting, above, over the course of the past several decades, the construction of housing in the region has failed to keep pace with population growth in the Bay Area. Although population growth has slowed and is predicted to continue at a relatively moderate rate through 2030, the region is still attempting to make up for housing shortages from previous growth periods. The demand for 8,263 housing units that would be generated by the Project would be less than the total number of units provided by the Project. The Project would provide a benefit to the region by constructing more housing than the demand it would generate, helping to achieve a better jobs/housing balance in the Bay Area.

The demand for housing units outside of the City, conservatively assuming that 45 percent of those employed at the Project site would commute from outside of San Francisco, would be dispersed throughout the nine-county Bay Area.[104] In addition, any potential Project-related increase in housing demand in the surrounding Bayview Hunters Point neighborhood would help to fill the existing and abnormally high vacancies in the neighborhood that contribute to conditions of economic blight. The Project would not create a substantial demand for housing in the Bayview Hunters Point neighborhood, San Francisco, or the region in excess of the total number of housing units provided as part of the Project.

The Project's contribution to the significant cumulative housing shortage in the Bay Area would not be cumulatively considerable because it would provide more housing than is required by Project demand. The Project's cumulative impact would be less than significant.

[104] Refer to the discussion of commuting patterns in Section III.D (Transportation and Circulation).

Employment

The Bay Area is a major employment center, with over 3.4 million jobs reported in 2005.[105] A large percentage of this employment is in San Francisco. As shown in Table III.C-5, there were approximately 553,090 jobs in the City in 2005, approximately 17 percent of the 3.2 million total regional jobs. Development of cumulative projects in the Bay Area would be expected to result in indirect population growth through provision of increased employment opportunities. Employment growth would be considered substantial if it resulted in housing demand that would exceed planned regional housing development. It is possible that development of the cumulative projects could result in substantial employment growth that would result in a regional housing shortage. This is a potentially significant cumulative impact.

- Development at the Project site would provide 10,730 permanent jobs by 2032 (along with temporary construction-related jobs). Regional employment in 2005 consisted of 3.2 million jobs, with a projected increase of approximately 1.7 million jobs to 4.9 million jobs in 2030. San Francisco has traditionally experienced, and will continue to experience, ample employment opportunities that are not met by an equal supply of housing within the City, or even the Bay Area. The Project's contribution of 10,730 permanent jobs would represent 0.3 percent of the anticipated increase in regional employment through 2030 (the closest year to Project build-out for which employment projections have been prepared). The Project's employment would result in a related increase in housing demand for 8,263 units, as shown in Table III.C-9, which would be less than the total number of units provided by the Project.

Therefore, the population growth associated with increased employment from the Project would not result in housing demand that would exceed planned regional housing development, and would not be substantial. Because the employment increase associated with the Project would not be individually substantial or contribute to an exceedance of the City's employment projections, the Project would not result in a cumulatively considerable contribution to a potentially significant cumulative impact related to employment. The Project's cumulative impact would be less than significant.

Displacement of Existing Housing

Cumulative projects in the City and County of San Francisco could displace substantial numbers of people or existing housing and/or could necessitate construction of replacement housing elsewhere. Since there is a housing shortage in the City, as noted above, any projects that result in net displacement of existing housing would be considered to result in a potentially significant impact on housing.

The Project would demolish and replace 256 units at the Alice Griffith public housing site; the Project would not displace existing residents. Current vacant portions of the Alice Griffith site would be developed, and existing residents would occupy replacement public housing units before existing structures would be demolished. Overall, the Project would develop a total of 1,210 units of public housing, affordable housing, below-market rate housing, and market-rate housing in the Alice Griffith subarea. As the Project would not permanently displace any existing residents and would have no impact with respect to this threshold, it would not make a cumulatively considerable contribution to any potentially significant cumulative impact with regard to displacement of persons or housing. There would be no Project cumulative impact.

---

SECTION III.D TRANSPORTATION AND CIRCULATION

III.D.1 Introduction

This section analyzes the potential Project-level and cumulative impacts on transportation and circulation resulting from implementation of the Project. Transportation-related issues of concern that are addressed include traffic on local and regional roadways, transit, bicycles, pedestrians, parking, freight loading, and construction-related activities. Transportation impacts are assessed for the land use development program for weekday AM and PM commute periods, and also for Sunday non-game day conditions. Impacts of the proposed stadium are assessed for 49ers game day conditions on a Sunday, and also for a secondary event conditions that would affect the weekday PM peak period. Impacts of events at the proposed arena were also examined separately for weekday PM peak period conditions. This section also identifies feasible mitigation measures that would reduce or avoid significant impacts.

This section is based on information contained in the Candlestick Point–Hunters Point Shipyard Phase II Development Plan Transportation Study, prepared by CHS Consulting, Fehr & Peers, and LCW Consulting. A copy of the Final Transportation Study is included as Appendix D (Transportation Study).

III.D.2 Setting

The transportation study area includes all aspects of the transportation network that may be measurably affected by the Project. The transportation study area is defined by travel corridors and by facilities such as bus stops/transit stations. It includes the freeway segments, freeway ramps, and existing and proposed street intersections that residents and visitors would use in traveling to and from the Project. Figure III.D-1 (Transportation Study Area) presents the transportation study area.

A total of 59 existing intersections (including five intersections within the City of Brisbane), 11 freeway on- and off-ramps, and five freeway segments within the study area were identified as key locations that would likely be impacted by the Project, and were selected for detailed study of the Project impacts. The study intersections include all major intersections along Third Street, Bayshore Boulevard, and access routes to and from US-101 (including the off-ramp and local street junctions). Intersections further away were not analyzed as part of the study, as Project traffic remaining on local streets would be dispersed such that the Project traffic would not meet the significance thresholds identified in this section. Figure III.D-2 (Traffic Analysis Locations) presents the traffic analysis locations.

The transit analysis included an assessment of the Muni transit lines within the transportation study area that would serve the Project site, and/or be affected by vehicular traffic generated by the Project.

The parking analysis focused on three subareas where the stadium game day parking would occur including the on-site and off-site lots, as well as residential streets adjacent in Little Hollywood, India Basin and Bayview/Candlestick Point.

FIGURE III.D-2 Candlestick Point — Hunters Point Shipyard Phase II EIR

TRAFFIC ANALYSIS LOCATIONS

Roadway Network

Regional Access

Travel to and from the Project vicinity involves the use of regional transportation facilities, highways, and transit services that link San Francisco with other parts of the Bay Area and Northern California. Candlestick Point is accessible by local streets with connections to and from regional freeways and highways in the state system.

The Project site is served by US-101, with freeway interchanges at Harney Way and Alana Way, Bayshore Boulevard/Third Street and Cesar Chavez Street. These interchanges provide full directional access, except at Bayshore/Third there is no northbound on-ramp, and at Cesar Chavez Street there is no southbound on-ramp. US-101 has a southbound off-ramp at Paul/San Bruno; southbound and northbound on-ramps at Industrial Avenue; and southbound on- and off-ramps and a northbound off-ramp at Silver Avenue.

US-101 and I-280 merge approximately two miles north of Candlestick Point. North of the US-101/I-280 junction, US-101 merges with I-80 which leads to the Bay Bridge and the East Bay. Approximately two miles south of Candlestick Point, US-101 merges with I-380[106] near the San Francisco International Airport.

Local Access

The primary streets that serve the Project vicinity, listed in alphabetical order, include.

Alana Way is an approximately 1,500-foot two-way roadway segment that connects Beatty Avenue with Harney Way. It serves as the primary connection between Harney Way and US-101 southbound ramps at Alana/Beatty. Alana Way has one travel lane in the eastbound direction towards Harney Way, and two travel lanes in the westbound direction towards Beatty Avenue. On-street parking is not permitted at any time.

Arelious Walker Drive (previously named Fitch Street) is a north/south discontinuous roadway that is divided by Yosemite Slough and Hunters Point hill. Arelious Walker Drive runs between Gilman and Carroll Avenues, between Shafter and Palou Avenues, and between Innes and Galvez Avenues. Like other north/south streets in the vicinity, the Arelious Walker Drive alignment has a 64-foot-wide right-of-way with room for two 10-foot-wide sidewalks (presently un-paved). This street serves as an alternative way to access the northern unpaved privately owned parking lots used for stadium parking. Arelious Walker Drive between Gilman and Carroll Avenues is part of Bicycle Route #805, and is part of the unimproved on-street Bay Trail.

- **Bayshore Boulevard** is a north/south arterial that generally parallels US-101. Bayshore Boulevard has two to three travel lanes in each direction, separated by a median. The General Plan designates Bayshore Boulevard as a Major Arterial, part of the MTS Network, and a Transit Preferential Street (other—secondary), and a Neighborhood Commercial Street. South of Arleta Avenue, Bayshore Boulevard is designated as a Transit Preferential Street (other—secondary). Bayshore Boulevard is part of Bicycle Routes #25 and #5. The T-Third light rail line runs on Bayshore Boulevard between Hester Avenue and Sunnydale Avenue.

[106] I-380 is a short 3.3-mile east/west highway that connects I-280 in San-Bruno with US-101 near the San Francisco International Airport.

Beatty Avenue is a two-way east/west roadway between Tunnel Avenue and the US-101 southbound ramps at the intersection of Alana/Beatty. Beatty Avenue has one travel lane in each direction.

Blanken Avenue is a two-way east/west roadway that extends from Bayshore Boulevard through the Little Hollywood area west of Executive Park. The roadway has one lane in each direction with sidewalks and unrestricted parking on both sides of the street. Commercial vehicles weighing more than 6,000 pounds are prohibited from using this roadway as a through route. Blanken Avenue terminates at the intersection of Executive Park Boulevard and Candlestick Road.

Cargo Way is an east/west roadway that extends between Third and Jennings Streets, and serves as the primary access point for the Port of San Francisco Intermodal Container Terminals. Cargo Way generally contains two travel lanes in each direction. The General Plan identifies Cargo Way as a Secondary Arterial, and as a street with significant truck traffic. Cargo Way is part of the unimproved on-street Bay Trail.

Carroll Avenue is an east/west roadway between Third Street and Arelious Walker Drive. Carroll Avenue has one eastbound lane and two westbound lanes, with a right-of-way width of 80 feet. It has discontinuous sidewalks, and, due to the rail tracks, there is no sidewalk on the south side of Carroll Avenue between Jennings and Third Streets. Between Ingalls and Hawes Streets there are no sidewalks on the north side of the street, and between Hawes and Griffith Streets there are no sidewalks on either side of the street. Sidewalks to the east of Ingalls Street are generally discontinuous or frequently obstructed by parked vehicles. On-street parking is permitted west of Ingalls Street. The General Plan identifies Carroll Avenue as a street with significant truck traffic. Carroll Avenue is a part of Bicycle Route #805. Between Arelious Walker Drive and Ingalls Street, Carroll Avenue is currently part of the unimproved on-street Bay Trail.

Cesar Chavez Street is a major east/west arterial between Douglass Street to the west and the Port of San Francisco North Container Terminal, east of Third Street. In the vicinity of the Project, Cesar Chavez Street generally has two to three travel lanes in each direction, with a center median. West of Guerrero Street, Cesar Chavez Street has one lane in each direction. In the General Plan, Cesar Chavez Street is identified as a Major Arterial in the CMP Network from Guerrero Street to Third Street, a Secondary Arterial east of Third Street, and part of the MTS Network. It is identified as a Route with Significant Truck Traffic east of US-101. Cesar Chavez Street is part of the Bicycle Route #60.

Crisp Avenue[107] is an east/west roadway that extends from the intersection of Griffith/Palou to Spear Avenue within the Shipyard. Public vehicle access is currently not permitted, with the exception of emergency vehicles, and the roadway is currently gated (Crisp south gate) at the intersection of Griffith/Palou. Crisp Avenue served as the primary truck and rail access into the Shipyard until 1971. Crisp Avenue would be reopened as part of the Project.

Evans Avenue is an east/west arterial, with two travel lanes in each direction. Evans Avenue extends between Cesar Chavez Street and Jennings Street (where it becomes Hunters Point Boulevard). The General Plan identifies Evans Avenue between Cesar Chavez Street and Third Street as a Major Arterial in the CMP Network, and part of the MTS Network. Evans Avenue between Third Street and Jennings Street

[107] Background documents relevant to this Project variously use the term Crisp Road or Crisp Avenue; irrespective of the use of Road or Avenue, the text and/or graphics are referring to that section of road that travels from Revere Avenue to Spear Avenue.

is identified as a Secondary Arterial, and part of the MTS Network. The General Plan also identifies Evans Avenue as a street with significant truck traffic. Evans Avenue is part of Bicycle Route #68, and between Third and Jennings Streets a bicycle lane is provided in each direction.

Geneva Avenue is a major east/west roadway that connects Bayshore Boulevard in Brisbane and Daly City to State Route 1 and I-280 in San Francisco. Geneva Avenue generally has two travel lanes in each direction. The General Plan designates Geneva Avenue as a major arterial, and as a Transit Preferential Street. It is also part of the Congestion Management Program Network. Geneva Avenue is part of Bicycle Route #90. The Geneva Avenue Corridor is part of an ongoing Transit Preferential Street study by SFMTA to identify short- and mid-term improvements to increase transit reliability, performance, and service.

Gilman Avenue is an east/west street between Third Street and Giants Drive/Hunters Point Expressway. Gilman Avenue has one eastbound travel lane and two westbound lanes, and on-street parking is generally permitted. As with Jamestown and Ingerson Avenues, commercial vehicles weighing more than 6,000 pounds are prohibited from Gilman Avenue between Third and Fitch Streets, except for local service.

Griffith Street is a north/south discontinuous roadway that is divided by Yosemite Slough. On the south side of the slough, Griffith Street runs between Gilman Avenue and Cameron Way. North of the Slough, Griffith Street extends from Navy Road south to Thomas Avenue. Between Thomas Avenue and the slough, Griffith Street is an unimproved dirt road. The General Plan identifies Griffith Street between Thomas Avenue and Crisp Avenue as a street with significant truck traffic.

Harney Way is the primary southern access road to Candlestick Point. Harney Way provides a direct connection between US-101 and Jamestown Avenue. Vehicles destined to and from US-101 northbound use the Harney Way ramps, while vehicles destined to and from US-101 southbound use the Alana/Beatty ramp on the west side of US-101 (via Alana Way). Between Alana Way and Jamestown Avenue, Harney Way has two travel lanes in each direction. On-street parking is not permitted at any time, and a sidewalk is provided only on the north side. Harney Way is part of Bicycle Route #805.

Hunters Point Boulevard is an arterial that connects Evans Avenue at Jennings Street with Innes Avenue. Hunters Point Boulevard and Innes Avenue serve as the primary access road to the Shipyard. Hunters Point Boulevard has two travel lanes in each direction. The General Plan identifies Hunters Point Boulevard as a Secondary Arterial, and part of the MTS Network. It also identifies Hunters Point Boulevard as a street with significant truck traffic. Hunters Point Boulevard is part of Bicycle Route #68, and contains a bicycle lane in each direction.

Hunters Point Expressway (and the road south of the Harney Way/Jamestown Avenue intersection, called Jamestown Avenue Extension) circles the existing stadium and parking lot, and connects the east end of Jamestown Avenue with the east end of Gilman Avenue. Hunters Point Expressway provides access to the Candlestick Point State Recreation Area. The number of travel lanes on Hunters Point Expressway varies. In general, there are two continuous travel lanes in each direction, with additional lanes providing access between Jamestown and Gilman Avenues and the gates to the on-site parking. On-street parking is not permitted at any time. However, along parts of Jamestown Avenue Extension, on-street parking is permitted but restricted on event days. Hunters Point Expressway is part of Bicycle Route #805.

Illinois Street is a two-way, north/south roadway that generally parallels Third Street, extending from 16th Street over the Islais Creek Channel and merges into Cargo Way at the Amador Street intersection. The roadway primarily has one lane in each direction with sidewalks and on-street parking on both sides of the street

Indiana Street is a north/south roadway between Mariposa and Tulare Streets. Between Cesar Chavez and 25th Streets, Indiana Street operates one-way northbound and provides access to the I-280 northbound on-ramps at 25th Street. Indiana Street generally has on-street parking, both perpendicular and parallel, on both sides of the street. Indiana Street is part of Bicycle Route #907.

Ingalls Street is a north/south roadway between Jamestown Avenue and Innes/Middle Point. Ingalls Street has one travel lane in each direction, and on-street parking and sidewalks on both sides of the street. Ingalls Street has narrow sidewalks and very wide travel lanes between Yosemite Avenue and Thomas Avenue. Prior to the closure of the Hunters Point Shipyard, Ingalls Street was part of the designated truck route between Carroll Avenue and the currently inactive south (Crisp) gate at Palou Avenue. The General Plan identifies Ingalls Street between Carroll and Thomas Avenues as a street with significant truck traffic. Ingalls Street between Carroll and Yosemite Avenues is currently part of the unimproved on-street Bay Trail.

Ingerson Avenue is an east/west street between Third Street and Giants Drive. Ingerson Avenue has one travel lane in each direction and on-street parking is permitted. Commercial vehicles weighing more than 6,000 pounds are prohibited from traveling on Ingerson Avenue between Third and Arelious Walker Drive, except for local service.

Innes Avenue is an east/west arterial that provides direct access to Hunter Point Shipyard's Innes (north) gate. It contains two travel lanes in each direction. The General Plan identifies Innes Avenue as a Secondary Arterial and part of the MTS Network. It also identifies Innes Avenue as a street with significant truck traffic. Innes Avenue is part of Bicycle Route #68.

Jamestown Avenue is an east/west street between Third Street and Hunters Point Expressway. West of Redondo Street, Jamestown Avenue has one travel lane in each direction. East of Redondo Street to Giants Drive, there is a substantial change in lane width as Jamestown Avenue increases to one lane in the eastbound direction and two lanes in the westbound direction. Commercial vehicles weighing more than 6,000 pounds are prohibited from using Jamestown as a through route. On-street parking is generally permitted on Jamestown Avenue. Jamestown Avenue provides access to Bayview Park and the Candlestick Point Recreation area, and is identified in the General Plan as a Recreational Street.

Oakdale Avenue is an east/west arterial between Bayshore Boulevard and Third Street. East of Third Street, Oakdale Avenue is discontinuous and is generally a residential street. The General Plan identifies Oakdale Avenue between Bayshore Boulevard and Third Street as a Secondary Arterial. Oakdale Avenue between Bayshore Boulevard and Phelps Street is part of Bicycle Route #170, and bicycle lanes are provided on both sides of the street between Selby and Phelps Streets.

Palou Avenue is an east/west roadway between Barneveld Avenue and Griffith Street. It generally has one travel lane in each direction, and parking on both sides of the street. Palou Avenue has truck restrictions (vehicles in excess of 6,000 pounds prohibited) between Selby Street and Griffith Street. Between Phelps and Griffith Streets, Palou Avenue is part of Bicycle Routes #7 and #70.

Pennsylvania Avenue is a two-way north/south roadway between 17th and Cesar Chavez Streets. Pennsylvania Avenue generally has on-street parking on both sides of the street. Pennsylvania Avenue provides on- and off-ramp access to southbound I-280 at Mariposa, 18th, 25th and Cesar Chavez Streets.

Sunnydale Avenue is a two-way east/west roadway that extends west of Bayshore Boulevard to Persia/Mansell. To the east of Bayshore Boulevard, Sunnydale Avenue is an unpaved dead-end roadway. West of Bayshore Boulevard, the roadway has one lane in each direction with sidewalks and on-street parking on both sides.

Third Street is the principal north/south arterial in the southeast part of San Francisco, extending from its interchange with US-101 and Bayshore Boulevard to Market Street in downtown. It is the main commercial street in the Bayview Hunters Point neighborhood and also serves as a through street and an access way to the industrial areas north and east of US-101. In the Project vicinity, Third Street has two travel lanes in each direction. On-street parking is generally permitted on one side of the street. The T-Third light rail operates in an exclusive median right-of-way, with the exception of the segment between Kirkwood and Thomas Avenues, where the light rail shares the travel lane with vehicles. In the General Plan, Third Street is designated as a Major arterial, as a Transit Preferential Street (TPS) in the General Plan, and as a route with significant truck traffic (between the segment between Jerrold Avenue and Fourth Street).

Thomas Avenue is an east/west roadway between Third and Griffith Streets. West of Ingalls Street, Thomas Avenue is a residential street, while east of Ingalls Street, there is a mix of land uses, including residential and light industrial uses. The General Plan identifies Thomas Avenue between Ingalls and Griffith Streets as a street with significant truck traffic.

Tunnel Avenue is a two-way north/south roadway that extends south of Bayshore Boulevard and merges into Bayshore Boulevard at Old County Road. The roadway has one lane in each direction with sidewalks and unrestricted on-street parking on both sides of the street north of Sierra Point Lumber. On-street parking is prohibited on Tunnel Avenue south of Sierra Point Lumber. Tunnel Avenue provides access to Bayshore Caltrain Station and to the US-101 ramps at Alana/Betty. Tunnel Avenue is part of Bicycle Route #905.

Underwood Avenue is an east/west roadway between Third Street and Hawes Street. Underwood Avenue is primarily a residential street between Third and Jennings Streets, and between Jennings and Ingalls Streets there is a mix of residential and light industrial land uses. Between Ingalls Street and Hawes Streets, Underwood Avenue is an unimproved street without paving or gutters, with light/medium industrial land uses.

25th Street is a two-way east/west roadway two blocks north of Cesar Chavez Street between Michigan Street to the east and Grand View Avenue, near Market Street, to the west. It is discontinuous across US-101. 25th Street has one travel lane in each direction, with parking on both sides of the street.

Intersection Operations

Existing conditions on regional facilities and at local intersections were analyzed for the weekday AM (8:00 to 9:00 A.M.) and PM (5:00 to 6:00 P.M.) peak hours, and for Sunday (no football game) PM peak hour (4:00 to 5:00 P.M.) conditions. The weekday AM and PM peak hours consider the current morning and evening commute periods. The Sunday PM peak hour coincides with the time that afternoon football games typically end, and the majority of the spectators depart the stadium. Figure III.D-2 presents the study intersections.

Traffic conditions at the study intersections were evaluated using level of service (LOS). Level of Service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. Table III.D-1 (LOS Definitions for Signalized and Unsignalized Intersections) defines each of the levels of service and shows the correlation between average control delay and level of service.

Table III.D-1 LOS Definitions for Signalized and Unsignalized Intersections

Control/ LOS	*Description of Operations*	*Average Control Delay (seconds per vehicle)*
Signalized		
A	Insignificant Delays: No approach phase is fully used and no vehicle waits longer than one red indication.	≤ 10
B	Minimal Delays: An occasional approach phase is fully used. Drivers begin to feel restricted	> 10.0 and ≤ 20.0
C	Acceptable Delays: Major approach phase may become fully used. Most drivers feel somewhat restricted	> 20.0 and ≤ 35.0
D	Tolerable Delays: Drivers may wait through no more than one red indication. Queues may develop but dissipate rapidly without excessive delays	> 35.0 and ≤ 55.0
E	Significant Delays: Volumes approaching capacity. Vehicles may wait through several signal cycles and long queues form upstream	> 55 and ≤ 80
F	Excessive Delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections	> 80.0
Unsignalized		
A	No delay for STOP-controlled approach	≤ 10.0
B	Operations with minor delays	> 10.0 and ≤ 15.0
C	Operations with moderate delays	> 15 and ≤ 25.0
D	Operations with some delays	> 25.0 and ≤ 35.0
E	Operations with high delays and long queues	> 35.0 and ≤ 50.0
F	Operations with extreme congestion, with very high delays and long queues unacceptable to most drivers	> 50.0

SOURCE: Highway Capacity Manual (HCM 2000), Transportation Research Board, 2000.

During the weekday AM and PM, and Sunday PM peak hours, most study intersections currently operate at LOS D or better. During the weekday AM peak hour, the intersections of Cesar Chavez/Pennsylvania/I-280 and San Bruno/Silver operate at LOS E conditions. During the weekday PM peak hour, the intersection of Bayshore/Alemany/Industrial operates at LOS E conditions. The poor operating conditions at intersections operating at LOS E are generally related to high volumes of traffic destined to US-101 and I-280. During Sunday PM peak hour conditions (without a football game), none of the 59 study intersections currently operate at LOS E or LOS F conditions. Existing operating conditions for local intersections are provided in Table III.D-9 through Table III.D-11 in Section III.D.4 (Impacts).

Freeway Mainline Operations

The LOS for a freeway section, weaving section, and on-ramp junction with the freeway is based on vehicle density (passenger cars/lane/mile) and service volume (passenger cars/hour) using the relationships presented in Table III.D-2 (LOS Definitions for Freeway Mainline, Weaving, and Ramp Junction). Service volume is the primary measure of the overall weaving segment. The specific level of service, and thus

service volume, is prescribed by the weaving movement predicated on the weaving volume, number of lanes, and length of weave relationship. The value of service volume is determined with the aid of nomographs published in *Completion of Procedures for Analysis and Design of Traffic Weaving Sections*, by J Leisch & Associates, September 1983.

Table III.D-2 LOS Definitions for Freeway Mainline, Weaving, and Ramp Junction

	Maximum Density (Passenger Cars per Mile per Lane)		*Service Volume (Passenger Cars per Hour)*		
			Freeway Weaving Sections (Lanes)		
LOS	*Basic Freeway Sections*	*Freeway Weaving Segments and Ramp Junctions*	*2*	*3*	*4*
A	< 11	< 10	< 750	< 800	< 850
B	> 11 to 18	> 11 to 20	>750 to 1,000	>800 to 1,100	>850 to 1,200
C	> 18 to 26	> 20 to 28	>1,000 to 1250	>1,100 to 1,350	>1200 to 1,450
D	> 26 to 35	> 28 to 35	>1,250 to 1550	>1,350 to 1,600	>1,450 to 1,650
E	> 35 to 45	> 35	>1,550 to 1,900	>1,600 to 1,900	>1,650 to 1,900
F	> 45	Demand exceeds capacity		> 1900	

SOURCE: Highway Capacity Manual (HCM), Chapter 23: Basic Freeway Sections and Chapter 25: Ramps and Ramp Junctions Methodology, Transportation Research Board, 2000, Completion of Procedures for Analysis and Design of Traffic Weaving Sections, Jack E. Leisch & Associates, September 1983.

Freeway mainline analysis was conducted at the following segments:

- US-101 northbound—between Cesar Chavez Street and Vermont Street
- US-101 northbound—between Harney Way and Third Street/Bayshore Boulevard
- US-101 northbound—between Sierra Point Parkway and Harney Way
- US-101 southbound—between the I-80 merge and Cesar Chavez Street
- US-101 southbound—between Third/Bayshore and Alana Way
- US-101 southbound—between Alana Way and Sierra Point Parkway
- I-280 northbound—between the Alemany off-ramp and Alemany on-ramp
- I-280 southbound—between the Alemany on-ramp and Alemany off-ramp
- I-280 northbound—between 25th Street and Mariposa Street
- I-280 southbound—between Mariposa Street and 25th Street

All analysis segments experience LOS E or LOS F conditions during the commute periods—either in the AM or PM peak hours, with the exception of the segment of US-101 southbound between the I-80 westbound merge and Cesar Chavez. The segment of US-101 southbound between Third/Bayshore and Sierra Point experiences LOS E conditions during both the AM and PM peak hours. Existing operating conditions at the freeway mainline segments are provided in Table III.D-12 in Section III.D.4.

Ramp Operations

A ramp junction analysis was conducted to determine the operating conditions for ramp volumes merging with the freeway mainline traffic flow. Freeway ramps were evaluated using the *Highway Capacity Manual 2000* methodology for ramp merge and diverge conditions. Service levels at the on- and off-ramps are determined based on density, as calculated using the freeway volumes and the ramp volumes at each study location. Similar to the freeway mainline, the operating characteristics of the ramps are described using the concept of LOS (see Table III.D-2).

Freeway ramp junction analysis was conducted at the on-ramp and off-ramps:

- US-101 northbound on-ramp from Sierra Point Parkway
- US-101 northbound on-ramp from Harney Way
- US-101 northbound on-ramp from Bayshore Boulevard
- US-101 northbound on-ramp from Alemany Street
- US-101 northbound on-ramp from Bayshore/Cesar Chavez
- US-101 southbound off-ramp to Bayshore/Cesar Chavez
- US-101 southbound on-ramp from Cesar Chavez/Potrero
- US-101 southbound on-ramp from Alemany/San Bruno
- US-101 southbound on-ramp from Third/Bayshore
- US-101 southbound on-ramp from Alana Way
- US-101 southbound on-ramp from Sierra Point/Lagoon
- I-280 northbound off-ramp to Cesar Chavez
- I-280 northbound on-ramp from Indiana/25th
- I-280 southbound off-ramp to Pennsylvania/25th
- I-280 southbound on-ramp from Pennsylvania/25th

During the weekday AM and PM peak hours, all of the ramps currently operate at LOS D or better, with the exception of the US-101 southbound on- and off-ramps at Cesar Chavez, and northbound on-ramps from Cesar Chavez Street and Alemany Street. Existing operating conditions at the freeway mainline segments are provided in Table III.D-13 in Section III.D.4.

Freeway Ramp Diverge Queue Storage

Within dense urban areas such as San Francisco, off-ramp operating conditions are largely controlled by the operations at the off-ramp terminus with the street network. For key off-ramps in the study area, the off-ramp queues during the red signal phase were compared to the storage capacity of the off-ramp. The storage capacity of the off-ramp was calculated by estimating the distance between the freeway diverge gore point[108], and the stop bar for the off-ramp approach to the street intersection. Vehicle queue lengths on the off-ramp approaches to signalized intersections were estimated from intersection LOS calculations, by multiplying the 95th percentile vehicle queue of the constrained movement by 25 feet to account for average vehicle lengths and the space between queued vehicles.

The ramp queue storage analysis was conducted at the following off-ramps:

- US-101 northbound off to Harney Way
- US-101 northbound off to Bayshore/Cesar Chavez
- US-101 southbound off to San Bruno/Silliman
- US-101 southbound off to San Bruno/Mansell
- US-101 southbound off to Bayshore/Hester
- US-101 southbound off to Alana Way
- US-101 southbound off to Sierra Point/Lagoon
- I-280 northbound off to Cesar Chavez
- I-280 southbound off to Pennsylvania

[108] A gore point is the triangular area of land where freeways split or merge.

Under existing conditions, the queues at the off-ramp approach to the signalized intersections are accommodated within the ramp storage capacity. Existing ramp storage conditions at the off-ramps are provided in Table III.D-14 in the Impact analysis.

Transit

The study area is relatively well served by public transit, with routes providing crosstown, community, downtown, and regional service. Local service within the study area is provided by the San Francisco Municipal Railway (Muni) bus and light rail lines, which can be used to access regional transit operators. Service to and from the East Bay is provided by BART, AC Transit, and ferries; service to and from the North Bay is provided by Golden Gate Transit buses and ferries; and service to and from the Peninsula and South Bay is provided by Caltrain, SamTrans, and BART.

Figure III.D-3 (Existing Transit Network) presents the Muni lines serving the study area. Table III.D-3 (Muni Lines Serving Project Study Area) summarizes the frequency of service for the Muni bus and light rail lines serving the study area. Peak period service on most lines is at 8- to 10-minute headways between buses. The 54-Felton has headways between buses of 20 minutes, and the 56-Rutland has headways of 30 minutes. The 44-O-Shaughnessey runs most frequently, with 6-minute headways between buses.

Table III.D-3 Muni Lines Serving Project Study Area

	Frequency of Service (average time in minutes)		
Route	*AM Peak Period (7:00 to 9:00 A.M.)*	*Midday Period (9:00 A.M. to 4:00 P.M.)*	*PM Peak Period (4:00 to 6:00 P.M.)*
9-San Bruno	7.5	10	7.5
9X-Bayshore Express	10	12	10
9AX-Bayshore "A" Express	10	--	10
9BX-Bayshore "B" Express	15	--	10
19-Polk	10	24	10
23-Monterey	15	20	14
24-Divisadero	8.5	10	10
28L-19th Avenue	10	—	10
29-Sunset	10	15	10
44-O-Shaughnessey	6	15	7.5
48-Quintara-24th Street	12	20	12
54-Felton	20	20	20
56-Rutland	30	30	30
T-Third	8.5	10	8.5

FIGURE III.D-3

Candlestick Point — Hunters Point Shipyard Phase II EIR

EXISTING TRANSIT NETWORK

BART operates regional rail transit service connecting San Francisco with the East Bay and northern San Mateo County. BART provides service along Market and Mission Streets and near the western I-280 corridor in San Francisco. Transit connections can be made to the following BART stations from the Project site: Balboa Park Station via the 29-Sunset from Candlestick Point, Glen Park Station via the 23-Monterey and the 44-O'Shaughnessy, and the Embarcadero station via the T-Third light rail route. BART operates at service frequencies of three minutes in the peak periods for intra-San Francisco travel.

Caltrain provides rail passenger service on the Peninsula and the Santa Clara Valley between Gilroy and San Francisco. The Peninsula Corridor Joint Powers Board (JPB), a joint powers agency consisting of San Francisco, San Mateo, and Santa Clara Counties, operates the service. Caltrain currently operates 86 trains each weekday, with a combination of Baby Bullet, express, and local services. Headways during the peak periods are approximately ten to thirty minutes. The San Francisco Caltrain terminal is at Fourth Street between King and Townsend Streets to the north of the study area.

The closest active Caltrain station to the study area is the Bayshore station in Brisbane at the San Mateo/San Francisco border. The station is on Tunnel Avenue, just southeast of Bayshore Boulevard. Not all trains stop at the Bayshore Station. During the peak commute periods, one train per hour in each direction stops at the Bayshore Station. There are no direct connections with other transit services. However, Muni and SamTrans can be accessed by walking two to three blocks to bus stops along Bayshore Boulevard.

SamTrans, operated by the San Mateo County Transit District, provides bus service between San Mateo County and San Francisco. SamTrans operates 12 bus lines that serve San Francisco, including nine routes into the downtown area. However, only two routes—the 292 and 397—serve the Bayview neighborhood along Bayshore Boulevard; and only route 292 operates during peak hours. Headways during the peak commute periods are approximately 15 minutes per line. There are no direct SamTrans services to Candlestick Point, except during football game days.[109] Route 7B operates along Bayshore Boulevard and stops near the Bayshore Caltrain station on game days.

AC Transit is the primary bus operator for the East Bay, including Alameda and western Contra Costa Counties. AC Transit operates 37 routes between the East Bay and San Francisco, all of which terminate at the Transbay Transit Terminal, located on Mission Street, between First and Fremont Streets. Most Transbay service is peak-hour and peak-direction (to San Francisco during the AM peak period and from San Francisco during the p.m. peak period), with headways of 15 to 30 minutes per route. To access Candlestick Point, AC Transit riders must transfer at the Transbay Terminal to the T-Third line, and then to the 29-Sunset at Paul Avenue.

The Golden Gate Bridge, Highway, and Transportation District (GGBHTD) provides bus service between the North Bay (Marin and Sonoma Counties) and San Francisco. Golden Gate Transit operates 18 commuter bus routes and two basic routes with service between cities in the North Bay and San Francisco. Most routes serve either the Civic Center (via Van Ness Avenue and Mission Streets) or the Financial District (via Battery and Sansome Streets). Basic bus routes operate at 15 to 90 minute headways, depending on the time and day of the week. Commute and ferry feeder bus routes operate at more frequent intervals in the mornings and

[109] In 2008 SamTrans service to the stadium was taken over by Silverado Stages. In 2009, Golden Gate Transit service was taken over by California Wine Tours and Santa Clara VTA service was taken over by Silverado Stages.

evenings. Golden Gate Transit does not provide local service within San Francisco Golden Gate Transit can be accessed from the study area via the T-Third line, with a transfer near the Transbay Terminal.

The GGBHTD also provides ferry service between the North Bay and San Francisco. During the AM and PM peak periods, ferries operate between Larkspur and San Francisco and between Sausalito and San Francisco. The San Francisco terminal is at the Ferry Building, on The Embarcadero at Market Street. Access to the Ferry Building would generally require travel on the T-Third LRT line to the Embarcadero Station.

Bicycles

Existing bicycle facilities in the study area include routes that are part of the San Francisco Bicycle Network, and regional routes, part of the San Francisco Bay Trail system. Bikeways are typically classified as Class I, Class II, or Class III facilities.[110] Class I bikeways are bike paths with exclusive right-of-way for use by bicyclists or pedestrians. Class II bikeways are bike lanes striped with the paved areas of roadways and established for the preferential use of bicycles; Class III bikeways are signed bike routes that allow bicycles to share travel lanes with vehicles. Figure III.D-4 (Existing San Francisco Bicycle Route Network) presents the bicycle routes within the study area, as identified in the Official San Francisco Bike Route System; Figure III.D-5 (Existing San Francisco Bay Trail Plan Route) presents the existing Bay Trail facilities.

In June 2009, the San Francisco Bicycle Plan was approved by the SFMTA Board. Near-term improvement projects on the existing bicycle network in the study area are noted below, and both near-term and long-term improvements are described in additional detail in the "Analytic Method" section in Section III.D.4.

Route #5: Route #5 is the easternmost north/south bicycle route, runs between Visitacion Valley and North Beach, primarily as a Class III facility along Third Street and Illinois Street, and as a Class II facility along Bayshore Boulevard (south of US-101), The Embarcadero, and much of San Bruno Avenue. Since southbound Third Street does not cross over US-101 to connect with Bayshore Boulevard, southbound Bicycle Route #5 is routed onto Paul Avenue (via Connector Route #705) and San Bruno Avenue (also Bicycle Route #25). This split in the route is required, since the US-101 undercrossing between southbound Third Street and southbound Bayshore Boulevard that would require bicyclists to weave across high-speed traffic. Bicycle Route #5 connects with a regional bicycle route in Brisbane. San Francisco Bicycle Plan Project 4-3: Illinois Street Bicycle Lanes will provide Class II bicycle lanes in both directions on Illinois Street between 16th Street and Cargo Way.

Route #7: Route #7 is a Class III bike route between Mariposa Street and Carroll Avenue, via Indiana Street, Third Street, Phelps Street, Palou Avenue, and Keith Street. Route #7's southern terminus is at Keith Street and Carroll Avenue at the Bayview Playground. It is a Class III facility; however, wider travel lanes that allow bicyclists to ride outside of the path of vehicle travel are provided on sections of Indiana and Phelps Streets, and on Keith Street.

[110] Bicycle facilities are defined by the State of California in the *California Streets and Highway Code* Section, 890.4.

Candlestick Point — Hunters Point Shipyard Phase II EIR

EXISTING SAN FRANCISCO BAY TRAIL PLAN ROUTE

FIGURE III.D-5

Route #25: Route #25 runs between the southeastern part of San Francisco and the Marina District. Route #25 runs along San Bruno Avenue, Bayshore Boulevard, and Oakdale Avenue in the Bayview Hunters Point area. Within the study area, Route #25 is a Class III facility. North of the study area, Route #25 runs as both a Class II facility (e.g., along Potrero Avenue, Harrison Street, and 11th Street), and as a Class III facility (e.g., 10th Street, Polk Street). San Francisco Bicycle Plan Project 5-4: Bayshore Boulevard Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions of travel on Bayshore Boulevard between Cesar Chavez Street and Silver Avenue.

Route #60: Route #60 runs between the Great Highway/Vicente and Cesar Chavez Street/Illinois Street. In the study area, it is a Class III facility along Cesar Chavez Street between Bayshore Boulevard and Mississippi Street, and a Class II facility between Mississippi and Illinois Streets. San Francisco Bicycle Plan Project 5-5: Cesar Chavez Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions on Cesar Chavez Street between Kansas Street (near US-101) and Mississippi Street (near I-280).

Route #68: Route #68 runs from the Innes gate at Hunters Point Shipyard north along Innes Avenue, Hunters Point Boulevard, and Evans Avenue to Cesar Chavez. This route has dedicated bike lanes (Class II) on both sides of Evans Avenue, and Hunters Point Boulevard between Innes Avenue and Third Street. San Francisco Bicycle Plan Project 4-4: Innes Avenue Bicycle Lanes will involve the installation of Class II or III bicycle facilities in both directions of Innes Avenue between Donahue Street and Hunters Point Boulevard.

East-West Route #70 runs along Palou Avenue, Silver Avenue, and Monterey Boulevard between the Bayview Hunters Point area and West Portal as a Class III facility. The eastern terminus of this route is currently the Crisp south gate to Hunters Point Shipyard at Griffith Street and Palou Avenue.

Route #170: Connector Route #170 runs along Oakdale Avenue between Third Street and Bayshore Boulevard. Between Third Street and Bayshore Boulevard, this route has Class II bicycle lanes on both sides of the street.

Route #805: Connector Route #805 is a Class III facility that connects between Beatty Avenue and Tunnel Avenue (near the Bayshore Caltrain Station) in Brisbane and Third Street and Carroll Avenue. This route passes Candlestick Park stadium and the Candlestick Point State Recreation Area via Harney Way, Hunters Point Expressway, Gilman Avenue, Arelious Walker Drive, and Carroll Avenue.

Route #905: Route #905 is a short Class III route that runs along Tunnel Avenue south, east of Bayshore Boulevard. Bicycle Route #905 connects with regional bicycle routes to the south in Brisbane and South San Francisco.

Route #907: Route #907 is a short Class II route that runs along Indiana Street between César Chávez Street and the embankment at Islais Creek, where it dead-ends.

Route #925: Route #925 is a short Class III route that runs along Blanken Avenue between Tunnel Avenue and Bayshore Boulevard, connecting Route #5 and Route #905.

The San Francisco Bay Trail is designed to create recreational pathway links to the various commercial, industrial, and residential neighborhoods that surround the San Francisco Bay. In addition, the trail connects points of historic, natural, and cultural interest; recreational areas such as beaches, marinas, fishing

- piers, boat launches, and over 130 parks and wildlife preserves totaling 57,000 acres of open space. At various locations, the Bay Trail consists of paved multi-use paths, dirt trails, and in some cases, bike lanes and sidewalks. Within the study area, the Bay Trail has two discontinuous segments of existing, off-street pathways, one in the area of Candlestick Point and Harney Way, and another segment which partially surrounds India Basin. The Bay Trail currently bridges the gap between Islais Creek and Candlestick Point with an inland route that shares portions of Gilman Avenue, Arelious Walker Drive, Carroll Avenue, Ingalls Street, Yosemite Avenue, and Third Street. An improved trail exists in the southern part of the Candlestick Point State Recreation Area where public access improvements have been made, but the northern section is unimproved within the Project site. The trail starts northeast of the US-101 northbound Harney Way ramps. Parking is available off of Harney Way, west of Jamestown Avenue (approximately 30 parking spaces are currently provided), and parking, restrooms, and boat ramp facilities are provided off of Hunters Point Expressway near Gilman Avenue. Portions of the Bay Trail are also improved to the northeast of the Shipyard within the India Basin Open Space and Shoreline Parks.

The majority of the study area is flat, with limited changes in grades, facilitating bicycling within and through the area. East of Third Street, there are active and inactive rail tracks within the roadways that could impede bicycle travel. While the Bayview Hill and the Hunters Point hill pose challenges for bicyclists, the majority of the study area is relatively flat.

Bicycle activity in the study area is generally low. Weekday AM and PM peak period and Saturday midday period bicycle volume counts were conducted on Third Street, Oakdale Avenue, and Evans Avenue. Hourly bicycle volumes ranged between 1 and 30 bicyclists per hour, with the greatest number on bicyclists on Third Street and on Oakdale Avenue. More bicyclists were observed on weekdays than weekends.

Pedestrians

Pedestrian facilities within the study area vary, between the areas on the east side of Third Street and the industrial land uses surrounding the Caltrain rail corridor on the west side of Third Street. On the west side of Third Street, many of the commercial facilities surrounding the railroad mainline have partial or no sidewalks. Several of the streets in this area have active and inactive railroad tracks and many of the former industrial and storage buildings in the area retain large raised freight loading/unloading platforms abutting the street.

On Third Street and on the residential streets immediately surrounding Third Street, the sidewalk network is adequate and relatively complete. In the light manufacturing areas surrounding Yosemite Slough the sidewalk network is less complete and frequently obstructed by illegally parked vehicles and or vehicles loading. The extent, condition, and usability of the sidewalks generally decrease closer to Yosemite Slough (within the Project vicinity). There are also gaps in the sidewalk network on Innes Avenue approaching Hunters Point Shipyard.

The Candlestick Point State Recreation Area has a network of existing multi-use trails that extend from the County line to a point just southeast of the intersection of Gilman Avenue and Donahue Street (an undeveloped 'paper' street).[111] Most of these paths are within the park and do not intersect the local roadways, although some connect to, or are part of, the Bay Trail.

[111] A paper street is a road or street that appears on maps but does not exist in reality.

There are several dedicated pedestrian overcrossings in the vicinity of Candlestick Park. These structures are designed to reduce pedestrian-vehicle conflicts associated with Candlestick Park events and adjacent schools. These include the stadium-related overcrossing of Jamestown Avenue just north of Harney Way and overcrossing of Harney Way, just west of Jamestown Avenue, and the overcrossing of Gilman Avenue at Griffith Street adjacent to the Bret Harte School.

Pedestrian activity in the immediate vicinity of the Project site is light throughout the day during non-game days. During game days, pedestrians flood the area traveling between the on-site and off-site parking facilities and the stadium.

Third Street is the primary pedestrian corridor in the study area, with the central commercial core located roughly between Thomas Avenue and Kirkwood Streets (south of Evans Avenue). Counts of pedestrian volumes at crosswalks at three intersections on Third Street were conducted in September 2007 during the weekday AM and PM peak periods. Peak hour pedestrian volume at the crosswalks ranged between 25 and 400 pedestrians per hour, with the greatest number of pedestrians at the intersection of Third/Palou.

Parking

In general, on-street parking in the study area is generally unrestricted (other than weekly street cleaning), and is typically permitted on both sides of the street. On the wider avenues in the study area (generally with an 80-foot-wide right-of-way width) with light industrial land uses, roadways, such as Donner Avenue and Bancroft Avenue between Jennings and Hawes Streets, accommodate 90-degree perpendicular parking. Along Third Street on-street parking is metered, and has been removed in the vicinity of the light rail stations. There are no Residential Permit Parking (RPP) areas within the study area.

Surveys of on-street parking were conducted for three subareas:

- Candlestick Point/Bayview—Within the mostly residential and partial industrial area bounded by Third Street to the west, Carroll Avenue to the north, Arelious Walker Drive to the east, and Jamestown Avenue to the south
- Little Hollywood—Within the mostly residential area bounded by Bayshore Boulevard to the west and north, US-101 to the north and east, and the San Francisco/San Mateo County line to the south
- India Basin—Within the mostly industrial area bounded by Jennings Street to the west, Hunters Point Boulevard/Innes Avenue to the south, Donahue Street to the east, and India Basin to the north

During the daytime, on-street parking utilization is greatest in the Candlestick Point/Bayview subarea, and ranges between 66 percent during the midday period (accommodating employee parking demand associated with the industrial uses) and 57 percent during the evening. Parking demand within the Little Hollywood residential neighborhood is greatest during the evening period, with parking occupancy at about 60 percent. Within the India Basin parking study area, weekday midday and evening parking utilization is low, between 17 and 28 percent, reflecting the limited residential and industrial uses in the area.

There are no City-owned off-street parking facilities in the study area. There is limited number of privately owned parking facilities in this subarea and most drivers rely on on-street parking in the area. The available privately owned off-street parking facilities serve the employees and visitors to the businesses adjacent to them and are not available for general public parking.

Existing Game Day Operations

The additional traffic added to the transportation network following a football game at Candlestick Park results in substantial congestion on local streets between parking facilities and the freeway, and on the freeways, particularly where game day traffic merges with other traffic already on the freeway. This section discusses the existing transportation conditions on days when football games are played at Candlestick Park.

Football Game Frequencies

Candlestick Park currently serves as the home of the San Francisco 49ers. The existing Candlestick Park stadium typically hosts up to 12 games per year, including eight regular season games, typically two pre-season games, and for teams that qualify for playoffs, typically two post-season games. Professional football games on the west coast are typically scheduled for 1:00 P.M. (Pacific Time) on Sundays, from September through early December. The post-season runs into January and games can be played on either Saturday or Sunday. At the conclusion of the college football season in late November, a few NFL games are played on Saturdays, as are some pre-season games. Successful teams typically play at least one Monday night (6:00 P.M.) game, and the 49ers have had at least one such home game in each of the past several seasons. Occasionally (no more than once per year), Sunday games are held at 5:00 P.M. The typical duration of a football game is approximately three hours.

Pre-Game and Post-Game Conditions

Ingress and Egress Routes

Vehicles access Candlestick Park by several routes, depending on the level of congestion and the vehicles' point of origin. Most vehicles arriving from the south (San Mateo and Santa Clara Counties, as well as traffic from Alameda County using the San Mateo or Dumbarton Bridges) use northbound US-101 and enter the site via the Harney Way exit. Vehicles from the north coming from either I-280 or US-101 use the Silver Avenue, Paul Avenue, Bayshore Boulevard/Third or the Alana/Beatty exits to reach the north access routes (Carroll, Gilman, and Jamestown) to the stadium. In order to accommodate peak inbound and outbound traffic volumes generated by the largest special events at Candlestick Park, traffic lanes on Harney Way and on the roadway surrounding the Candlestick Park parking lot (Jamestown Avenue Extension, Hunters Point Expressway and part of Gilman Avenue) are reversed on event days. Overhead Lane Use Control Signals are used to designate the direction of each lane.

On event days, each lane has either a green downward-pointing arrow or a red arrow above it to indicate to drivers in each direction whether they may drive in that lane. The portion of Harney Way between Alana Way near US-101 and Jamestown Avenue operates one-way eastbound (toward Candlestick Park) for several hours before events. Jamestown Avenue Extension and Hunters Point Expressway operate one-way counterclockwise before events. The portion of Gilman Avenue west of Candlestick Park Parking Lot Gate 4 is two-way before events to provide access to Gate F from the west. Once the pre-event traffic dies down, these roadways are converted back to two-way operation. In the last 30–60 minutes before the end of the event, the reversible roadways are converted to one-way operation away from the parking lot exits. Gilman Avenue operates one way westbound, while Hunters Point Expressway, Jamestown Avenue Extension and Harney Way operate one-way clockwise and westbound, respectively. During the post-game period, the Candlestick Park exit from northbound US-101 is closed to all traffic, in order to prevent off-ramp traffic

from conflicting with the one-way westbound post-event traffic on Harney Way. Additionally, all traffic using the Candlestick Park exit from southbound US-101 is forced to proceed westbound on Beatty Avenue in order to prevent this traffic from having to make a U-turn if it were to proceed eastbound on Alana Way. Once the post-event traffic dies down, the roadways revert to the normal two-way operation.

Traffic Operations

Pre-Game Conditions: For a typical Sunday football game starting at 1:00 PM, vehicle arrival is spread over about six hours with approximately 40 percent of the vehicles arriving between one and two hours prior to the game start time, and 60 percent within the other five hours prior to the game. Since the arrival is spread out over a period of time, the game-related traffic does not substantially affect traffic flow on the study area freeways. During a recent Sunday football game, some localized congestion was observed at US-101 northbound upstream of the Harney Way exit, as vehicles queued up from Harney Way and on US-101 southbound upstream of the Alana/Beatty exit. The vehicles accessing the stadium from Third Street contribute to congestion and queues on the local residential streets, including Third Street, Gilman Avenue, Carroll Avenue and Jamestown Avenue. In September 2009, a pedestrian bridge was installed on Hunters Point Expressway at the location of the pedestrian crossing to the State Park parking lots. Since installation of the pedestrian bridge, pre-game traffic conditions improved.

During pre-game conditions, San Francisco Police Department (SFPD) officers, Parking Control Officers (PCOs), and California Highway Patrol (CHP) officers are posted on roadways leading to the stadium, in particular Harney Way, Hunters Point Expressway, Ingerson Avenue, and Gilman Avenue. Officer tasks include ensuring smooth traffic flow on the one-way inbound Harney Way, directing vehicles to proceed to downstream gates and off-site parking lots, and towing vehicles that obstruct traffic movement. In addition, they are responsible for providing priority to transit vehicles, ensuring pedestrian safety, and orderly queuing at the gates to the internal parking lot. Approximately 60 officers are posted during a football game.

Post-Game Conditions: Immediately following the end of the game, most spectators attempt to leave the stadium parking facilities, although depending on the game outcome, some patrons leave early to avoid congestion and a portion remain for tailgate parties. Players, press, administrative staff, and employees generally remain on site longer than spectators. Typical clearance times for each of the egress routes following a sell-out football game vary; however, congestion and queues in the vicinity of the stadium generally clear up approximately one and a half to two hours following the end of the game.

During post-game conditions, Harney Way is converted to one-way outbound operation, with two lanes merging to one onto the northbound on-ramp and two lanes continuing onto Alana Way to access the southbound on-ramp and Beatty Avenue. To facilitate flow onto the on-ramps, the US-101 northbound off-ramp is closed at Harney Way, and the allowable movements at the southbound off-ramp are restricted to westbound through onto Beatty Avenue. During post-game conditions, the southbound on-ramp is metered via a ramp-metering signal to ensure stable traffic conditions on freeway mainline. Travel lanes on the mainline are also closed to increase the capacity of the on-ramp during post-game conditions. Field observations during recent games indicated that there is some localized congestion on US-101 southbound upstream of and at the ramp merge influence area. Caltrans uses Variable Message Signs (VMS) on southbound US-101 and southbound I-280 upstream of the on-ramp to direct through traffic to southbound I-280 instead of southbound US-101 during post-game conditions.

On US-101 northbound, stadium traffic generally does not have difficulty merging with the freeway mainline traffic, as northbound US-101 traffic volumes approaching Harney Way are generally lower than the southbound volumes. However, as stadium traffic merges with I-80 eastbound traffic leaving downtown San Francisco, congestion and queues extend upstream from the Bay Bridge to the US-101/I-280 merge. This congestion persists long after all congestion and queues dissipate in the vicinity of Candlestick Point.

The surge of vehicles exiting the parking facilities results in queues on the internal roadways and at access roads to Third Street and the on-ramps to US-101. The queues on Jamestown Avenue, Gilman Avenue, and Carroll Avenue are mainly constrained by the capacity of the intersections of the respective street at Third Street. The traffic signals on Third Street are timed to prioritize transit movements along Third Street, including the T-Third light rail, which results in limited capacity for cross-traffic.

During post-game conditions, the San Francisco Police Department officers, PCOs and CHP officers ensure that traffic exits the stadium parking facilities in an orderly fashion and that vehicles access the regional routes as quickly as possible. Responsibilities of the officers include waving vehicles through STOP signs and ensuring that Ingerson Avenue is used by buses, taxis, and emergency vehicles. A CHP officer is posted at the intersection of Alana/Beatty to wave vehicles through the STOP sign and onto the US-101 southbound on-ramp. However, many vehicles come to a full stop prior to processing through the intersection.

Transit Services

Muni and Tri-Delta Transit and numerous private charter bus operators provide game day special services to Candlestick Park. BART, AC Transit, and Caltrain do not provide any special game day services. The San Mateo County Transit District (SamTrans), Golden Gate Transit, and the Santa Clara Valley Transportation Authority (VTA) have historically provided transit service to Candlestick Park; however, they have recently stopped providing this service, which will instead be provided by private charter companies.

Muni: On game days, Muni offers express services 75X, 77X, 78X, and 79X to and from the stadium. Line 75X provides express, non-stop shuttle service between Candlestick Park and the Balboa Park BART Station (via Geneva Avenue and Bayshore Boulevard). Line 77X provides express service from the Van Ness corridor, with service between the intersection of California/Van Ness and Candlestick Park (via Van Ness Avenue, South Van Ness Avenue, Mission Street and US-101). Line 78X provides express service along the Park Presidio/19th corridor, from the Funston/California intersection (via Park Presidio, 19th Avenue, Junipero Serra Boulevard, Ocean Avenue, Geneva Avenue, and Bayshore Boulevard). Line 79X provides express service from downtown, with service between Candlestick Park and the Sutter/Montgomery intersection (via Stockton Street, Fourth Street, Folsom Street, and U.S 101). The service starts about three hours prior to the beginning of the football game, and operates at headways of approximately 7 to 10 minutes.

Muni also operates special shuttle services from the Bacon/San Bruno intersection (86-Stadium Shuttle) and from the Gilman/Paul T-Third station (87-Stadium Shuttle). The shuttle service begins about four hours before the game and operates at approximately 5 to 10 minute headways. Approximately 6,500 spectators currently use the special Muni bus services to the stadium.

Tri-Delta Transit: Tri-Delta Transit provides one special game day bus to Candlestick Park from eastern Contra Costa County, with stops in Brentwood, Antioch, and Pittsburg. Tickets may be purchased in advance, or on the bus on the day of the games.

Neither AC Transit nor BART provide special game day service. AC Transit riders can take AC Transit to the San Francisco Transbay Terminal, walk to the intersection of Sutter/Montgomery intersection and transfer to the Muni 9X-Bayshore Express to the stadium. BART riders from East Bay need to take BART to the Montgomery Station and transfer to the Muni 79X-Bayshore Express to the stadium. BART riders from San Mateo County need to take BART to the Balboa Park station and transfer to Muni Line 78X-Candlestick Express at Geneva Avenue.

Charter Buses: A substantial number of spectators using transit come by private charter buses. Various groups charter buses from private companies including Frontier Tour Charter Bus, Evans, Pro Trav Charter, and Sierra Pacific Tours. According to the San Francisco 49ers, approximately 3,000 spectators currently arrive and leave by private charter bus. In addition, private charter service from Santa Clara, San Mateo, Marin, and Sonoma counties will be initiated this season, replacing service previously provided by the VTA, SamTrans, and Golden Gate Transit, respectively. Routes and service are expected to be similar to that previously provided by those operators.

Bus Access and Parking: Buses from the north generally access the stadium by way of Ingerson or Jamestown Avenue, using the Third Street or Paul Avenue exits from US-101 southbound. Buses from the south access the stadium using the Third Street exit. Ingerson Avenue between Third Street and Giants Drive is exclusively used by buses, taxis, and emergency vehicles during pre- and post-game periods.

Southbound buses leaving the stadium generally use westbound Ingerson Avenue to southbound Third Street and take the southbound US-101 on-ramp at Bayshore/Third. Northbound buses use northbound US-101 via the on-ramp at Bayshore/Third. The special Muni shuttle to San Bruno/Bacon turns from Ingerson Avenue onto Third Street northbound, and left at Gilman/Paul. In general, buses operate inbound on Jamestown Avenue during the pre-game period and outbound on Ingerson Avenue during the post-game period.

Muni buses load and unload passengers along the drop-off roadway (Giants Drive) north of Jamestown Avenue. Other buses (including charters) load and unload in the main parking lot. Muni buses park free along the drop-off roadway (Giants Drive) parallel to Jamestown Avenue. All other buses park in the main parking lot. The buses in the main lot are parked end-to-end. As a result, some fully loaded buses after the game are delayed until the bus parked in front of them leaves.

Pedestrian Circulation

The number of pedestrians in the vicinity of the stadium is highest during post-game conditions with spectators exiting the stadium at once. The primary pedestrian flows are towards the internal and off-site parking areas east of the stadium, and towards the parking areas along Harney Way and Little Hollywood/Tunnel Avenue, and to the off-site lot along Jamestown Avenue and T-Third line on Third Street.

The two pedestrian overcrossings, one crossing Jamestown at Harney Way, and one crossing the drop-off loop (connecting with Jamestown Avenue approximately 350 feet north of Harney Way), are too narrow

to accommodate the surge of pedestrians leaving the stadium. Queues form at the approaches to the pedestrian overcrossings, particularly at Jamestown/Harney. This crossing has fences on either side of the sidewalk to channelize pedestrians and to prevent pedestrians from crossing Jamestown Avenue or Harney Way at-grade.

East of the stadium, pedestrian flows generally spread out throughout the internal lot, and cross Hunters Point Expressway at-grade along the roadway. These uncontrolled crossings often result in conflicts between pedestrians and vehicles, and police occasionally control these crossings. In September 2009, a pedestrian bridge was installed on Hunters Point Expressway at the location of the at-grade pedestrian crossing to the State Park parking lots.

Parking Conditions

Game day parking demand for 49er games at the existing stadium is accommodated within off-street surface parking lots and on-street parking adjacent to the neighborhood and to the west in the Little Hollywood neighborhood. Game day parking demand varies depending on attendance levels, and maximum demand occurs during sell-out games.

Parking for 49er games is provided within stadium parking lots, on state park land, and in satellite parking lots. A total of 18,880 off-street parking spaces are provided for a typical 49ers game, generally at a fee of $30 per auto. Approximately 48 percent of the off-street parking spaces are in the stadium parking lot (9,110 spaces for autos, buses, recreational vehicles, limousines, press and players), 23 percent are located in state park land lots (5,470 spaces), and 29 percent are located in satellite parking lots (4,300 spaces). In addition to the satellite parking lots, there are a number of parking spaces in private lots that are generally restricted for use by residents, customers, employees of private businesses, or public agencies; however, some of the spaces are made available to the public on football game days. The 49ers estimate that up to 3,000 spaces are available on private land for game day parking.

In addition to the off-street parking, nearby on-street parking is heavily used by football fans, particularly in the Little Hollywood neighborhood across from the stadium. During game day parking surveys, within the area bounded by US-101, Bayshore Boulevard and the County line, all on-street parking spaces were occupied (compared with 60 percent on a non-football Sunday), resulting in an inconvenience for residents. In the area northwest of the stadium, bounded by Third Street, Jamestown Avenue, Giants Drive/Arelious Walker Drive, and Carroll Avenue, on-street parking is about 86 percent occupied, compared to about 70 percent on a non-game Sunday; the increased occupancy rate is primarily due to reduced parking supply caused by game day parking prohibitions.

In general, many football spectators arrive up to five hours before kickoff to prepare and eat food and drink beverages near their vehicles in the parking lots. These "tailgate" parties take place in the car and RV parking lots. Based on previously collected information on stadium parking accumulation, on a typical game day, up to 40 percent of vehicles arrive between one and two hours prior to kickoff.

During game days, parking restrictions are implemented to increase traffic capacity in and out of the facility and to reduce congestion. On game days parking is prohibited between 10:00 A.M. and 6:00 P.M. on one or both sides of the following streets: Carroll Avenue, Gilman Avenue, Ingerson Avenue, Jamestown Avenue, Paul Avenue, and Third Street.

III.D.3 Regulatory Framework

This section provides a summary of the plans and policies of the City and County of San Francisco, and regional, state, and federal agencies that have policy and regulatory control over the Project site. These plans and policies include the San Francisco General Plan, the Better Streets Plan, the San Francisco Bicycle Plan, the San Francisco Bay Trail Plan, and the Transit First Policy.

Federal

There are no federal transportation regulations applicable to the Project.

State

The San Francisco Bay Plan was prepared by the San Francisco Bay Conservation and Development Commission (BCDC) pursuant to the McAteer-Petris Act of 1965 which established the Commission as a temporary agency to prepare an enforceable plan to guide the future protection and use of San Francisco Bay and its shoreline. The Bay Plan contains the following transportation policies that are relevant to the Project:

- Transportation Policy 1: Because of the continuing vulnerability of the Bay to filling for transportation projects, the Commission should continue to take an active role in Bay Area regional transportation and related land use planning affecting the Bay, particularly to encourage alternative methods of transportation and land use planning efforts that support transit and that do not require fill. The Metropolitan Transportation Commission, the California Department of Transportation, the California Transportation Commission, the Federal Highway Administration, county congestion management agencies and other public and private transportation authorities should avoid planning or funding roads that would require fill in the Bay and certain waterways.
- Transportation Policy 2: If any additional bridge is proposed across the Bay, adequate research and testing should determine whether feasible alternative route, transportation mode or operational improvement could overcome the particular congestion problem without placing an additional route in the Bay and, if not, whether a tunnel beneath the Bay is a feasible alternative.
- Transportation Policy 3: If a route must be located across the Bay or a certain waterway, the following provisions should apply:
    a. The crossing should be placed on a bridge or in a tunnel, not on solid fill.
    b. Bridges should provide adequate clearance for vessels that normally navigate the waterway beneath the bridge.
    c. Toll plazas, service yards, or similar facilities should not be located on new fill and should be located far enough from the Bay shoreline to provide adequate space for maximum feasible public access along the shoreline.
    d. To reduce the need for future Bay crossings, any new Bay crossing should be designed to move the largest number of travelers possible by employing technology and operations that increase the efficiency and capacity of the infrastructure, accommodating non-motorized transportation and, where feasible, providing public transit facilities.
- Transportation Policy 4: Transportation projects on the Bay shoreline and bridges over the Bay or certain waterways should include pedestrian and bicycle paths that will either be a part of the Bay Trail or connect the Bay Trail with other regional and community trails. Transportation projects should be designed to maintain and enhance visual and physical access to the Bay and along the Bay shoreline.

- Transportation Policy 5: Ferry terminals should be sited at locations that are near navigable channels, would not rapidly fill with sediment and would not significantly impact tidal marshes, tidal flats or other valuable wildlife habitat. Wherever possible, terminals should be located near higher density, mixed-use development served by public transit. Terminal parking facilities should be set back from the shoreline to allow for public access and enjoyment of the Bay.

Regional

There are no regional transportation regulations applicable to the Project.

Local

San Francisco General Plan

The Transportation Element of the San Francisco General Plan is composed of objectives and policies that relate to the nine aspects of the citywide transportation system: General Regional Transportation, Congestion Management, Vehicle Circulation, Transit, Pedestrian, Bicycles, Citywide Parking, and Goods Management. The Transportation Element contains the following objectives and policies that are directly pertinent to consideration of the Project:

- Use the transportation system as a means for guiding development and improving the environment. (Transportation Element Objective 2)
- Use rapid transit and other transportation improvements in the city and region as the catalyst for desirable development, and coordinate new facilities with public and private development. (Transportation Element Objective 2, Policy 2.1)
- Organize the transportation system to reinforce community identity, improve linkages among interrelated activities, and provide focus for community activities. (Transportation Element Objective 2, Policy 2.4)
- Improve bicycle access to San Francisco from all outlying corridors. (Transportation Element Objective 9)
- Where Bicycles are prohibited on roadway segments, provide parallel routes accessible to bicycles or shuttle services that transport bicycles. (Transportation Element Objective 9, Policy 9.2)
- Establish public transit as the primary mode of transportation in San Francisco and as a means through which to guide future development and improve regional mobility and air quality. (Transportation Objective 11)
- Develop and implement a plan for operational changes and land use policies that will maintain mobility and safety, despite a rise in travel demand that could otherwise result in system capacity deficiencies. (Transportation Element Objective 14)
- Ensure that traffic signals are timed and phased to emphasize transit, pedestrian, and bicycle traffic as part of a balanced multimodal transportation system. (Transportation Element Objective, 14, Policy 14.2)
- Improve transit operation by implementing strategies that facilitate and prioritize transit vehicle movement and loading. (Transportation Element Objective 14, 14.3)
- Reduce congestion by encouraging alternatives to the single-occupancy auto through the reservation of right-of-way and enhancement of other facilities dedicated to multiple modes of transportation. (Transportation Element Objective 14, Policy 14.4)

- Encourage the use of transit and other alternative modes of travel to the private automobile through the positioning of building entrances and the convenient location of support facilities that prioritizes access from these modes. (Transportation Element Objective 14, Policy 14.7)
- Establish a street hierarchy system in which the function and design of each street are consistent with the character and use of the adjacent land. (Transportation Element Objective 18)
- Design streets for a level of traffic that serves, but will not cause a detrimental impact on, adjacent land uses or eliminate the efficient and safe movement of transit vehicles and bicycles. (Transportation Element Objective 18, Policy 18.2)
- Discourage high-speed through traffic on local streets in residential areas through traffic "calming" measures that are designated not to disrupt transit service or bicycle movement…" (Transportation Element Objective 18, Policy 18.4)
- Improve the city's pedestrian circulation system to provide for efficient, pleasant, and safe movement. (Transportation Element Objective 23)
- Widen sidewalks where intensive commercial, recreational, or institutional activity is present and where residential densities are high. (Transportation Element Objective 23, Policy 23.2)
- Maintain a strong presumption against reducing sidewalk widths, eliminating crosswalks, and forcing indirect crossings to accommodate automobile traffic. (Transportation Element Objective 23, Policy 23.3)
- Ensure convenient and safe pedestrian crossings by minimizing the distance pedestrians must walk to cross a street. (Transportation Element Objective 23, Policy 23.6)
- Improve the ambiance of the pedestrian environment. (Transportation Element Objective 24)
- Provide secure and convenient parking facilities for bicycles. (Transportation Element Objective 28)
- Provide secure bicycle parking in new governmental, commercial, and residential developments. (Transportation Element Objective 28.1)
- Provide parking facilities which are safe, secure, and convenient. (Transportation Element Objective 28, Policy 28.3)
- Relate the amount of parking in residential areas and neighborhood commercial districts to the capacity of the city's street system and land use patterns. (Transportation Element Objective 34)
- Regulate off-street parking in new housing so as to guarantee needed spaces without requiring excesses and to encourage low auto ownership in neighborhoods that are well served by transit and are convenient to neighborhood shopping. (Transportation Element Objective 34, Policy 34.1)
- Permit minimal or reduced off-street parking for new buildings in residential and commercial areas adjacent to transit centers and along transit preferential street. (Transportation Element Objective 34, 34.3)
- Meet short-term parking needs in neighborhood shopping districts consistent with preservation of a desirable environment for pedestrians and residents. (Transportation Element Objective 35)
- Provide convenient on-street parking specifically designed to meet the needs of shoppers dependent upon automobiles. (Transportation Element Objective 35, 35.1)
- Assure that new neighborhood shopping district parking facilities and other auto-oriented uses meet established guidelines. (Transportation Element Objective 35.2)
- Make freeway and major surface street improvements to accommodate and encourage truck/service vehicles in industrial areas away from residential neighborhoods. (Transportation Element Objective 39)

The Project site is relatively isolated from the rest of the City, and the surrounding topography of the hills and the Yosemite Slough create a context with limited connections to the broader transportation network. Existing pedestrian volumes and bicycle activity in the Project vicinity are low throughout the day. Consistent with the objectives and policies of the General Plan, key goals of the Project are to prioritize walking, bicycling and transit travel, making these attractive and practical transportation options. The land use program and transportation program developed for the Project consists of strategies to contain as many trips as possible within Candlestick Point and Hunters Point Shipyard, and to maximize the usefulness of walking and bicycling, a parking plan designed to discourage the overall usage of private automobiles, increased transit service, and a Transportation Demand Management Plan. The following illustrate a few features of the Project designed to promote pedestrian, bicycle, and transit travel.

- The development pattern is designed to facilitate walking and cycling for internal trips, and bus service for trips elsewhere.
- Streets are designed to support a variety of travel modes at moderate to low speeds, and are arranged in a pedestrian-oriented grid of small blocks.
- All of the homes within each community are within a 15-minute walk of a transit stop, where frequent service would be available.
- New and improved transit service would be provided to the Project site.

Better Streets Plan

The *Better Streets Plan* (draft June 2008) focuses on creating a positive pedestrian environment through measures such as careful streetscape design and traffic calming measures to increase pedestrian safety. The Project roadway cross-sections were designed to safely accommodate multi-modal transportation within the Project site, and include roadway and streetscape improvements on roadways outside of the Project site. Particular attention was paid to designing improvements that would support safe and smooth interaction between pedestrians, automobiles, and bicycles. The Project's street layout and roadway cross-sections are consistent with the *Better Streets Plan,* except in few locations where unique right-of-way constraints have placed severe constraints that limit wider sidewalks, such as along steep hillsides or the Bay shoreline.

San Francisco Bicycle Plan

The *San Francisco Bicycle Plan* describes a City program to provide the safe and attractive environment needed to promote bicycling as a transportation mode. The certification of the *San Francisco Bicycle Plan Final EIR* was affirmed by the Board of Supervisors in August 2009. The San Francisco Bicycle Plan identifies near-term improvements that could be implemented within the next five years, as well as policy goals, objectives and actions to support these improvements. It also includes long-term improvements, and minor improvements that would be implemented to facilitate bicycling in San Francisco. When the injunction to stop implementation of the *San Francisco Bicycle Plan* improvements that was issued on June 2006 by the Superior Court of California is lifted, implementation of near-term improvements would be contracted. The *San Francisco Bicycle Plan* includes five near-term and five long-term projects within the study area. Project improvements on Innes Avenue would overlap with Bicycle Plan Project 4-4: Innes Avenue Bicycle Lanes, however, Project improvements would be consistent with the Bicycle Plan.

San Francisco Bay Trail Plan

Refer to Section III.B (Land Use and Plans) regarding a description of the San Francisco Bay Plan and its application to the Project. The following information about the San Francisco Bay Plan is related to the Transportation analysis.

The 2005 Gap Analysis Study prepared by ABAG, for the entire Bay Trail area, attempted to identify the remaining gaps in the Bay Trail system, classify the gaps by phase, county and benefit ranking, develop cost estimates for individual gap completion, identify strategies and actions to overcome gaps, and present an overall cost and timeframe for completion of the Bay Trail system. Within the Project site, the 2005 Gap Analysis Study proposes to connect existing Bay Trail segments that are located north and south of the Project site by extending the trail along the waterfront of the Candlestick Point Recreation Area and through the Project site along HPS. The proposed trail would then connect to the existing trail north of the Project site along the India Basin shoreline.

The Gap Analysis Study also proposes an alternate, inland connection that is partially within the Project site, with the proposed trail traveling east along Gilman Avenue with the Project site, continuing north along Third Street that would ultimately connect to the existing waterfront portion of the trail near the India Basin via Yosemite Avenue/Carroll Avenue and Cargo Way.[112]

The Project would include the construction of the Bay Trail throughout the Project site, and support the proposed waterfront trail connection route within the Gap Analysis Study area, whereby the existing trail south of the Project site would ultimately connect to the existing northern trail along the India Basin shoreline. The Bay Trail would be accessible for pedestrians and bicyclists with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/US-101 interchange, through the CPSRA, Yosemite Slough, and HPS Phase II shoreline to India Basin. Refer to Figure III.B-3 (San Francisco Bay Trail Plan).

Transit First Policy

In 1998, the San Francisco voters amended the City Charter (section 16.102) to include a Transit-First Policy. The Transit-First Policy is a set of principles which underscore the City's commitment that travel by transit, bicycle, and one foot be given priority over the private automobile. These principles are embodied in the policies and objectives of the Transportation Element. All City boards, commissions, and departments are required, by law, to implement transit-first principles in concluding City affairs.

The proposed Project has been formulated to implement the City's Transit-First Policy by encouraging development that promotes use of public transit. Specifically, the Project's Transit Plan includes significant improvements to transit service in the Hunters Point Shipyard, Candlestick Point, and Bayview Hunters Point neighborhoods. Improvements include route extensions, increased frequencies on existing lines, extensions of proposed BRT service into the site, and new downtown express bus service. Furthermore, the development program and street grid is designed to encourage and facilitate walking to nearby transit stops.

[112] ABAG, *Gap Analysis Study: A Report on Closing the Gaps in the 500-mile Regional Trail System Encircling San Francisco Bay*, 2005. http://www.abag.ca.gov/bayarea/baytrail/gap-analysis.html (accessed online August 2, 2009).

III.D.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to transportation, but generally consider that implementation of the Project would have significant impacts on these resources if it were to:

D.a Cause an increase in traffic that is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume-to-capacity ratio on roads, or congestion at intersections)

D.b Exceed, either individually or cumulatively, an LOS standard established by the county congestion management agency for designated roads or highways (unless it is practical to achieve the standard through increased use of alternative transportation modes)

D.c Result in a change in air traffic patterns, including either an increase in traffic levels, obstructions to flight, or a change in location, that causes substantial safety risks

D.d Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses

D.e Result in inadequate parking capacity that could not be accommodated by alternative solutions

D.f Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., conflict with policies promoting bus turnouts, bicycle racks, etc.), or cause a substantial increase in transit demand that cannot be accommodated by existing or proposed transit capacity or alternative travel modes

The transportation and circulation impact findings herein are also based on the following significance criteria used by the San Francisco Planning Department for the determination of impacts associated with a proposed project:[113]

D.g Traffic—In San Francisco, the threshold for a significant adverse impact on traffic has been established as deterioration in the LOS at a signalized intersection from LOS D or better to LOS E or LOS F, or from LOS E to LOS F. The operational impacts on unsignalized intersections are considered potentially significant if project-related traffic causes the level of service at the worst approach to deteriorate from LOS D or better to LOS E or LOS F and Caltrans signal warrants would be met, or causes Caltrans signal warrants to be met when the worst approach is already at LOS E or LOS F.

For an intersection that operates at LOS E or LOS F under existing conditions, there may be a significant adverse impact depending upon the magnitude of the project's contribution to the worsening of delay. In addition, a project would have a significant adverse effect if it would cause major traffic hazards, or would contribute considerably to the cumulative traffic increases that would cause the deterioration in LOS to unacceptable levels (i.e., to LOS E or LOS F).

The operational impacts on freeway mainline segments and freeway on-ramp merge and off-ramp diverge operations are considered significant when project-related traffic causes the level of service to deteriorate from LOS D or better to LOS E or LOS F, or from LOS E to LOS F. In

[113] Five of the study intersections are in the City of Brisbane. The level of service standard for all arterial streets within the City of Brisbane is LOS D, except for the intersections on Bayshore Boulevard at Old County Road and San Bruno Avenue, which shall not be less than LOS C.

addition, a project would have a significant effect on the environment if it would contribute substantially to congestion at unacceptable levels.

D.h Parking—Parking supply is not considered to be a part of the permanent physical environment in San Francisco.[114] Parking conditions are not static, as parking supply and demand varies day to night, day-to-day, month-to-month, etc. Hence, the availability of parking spaces (or lack thereof) is not a permanent physical condition, but changes over time as people change their modes and patterns of travel.

Parking deficits are considered to be social effects, rather than impacts on the physical environment as defined by CEQA. Under CEQA, a project's social impacts need not be treated as significant impacts on the environment. Environmental documents should, however, address the secondary physical impacts that could be triggered by a social impact (CEQA Guidelines § 15131(a)). The social inconvenience of parking deficits, such as having to hunt for scarce parking spaces, is not an environmental impact, but there may be secondary physical environmental impacts, such as increased traffic congestion at intersections, air quality impacts, safety impacts, or noise impacts caused by congestion. The absence of a ready supply of parking spaces, combined with available alternatives to auto travel (e.g., transit service, taxis, bicycles or travel by foot) and a relatively dense pattern of urban development, may induce many drivers to seek and find alternative parking facilities, shift to other modes of travel, or change their overall travel habits. Any such resulting shifts to transit service in particular, would be in keeping with the City's "Transit First" policy. The City's Transit First Policy, established in the City's Charter Section 16.102 provides that "parking policies for areas well served by public transit shall be designed to encourage travel by public transportation and alternative transportation."

The transportation analysis accounts for potential secondary effects, such as cars circling and looking for a parking space in areas of limited parking supply, by assuming that all drivers would attempt to find parking at or near the project site and then seek parking farther away if convenient parking is unavailable.

D.i Transit—The project would have a significant effect on the environment if it would cause a substantial increase in transit demand that could not be accommodated by adjacent transit capacity, resulting in unacceptable levels of transit service; or cause a substantial increase in operating costs or delays such that significant adverse impacts in transit service levels could result.

The project would also have a significant effect on the environment if it would increase transit travel times on a particular route such that existing (or proposed) headways could not be maintained based on the existing (or proposed) vehicle fleet.

D.j Pedestrians—The project would have a significant effect on the environment if it would result in substantial overcrowding on public sidewalks, create potentially hazardous conditions for pedestrians, or otherwise interfere with pedestrian accessibility to the site and adjoining areas.

D.k Bicycles—The project would have a significant effect on the environment if it would create potentially hazardous conditions for bicyclists or otherwise substantially interfere with bicycle accessibility to the site and adjoining areas.

D.l Loading—The project would have a significant effect on the environment if it would result in a loading demand during the peak hour of loading activities that could not be accommodated within the proposed on-site loading facilities or within convenient on-street loading zones, and if it

[114] Under California *Public Resources Code*, Section 21060.5, "environment" can be defined as "the physical conditions which exist within the area which will be affected by a Project, including land, air, water, minerals, flora, fauna, noise, and objects of historic or aesthetic significance."

would create potentially hazardous traffic conditions or significant delays affecting traffic, transit, bicycles or pedestrians.

D.m Emergency Vehicle Access—The project would have a significant impact on the environment if it would result in inadequate emergency vehicle access.

D.n Construction—Construction-related impacts generally would not be considered significant due to their temporary and limited duration. However, in circumstances involving large development plans where construction would occur over long periods of time, construction-related impacts may be considered significant.

Analytic Method

This section presents the methodology for developing No Project and Project conditions, and information considered in the travel demand and impact analysis. Specifically, in the following order:

1. Approach to impact analysis, including analysis year and comparison to No Project conditions;
2. Future 2030 baseline transportation improvements assumed for the analysis of both 2030 No Project and Project conditions;
3. Methodology for development of future year 2030 No Project conditions traffic forecasts;
4. Transportation improvements proposed as part of the Project and assumed to be completed, and were included in assessment of travel demand and impact analysis;
5. Methodology and results of the Project travel demand forecasts for the development program, and separately for events at the stadium and arena;
6. Methodology for assessing impact of traffic volume increases on transit travel times; and
7. Methodology for transit capacity utilization analysis.

1. Analysis Approach

The analysis of the Project was conducted for future year 2030 conditions. Year 2030 was selected as the future analysis year, since the San Francisco County Transportation Authority (SFCTA) travel demand model (SF-CHAMP) used in the analysis develops traffic and transit forecasts for cumulative development and growth through the year 2030. Often, analyses examine "Existing plus Project" and "Long-Term Future plus Project" conditions to assess the near- and long-term impacts of a project. However, because Project buildout is expected to occur over almost 20 years, a near-term plus project scenario would not materialize, and therefore, was not analyzed. In addition, the Project impact analysis was conducted for 2030 conditions, rather than existing conditions, to account for the substantial roadway and transit network and development changes associated with the Project that would occur over a period of about 20 years (Project construction initiated in 2011 and completed by 2029), and to account for the major changes to the area that are projected to occur. The Project impact analysis therefore represents a cumulative growth scenario for the year 2030 for non-Project generated growth and transportation network improvements accounted for in the No Project conditions, and includes growth from development that would occur with implementation of the Project.

Project impacts were assessed by comparing future year 2030 conditions with the Project ("Project") to 2030 No Project conditions ("2030 No Project"). The 2030 No Project condition includes development within Hunters Point Shipyard associated with approved Phase I, as well as buildout of the existing Hunters Point Shipyard Redevelopment Plan, which would be replaced by the Project. However, for purposes of defining and assessing effectiveness of proposed mitigation measures, the total effect of the Project was

considered (i.e., total vehicle, transit, bicycle and pedestrian trips generated by the Project were considered, not just the increase from the 2030 No Project condition which assumes development within the Hunters Point Shipyard component of the Project). Further, for purposes of determining the Project's contribution to cumulative impacts, the total Project effect was considered.

The Project was determined to have a significant traffic impact at an intersection if Project-generated trips would cause an intersection operating at LOS D or better under 2030 No Project conditions to operate at LOS E or LOS F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions. At intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the increase in Project vehicle trips were reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F.

For freeway mainline and ramp analyses, locations where the Project would result in a change from LOS D or better under 2030 No Project conditions to LOS E or LOS F, or from LOS E or LOS F, with the Project are identified as Project impacts. At locations that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the Project trips, as a percentage of total traffic volumes on the facility were reviewed to determine whether the increase would contribute considerably to total volumes on the facility.

The Project was determined to have a significant impact if it would increase transit travel times such that additional transit vehicles would be required to maintain the proposed headways. This was assumed to be the case if either the Project's travel time increases to a particular route would be greater than ½ its proposed headway or if the number of required vehicles estimated using SFMTA's cost/scheduling model, which takes into account scheduled breaks and extra time built into schedules, increases by one or more vehicles with the addition of the Project characteristics. The Project would have a significant contribution to a cumulative impact if it was determined to have a significant Project impact. In a few circumstances, although no Project impact was identified, the Project contribution to the cumulative scenario was determined to be considerable when a transit line travels through intersections that would operate at LOS E or LOS F due to Project traffic.

The calculations that were used to determine the Project's contribution to cumulative impacts are contained in the appendices to the Transportation Study.

2. Future 2030 Baseline Transportation Improvements

In addition to improvements proposed by the Project, the analysis assumes completion of certain planned and reasonably foreseeable roadway and transit improvements in the Project vicinity that, although not part of the Project, could affect circulation. These improvements would be completed by the City and County of San Francisco directly or through development approvals.

Roadway Improvements

These improvements were identified as mitigation measures in the EIRs prepared for the Bayview Hunters Point Redevelopment Plan and the Visitacion Valley Redevelopment Plan, and implementation will be assured through conditions of approval placed on the development projects by the Planning Department and the San Francisco Redevelopment Agency.

- **Bayshore/Paul**—At this signalized intersection, as part of the Bayview Hunters Point Redevelopment Plan the signal will be changed from northbound and southbound Bayshore Boulevard operating with permitted left turns (left turns yield to oncoming traffic), to protected left turn movements with an exclusive signal phase.
- **Bayshore/Tunnel**—At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal-timing plan, to redistribute green time from the southbound left turn movement to the northbound/southbound through movements.
- **Bayshore/Arleta/San Bruno**—At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal-timing plan, to redistribute green time from the northbound left turn movement to the southbound through movement.
- **Bayshore/Leland**—At this signalized intersection, the Visitacion Valley Redevelopment Plan calls for improvements to the signal-timing plan, to redistribute green time from the northbound left turn movement to the northbound/southbound through movements. As part of this improvement, the westbound approach will be restriped to provide two travel lanes: a left-through lane and an exclusive right-turn lane.
- **Bayshore/Visitacion**—The Visitacion Valley Redevelopment Plan calls for reconfiguration of this signalized intersection to extend the southbound left turn pocket by 80 feet. As part of this improvement, the west-side Bayshore/Leland Muni bus stop would be relocated to the south of Leland Avenue.
- **Bayshore/Sunnydale**—The Visitacion Valley Redevelopment Plan calls for reconfiguration of this signalized intersection to extend the southbound left turn pocket by 100 feet. In addition, the Plan calls for improvements to the signal timing plan, to redistribute green time from the northbound/southbound left turn movements to the eastbound/westbound through movements. The westbound and eastbound approaches will be restriped to provide two travel lanes: a shared left-through lane and an exclusive right-turn lane.
- **Tunnel/Blanken**—The Visitacion Valley Redevelopment Plan calls for reconfiguration of this intersection to eliminate the all-way STOP-sign controls and install new traffic signal poles, masts and signal heads. In addition, the approaches to the intersection would be restriped to provide for two travel lanes for each approach.
- **Bayshore/Blanken**—At this signalized intersection, the Visitacion Valley Plan calls for restriping of the westbound approach of Blanken Avenue at Bayshore Boulevard to two lanes, to provide for an exclusive left-turn lane, and an exclusive right-turn lane.
- **Executive Park Improvements**—The Executive Park Property Owners are also required to make local roadway improvements when warranted by poor operating conditions. These include the following short-term and long-term improvements:
  - > Signalization of Harney Way/Executive Park Boulevard East
  - > Signalization and reconfiguration of Harney Way/Alana Way/Thomas Mellon Drive intersection
  - > Widening of Harney Way by one lane
  - > Signalization of Executive Park Boulevard West/Alana Way and the restriping of the southbound approach from one shared lane to one exclusive left lane and one exclusive right lane
  - > Widening of Alana Way by one lane and two lanes
  - > Signalization of Alana Way/Beatty Road

Two regional roadway improvements were included as part of the future year 2030 No Project and Project analysis. These improvements are currently being designed and analyzed to accommodate the travel demand associated with the areawide projects in both San Francisco and San Mateo counties. Implementation of these improvements would be based on fair-share funding measures through interjurisdictional study and cooperation, such as the ongoing interjurisdictional Bi-County Transportation Study effort led by the SFCTA. Within San Francisco, the Planning Department and the Redevelopment Agency will require project developer fair share contributions to these identified funding needs as a condition of development approval or as a condition of any Owner Participation Agreement. These regional roadway improvements are:

- **Geneva Avenue/Harney Way Extension**—Geneva Avenue, which currently ends at Bayshore Boulevard, would be extended east to meet Harney Way, improving east/west access in the area. The Geneva Avenue Extension would have three eastbound and three westbound travel lanes between Bayshore Boulevard and a new interchange with US-101. Currently, the nearest east/west access road is Blanken Avenue, which is designed as a neighborhood collector roadway and could not accommodate the additional east/west traffic generated by area projects. The lead agency for this Project is the City of Brisbane, with the Caltrans Project Study Report (PSR) expected to be completed in 2010.
- **New US-101 Interchange at Geneva/Harney**—In conjunction with the extension of Geneva Avenue east, the existing Harney Way interchange is proposed to be redesigned as a typical diamond interchange, subject to review and approval by Caltrans. Caltrans and the City of Brisbane are the lead agencies for this project, and a PSR is currently being prepared. Two alternatives are currently being assessed; one with Geneva Avenue/Harney Way crossing under US-101, and one with Geneva Avenue/Harney Way crossing over US-101.

  At the time the analysis was completed, the Geneva Avenue/Harney Way crossing of US-101 was proposed to have six lanes eastbound (three left-turn lanes and three through lanes) and six lanes westbound (three left-turn lanes and three through lanes), for a total of twelve lanes (refer to Appendix L of the Transportation Study). The intersections of the northbound and southbound ramps with Geneva Avenue/Harney Way would be signalized. For both alternatives, a new bypass to the existing northbound Third Street off-ramp would be constructed, with the intention of diverting traffic on the existing off-ramp from the northbound mainline and improving conditions at the weave section where the new proposed northbound on-ramp from Harney Way would join the mainline.

Transit Improvements

SFMTA has proposed changes to several of the lines that would serve the study area as part of its Transit Effectiveness Project (TEP). The TEP is a comprehensive review of Muni operations, with numerous proposals for service and street network changes to address issues related to reliability, travel times, and service areas. Service planning changes are budget-neutral, while additional funding will be required for capital needs (e.g., additional buses). SFMTA will pursue Proposition K funds and federal grants for capital funding. The changes affecting the study area include:

- Eliminating 19-Polk service to the Hunters Point Shipyard.
- Increasing frequency on the 24-Divisadero from 8.5 minutes in the AM peak hour and 10 minutes in the PM peak hour to 7.5 minutes in the AM and PM peak hours.
- Increasing frequency on the 44-O'Shaughnessey to 6 minutes in the PM peak hour.
- Increasing frequency on the 54-Felton from 30 minutes to 20 minutes in the AM and PM peak hours.

- Extending the 48-Quintara-24th Street from its current terminus at 25th Street and Connecticut Street in Potrero Hill into the Hunters Point Shipyard in order to offset the elimination of the 19-Polk service to Hunters Point Shipyard. Frequencies on the 48-Quintara-24th Street would be reduced from 12 minutes to 15 minutes in the AM and PM peak hours.
- Extending the 28L-19th Avenue Limited from its current terminus at the Daly City BART station up to Geneva Avenue, terminating just east of Mission Street. The 28L-19th Avenue Limited would maintain its current 10-minute frequency in the AM and PM peak hours.
- Extending/rerouting the T-Third light rail line north of the station at Fourth and King Streets. Currently the T-Third continues north along The Embarcadero, entering the Market Street subway just north of Folsom Street. As part of the Central Subway project, beginning in approximately year 2016, the T-Third line will continue north on Fourth Street, entering a new subway under Fourth Street just south of Harrison Street. The new terminus will be in Chinatown, below Stockton Street. The Central Subway operating plan calls for single-car trains at 7.5-minute frequencies during peak hours between Chinatown and Bayview, as well as a two-car short-line train between Chinatown and Mariposa Street operating at 7.5-minute frequencies.

While not included in the assumptions for future transit conditions, the objectives of the ongoing Bayshore Intermodal Station Access Study would complement the TEP improvements, as well as Project transit improvements. The SFCTA is conducting the Bayshore Intermodal Station Access Study to develop multi-jurisdictional consensus around a vision and conceptual design for new intermodal transit connections and passenger access to the Bayshore Caltrain Station. Multiple planning processes are proceeding to develop projects that would connect new transit services to the Bayshore Station, including an extension of the T-Third light rail line from its current nearby terminus, the extension of the BRT line to Hunters Point Shipyard, and a new local street connection across Bayshore Boulevard, the Caltrain tracks, and US-101 as a Geneva Avenue extension. The SFCTA is partnering with stakeholder agencies to develop the proposed station connections in a seamless fashion and to promote strong multimodal access to the station. The end result will be a set of conceptual designs for the station and the new connections to serve as a vision that the individual projects will implement as they progress through their planning and preliminary engineering phases.

Bicycle Improvements

The *San Francisco Bicycle Plan*, adopted in June 2009, identifies near-term improvements that could be implemented within the next five years, as well as policy goals, objectives and actions to support these improvements. It also includes long-term improvements, and minor improvements that would be implemented to facilitate bicycling in San Francisco. When the injunction to stop implementation of the Bicycle Plan improvements that was issued on June 2006 by the Superior Court of California is lifted, that implementation of near-term improvements would be contracted. Funds for Bicycle Plan improvements would be available from the State Bicycle Transportation Account and San Francisco Measure C funding. The SFMTA, the San Francisco Recreation and Park Department (SFRDP), the Port of San Francisco (Port), or the San Francisco Department of Public Works (under the direction of SFMTA or SFRPD), would implement improvements, depending on which entity has jurisdiction. The *San Francisco Bicycle Plan* includes six short-term projects within the study area:

- *San Francisco Bicycle Plan* Project 4-2: Cargo Way Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions on Cargo Way between Third Street and Jennings Street. On-street parking on the south side of Cargo Way will be removed, and a Class II left-turn bicycle lane will be

installed on eastbound Cargo Way approaching Illinois Street and Amador Street. Cargo Way is not currently part of the citywide bicycle route network, and is under the jurisdiction of the Port.

- *San Francisco Bicycle Plan* Project 4-3: Illinois Street Bicycle Lanes would involve the installation of Class II bicycle lanes in both directions on Bicycle Route #5 on Illinois Street between 16th Street and Cargo Way. On-street parking on the east side of Illinois Street north of 22nd Street will be removed, and additional on-street parking spaces will be provided on Tennessee Street, 22nd Street, and 24th Street.
- *San Francisco Bicycle Plan* Project 4-4: Innes Avenue Bicycle Lanes will involve the installation of Class II or Class III bicycle facilities in both directions on Bicycle Route #68 on Innes Avenue between Donahue Street and Hunters Point Boulevard. Two options have been identified for this segment and a preferred option was not included in the Bicycle Plan Final EIR: Option 1 would add Class II bicycle lanes in both directions, and remove on-street parking on the south side of Innes Avenue between Hunters Point Boulevard and Earl Street, and on both sides of Innes Street between Earl Street and Donahue Street. Option 2 would be similar to Option 1, except for the segment from Hunters Point Boulevard to Earl Street, where sharrows would be added to the existing Class III bicycle route in both directions. There would be no parking or travel lane removals associated with Option 2 between Hunters Point Boulevard and Earl Street.
- *San Francisco Bicycle Plan* Project 5-4: Bayshore Boulevard Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions of travel along most of Bayshore Boulevard between Cesar Chavez Street and Silver Avenue (Bicycle Route #25). Sharrows would be added in each direction between Cesar Chavez Street and approximately the beginning of the couplet split (i.e., at Jerrold Avenue). On-street parking will be removed on both sides of Bayshore Boulevard from the couplet split to Industrial Street, and one northbound lane will be removed beginning midblock between Helena and Industrial Streets. Sharrows will be added on northbound Bayshore Boulevard to Oakdale Avenue, Loomis Street, Barneveld Avenue, and Jerrold Avenue, and the northbound curbside bicycle lane from Helena Street to Marengo Street will be a shared transit and bicycle lane.
- *San Francisco Bicycle Plan* Project 5-5: Cesar Chavez Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions on Bicycle Route #25 on Cesar Chavez Street between Kansas Street (near US-101) and Mississippi Street (near I-280). To accommodate the bicycle lanes, one of the two eastbound travel lanes will be removed.
- *San Francisco Bicycle Plan* Project 5-13: San Bruno Bicycle Lanes will involve the installation of Class II bicycle lanes in both directions on Bicycle Route #25 on San Bruno Avenue between Silver Avenue and Paul Avenue. To accommodate the bicycle lanes, on-street parking would need to be removed in the segment between Silliman Street and Silver Avenue.

The *San Francisco Bicycle Plan* includes 24 long-term improvements that are proposed to be designed and implemented citywide over time. These improvements would complete the bicycle route network envisioned in the Bicycle Plan, close network gaps, refine and rationalize the bicycle route network, and improve safety and the bicyclist experience. Five long-term improvements have been identified within the study area for further design, environmental review, and possible implementation. With the exception of the Bay Trail improvements which involve construction of a Class I off-street path, and Mendell Street which is currently a plaza, the long-term improvements generally involve implementation of Class II or Class III bicycle facilities. Design of these improvements would occur within the context of the bicycle route network, planned development characteristics, and roadway network configuration at the initiation of the design and review process for each improvement. The five long-term improvements include:

- Long-Term Improvement L-3: Bay Trail Improvements in the vicinity of Hunters Point
- Long-Term Improvement L-4: Bayview Transportation Improvements Project
- Long-Term Improvement L-11: Industrial St between Loomis St and Oakdale Ave
- Long-Term Improvement L-12: Jennings St between Cargo Way and Evans Ave
- Long-Term Improvement L-15: Mendell St between Oakdale Ave and Palou Ave

3. Development of Year 2030 No Project Conditions

Future year 2030 No Project conditions were developed via a two-step process which utilized (1) the SFCTA travel demand model (SF-CHAMP) to determine background transit ridership and traffic growth on study area roadways, and (2) traffic volume overlays to reflect traffic volume turning movements associated with nearby developments that are not fully reflected in the SF-CHAMP model output.

SF-CHAMP Model Growth Projections

Future year 2030 traffic volume forecasts were estimated based on cumulative development and growth identified by SF-CHAMP travel demand model. The SF-CHAMP model is an activity-based travel demand model that has been validated to existing conditions and can be used to forecast future transportation conditions in San Francisco, and is updated regularly. The model predicts person-travel based on assumptions of growth in population, housing units, and employment by mode for auto, transit, walk, and bicycle trips. The SF-CHAMP model also provides forecasts of vehicular traffic on regional freeways, major arterials and on the study area local roadway network considering the available roadway capacity, origin-destination demand and congested travel speeds.

The SF-CHAMP model travel demand estimates incorporate the Association of Bay Area Governments (ABAG) land use and socio-economic database and growth forecasts for the year 2030 (Projections 2007), which provide forecasts of economic and population growth for San Francisco, as well as for the remaining eight Bay Area counties. Within San Francisco, the San Francisco Planning Department is responsible for allocating ABAG's countywide growth forecast to each SFCTA Model Traffic Analysis Zone (TAZ), based upon existing zoning and approved plans, using an area's potential zoning capacity and the anticipated extent of redevelopment of existing uses. The increase in transit and vehicle trips between existing conditions and 2030 No Project conditions was based on a comparison between model output that represents existing conditions and model output for 2030 conditions.

Local Development Traffic and Transit Overlays

In the Project vicinity, several development proposals have recently been approved or are in environmental review. While these projects had been included as part of the growth projections in the SF-CHAMP model, to account for the localized effects of traffic and transit demand, the trip generation associated with those projects was extracted from the SF-CHAMP model output, and replaced by more detailed travel demand estimates used in the environmental review of these projects.

Those projects include the Visitacion Valley Redevelopment program (Visitacion Valley Redevelopment Program Final EIR), Hunters View (227-229 West Point Road EIR), Executive Park Development Plan (conversion of office space to residential, neighborhood serving retail and community space—EIR ongoing), and Brisbane Baylands. The 2030 No Project condition also assumes development within

Hunters Point Shipyard associated with the approved Phase I, buildout of the existing Hunters Point Shipyard Redevelopment Plan, and proposed development within India Basin. Travel demand associated with Hunters Point Shipyard and India Basin development was developed consistent with the methodology described below for the Project conditions. No new development was assumed for Candlestick Point in the 2030 No Project condition, as there are no previously approved plans for the area.

Sunday PM Peak Hour Traffic Forecasts

Since the SF-CHAMP model is a weekday travel demand model, future year Sunday PM peak hour conditions were estimated based on the net growth developed for the weekday PM condition. Weekday PM to Sunday PM conversion factors were developed for each intersection, based on the existing relationship between weekday PM and Sunday PM peak hour, as determined from existing traffic counts.

4. Transportation Improvements Proposed as Part of the Project

Roadway Improvements

The Project would include on-site and external transportation improvements. The internal street network and external roadway improvements were designed to support transit, bicycle and pedestrian circulation, as shown in Figure III.D-6 (Proposed Roadway Improvements). Proposed roadway improvements would include the following:

Harney Way Widening—The existing four-lane Harney Way would be widened to the north and south of its existing alignment, and would be rebuilt to contain between two and three travel lanes in each direction, turn pockets, two BRT-only lanes, Class I and Class II bicycle facilities, new sidewalks, as well as landscaped area. Initially, the roadway would be rebuilt as a new five-lane roadway (with right-of-way reserved for additional lane(s) to be built in the future as needed for increased traffic levels). There would be two lanes in each direction, with eastbound left-turn lanes at Thomas Mellon Circle and Executive Park Boulevard East and a westbound right-turn lane at the Executive Park Boulevard East intersection. Figure III.D-7 (Proposed Harney Way Widening—Initial Configuration) presents the initial phase of Harney Way widening. A Class II bicycle lane would be provided on the north side of the roadway, and a Class I bicycle path would be provided on the south side of the roadway. Two exclusive Bus Rapid Transit (BRT)[115] lanes would be constructed adjacent to the roadway on its north side. They would be separated from the roadway by a six-foot median that would widen to ten feet at the proposed BRT stops to allow for a passenger-loading platform. A BRT stop at the intersection of Harney Way and Thomas Mellon would serve the proposed Executive Park development. Six lanes would be constructed west of Thomas Mellon Drive to connect with the future modifications to the US-101 interchange. The BRT right-of-way has been designed to meet "rail ready" standards for future conversion to light rail, although such conversion is not contemplated in this Project. New traffic signals would be installed at these intersections. After games at the new 49ers stadium, left turns would be prohibited at the two Harney Way intersections with Thomas Mellon Drive and Executive Park Boulevard for a period to allow for the configuration of the roadway to change to four westbound auto lanes and one eastbound auto lane.

[115] Bus Rapid Transit (BRT) is an integrated system of facilities, services, and amenities that collectively improves the speed, reliability, and identity of bus rapid transit. BRT combines stations, vehicles, services, running ways (e.g., curb bus lanes, median busways, mixed-flow lanes), and Intelligent Transportation Systems (ITS) elements into an integrated system.

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.D-7

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED HARNEY WAY WIDENING – INITIAL CONFIGURATION

Under the final configuration, a portion of the landscaped area installed as part of the initial widening would be rebuilt to provide an additional lane from the proposed Harney Interchange east to Arelious Walker Drive, if necessary. Figure III.D-8 (Proposed Harney Way Widening—Ultimate Configuration) presents the final configuration of the Harney Way widening.

New and Improved Roadways—The street network proposed for Hunters Point Shipyard and Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, using typical Bayview block sizes. Within Candlestick Point the extension and completion of the street network would enhance access between the existing neighborhoods and the existing and proposed waterfront park. Within Hunters Point Shipyard, the street grid would be aligned to focus on connections to the waterfront.

Streets would be designed as complete streets consistent with the Better Streets Plan (Draft for Public Review, June 2008) to enable safe access for all users[116]. Proposed techniques would include driveway access management; traffic calming features such as signage and striping, pedestrian bulbouts where feasible at intersections, and refuge islands; streetscape amenities including street furniture, lighting, and plantings; and other features that would facilitate a high-quality pedestrian and bicycle network consistent with San Francisco's "Better Streets" Plan.

The spine of the Project's street network would be a continuous arterial beginning in the northwest of Hunters Point and traveling south to Candlestick Point. The portion of the arterial within Hunters Point would incorporate Innes Avenue, Robinson Street, and Crisp Avenue. The portion of the arterial connecting Hunters Point and Candlestick Point would incorporate a new Underwood Avenue extension and an improved Ingalls Street and Carroll Avenue. The reconfigured Arelious Walker Drive on the western edge of Candlestick Point would connect to an improved Harney Way at the southernmost point of Candlestick Point.

The Hunters Point Shipyard and Candlestick Point arterial streets would function as the primary thoroughfares of the project, with generally perpendicular collector, parkway and park edge streets playing a subordinate role. BRT lanes would be on the north side of Harney Way before diverting through the Candlestick Point site, using the Yosemite Slough bridge to reach Hunters Point Shipyard. Automobiles would not be permitted to use the Yosemite Slough bridge except on game days, and would instead be routed via Carroll Avenue, Ingalls Street, Thomas Avenue, and Griffith Street. The local streets that form the balance of the street network would be Neighborhood Residential streets.

Hunters Point Shipyard would be served by a four-lane roadway extension of Thomas Avenue connecting to Arelious Walker Drive and Crisp Avenue via Griffith Street. Ingalls Street would contain two travel lanes and on-street parking/loading on both sides of the roadway. The existing portion of Thomas Avenue would be converted from a two-lane to a four-lane facility. On Thomas Avenue, parking would be retained on both sides of the roadway. Innes Avenue east of Donahue Street would be reconfigured to provide for two travel lanes in each direction and on-street parking on both sides of the roadway (this segment was recently constructed as part of HPS Phase I and contains one travel lane in each direction).

[116] Complete Streets are designed and operated to enable safe access for all users. Pedestrians, bicyclists, motorists, and transit riders of all ages would be able to safely move along and across a complete street.

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.D-8

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED HARNEY WAY WIDENING – ULTIMATE CONFIGURATION

Game Day Roadway Network—Several roadway lane configurations would be temporarily changed to allow for the efficient ingress and egress of auto traffic to and from the proposed 49ers stadium before and after games. These roadways include Innes Avenue, Robinson Avenue, and Fisher Avenue on the north side of the Hunters Point Shipyard; Crisp Avenue on the southern side of the Hunters Point Shipyard; Griffith Street, Thomas Avenue, and Ingalls Street between the Shipyard and Candlestick Point; and Arelious Walker and Harney Way on Candlestick Point. Additionally, the Yosemite Slough bridge would be opened to vehicular traffic during this period. The bridge would be able to carry four lanes of auto traffic before and after games. In all cases, a travel lane would be dedicated to the "off-peak" travel direction (away from the stadium pre-game and to the stadium post-game) for local traffic and emergency access vehicles. Traffic control officers would be stationed at major intersections.

Streetscape Improvements—Streetscape improvements are planned for several key Bayview Hunters Point roadways: Harney Way and Innes, Palou, Gilman, Ingerson, and Jamestown Avenues. These streets would serve as primary routes for pedestrians, bicyclists, transit riders, and drivers. They are proposed to enhance the safety and experience of road users and existing residents, and are consistent with San Francisco's "Better Streets" Plan.

Enhanced streetscape design, including street trees, sidewalk plantings, furnishings, and paving treatments would be designed to visually tie together the proposed Project with the greater Bayview neighborhood. Specific streetscape treatments would vary depending on existing right-of-way and traffic demands. Streetscape improvements would take into consideration visibility at STOP-sign controlled intersections.

Yosemite Slough Bridge—A new Yosemite Slough bridge would extend Arelious Walker Drive from Candlestick Point to Hunters Point Shipyard. The bridge would have an 81-foot-wide right-of-way and would contain a 40-foot-wide landscaped greenway, two 11-foot-wide BRT lanes, a sidewalk, and a Class I bicycle path. On 49ers game days, the 40-foot-wide landscaped area would be converted to four peak direction travel lanes for game day auto traffic. The Yosemite Slough bridge would not be used for vehicular traffic at any other time, including secondary events at the new stadium.

The Yosemite Slough bridge is a fundamental component of the proposed BRT service between Hunters Point Shipyard and points to the west, including Candlestick Point, the Bayshore Caltrain station, and the Balboa Park BART station. It would be a continuation of the dedicated right-of-way for BRT on Harney Way and through Candlestick Point that, along with signal priority to BRT vehicles, is essential to provide direct, fast and reliable BRT service, and is designed to be "rail ready" (not to preclude possible conversion to light-rail).

The bridge sidewalk and Class I bicycle path would provide a direct connection between Candlestick Point and Hunters Point Shipyard for pedestrians and bicyclists at all times, and would reduce the potential for conflicts between BRT vehicles and motorists, pedestrians and bicyclists.

During game days, the 40-foot-wide landscaped median would serve as the primary and most-direct route between the stadium parking areas and US-101. This route would minimize the intrusion of game day traffic onto local residential streets (by directing vehicles directly onto Harney Way) and reduce the duration of post-game congestion.

Other Off-site Improvements—The Project would include installation of new traffic signals at existing unsignalized intersections as part of the transit preferential treatment[117] on Palou Avenue, or when traffic volumes warrant signalization at:

- Palou Avenue and Griffith Street
- Palou Avenue and Hawes Street
- Palou Avenue and Ingalls Street
- Palou Avenue and Jennings Street
- Palou Avenue and Keith Street
- Palou Avenue and Lane Street
- Carroll Avenue and Ingalls Street
- Thomas Avenue and Ingalls Street
- Arelious Walker Drive and Carroll Avenue
- Arelious Walker Drive and Gilman Avenue
- Arelious Walker Drive and Ingerson Avenue
- Arelious Walker Drive and Harney Way
- Pennsylvania Avenue/25th Street
- Evans/Jennings/Middlepoint

At the intersection Evans/Jennings/Middlepoint, in addition to signalization, the Project would revise the existing lane configuration on the Evans Avenue and Jennings Street approaches.

- The Project would reconfigure the existing three travel lanes on Evans Avenue for both the eastbound and westbound approaches to provide a shared through and left-turn lane, a through lane, and a right-turn lane. Since there are no bicycle lanes or on-street parking, this reconfiguration of the existing lanes would not impact parking or bicycle travel.
- The Project would reconfigure the southbound approach of Jennings Street to Evans Avenue to provide a southbound left turn pocket, and a shared southbound through and right-turn lane. The reconfiguration of the southbound approach would require displacement of about 200 feet of on-street parking on the west side of Jennings Street, which would eliminate about 8 to 10 parking spaces.

At the intersection of Palou/Griffith/Crisp, in addition to signalization, the Project would revise the existing lane configuration on the westbound Crisp Avenue, eastbound Palou Avenue, and northbound Griffith Street approaches.

- The Project would reconfigure the intersection by removing the southwest leg of Crisp Avenue and creating limited access for the eastern block of Palou Avenue. The Crisp Avenue westbound approach would be restriped to provide two approach lanes, a left-turn lane, and a shared left/through/right lane.
- The Project would also reconfigure the northbound Griffith Street approach to provide two lanes, a shared left/through/right-turn lane, and a right-turn lane. Additionally, the eastbound approach of Palou Avenue would be reconfigured to provide two approach lanes, a left-turn lane, and a shared through and right-turn lane. The reconfiguration of the northbound approach would require

[117] Transit preferential street treatments include measures (e.g., transit-only lanes, traffic signal pre-emption, sidewalk bus bulbs) that would improve transit travel times and service by giving priority to transit vehicles when conflicts with cars occur.

displacement of about 200 feet of on-street parking on the east side of Griffith Street, which would eliminate about 8 to 10 parking spaces.

At the intersection of Carroll/Ingalls, in addition to signalization, the Project would revise the existing lane configuration on the westbound approach of Carroll Avenue, the southbound approach of Ingalls Street, and the eastbound approach of Carroll Avenue.

- The Project would reconfigure Carroll Avenue to provide two travel lanes and a bicycle lane in each direction. This would allow for a shared left turn and through lane, and a shared through and right turn at both the east- and westbound approaches. The southbound approach would be reconfigured to allow for two approach lanes: a left-turn lane, and a shared through and right-turn lane. The reconfiguration of the southbound approach would require displacement of about 200 feet of on-street parking/loading on the west side of Ingalls Street.

At the intersection of Thomas/Ingalls, in addition to signalization, the Project would revise the existing lane configuration on the westbound approach of Thomas Avenue.

- The Project would reconfigure the westbound approach of Thomas Avenue to Ingalls Street to provide two lanes, a left-turn lane, and a shared through and right-turn lane. Thomas Avenue would be reconfigured to provide two travel lanes in each direction and on-street parking on both sides of the street.

Transportation Management System—The Project would include a transportation management system. The system would include the installation and coordination of existing and new signals at over 30 intersections in the Project vicinity and the surrounding area using fiber-optic technology including several changeable message signs and lane use control signals on roadways with reversible lanes. A Transportation Management Center near the 49ers stadium site would operate the system on game days. The Transportation Management Center would be operated by SFMTA.

Transit Improvements

The Transportation Plan would include the following transit improvements, which were assumed as part of the future transportation system:

- Extension of existing Muni routes to better serve the Project site
- Increased frequencies on existing routes to provide more capacity
- Provision of new transit facilities and routes to the Project

New direct transit service is proposed to serve employment trips to downtown San Francisco. Connections to the regional transit network (BART and Caltrain) would serve employment centers in the South Bay and the East Bay. Many of the proposed transit lines would include transit priority systems that would use sensors to detect approaching transit vehicles and alter signal timings to improve transit efficiency. The proposed transit improvements are illustrated in Figure III.D-9 (Proposed Transit Improvements) and are described below:

- Three routes would be extended into the proposed Hunters Point Transit Center: the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street.
- Frequencies on the 24-Divisadero would increase to 6 minutes in the AM and PM peak hours. Frequencies on the 44-O'Shaughnessey would remain at 6 minutes and frequencies on the 48-Quintara-24th Street would increase from 15 minutes to 10 minutes in the AM and PM peak hours.

SOURCE: Fehr & Peers, 2009.

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.D-9

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED TRANSIT IMPROVEMENTS

- The Project would also extend the 29-Sunset from its current terminus near the Alice Griffith housing development, near Gilman Avenue and Giants Drive, into the proposed Candlestick Point retail area, and increase its frequency by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak hours.
- The T-Third service between Bayview and Chinatown via the Central Subway would convert from one-car to two-car trains, but headways would remain unchanged. The ultimate service for the T-Third is under study by SFMTA as part of implementation of the Central Subway project, and may change. The information included in this study reflects discussions with SFMTA staff and the best available information at the time.
- The 28L-19th Avenue Limited would be extended to the Hunters Point Shipyard transit center. The 28L-19th Avenue Limited would travel along Geneva Avenue and the proposed Geneva Avenue extension to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center. Frequencies on the 28L-19th Avenue Limited would be increased, and headways between buses would be reduced from 10 minutes to 5 minutes.
- New CPX-Candlestick Express to downtown serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on US-101 toward downtown, terminating at or near the Transbay Terminal.
- New HPX-Hunters Point Shipyard Express to downtown serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Street, with stops at the India Basin and Hunters View areas, before continuing along Jennings Street, Cargo Way and Illinois Street to 25th Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.

For the purposes of this document, no assumptions were made about increasing frequencies at Caltrain's Bayshore Station below 30-minute headways, nor about extending Caltrain to downtown or having High-Speed Rail operate on Caltrain right-of-way and using Bayshore Station. Additionally, while SamTrans regional bus service connects the proximate area with the South Bay no assumptions were made for significant transit use of SamTrans.

Bay Trail, Blue Greenway, and Bicycle Circulation Improvements

The Project would include the construction of the regionally adopted Bay Trail in the southeastern portion of San Francisco, and incorporation of the Blue Greenway, a network of enhanced pedestrian and bicycle links in through the eastern portion of San Francisco to the waterfront. Trail improvements would include a pedestrian and bicycle trail along the shoreline with connections to the existing and new parks, from the western boundary of Candlestick Point near the Harney Way/US-101 interchange, through the SRA, Yosemite Slough, and HPS shoreline to India Basin. The Bay Trail would be incorporated into the design of the parks.

Bikeways would provide connections within the Project and the surrounding neighborhoods and other parts of the City, including exclusive bikeways on the proposed Yosemite Slough bridge. Bicycle lanes would be provided along major roadways, consistent with City guidelines, and it is anticipated that as the street network develops, the bicycle facilities would be incorporated into the official Bicycle Route network. The Bay Trail would be extended along the entire Project waterfront. There would be bicycle parking in

each commercial parking facility and residential garages. New commercial buildings with at least 20,000 gsf of floor area, as well as other facilities and attractions would provide locker and shower facilities. Bicycle racks would also be installed in parks, and along the streetscape of commercial and some residential streets. The proposed bicycle facilities and Bay Trail improvements within Hunters Point Shipyard and Candlestick Point are presented in Figure III.D-10 (Project Bicycle Network and Bay Trail Improvements).

Pedestrian Circulation Improvements

The pedestrian network would encourage walking as a primary mode of transportation within the Project site, and with separated pedestrian pathways, between Hunters Point and Candlestick Point on the Yosemite Slough bridge. Sidewalk and multi-use pathways would allow access to transit facilities and to shopping, schools, and recreation. The interior roadway network would include traffic calming features to facilitate safe pedestrian travel. The streets would be designed to accommodate multi modal travel with features including curb extensions, intersection bulb-outs, raised crosswalks, comprehensive signage, street trees, narrow roadway lanes, and short blocks and other features to slow auto traffic. All pedestrian facilities would meet *Americans with Disabilities Act* (ADA) standards and are designed to conform to San Francisco's "Better Streets Plan" wherever possible. The proposed pedestrian circulation plan for Candlestick Point and Hunters Point Shipyard is presented on Figure III.D-11 (Project Pedestrian Circulation Plan).

Travel Demand Management Plan

The Project would develop and implement a Transportation Demand Management (TDM) Program designed to reduce use of single-occupant vehicles and to increase the use of rideshare, transit, bicycle and walk modes for trips to and from, as well as within the Project. A draft TDM Program has been developed in consultation with SFMTA and the Planning Department and is available for review at the San Francisco Planning Department. The program would establish target goals, monitoring program, and a reporting program to SFMTA and the Agency. The TDM Program would highlight the demand management qualities of the overall Project, including:

- Jobs-Housing Linkage. By providing a range of job types (retail, research, hospitality, office, etc.) and a range of housing types from affordable apartments to single-family homes, the Project would maximize the potential jobs/housing "matches" on site. Each match reduces the number of vehicle trips that would enter and leave the Project site during peak hours.
- Streets designed for low speed and safe crossings. In addition to new residential and commercial buildings, the Project would provide new infrastructure, including streets. All new streets and intersection upgrades would consider the needs of pedestrians and bicyclists.
- Land uses and transit located to encourage walking. People walk more when destinations are within close proximity, along flat routes with easy street crossings, and through interesting areas with storefronts, street trees, street furniture, and other pedestrian-oriented amenities. The Project embraces these principles, with all homes located within a 15-minute walk of transit and neighborhood retail services integrated into residential blocks. Many existing neighborhoods would also benefit from their proximity to enhanced transit service, schools, retail locations, and jobs with the Project site.

The program would include a menu of TDM tools that, when employed, would make the most of the above design qualities of the Project TDM Plan. These include:

PROJECT PEDESTRIAN CIRCULATION PLAN

Parking Strategies

- Visitor Variable, Market-Rate Parking Pricing. Visitor parking charges at variable market rates would encourage transit use. This can be accomplished by increasing parking rates during the peak period when transit service is most frequent, or increasing parking rates progressively to favor short-term parking over long-term parking, discouraging commuter parking.
- Maximum Permitted Parking Ratios. The Project includes a maximum permitted of one off-street parking space per residential unit, as well as maximum permitted ratios for other development types.
- Flexible Parking Management Strategies. Additional parking management strategies such as residential permit parking, time of day restrictions, parking technologies, and parking wayfinding would also be considered as needed to supplement other parking strategies.
- Unbundled Residential Parking. As required for all new residential developments with more than 10 units in San Francisco, residential parking would be "unbundled" and sold or leased separately from units. Unbundling parking makes the cost of parking visible to households, and may encourage some residents to save money by opting for a single off-street space or no dedicated parking. Unbundled parking would also serve as a "self selection" incentive for residents who prefer to live in car-free or car-reduced neighborhoods.

Transit Strategies and Support Strategies:

- Central Transit Hub. A transit center at Hunters Point Shipyard would enable efficient and convenient transfers while providing a central location for transportation brochures and other information to be distributed and for attended bicycle parking. Major BRT stops throughout the Project site would also include information kiosks and real-time transit updates.
- Enhanced Transit Service and Bicycle Facilities. Exclusive bike lanes and frequent bus rapid transit (BRT) service operating in dedicated lanes with signal priority, would offer convenient alternatives to driving to, from, and within the Project site. Additional transit service would include extended Muni routes, increased Muni frequencies, and enhanced connections to the regional network (BART and Caltrain).
- Bicycle Support Facilities. Bicycle support facilities to encourage bicycling would include parking facilities in both residential and commercial developments (such as racks, indoor/long-term parking, lockers, and showers), attended bicycle parking and repair facilities at major destinations (with discounted rental space for a bike station at the Hunters Point Shipyard Transit Center), and potentially a bike sharing or rental program.
- Wayfinding. A comprehensive wayfinding signage program would support the network of walkways and shared-use paths, encouraging pedestrian and bicycle trips.
- EcoPass. Homeowner's dues would include the cost of transit passes. The transit pass or "EcoPass" would offer significant benefits including a group discount (transit pass costs, while mandatory, would be priced significantly lower than individual passes because they are mandatory), a steady funding stream for enhanced transit service, and a "self selection" incentive—whereby more Eco-Minded (transit-inclined) residents would be attracted to live in the Project site.
- Carshare Services. Local carshare organizations would provide carshare vehicles throughout the Project site. Carshare services, such as City CarShare and ZipCar, allow members to use vehicles when needed, paying based on how much they drive. Employers may include carshare memberships for their employees as an element of their mandatory TDM Program. For multi-unit housing developments, carshare vehicles may be provided in residential garages.

- Employee TDM Programs. Employers of 20 or more employees in the Project site would be required to participate in TDM programs that would encourage the use of transit and facilitate walking and bicycling among their employees through both incentives and disincentives. Elements of the TDM programs may include:
  - > Information Boards/Kiosks. Employers would display transit routes and schedules; carpooling and vanpooling information; and bicycle lanes, routes, paths and facility information on information boards/kiosks or direct employees to web resources. "Real-time" monitors would be located near transit hubs, at outdoor transit shelters and inside lobbies, employment areas and other sheltered, well-lit areas where transit patrons can wait in relative comfort within immediate sightline of the transit stop or station.
  - > Commuter Benefits. The TDM program would include participation in the Commuter Benefits program for tax-free paycheck deductions of transit and bicycle commuter expenses.
  - > Employee EcoPass. Opportunities to provide employees with an "EcoPass" would be pursued, similar to the programs already underway at the University of California and the City of Berkeley. These passes would allow unlimited transit use and could be purchased at a discount bulk rate on a monthly and/or annual basis, and then be made available to all employees who work on the Project site.
  - > Carpool/Vanpools. Through their TDM program and in collaboration with the On-site TDM Coordinator, employers would offer carpool and vanpool matching services, subsidies, and priority accommodation. Designated and convenient spaces in parking facilities would be provided free to vanpools and carpools. The transit centers would also have designated signed areas for casual carpooling. Casual carpooling information would be provided through the On-site Coordinator's TDM website, brochures, and targeted marketing.
  - > Guaranteed Ride Home Program. A Guaranteed Ride Home program supported by employer participation would reimburse transit riders for return trip travel in the event of an emergency when an alternative means of travel is not available.
  - > Compressed Work Weeks, Flex Time, and Telecommuting. Through these strategies, employees would adjust their work schedule to reduce vehicle trips to the worksite.

Implementation and Monitoring Strategies

- CP-HPS Transportation Management Association. A Transportation Management Association (TMA) would be formed to develop, implement, operate, and administer strategies and programs to manage transportation resources in the Project and HPS Phase I, in accordance with the Project Transportation Demand Management Plan. The Transportation Coordinator (TC) team would act as staff to the TMA. The Board of Directors of the TMA representing private property owners would be established. The TMA would enter into Participation Agreements with property owners in the Project and HPS Phase I, setting forth the rights and obligations of each such owner relating to the programs and fees imposed by TMA.
- On-site Transportation Coordinator and Website. An On-site Transportation Coordinator would provide residents, employers, employees, and visitors with information regarding available transportation alternatives. The Transportation Coordinator would be responsible for implementation, monitoring, and improving on the measures of the TDM plan. The Coordinator would maintain a website to include transportation-related data and real-time transit information. The On-site Coordinator would serve as a liaison to City staff for all transportation concerns/communication needs.

- Targeted Marketing. From the day that the first employee comes in to work and the first family moves in, a plan would be in place to help people discover alternatives to driving alone in a car. The On-site Coordinator would be available to help people plan their trips and work with transportation agencies and others to promote transit, vanpooling, carpooling, and carsharing, bicycling, and walking. In addition to one-on-one outreach, TDM brochures and a website would be available on an ongoing basis. A yearly transportation options "fair" would also be scheduled for the neighborhood, with smaller outreach efforts available to employers and other organizations.
- Monitoring of Transportation Demand. The transportation measures and programs would all be monitored on an annual basis to determine the success of the programs and to allow the On-site Coordinator to make decisions about the allocation of resources or changes in the services that may be needed to better address the needs of the Project area. The objective of the monitoring would be to maximize the use of alternatives to the single occupant automobile and reduce peak hour congestion. A monitoring program could include user surveys, automobile counts, transit ridership, and bicycle and car share usage and costs.
- Monitoring Effectiveness of Congestion-Reducing and Traffic Calming Efforts. As part of annual monitoring, the On-site Coordinator would, in cooperation with SFMTA, review the effectiveness of the Project's transportation measures and other traffic calming measures implemented in the area to reduce congestion due to Project vehicle trips and minimize traffic spillover to neighboring residential streets. If warranted, the On-site Coordinator and SFMTA would consider implementation of additional traffic-calming and congestion-alleviating measures, such as adding additional lanes to the streets that approach Third Street, or other congested areas.

5. Project Travel Demand

This section presents the travel demand methodology and results for the Project development plan—i.e., the 10,500 residential dwelling, about 885,000 square feet of neighborhood- and regional-serving retail, and about 2,650,000 square feet of commercial office and R&D uses. Travel demand associated with sell-out 49er game and a secondary event at the stadium, as well as a sell-out event for the arena is also included in this section.

Project

The transportation effects associated with the travel demand generated by the Project land uses were determined by calculating the daily person-trips generated by the different types of Project land uses, and the portion of those trips that would occur during the peak hours analyzed. After determining the number of person trips generated by the Project, the trips were distributed to geographical origins/destination areas, including five San Francisco areas (downtown CBD, the rest of Superdistrict 1, Superdistrict 2, Superdistrict 3, Superdistrict 4) and three other regions in the Bay Area (South Bay, East Bay and North Bay)[118]. The mode split analysis then determined the portion of these trips made via automobile, transit, or any other mode of transportation, based upon the origin/destination of the trips, the purpose of the trips, and the availability of various modes. Finally, automobile occupancy rates were determined, to yield the average number of individuals in a vehicle, and, thus, determine the number of vehicles that would be traveling to and from the Project study area.

[118] Superdistricts are travel analysis zones established by the Metropolitan Transportation Commission (MTC). San Francisco is divided into four Superdistricts delineated to capture the different travel characteristics that are associated with the various street network, transit opportunities, and geographical constraints of different areas of San Francisco.

The methods commonly used for forecasting trip generation of development projects in San Francisco are based on person-trip generation rates, trip distribution information, and mode split data described in the Transportation Impact Analysis Guidelines for Environmental Review, SF Planning Department, October 2002 (*SF Guidelines).* These data are based on a number of detailed travel behavior surveys conducted within San Francisco. The data in the *SF Guidelines* are generally accepted as more appropriate than conventional methods because of the relatively unique mix of uses, density, availability of transit, and cost of parking commonly found in San Francisco. However, the methods describe in the *SF Guidelines* cannot be directly applied to the Project because of its large scale, specific location and distinctive character.

Similarly, standard trip generation rates, such as those provided by *Trip Generation,* 7th Edition, 2003, Institute of Transportation Engineers, would not be suitable for the Project, unless appropriate adjustments were made to account for the Project size, mix, and availability of transit.

To account for the trip-making patterns of this Project, a state-of-the-practice trip generation forecasting method was used in this analysis. This method was originally developed by Fehr & Peers and others for the US Environmental Protection Agency (EPA) and has been endorsed for use in project-specific and planning-level analyses by a number of jurisdictions, including the California Department of Transportation (Caltrans). This method is commonly referred to as the "4D" method, and generally accounts for the following factors that may influence travel behavior:

- Development scale—the amount of trips generated increases as the amount of development increases;
- Density of the project—the higher the project's density, the less vehicular traffic generated per unit of development;
- Diversity of uses—an appropriate mix of uses can lead to internalization of trips and trip-linking within a project; and,
- Design of project—a walkable, pedestrian- and bicycle-oriented circulation system can help to reduce automobile dependence within a project site.

The general concept behind the 4D method is that projects that deviate from a base case (in this case, ITE trip generation rates which represents a "national average") with respect to the four bulleted variables above exhibit different traffic generation patterns. Elasticities have been derived from travel behavior surveys from the Bay Area to help estimate how traffic generation changes as a function of changes in the 4Ds. Those elasticities are used to adjust the base case trip generation to account for the project's density, diversity, and pedestrian/bicycle friendliness (i.e., design) compared to typical suburban developments reflected in the ITE trip generation rates. Applying the 4D method results in a percentage reduction in vehicular traffic generation from the base case (i.e., ITE *Trip Generation*).

The travel demand analysis assumes implementation of the Project's improvements to transit service and a travel demand management (TDM) program, as described above. The transit improvements would be in addition to those currently proposed as part of SFMTA's Transit Effectiveness Program.

Project Trips by Mode

Table III.D-4 (Project Person and Vehicle Trips by Mode) summarizes the Project peak hour person-trips and vehicle trips during a typical weekday and Sunday. Between 28 and 34 percent of weekday AM and

PM peak hour person-trips would be internal/linked trips that would remain within the Project site and would occur primarily by walking and bicycling. External trips would occur via auto, transit, and bicycle modes; approximately 76 percent of peak hour external trips would occur by auto, 21 percent by transit, and 3 percent by bicycling. During the Sundays PM peak hour, fewer trips would be internal to the Project site, and fewer trips would occur via transit. On Sundays between 20 and 33 percent of trips would be internal/linked. Of the external trips, between 79 and 82 percent would be by auto, between 15 and 18 percent by transit, and about 3 percent by bicycle mode.

Table III.D-4 Project Person and Vehicle Trips by Mode

Project Trip Distribution

Table III.D-5 (Project Weekday AM and PM Peak Hour Distribution Patterns) presents the distribution of the weekday AM and PM transit and vehicle trips to and from San Francisco and areas outside of San Francisco. Project trip distribution was based on information obtained from the SF-CHAMP model for the Traffic Analysis Zones included within the Project boundaries. During the weekday AM and PM peak hours, the majority of transit trips and about half of vehicle trips would occur within the boundaries of San Francisco, with a greater portion of work trips occurring by transit than non-work trips. Within San Francisco, the greatest number of trips would occur between the Project site and Superdistrict 3. Superdistrict 3 is the southeast quadrant of San Francisco and is bounded by the San Mateo County line to the south and San Francisco Bay to the east, and reaches westward to incorporate the Twin Peaks area. For trips outside of San Francisco, the majority would be to and from nearby Brisbane, Daly City, San Bruno and South San Francisco. Sunday trip distribution patterns would be similar to those presented for weekday PM peak hour conditions.

Table III.D-5 Project Weekday AM and PM Peak Hour Distribution Patterns

SOURCE: Fehr & Peers

Stadium and Arena

The number of person-trips made by spectators to the proposed football stadium and the arena was estimated based on the proposed number of seats and a sell-out condition. For the stadium, travel demand is also presented for a smaller secondary event with an attendance of about 37,500 spectators.

49ers Game Day Travel Demand at the Proposed Stadium

As noted above, 49er game day travel demand estimates were based on a sellout game, when all 69,000 seats are sold. The number of person-trips made by spectators was estimated based on the number of seats proposed for the new stadium, less the average number of "no-shows." Information provided by the San Francisco 49ers indicates that with a 69,000-seat stadium, there would be approximately 3,450 "no-shows"

per game (an average 5 percent), resulting in an actual attendance of 65,550 for a sellout game. In addition to the 65,550 spectators, the 49ers have indicated that currently up to 725 game operations/media personnel attend home games, and that approximately 2,610 other game day employees (concessions, security, janitorial, etc.) are on site each game, for a total on-site population of 68,885 people for a sell-out game.[119]

With the relocation of the stadium and provision of new transit service proposed by the Project, the mode of travel to the stadium is expected to change compared to existing conditions, with increased use of transit. Based on existing attendance data obtained from the 49ers and SFMTA, 81 percent of the spectators arrive via automobile, and the remaining 19 percent come by transit, including 11 percent on Muni, 5 percent on SamTrans, Santa Clara Transit and Golden Gate Transit,[120] and the remaining 3 percent come by other private charter service. Although mode split can vary from game to game, these percentages represent average game day conditions. As noted above, in light of the new transit service proposed by the Project, a modest rise in transit use (from 19 percent to 25 percent) to the stadium was assumed to occur. Given the extent of transit improvements and demonstrated evidence from other locations that the NFL would consider transit as a means to reach games, this increase is a reasonable assumption. This analysis assumes that game operations staff and media personnel would likely use autos. Other game day employees are likely to use transit in a similar ratio as patrons (i.e., 25 percent). In addition to the existing game day transit service provided by Muni and charter bus service, the following transit service was assumed in the travel demand estimates:

- Harney Way BRT. The new express service would run in dedicated bus lanes from the proposed stadium site to key points west and south. This would greatly improve pre-and post-game transit running times as buses would bypass congested traffic conditions on Harney Way. The BRT service would also offer efficient and convenient access to regional transit service, such as Caltrain and BART.
- Palou Avenue Transit Preferential Street. On game days Palou Avenue would be a dedicated transit-only street to allow buses to proceed to the T-Third light rail line and points west and north without mixing in congested pre- and post-game traffic.
- Extension of Existing Transit Routes. In addition to operating "game day express" bus routes from strategic locations throughout San Francisco consistent with current game-day operations, the Project transit plan calls for extending several existing Muni bus routes (i.e., 24-Divisadero, 44-O'Shaughnessy, and 48-Quintara-24th Street) to provide regular service into the Project site. This service would be part of regularly scheduled service and would not be special game day service. As a result, patrons would be expected to be familiar with the routes.

Table III.D-6 (Projected Football Game Day Trip Generation by Mode) summarizes the number of people on-site by mode of access, and the number of post-game transit and vehicle trips associated with a sell-out game. The number of vehicle trips was determined by dividing the number of attendees that arrive via auto by the vehicle occupancy rate (VOR). Average VORs not only vary by type of vehicle but can also tend to vary depending on the type of stadium seating. For example, existing San Francisco 49ers data indicate that the average VOR for spectators in the club seating sections is 2.0, while the average VOR for spectators in the general seating sections is 3.0.

[119] The number of game operations/media personnel and other game day employees is expected to remain similar with a new stadium at Hunters Point Shipyard.
[120] In 2008 and 2009, game day SamTrans, Golden Gate Transit, and VTA transit service have been replaced with private charter. Ridership is expected to remain similar.

Table III.D-6 Projected Football Game Day Trip Generation by Mode

		Attendees by Mode	*Vehicle Trips*	*Transit Trips*

	Total	***68,886***	***20,135***	***17,041***

SOURCE: Fehr & Peers.

The number of vehicles exiting the Project site following a game was determined based on the parking constraints associated with limiting game day off-street parking supply to 17,415 parking spaces, and variable factors such as game score, weather, traffic conditions, and the post game activities. An additional factor is the potential synergy after the football game between the stadium and the regional retail development at Candlestick Point, which may result in more spectators electing to stay later than currently do at Candlestick Park.

As noted above, the off-street parking supply dedicated for a football game would be 17,415 spaces, of which 340 spaces adjacent to the stadium would be reserved for buses, and the remaining 17,075 would be for private autos, RVs, limos, etc. Of the 17,075 spaces, 16,075 spaces would be adjacent to the stadium and the R&D development, and 1,000 spaces would be provided in Candlestick Point within a parking structure. As a result, 3,059 vehicles of the total unconstrained demand of 20,134 would not be able to park on-site on game days. These vehicles would likely park in other off-site parking lots and either walk or take transit into the stadium area. Therefore, although the demand for travel to the Project site on game days would be 20,134 vehicles, the actual amount that would park within the Project site on game days would be constrained by the 17,075 total parking spaces provided for game day spectators and/or employees.

Therefore, for a sell-out game, the vehicle exiting demand for the hour immediately following the end of the game would roughly range between 14,500 vehicles if there are some early and some late departures, and 17,100 vehicles if everyone attempted to leave at the end of the game. A typical end time for a Sunday football game is 4:00 P.M.

The geographic distribution of spectators was obtained from information provided by the San Francisco 49ers on their season ticket holders. Since the vast majority of football spectators are season ticket holders, the pattern can be expected to be representative of travel patterns by both season, as well as non-season, ticket holders. The information obtained from the 49ers indicates that approximately 40 percent of the season ticket holders reside in the South Bay (including all of San Mateo County), 16 percent in the East Bay, 14 percent within San Francisco, and 10 percent in the North Bay counties. The remaining 20 percent reside in locations outside the Bay Area such as the Central Valley and Sacramento.

Secondary (Non-Football) Events at the Proposed Stadium

It is anticipated that other types of events, such as soccer games or concerts, may also be scheduled at the stadium. A typical secondary event at the new stadium could occur at any time of day and on any day of the week, with an expected crowd ranging from 15,000 (e.g., monster truck rally) to sell-out conditions. For purposes of the transportation analysis, an event with 37,500 spectators was analyzed, which reflects events such as a Metallica concert. Assuming an approximate weekday evening start time of about 7:00 P.M., the weekday PM peak hour (5:00 to 6:00 P.M.) was analyzed for pre-event conditions to address transportation impacts associated with possible secondary events on evening commute traffic conditions. Secondary events would be limited to 20 total occurrences per year.

Unlike football games, where there would be special transit service to the stadium, it is assumed that for secondary events only regularly scheduled transit service would be provided by Muni and only a small percentage of private charter buses would be expected. However, the amount of regularly scheduled PM peak period transit service serving the new stadium would be substantial, such that transit mode share for a secondary event at the stadium would be about 25 percent. It is estimated that the 37,500 spectators would generate about 28,125 persons coming by autos, and 9,375 persons taking transit, including regularly scheduled service and charter buses. Assuming that the average number of spectators per auto for a secondary event would be similar to that for football spectators in the general seating section (i.e., 3 spectators per auto), the 28,125 persons taking autos would translate to 9,375 vehicles to the stadium, and up to 10,100 vehicles including employees.

Based on a technical paper on major event traffic (ITE, 1997), it was assumed that approximately 25 percent of the total number of spectators at a secondary event would arrive within the one hour prior to the event start time, 50 percent would arrive within the second hour, and the remaining 25 percent would arrive within the third hour prior to the event start time. As such, about 50 percent, or 4,688 of the spectator vehicles would arrive between 5:00 and 6:00 P.M. for a weekday evening event starting at 7:00 P.M. Employees would arrive to the site earlier than 5:00 P.M.

The geographic distribution of trips associated with a secondary event would vary depending on the event. However, for the purposes of this transportation analysis, it was assumed that the geographic location of the secondary event spectators would be similar to that of the football spectators, where approximately 40 percent would come from the South Bay, 16 percent from the East Bay, 14 percent from within San Francisco, 10 percent from the North Bay, and 20 percent from locations outside of the Bay Area.

Events at the Proposed Arena

The Project also includes a new 10,000-seat arena within Candlestick Point that would be used for theater productions, concerts, speaking engagements, educational events, or sporting events, while most events at the arena would be for smaller audiences. It is anticipated that up to 150 events per year could occur at the arena (e.g., Wednesday, Friday, and Saturday every week per year). Similar to the analysis of secondary events at the stadium, assuming an approximate weekday evening start time of 7:00 P.M., the weekday PM peak hour (5:00 to 6:00 P.M.) was analyzed for pre-event conditions to address transportation impacts associated with sold-out events that may occur at the arena. Although no specific program has been developed for events at the arena, sell-out events with 10,000 attendees occurring during weekday evenings would likely be infrequent.

The analysis of a sold-out event at the arena assumes that only regularly scheduled transit service would be provided and that only a small number of attendees would arrive by private charter bus. The analysis assumes that 20 percent of attendees would arrive by transit. Therefore, of the 10,000 spectators, 2,000 would be expected to arrive by transit and 8,000 would be expected to arrive via auto. Assuming that the average vehicle occupancy for a sold-out event at the arena would be similar to that of spectators to a 49ers game or for a secondary event at the stadium (i.e., 3 spectators per auto), the 8,000 people arriving via auto would generate an additional 2,667 vehicles to the stadium, and up to 2,860 vehicles including employees (assuming similar ratios of employees to spectators as football game days).

Arrival and departure patterns for a sold-out event at the arena would likely be similar to those of secondary events at the stadium. It was assumed that 50 percent of the attendees, or 1,333 vehicles and 1,000 transit trips, would arrive between 5:00 and 6:00 P.M. for an event that begins at 7:00 P.M. Employees would arrive earlier and would not affect the 5:00 to 6:00 P.M. peak hour.

Similar to secondary events at the stadium, the geographic distribution of trips associated with events at the arena would vary depending on the event. For purposes of this analysis, it was assumed that the geographic location of the attendees would be similar to that of the football spectators, with 40 percent of attendees arriving from the South Bay, 16 percent from the East Bay, 14 percent from within San Francisco, 10 percent from the North Bay, and 20 percent from locations outside the Bay Area.

Parking Demand

The *SF Guidelines* methodology for estimating parking demand was used to calculate the parking demand associated with the land uses for each analysis scenario. Parking demand was estimated separately for residential and non-residential uses as follows:

- Residential Parking Demand—For individual development projects, residential parking demand is estimated based on the number and type of housing unit (i.e., studios/one bedroom versus two and two-plus bedroom units, and affordable versus market rate housing) that would be constructed.
- Non-Residential Parking Demand—Non-residential demand was estimated for both short-term and long-term demand. Long-term demand refers to demand generated by employee trips by auto, while short-term demand refers to demand associated with visitor trips. Long-term demand was calculated by applying the vehicle mode choice by Project subarea to the projected number of new employees associated with each land use. Average hour short-term demand was calculated by applying an average turnover of 5.5 vehicles per space to the daily non-work trips by vehicle (one-way trips).

Table III.D-7 (Project Parking Demand) presents the residential and non-residential parking demand for the Project. The parking demand excludes the stadium and arena event demands presented in the previous section.

Table III.D-7 Project Parking Demand

	Residential	*Non-Residential*		
Project Area	*Long Term Demand*	*Long Term Demand*	*Short-Term Demand*	*Total Demand*
Hunters Point Shipyard	3,110	3,818	996	7,924
Candlestick Point	9,212	1,475	2,622	13,309
Total	***12,322***	***5,293***	***3,618***	***21,233***

SOURCE: CHS Consulting, LCW Consulting

Loading Demand

The *SF Guidelines* methodology for estimating commercial vehicle and freight loading/loading demand was used to calculate the demand associated with each analysis scenario. Daily truck trips generated per 1,000 square feet were calculated based on the rates contained in the *SF Guidelines*, then converted to hourly demand based on a 9-hour day and a 25-minute average stay. Average hourly demand was converted to a peak hour demand by applying a peaking factor, as specified in the *SF Guidelines*. Table III.D-8 (Project Loading Demand) presents the number of trucks generated by the Project land uses on a daily basis, and the demand for loading dock spaces during the peak hour of loading activities.

Table III.D-8 Project Loading Demand

Project Area	*Daily Truck Generation*	*Peak Hour Loading Dock Space Demand*
Hunters Point Shipyard	713	41
Candlestick Point	507	29
Total	***1,220***	***70***

SOURCE: LCW Consulting.

6. Transit Delay Methodology

Project impacts to transit measured in terms of increases to transit travel times on routes serving the Project vicinity which would be most likely affected by congestion associated with Project-generated vehicle trips. The analysis evaluated the increases to transit travel times associated with the following three influencing factors.[121]

- **Traffic congestion delay**—Traffic congestion associated with increases in area traffic slow down transit vehicles and results in increased transit travel times. Traffic congestion delays were calculated by summing the average vehicular delay at each intersection along the transit line's route within the study area. The increase in total route segment delay is equal to the increase in travel time associated with the Project.
- **Transit re-entry delay**—Transit vehicles typically experience delays after stopping to pick up and drop off passengers while waiting for gaps in adjacent street traffic in order to pull out of bus stops. As traffic volumes on the adjacent street increase, re-entering the flow of traffic becomes more difficult and transit vehicles experience increased delay. Transit re-entry delay was calculated using empirical data presented in the 2000 Highway Capacity Manual (HCM). Total transit re-entry delay for each route was calculated as the sum of transit re-entry delay at each stop within the study area.
- **Passenger boarding delay**—Although increases in transit ridership are generally viewed positively, the amount of time a transit vehicle has to stop to pick up and drop off passengers (i.e., the transit vehicle dwell time) is directly correlated to the number of passengers boarding the vehicle. If, as proposed, the Project includes substantial improvements to transit service in the future (and as general transit ridership grows), vehicles would have to spend more time at stops, which may increase overall transit travel times. Passenger boarding delay was calculated assuming two seconds per

[121] The methodology used is similar to that used in the *San Francisco Bicycle Plan Draft EIR*, San Francisco Planning Department, November 2008, except that methodology included the additional transit delay associated with substantial increases in bicycle volumes, which was appropriate for a project contemplating large-scale changes to the City's bicycle network. Bicycle volumes are not expected to substantially change as part of this project, so the "bicycle delay" was not included. However, instead, this evaluation includes the added delay associated with increases in passenger boardings, which is more appropriate for this project since the project includes major improvements to area transit service.

passenger boarding for buses, and 0.5 seconds per passenger boarding for light rail vehicles. Passenger boardings within the study area were estimated by examining the increases in ridership across the study area cordons.

Although the transit routes in the study area would not be extended into the study area under existing conditions or under 2030 No Project conditions, transit delay for those scenarios was calculated as if the transit routes were extended only for purposes of comparing Project impacts. Generally, the increases in travel times associated with the Project are smaller than those associated with the increases expected between existing and 2030 No Project conditions. It should be noted that the determination of additional transit vehicles needed to maintain headways accounts for congestion on local streets, and does not include additional delay due to increased freeway congestion which would affect lines traveling on US-101 and I-280.

The Project was determined to have a significant impact if it would increase transit travel times such that additional transit vehicles would be required to maintain the proposed headways. This was assumed to be the case if either the Project's travel time increases to a particular route would be greater than ½ its proposed headway or if the number of required vehicles estimated using SFMTA's cost/scheduling model, which takes into account scheduled breaks and extra time built into schedules, increases by one or more vehicles with the addition of the Project characteristics.

The results of the analysis, in terms of additional buses needed to maintain headways, are summarized in Table III.D-9 (Additional Muni Transit Vehicle Requirements—2030 Conditions Weekday AM and PM Peak Periods). The transit vehicle requirements are presented for Project conditions (which reflects increases in transit travel times from 2030 No Project conditions) and for 2030 No Project conditions (which reflects increases in travel times between existing and 2030 No Project conditions). Additional information regarding the transit delay methodology and analysis results is included in the Transportation Study.

Table III.D-9 Additional Muni Transit Vehicle Requirements—2030 Conditions Weekday AM and PM Peak Periods

7. Transit Capacity Utilization Analysis Methodology

The impact of additional transit ridership generated by the Project was assessed by comparing the projected ridership to the available transit capacity. Transit "Capacity Utilization" refers to transit riders as a percentage of the capacity of a transit line, or group of lines combined and analyzed as cordons or Screenlines across which the transit lines travel. The transit capacity utilization analysis was conducted for three conditions:

- At three cordons in the Project vicinity to identify the localized impacts of Project transit trips on Muni routes
- At the four standard Downtown Screenlines used to assess impacts on transit service between downtown and the rest of the City. The Downtown screenline analysis is conducted at the maximum load point (i.e., the point of greatest demand) for most transit lines traveling into and out of Downtown
- At the three standard Regional Screenlines to determine impacts on regional service providers

Muni

The number of AM and PM peak hour riders was obtained from Muni monitoring data for existing conditions, and adjusted for future year 2030 No Project conditions as described above using the SF-CHAMP travel demand model. The service capacity of each line was estimated by multiplying the passenger capacity of each transit vehicle by the number of actual trips that occurred when the ridership data was collected. The capacity includes seated passengers and an appreciable number of standing passengers per vehicle (the number of standing passengers is between 30 and 80 percent of the seated passengers depending upon the specific transit vehicle configuration). The maximum loads, including both seated and standing passengers, vary by vehicle type and are 45 passengers for a 30-foot bus, 63 passengers for a 40-foot bus, 94 passengers for a 60-foot bus, and 119 passengers for a light-rail vehicle. The percent utilization of capacity was then calculated by comparing the ridership demand to the capacity provided. Muni has established a capacity utilization standard of 85 percent.

The Muni capacity utilization analysis was conducted at three cordons at the perimeter of the study area. The three cordons and the Muni lines included in each analysis cordon are:

- North cordon at Cesar Chavez Street: T-Third, 9-San Bruno, 19-Polk lines
- West cordon located west of US-101: 23-Monterey, 24-Divisadero, 29-Sunset, 44-O'Shaughnessy, 26-Quintara-24th Street, 54-Felton
- East of Third Street: 19-Polk, 23-Monterey, 29-Sunset, 44-O'Shaughnessy, 54-Felton. The East of Third cordon was analyzed to assess the degree to which Project transit demand between the Project site and the T-Third Street light rail service would affect localized transit capacity

Downtown screenlines examine the overall utilization of Muni transit capacity into and out of downtown San Francisco from the Northeast, Northwest, Southeast, and Southwest of San Francisco. The downtown screenline analysis is included in the *SF Guidelines*, and has been recently updated to 2030 conditions as part of the analysis of the Planning Department's downtown Transit District Center project.

Regional Service Providers

Regional transit service was evaluated at the screenline level for the locations where different regional transit service enters San Francisco, including the North Bay (Golden Gate Transit and Ferries), East Bay (BART, AC Transit, Ferries), and South Bay (BART, Caltrain, SamTrans). All of the regional transit operators except BART have a one-hour load factor standard of 100 percent, which would indicate that all seats are full. BART has a peak period load factor standard of 115 percent, which indicates that all seats are full, and an additional 15 percent of the seating capacity are standees (i.e., 1.15 passengers per seat). The regional screenline analysis is included in the *SF Guidelines*, and has been recently updated to 2030 conditions as part of the analysis of the Planning Department's downtown Transit District Center project.

Additional information regarding the transit capacity utilization analysis, and illustration of the location of cordon and screenline locations, is included in the *Transportation Study*.

On-Site and Off-Site Construction Impacts

Impact TR-1: Construction Vehicle Traffic and Roadway Construction

Impact TR-1 **Construction of the Project would result in transportation impacts in the Project vicinity due to construction vehicle traffic and roadway construction and would contribute to cumulative construction impacts in the Project vicinity. (Significant and Unavoidable with Mitigation) *[Criterion D.n]***

- Buildout of the Project would occur over a 20-year period between 2011 and 2031. Initial construction activities would include demolition of existing structures, utility relocation and site clearance and grading at Hunters Point Shipyard to make the land available for the new stadium. The new stadium and the Yosemite Slough bridge are anticipated to be completed by 2017 in time for the 2017 football season.

Construction of the Project would occur in several phases. The duration of each phase would vary, depending on the type of development (e.g., residential, retail, office) and the amount of building space included in each phase. The majority of development would occur and be occupied by the end of the
- second phase, which has a scheduled completion date of 2023. The majority of the roadway network improvements would occur by 2019 (Phase I), and most transit improvements would be phased in by 2023 (within Phase I and Phase II). Construction impacts within the Project site would affect new residents, employees, and visitors to the area. Overall, throughout the construction period the addition of worker-related vehicles and transit trips would be less than those associated with Project conditions at full buildout.

During construction of the Project phases, building activities would generate traffic volumes from construction workers, truck deliveries of supplies and construction equipment, and the hauling of soils during Project grading and excavation. The peak phases of construction activities would occur between
- 2013 and 2018, when grading and infrastructure improvements would be ongoing at both Candlestick Point and Hunters Point Shipyard. During this phase, there would be between 130 and 460 construction workers that would be on-site on a daily basis, and between 70 and 540 construction truck trips that would travel to and from the site on a daily basis. These truck trip estimates assume that about 40 percent of the required import fill materials would be brought onto the site via barge, with the remaining arriving by truck.

Shoreline improvements at both Hunters Point Shipyard and Candlestick Point would peak in 2017, and would require an additional 45 to 50 construction workers on-site.

Construction related activities would generally occur Monday through Saturday, between 7:00 A.M. and 8:00 P.M., and the typical work shift for most construction workers would be from 7:00 A.M. to about 3:30 P.M. Construction is not anticipated to occur on Sundays or major legal holidays, but may occur on an as-needed basis. The hours of construction would be stipulated by the Department of Building Inspection, and the contractor would be required to comply with the San Francisco Noise Ordinance.[122] Delivery and removal of extra long or wide bridge construction components, equipment, or materials may occur outside theses hours on an as-needed basis.

Construction staging would mostly occur within the individual sites under construction or along existing street right-of-way. Construction staging would involve staging of construction vehicles, storage of construction materials, construction worker vehicles, delivery, and hauling trucks. Due to the large amount of vacant land in the Project site, construction staging would occur on-site, and construction-worker vehicles would likely park near construction sites in the Project site during most phases, and would not occupy spaces on neighborhood streets.

While the exact routes that construction trucks would be using would depend on the location of individual construction sites, it is expected that Harney Way, Hunters Point Expressway, Innes Avenue, Evans Avenue, Cesar Chavez Street, and Third Street would be the primary haul routes between US-101 and the various components of the Project.

In general, construction related transportation impacts would include impacts in the immediate vicinity of the development project under construction, on roadways within the Project site, and cumulative construction traffic impacts along the roadways in the Bayview Hunters Point neighborhood. Since the Project includes building construction as well as construction of a new street system and transit route extensions into the Project site, all Project construction operations would include plans for the closure of traffic/parking lanes and sidewalks adjacent to construction sites. The closure of sidewalks and parking lanes could last throughout the entire construction phase for each building or group of buildings. It is possible that more than one location within the Project site could be under construction at any one time and that multiple travel lane closures may be required.

During the construction period, temporary and intermittent disruption to existing and proposed transit routes and bus stops may occur, and some bus routes may need to be temporarily rerouted (for example, the 29-Sunset on Gilman Avenue and Giants Drive, the 54-Felton on Ingalls, the 23-Monterey and 44-O'Shaughnessey on Palou Avenue, and the 19-Polk on Innes Avenue. In addition, temporary and intermittent interference to transit operations caused by increased truck movements to and from the construction sites may occur. Any change in transit routes and stops would have to be coordinated and approved by the SFMTA.

Due to the reduction in travel lanes, the remaining travel lanes would become more congested with automobiles, trucks and buses, which would pose a greater challenge for bicycle travel in the area. Since bicycle traffic in the Project vicinity is relatively low, this impact is not anticipated to be significant. Existing

[122] The San Francisco Noise Ordinance permits construction activities seven days a week, between 7:00 A.M. and 8:00 P.M.

pedestrian volumes along the key access routes and at the proposed construction sites are low and, therefore, any sidewalk closures or rerouting of the walkway would not significantly affect pedestrian circulation. In general, temporary pedestrian walkways must be maintained in order to facilitate pedestrian movements.

The construction activities associated with the Project would overlap with construction activities of other development projects in the area, notably the HPS Phase I, Executive Park site, Brisbane Baylands, Visitacion Valley, India Basin Shoreline, and the Hunters View site. In addition, the Project construction activities would also overlap with nearby proposed transportation improvement projects, such as the US-101/Harney interchange improvements, and the Geneva Avenue Extension. These overlapping construction activities would increase the number of construction worker vehicles and trucks traveling to and from the project sites along Harney Way and Jamestown Avenue for the Executive Park project and for development within Candlestick Point, and on Cesar Chavez Street and Evans Avenue for the India Basin Shoreline, Hunters View project, and development within Hunters Point Shipyard. For example, construction activities of one or more projects that adversely affect roadway capacity (e.g., Harney Way widening), combined with construction vehicle traffic traveling to and from the roadway project and nearby development projects under construction (e.g., Executive Park and Candlestick Point), could result in increased delays due to traffic diversions and substantial increases in truck traffic.

Given the magnitude of development proposed for the area, the Project's prolonged construction period, and the lack of certainty about the timing of the projects in the area, significant Project-related and significant Project contributions to cumulative traffic and circulation impacts could occur on some roadways, such as US-101, Cesar Chavez Street, Evans Avenue, Harney Way, and Bayshore Boulevard. Cumulative impacts would include construction detours and increased travel times, although the extent and duration of delay would vary depending on individual driver's origin and destination, time of travel and use of alternate routes. Implementation of individual traffic control plans would minimize impacts associated with each project and reduce each project's contribution to cumulative impacts in overlapping areas. However, some disruption and increased delays could still occur even with implementation of traffic control plans, and it is possible that significant construction-related traffic impacts on local and regional roadways could still occur.

MM TR-1 *Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program. The Project Applicant shall develop and implement a Candlestick Point–Hunters Point Shipyard Phase II Construction Traffic Management Program to minimize impacts of the Project and its contribution to cumulative impacts related to construction activities and construction traffic. The program shall provide necessary information to various contractors and agencies as to how to maximize the opportunities for complementing construction management measures and to minimize the possibility of conflicting impacts on the roadway system, while safely accommodating the traveling public in the area. The program shall supplement and expand, rather than modify or supersede any manual, regulations, or provisions set forth by SFMTA, DPW or other City departments and agencies.*

Preparation of the Construction Management Program shall be the responsibility of the Project Applicant, and shall be reviewed and approved by SFMTA and DPW prior to initiation of construction. The Project Applicant shall update the program prior to approval of development plans for Phase 2, Phase 3, and Phase 4 of construction to reflect any change to Project development schedule, reflect transportation network changes, to update status of other development construction activities, and to reflect any changes to City requirements.

The program shall:

- *Identify construction traffic management practices in San Francisco, as well as other jurisdictions that although not being implemented in the City could provide useful guidance for a project of this size and characteristics.*
- *Describe procedures required by different departments and/or agencies in the City for implementation of a construction management plan, such as reviewing agencies, approval process, and estimated timelines.*
- *Describe coordination efforts associated with the Navy remediation efforts and scheduling regarding construction vehicle routing via the Crisp gate.*
- *Identify construction traffic management strategies and other elements for the Project, and present a cohesive program of operational and demand management strategies designed to maintain acceptable levels of traffic flow during periods of construction activities in the Bayview Hunters Point area. These could include construction strategies, demand management strategies, alternate route strategies, and public information strategies.*
- *Coordinate with other projects in construction in the immediate vicinity, so that they can take an integrated approach to construction-related traffic impacts.*
- *Present guidelines for selection of construction traffic management strategies.*

Implementation of mitigation measure MM TR-1 would help minimize the Project construction-related transportation impacts, and the Project's contribution to cumulative-construction related transportation impacts. However, some disruption and increased delays could still occur even with implementation of mitigation measure MM TR-1, and it is possible that significant construction-related transportation impacts on local and regional roadways could still occur. Localized construction-related transportation impacts would therefore remain significant and unavoidable.

Operational Impacts

Impact TR-2: Project and Cumulative Impacts to Traffic Volumes

Impact TR-2 **Implementation of the Project would cause an increase in traffic that would be substantial relative to the existing and proposed capacity of the street system, even with implementation of a Travel Demand Management Plan. (Significant and Unavoidable with Mitigation) *[Criterion D.a]***

The travel demand analysis presented above and the number of vehicle trips assumed in the traffic impact analysis reflects implementation of the Project TDM Plan to encourage transit use and discourage use of single-occupant vehicles. The results of the traffic impact analysis presented in Impact TR-3 though Impact TR-13 below indicate that implementation of the Project would result in significant increases in traffic volumes, and at some locations impacts would be significant and unavoidable. The Project also would make a significant contribution to cumulative impacts at some locations. To minimize the potential for an increase in Project-generated vehicles and the Project's contribution to significant cumulative impacts, implementation of the Project TDM Plan would be required.

The final TDM Plan has not been formally approved yet[123] and mitigation measure MM TR-2 is required to ensure the final TDM Plan will be prepared and implemented. Thus, mitigation measure MM TR-2 below requires preparation, approval, and implementation of the final TDM Plan.

MM TR-2 *TDM Plan. The Project Applicant shall prepare and implement a final TDM plan, which shall include the following elements:*

- *Visitor Variable, Market-Rate Parking Pricing*
- *Maximum Permitted Parking Ratios*
- *Flexible Parking Management Strategies*
- *Unbundled Residential Parking*
- *Transit Strategies and Support Strategies*
- *Central Transit Hub*
- *Enhanced Transit Service and Bicycle Facilities*
- *Bicycle Support Facilities*
- *Wayfinding Signs*
- *EcoPass for Residents*
- *Carshare Services*
- *Employee TDM Programs*
  - > *Information Boards/Kiosks*
  - > *In-building Real-Time transit monitors with sightlines of transit hubs*
  - > *Commuter Benefits*
  - > *Employee EcoPass*
  - > *Carpool/Vanpools*
  - > *Guaranteed Ride Home Program*
  - > *Compressed Work Weeks, Flex Time, and Telecommuting*
- *CP-HPS Transportation Management Association*
- *On-site Transportation Coordinator and Website*
- *Targeted Marketing*
- *Monitoring of Transportation Demand*
- *Monitoring Effectiveness of Congestion-Reducing and Traffic-Calming Efforts*

The final TDM plan shall be approved as part of the Disposition and Development Agreement (DDA).

With implementation of the mitigation measure MM TR-2, alternative modes would be encouraged, the use of single-occupant vehicles would be discouraged, and the impact of additional vehicles generated by the Project would be lessened. However, as described in Impact discussions below, the Project would still result in significant and unavoidable impacts on traffic and transit operations, and would still make

[123] A draft TDM has been prepared and is described above in "Analytic Method" section in Section III.D.4.

considerable contributions to cumulative impacts related to substantial increases in traffic. Thus, the Project and Project's contribution to traffic would remain significant and unavoidable.

Impact TR-3: Project and Cumulative Intersection Traffic Impacts

Impact TR-3 **Implementation of the Project would contribute traffic to significant cumulative impacts at intersections in the Project vicinity. (Significant and Unavoidable) *[Criteria D.a, D.b, D.g]***

An intersection level of service analysis was prepared for traffic operations at 60 study intersections for future year 2030 conditions. Project impacts were assessed by comparing future year 2030 conditions with the Project, to 2030 No Project conditions. The "Analysis Approach" section in Section III.D.4, presents the methodology used to determine Project impacts and whether the Project would contribute substantially to significant cumulative impacts. The Project was determined to have a significant traffic impact at an intersection if Project-generated trips would cause an intersection operating at LOS D or better under 2030 No Project conditions to operate at LOS E or LOS F, or intersections operating at LOS E under 2030 No Project conditions to deteriorate to LOS F conditions. At intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the increase in Project vehicle trips were reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F.

Table III.D-10 (Intersection LOS Existing, 2030 No Project and Project Conditions—Weekday AM Peak Hour) and Table III.D-11 (Intersection LOS Existing, 2030 No Project and Project Conditions—Weekday PM Peak Hour) present a comparison of the intersection LOS analysis for existing, 2030 No Project and Project conditions for the weekday AM and PM peak hours, respectively. Table III.D-12 (Intersection LOS Existing, 2030 No Project and Project Conditions—Sunday PM Peak Hour) presents this comparison for the Sunday PM peak hour. The results show that of the 60 study intersections, 39 are projected to operate at unacceptable levels under Project conditions during at least one peak hour based. At 10 of the 39 intersections, the Project would result in Project-specific impacts and would contribute to significant cumulative impacts. At nine of the 10 intersections where Project-specific impacts would result, no feasible mitigation measures have been identified.

a. Delay in seconds per vehicle. For Side Street STOP-controlled intersections, delay and LOS presented for worst approach. Worst approach indicated in ( ).
b. Intersections operating at LOS E or LOS F conditions highlighted in bold and overall intersection volume-to-capacity (v/c) ratio is presented.
c. Year 2030 analysis includes signalization as part of Executive Park Development or new Harney Interchange.
d. Year 2030 analysis includes signalization as part of Project.

The degradation in level of service would primarily be due to Project-related traffic increases along Third Street and Bayshore Boulevard, and major east/west streets serving Project traffic (e.g., Carroll Avenue, Gilman Avenue, Jamestown Avenue). Improvements along Third Street are limited due to right-of-way constraints associated with the Third Street light rail, and traffic signals on intersections along Third Street are timed to prioritize transit movements along Third Street. The SFMTA has indicated that there may be slight adjustments to the traffic signal timing for intersections along Third Street that could be implemented that would reduce auto delay at signalized intersections without degrading transit travel times. However, those improvements would not be sufficient to improve intersection operating conditions to acceptable levels.

To accommodate additional right-of-way needed for additional lanes, Third Street would need to be widened to the east and the west. This would require demolition of existing structures and substantial right-of-way acquisition, or reduction in corner sidewalk width and prohibition of on-street parking along Third Street. Widening Third Street or reducing the corner sidewalk space at this location would be inconsistent with the pedestrian environment created by the Third Street Light Rail Project, as it would make the pedestrian crossing of Third Street longer, and would require more dedicated pedestrian crossing time as part of the signal phasing plan. Due to the issues related to acquisition of additional right-of-way, the measure was determined to be infeasible.

At the intersection of Bayshore/Paul, the degradation in level of service would primarily be due to forecasted traffic volume increases on Paul Avenue. Paul Avenue is one of a relatively few number of streets in the area that connects between the east and west side of US-101. As a result, east/west travel in the area is concentrated to the few streets that provide connections across the freeway, including Paul Avenue. Widening Paul Avenue at this intersection would create the need for major right-of-way acquisition and likely require reconstruction of the US-101 overpass to accommodate a wider Paul Avenue cross section, which would be infeasible. Sufficient right-of-way is also not available on Bayshore Boulevard to provide additional capacity. Widening of Bayshore Boulevard at Paul Avenue, Cortland Avenue or at the US-101 northbound off-ramp would also not be feasible, as roadway widening would require major right-of-way acquisition along the entire Bayshore Boulevard corridor, at great cost and displacement of existing homes and businesses.

The Project's traffic impacts and the Project's contribution to cumulative impacts at these nine study intersections therefore would be significant and unavoidable.

Impact TR-4: Project and Cumulative Intersection Traffic Impacts

Impact TR-4 **At the intersection of Tunnel/Blanken, implementation of the Project would result in significant Project AM peak hour traffic impacts, and would contribute to cumulative PM peak hour traffic impacts. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

At the signalized intersection of Tunnel/Blanken (currently unsignalized and required to be signalized as part of the Visitacion Valley Mitigation Program), the intersection operating conditions would worsen in the AM peak hour from LOS D under 2030 No Project conditions to LOS F with the Project, resulting in a significant impact. In the PM peak hour, the intersection would operate at LOS F under 2030 No Project

and with the Project conditions. Based on an assessment of the critical movements at the intersection and Project contributions, the Project would contribute to cumulative PM peak hour traffic impacts.

MM TR-4 *Restripe the northbound and southbound approaches of the intersection of Tunnel/Blanken to provide dedicated left-turn lanes adjacent to shared through/right-turn lanes. The restriping would require prohibition of parking for 160 feet in the southbound approach (loss of eight parking spaces) and for 100 feet in the northbound approach (loss of five parking spaces).*

Implementation of the intersection restriping shall be the responsibility of SFMTA, and shall be implemented when intersection improvements associated with the Visitacion Valley Redevelopment Plan (i.e., signalization) are no longer sufficient to maintain acceptable intersection level of service conditions.

With implementation of mitigation measure MM TR-4, operations at this intersection would improve, but not to acceptable LOS D or better conditions during the AM and PM peak hours. Therefore, Project-related impacts at this intersection would remain significant and unavoidable.

Impact TR-5: Contributions to Cumulative Intersection Traffic Impacts

Impact TR-5 **Implementation of the Project would contribute traffic at some study area intersections that would operate at LOS E or LOS F under 2030 No Project conditions. (Significant and Unavoidable) *[Criteria D.a, D.b, D.g]***

At intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the increase in vehicle trips from 2030 No Project were reviewed to determine whether the increase would contribute considerably to critical movements operating at LOS E or LOS F. The Project contributions were examined at 29 study intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and Project contributions were determined to be significant at 20 intersections. No feasible mitigation measures were identified at 16 of the 20 intersections:

- Third Street/25th Street
- Third Street/Cesar Chavez Street
- Third Street/Cargo Way
- Third Street/Evans Avenue
- Third Street/Palou Avenue
- Third Street/Paul Avenue
- Bayshore Boulevard/Visitacion Avenue
- Bayshore Boulevard/Alemany Boulevard/Industrial Street
- Bayshore Boulevard/Blanken
- San Bruno Avenue/Paul Avenue
- San Bruno Avenue/Silver Avenue
- San Bruno Avenue/Mansell Avenue/US-101 Southbound Off-ramp
- Cesar Chavez Street/Pennsylvania/I-280
- Bayshore Boulevard/Bacon Street
- Bayshore Boulevard/Sunnydale Avenue
- Evans Avenue/Napoleon Avenue/Toland Street

The poor operating conditions would be due to forecasted traffic volume increases in the study area, and particularly along the north/south routes on Third Street, Bayshore Boulevard, and San Bruno Avenue. Improvements at these intersections are limited due to right-of-way constraints. Since no feasible mitigation measures were identified for the 16 study intersections, the Project-related contributions to cumulative traffic impacts at these locations would be significant and unavoidable.

Impact TR-6: Contributions to Cumulative Impacts at Geneva/US-101 Southbound Ramps and Harney/US-101 Northbound Ramps

Impact TR-6 **Implementation of the Project could contribute traffic at the intersections of Geneva/US-101 Southbound Ramps and Harney/US-101 Northbound Ramps, which would operate at LOS F under 2030 No Project conditions. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

As noted in Impact TR-5, the Project contributions to cumulative impacts were examined at 29 study intersections that would operate at LOS E or LOS F under 2030 No Project conditions. Project contributions were determined to be significant at 20 intersections. No feasible traffic mitigation measures were identified at 16 of the 20 intersections (Impact TR-5), while a mitigation measure was identified for the intersections of Geneva/US-101 Southbound Ramps and Harney/US-101 Northbound Ramps addressed in Impact TR-6, Amador/Cargo/Illinois addressed in Impact TR-7, and Bayshore/Geneva addressed in Impact TR-8.

MM TR-6 *Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts. The City of Brisbane and Caltrans, as part of the Harney Interchange Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) shall coordinate with the City of Brisbane and Caltrans to ensure Project-generated vehicle trips are accounted for in the Harney Interchange analyses and design.*

Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA or its equivalent. The Project Applicant shall contribute its fair share to the Harney Interchange Project.

Because the environmental review of the interchange project is not yet complete and the interchange would be approved by Caltrans, the implementation of mitigation measure MM TR-6 is uncertain and is outside of the City/Agency jurisdiction. Therefore, Project-related contributions to cumulative traffic impacts at these two intersections would remain significant and unavoidable.

Impact TR-7: Contributions to Cumulative Impacts at Amador/Cargo/Illinois

Impact TR-7 **Implementation of the Project could contribute traffic to the intersections of Amador/Cargo/Illinois, which would operate at LOS E under 2030 No Project. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

As noted in Impact TR-5, the Project contributions to cumulative impacts were examined at 29 study intersections that would operate at LOS E or LOS F under 2030 No Project conditions. Project contributions were determined to be significant at 20 intersections. No feasible traffic mitigation measures

were identified at 16 of the 20 intersections (Impact TR-5), while mitigation measures were identified for the four intersections discussed in Impact TR-6, Impact TR-7, and Impact TR-8.

MM TR-7 *Feasibility study of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. SFMTA shall conduct a feasibility study with the Port of San Francisco to determine the feasibility of reconfiguring the southbound approach on Illinois Street to provide a dedicated southbound left turn lane and a dedicated right-turn lane. Sufficient right-of-way is available to implement this improvement; however, provision of two southbound lanes would require narrowing a portion of the island to the west of the southbound approach to Cargo Way. Implementation of the intersection improvements shall be the responsibility of SFMTA and the Port of San Francisco, and shall be implemented when traffic operating conditions with the existing intersection configuration worsens to unacceptable levels. If determined feasible, the Project Applicant shall contribute its fair share to the intersection improvements.*

With implementation of MM TR-7, operations at this intersection would improve to acceptable LOS C conditions during the AM and PM peak hours. However, since a feasibility study would be required, implementation of MM TR-7 is uncertain, and therefore, Project-related impacts at this intersection would remain significant and unavoidable.

Impact TR-8: Contributions to Cumulative Impacts at Bayshore/Geneva

Impact TR-8 **Implementation of the Project could contribute traffic to the intersections of Bayshore/Geneva, which would operate at LOS F under 2030 No Project. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

As noted in Impact TR-5, the Project contributions to cumulative impacts were examined at 29 study intersections that would operate at LOS E or LOS F under 2030 No Project conditions. Project contributions were determined to be significant at 14 intersections. No feasible traffic mitigation measures were identified at 16 of the 20 intersections (Impact TR-5), while mitigation measures were identified for the four intersections discussed in Impact TR-6, Impact TR-7, and Impact TR-8.

MM TR-8 *Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts. The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure projected traffic volumes are accounted for in the design of the Geneva Avenue Extension.*

Mitigations and associated fair-share funding measures for cumulative regional roadway system impacts, including freeway segment impacts, shall be formulated through the current interjurisdictional Bi-County Transportation Study effort being led by the SFCTA or its equivalent. The Project Applicant shall contribute its fair share to the Geneva Avenue Extension Project.

Since implementation of mitigation measure MM TR-8 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Therefore, the Project-related impacts at this intersection would remain significant and unavoidable.

Impact TR-9: Project and Cumulative Intersection Traffic Impacts

Impact TR-9 **Implementation of the Project would have less-than-significant Project and cumulative impacts at some study area intersections that would operate at LOS E or LOS F under 2030 No Project conditions. (Less than Significant)** ***[Criteria D.a, D.b, D.g]***

As described in Impact TR-5 and Impact TR-6, at 20 of 29 intersections that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the increase in vehicle trips from 2030 No Project caused by the Project was determined to be significant. Project contributions at the following 9 of the 29 study intersections were determined to be less than significant:

- Cesar Chavez/Evans Avenue
- Bayshore/Hester/US-101 Southbound off-ramp
- Bayshore Boulevard/Tunnel Avenue
- Bayshore Boulevard/Arleta Street
- Bayshore Boulevard/Leland Avenue
- Bayshore Boulevard/Silver Avenue
- San Bruno/Silliman Street/US-101 Southbound Off-ramp
- Bayshore Boulevard/Old County Road
- Sierra Point/Lagoon Way

The poor operating conditions at these study area intersections would be due to traffic volume increases associated with other developments in the Project vicinity. Since the Project would not contribute significantly to the poor operating conditions, Project-related impacts at these locations would be less than significant.

Impact TR-10: Project and Cumulative Traffic Spillover

Impact TR-10 **Implementation of the Project would result in significant Project traffic spillover impacts and contribute to cumulative traffic spillover impacts. (Significant and Unavoidable with Mitigation)** ***[Criterion D.a]***

As described in Impact TR-3 through Impact TR-9, the Project would result in traffic volumes on area roadways, and most substantially on key north/south and east/west streets, which would also experience cumulative traffic growth. A concern in the Bayview Hunters Point neighborhood is the likelihood that existing residential streets would be "cut-throughs," shortcuts, or bypasses used by non-neighborhood traffic. Substantial amounts of cut-through traffic can result in impacts such as noise, safety impacts to pedestrians, impaired driveway access, interference with emergency vehicle access, increased dust, exhaust, and litter, and similar annoyances that adversely affect neighborhood character.

Within the Candlestick Point area, the Project would include new arterials connecting the Project site to Harney Way and US-101, as well as improvements to existing roadways such as Carroll Avenue, Gilman Avenue, and Jamestown Avenue. These improvements and new roadways would encourage residents and visitors to the Project to use the major arterials for access to and from the site, and would minimize the likelihood of cut-through traffic using residential streets in Bayview Hunters Point. Many of the residential

streets in the neighborhood do not cross Third Street to connect with Bayshore Boulevard, and therefore are not attractive bypass routes. In addition, left turns from Third Street are permitted at limited locations, with Carroll Avenue, Gilman Avenue and Jamestown Avenue anticipated to serve as the key east/west routes for Project traffic.

SFMTA has recently completed the *Bayview Traffic Calming Project*[124] which was a community-based process to identify problem locations with a study area roughly bounded by Jamestown Avenue, Third Street and Evans Avenue, and traffic calming measures. The study resulted in a list of traffic calming measures (such as gateway islands, speed humps, speed cushions, and traffic circles) along specific roadways. Implementation of improvements will be phased, and most cost-efficient solutions will be implemented first. Implementation of SFMTA's traffic calming recommendations for the Bayview (e.g., gateway islands, speed humps, speed cushions, and traffic circles) would discourage cut-through traffic.

In addition, the TDM Plan included as part of MM TR-2 would require annual monitoring of traffic conditions to review the effectiveness of the Project's transportation measures and other traffic calming measures implemented in the area to reduce congestion due to Project vehicle trips and to minimize traffic spillover to neighboring residential streets. If warranted, the On-site TDM Coordinator and SFMTA would consider implementation of additional traffic-calming and congestion-alleviating measures, such as adding additional lanes to the streets that approach Third Street, or other congested areas. However, given that many intersections at or near the Project site would be congested, it is likely that spillover impacts would still occur.

Implementation of mitigation measures MM TR-2 and MM TR-17 would likely reduce spillover impacts. Nonetheless, cut-through traffic may occur during periods of congestion, and the impacts associated with spillover traffic would remain significant and unavoidable.

Impact TR-11: Contributions to Cumulative Freeway Mainline and Weaving Segments Impacts

Impact TR-11 **Implementation of the Project would contribute to significant cumulative traffic impacts at four freeway segments. (Significant and Unavoidable)** ***[Criteria D.a, D.b, D.g]***

Freeway mainline level of service analysis was prepared for six locations on US-101 and four locations on I-280. For freeway mainline and ramp analyses, locations where the Project would result in a change from LOS D or better under 2030 No Project conditions to LOS E or LOS F, or from LOS E or LOS F, with the Project are identified as Project impacts. At locations that would operate at LOS E or LOS F under 2030 No Project conditions, and would continue to operate at LOS E or LOS F under Project conditions, the Project trips, as a percentage of total traffic volumes on the facility were reviewed to determine whether the increase would contribute considerably to total volumes on the facility.

Table III.D-13 (Mainline and Weaving Segment LOS Existing, 2030 No Project and 2030 Project Conditions) presents the results of the freeway mainline and weaving section analysis for existing, 2030 No Project and Project conditions. The Project would not cause any freeway mainline segment to deteriorate from acceptable LOS D or better to LOS E or F conditions, nor would it cause any segment to deteriorate

[124] *Bayview Traffic Calming Project* report, SFMTA, December 2006.

from LOS E to LOS F. However, the Project would contribute cumulatively considerable amounts of traffic to four freeway segments expected to operate at LOS E or LOS F under 2030 No Project conditions:

- US-101 northbound from Sierra Point to Alana/Geneva/Harney
- US-101 southbound from the I-80 Merge to Cesar Chavez
- US-101 southbound from Third/Bayshore to Alana/Geneva/Harney
- US-101 southbound from Alana/Geneva/Harney to Sierra Point

The Project's contributions to LOS E or LOS F conditions at the four freeway segments would be considered significant impacts. The projected poor operating conditions on the affected freeway segments could only be improved by creating additional mainline capacity, which would require substantial additional right-of-way acquisition, substantial freeway reconstruction, and associated substantial costs, and would require an associated interjurisdictional transportation improvement planning, prioritization and fair share funding formulation effort, that exceed the reasonable scope of the Project and reasonable control of the lead agency. More specifically:

- Freeway mainline widening to provide acceptable operational conditions would require acquisition of substantial right-of-way, and substantial and infeasible reconstruction of the affected freeway segments and associated over- and under-crossings, the cost of which far exceed the reasonable capability and responsibility of the Project, and for which no interjurisdictional fair share funding mechanism has been established
- The co-lead agencies (Planning Department and the Redevelopment Agency) do not have jurisdiction over the affected freeway right-of-way; the necessary right-of-way acquisition would necessarily involve Caltrans use of its eminent domain powers
- Expansion of portions of the affected freeway segments rights-of-way is constrained by existing topography
- Acquisition of portions of the necessary additional freeway mainline and associated under- and over-crossing right-of-way, and subsequent construction of the necessary freeway mainline widening and associated under- and over-crossings, could not be achieved without the displacement of existing businesses and households and demolition of existing residential and commercial establishments

Therefore, mitigation of this Project-related contribution to 2030 cumulative freeway congestion impacts to a less-than-significant level is considered to be infeasible. The Project-related contribution to this cumulative freeway segment congestion would be significant and unavoidable.

a. Segments operating at LOS E or LOS F conditions highlighted in bold
b. Density of vehicles per segment. pc/mi/ln = passenger cars per mile per lane.
c. For weaving sections service volume is reported as the measure of effectiveness. pc/h = passenger cars per hour
d. Weaving segments with speeds greater than 50 mph are outside of the realm of the weaving analysis, and thus are assumed to operate at LOS A.

Impact TR-12: Freeway Ramp Impacts

Impact TR-12 **Implementation of the Project would result in significant impacts at four freeway on-ramp locations. (Significant and Unavoidable) *[Criteria D.a, D.b, D.g]***

Table III.D-14 (Ramp Junction LOS Existing, 2030 No Project and 2030 Project Conditions) presents the results of the freeway ramps analysis for existing, 2030 No Project and Project conditions. The Project would cause four ramp junctions to deteriorate from acceptable LOS D or better to LOS E or F conditions or from LOS E to LOS F conditions:

- US-101 northbound on-ramp from Alemany Boulevard
- US-101 northbound on-ramp from Harney Way
- US-101 northbound on-ramp from Bayshore Boulevard/Cesar Chavez Street
- US-101 southbound on-ramp from Harney Way/Geneva Avenue

The Project would result in significant traffic impacts at these locations. Providing additional on-ramp lanes would simply increase the volume of traffic entering the freeway mainline segment, and may exacerbate the poor merging conditions. As noted in Impact TR-11, widening of US-101 to provide additional capacity would not be feasible. Thus, mitigation of these impacts has been determined to be infeasible. Project impacts at these locations would be significant and unavoidable.

Impact TR-13: Contributions to Cumulative Freeway Ramp Impacts

Impact TR-13 **Implementation of the Project would contribute to significant cumulative traffic impacts at 12 freeway ramp locations. (Significant and Unavoidable) *[Criteria D.a, D.b, D.g]***

The Project would also contribute cumulatively significant traffic increases at ramp junctions projected to operate at LOS E or LOS F under 2030 No Project conditions:

- US-101 northbound on-ramp from Sierra Point Parkway
- US-101 northbound on-ramp from Harney Way
- US-101 northbound on-ramp from Alemany Boulevard
- US-101 northbound on-ramp from Bayshore Boulevard/Cesar Chavez Street
- US-101 southbound off-ramp to Bayshore Boulevard/Cesar Chavez Street
- US-101 southbound on-ramp from Third Street/Bayshore Boulevard
- US-101 southbound on-ramp from Harney Way/Geneva Avenue
- US-101 southbound on-ramp from Sierra Point Parkway
- I-280 northbound off-ramp to Cesar Chavez Street
- I-280 northbound on-ramp from Indiana Street/25th Street
- I-280 southbound off-ramp to Pennsylvania Avenue/25th Street
- I-280 southbound on-ramp from Pennsylvania Avenue/25th Street

The Project would contribute to significantly cumulative traffic impacts at these locations. As described above in Impact TR-11, no feasible mitigation measures have been identified for the ramp junction locations. Therefore, the Project's contribution to cumulative impacts at the ramp locations would be significant and unavoidable.

Impact TR-14: Freeway Diverge Queue Storage Impacts

Impact TR-14 **Implementation of the Project could result in significant impacts related to freeway diverge queue storage at the Harney/US-101 Northbound Off-ramp. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

Table III.D-15 (Freeway Diverge Queue Storage Existing, 2030 No Project, and Project Conditions) presents the results of the ramp queue storage analysis for existing, 2030 No Project and Project conditions at 15 ramp locations. The Project would result in increases in traffic volumes that would cause the US-101 northbound off-ramp to Harney Way to experience queues that may extend back to the upstream freeway mainline segment which could result in unsafe conditions on the freeway mainline. The Project would therefore result in significant traffic impacts at this location.

SOURCE Fehr & Peers 2009

a. Ramps where there is potential for spillback are highlighted in bold.
b. 95th percentile queue is the length of queue that has a probability of 5 percent or less of being exceeded during the peak hour.
c. 2030 No Project conditions assume the reconstruction of the Harney Way Interchange as well as the connection of Geneva Avenue to the reconstructed interchange.

Mitigation measure MM TR-6 provides for the Project Applicant to pay a fair share toward the construction of the Harney Way Interchange Project, which could mitigate for the Project's contributions to this impact. Because the environmental review of the interchange project is not yet complete and the interchange project would be undertaken and approved by Caltrans, the implementation of mitigation measure MM TR-6 is uncertain and is outside the City/Agency jurisdiction. Therefore, Project-related impacts related to freeway diverge queue storage would be significant and unavoidable.

Impact TR-15: Contributions to Cumulative Freeway Diverge Queue Storage—Impacts

Impact TR-15 **Implementation of the Project could contribute to significant cumulative traffic impacts related to freeway diverge queue storage at some off-ramp locations (US-101 Northbound off-ramp to Harney Way, and US-101 Southbound Off-ramp to Harney Way/Geneva Avenue). (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

The Project would also contribute cumulatively significant traffic increases at off-ramps where queues may extend onto freeway mainline segments under year 2030 No Project Conditions:

- US-101 northbound off-ramp to Harney Way
- US-101 northbound off-ramp to Bayshore/Cesar Chavez
- US-101 southbound off-ramp to Harney/Geneva
- US-101 southbound off-ramp to Sierra Point/Lagoon
- I-280 northbound off-ramp to Cesar Chavez

Mitigation measure MM TR-6 provides for the Project Applicant to pay a fair share toward the construction of the Harney Way Interchange Project, which could mitigate for the Project's contributions to this impact. Because the environmental review of the interchange project is not yet complete and the interchange would be undertaken and approved by Caltrans, the implementation of mitigation measure MM TR-6 is uncertain and is outside the City/Agency jurisdiction. Therefore, Project's contribution to impacts related to freeway diverge queue storage would remain significant and unavoidable.

Impact TR-16: Project and Cumulative Impacts on Harney Way

- **Impact TR-16** **Implementation of the Project would increase traffic volumes and would not make a considerable contribution to cumulative traffic volumes on Harney Way. (Less than Significant with Mitigation)** ***[Criterion D.a]***

As part of the Project, the existing four-lane Harney Way would be widened to the north and south of its existing alignment, and would be rebuilt to contain between two and three travel lanes in each direction, turn pockets, two BRT-only lanes, Class I and Class II bicycle facilities, new sidewalks, as well as a landscaped area. Initially, the roadway would be rebuilt as a new five-lane roadway (with right-of-way reserved for additional lane(s) to be built in the future as needed for increased traffic levels). There would be two lanes in each direction, with eastbound left-turn lanes at Thomas Mellon Circle and Executive Park Boulevard East and a westbound right-turn lane at the Executive Park Boulevard East intersection. A Class II bicycle lane would be provided on the north side of the roadway, and a Class I bicycle path would be provided on the south side of the roadway. Two exclusive BRT lanes would be constructed adjacent to the roadway on its north side. After 49ers games at the new stadium, left turns would be prohibited at the two Harney Way intersections with Thomas Mellon Drive and Executive Park Boulevard for a period to allow for the configuration of the roadway to change to four westbound auto lanes and one eastbound auto lane. Under the final configuration, a portion of the landscaped area installed as part of the initial widening would be rebuilt to provide additional lane(s) from the proposed Harney Interchange east to Arelious Walker Drive, if necessary.

The initial phase of Harney Way widening would provide for additional landscaping area (i.e., in the area that would be converted to future travel lane(s)), which would make the pedestrian crossing of Harney Way shorter than with the final configuration. Under both the initial and final configurations, pedestrian crosswalks would be provided at the signalized intersections of Harney Way with Jamestown Avenue, Executive Park East and Thomas Mellon Drive, and pedestrian crossing times would be provided consistent with the requirements of the California Manual of Uniform Traffic Control Devices (MUTCD).

Since the need for the final lane configuration on Harney Way would depend on the rate of buildout of the Project, as well as the rate and extent of buildout of cumulative development in the area such as the Executive Park development, further studies would be needed to determine if and when additional travel lanes are needed to accommodate the traffic volume demand.

- *MM TR-16* *Widen Harney Way as shown in Figure 5 in the Transportation Study. Prior to issuance of the grading permit for Development Phase 2 of the Project, the Project Applicant shall widen Harney Way as shown in Figure 5 in the Transportation Study. Prior to the issuance of grading permits for Phases 2, 3 and 4, the Project Applicant shall fund a study to evaluate traffic conditions on Harney Way and determine whether additional traffic associated with the next phase of development would result in the need to modify Harney Way to its ultimate configuration, as shown in Figure 6 in the Transportation Study, unless this ultimate configuration has already been built. This study shall be conducted in collaboration with the SFMTA, which would be responsible for making final determinations regarding the ultimate configuration. The ultimate configuration would be linked to intersection performance, and it would be required when study results indicate intersection LOS at one or more of the three signalized intersection on Harney Way at mid-LOS D (i.e., at an average delay per vehicle of more than 45 seconds per vehicle). If the study and SFMTA conclude that reconfiguration would be necessary to accommodate traffic demands associated with the next phase of development, the Project Applicant shall be responsible to fund and complete construction of the improvements prior to occupancy of the next phase.*

With implementation of the mitigation measure MM TR-16, Harney Way would be widened and improved to its final configuration when traffic demand warrants additional capacity. Therefore, potential Project impacts and Project contribution to cumulative impacts on traffic capacity on Harney Way would be reduced to less than significant as demonstrated in Table III.D-10, Table III.D-11, and Table III.D-12.

Impact TR-17: Project and Cumulative Transit Capacity Impacts

Impact TR-17 **Implementation of the Project would not exceed available transit capacity, because the Project and the Project's contribution to cumulative demand would be accommodated within the existing transit service, proposed TEP service, plus the service proposed as part of the Project. (Less than Significant with Mitigation) *[Criterion D.f]***

The Project would include substantial improvements to transit service in the Hunters Point Shipyard, Candlestick Point, and Bayview neighborhoods, in addition to improvements currently proposed as part of SFMTA's Transit Effectiveness Program. As discussed in Impact TR-18, the Project improvements to transit service, combined with existing service and proposed TEP improvements, would provide transit capacity to accommodate the new transit riders generated by the Project and by cumulative development.

Although the Project Description includes a plan for increased transit service to the study area (described in the "Analytic Method" section in Section III.D.4), because the final Transit Plan has not been formally approved by SFMTA, mitigation measure MM TR-17 is required to ensure the final Transit Plan will be prepared and implemented. Thus, mitigation measure MM TR-17 below requires preparation, approval, and implementation of the final transit-operating plan.

MM TR-17 *Implement the Project's Transit Operating Plan. The Project Applicant shall work with SFMTA to develop and implement the Project's Transit Operating Plan. Elements of the Project Transit Operating Plan shall include:*

- *Extension of the 24-Divisadero, the 44-O'Shaughnessy, and the 48-Quintara-24th Street into Hunters Point Shipyard.*
- *Increased frequency on the 24-Divisadero to 6 minutes in the AM and PM peak periods. Extension of the 29-Sunset from its current terminus near the Alice Griffith housing development,*

near Gilman Avenue and Giants Drive, into the proposed Candlestick Point retail area. The 29-Sunset would operate a short line between Candlestick Point and the Balboa Park BART station. This would increase frequencies on the 29-Sunset by reducing headways between buses from 10 minutes to 5 minutes during the AM and PM peak periods between Candlestick Point and the Balboa BART station. Every other bus would continue to serve the Sunset District (to the proposed terminus at Lincoln Drive and Pershing Drive in the Presidio) at 10-minute headways.

- *Convert T-Third service between Bayview and Chinatown via the Central Subway from one-car to two-car trains or comparable service improvement. Extension of the 28L-19th Avenue Limited from its TEP-proposed terminus on Geneva Avenue, just east of Mission Street, into the Hunters Point Shipyard transit center. The 28L-19th Avenue Limited would travel along Geneva Avenue across US-101 via the proposed Geneva Avenue extension and new interchange with US-101, to Harney Way. East of Bayshore Boulevard, the 28L-19th Avenue Limited would operate as BRT, traveling in exclusive bus lanes into the Candlestick Point area. The BRT route would travel through the Candlestick Point retail corridor, and cross over Yosemite Slough into the Hunters Point Shipyard transit center.*
- *The 28L-19th Avenue Limited would operate a short line to the Balboa Park BART station. This would increase frequencies on the 28L-19th Avenue Limited by reducing headways between buses from 10 minutes to 5 minutes for the segment between Hunters Point Shipyard and the Balboa Park BART station. Every other bus would continue to the Sunset District (to the proposed terminus at North Point Street and Van Ness Avenue) at 10-minute headways. If the TEP-proposed extension of the 28L has not been implemented by the SFMTA by the time implementation of this measure is called for in the Transportation Study (Appendix D), the Project Applicant shall fund the extension of that line between its existing terminus and Bayshore Boulevard.*
- *New CPX-Candlestick Express to downtown serving the Candlestick Point site, traveling along Harney Way (with potential stops at Executive Park), before traveling on US-101 toward downtown, terminating at the Transbay Terminal.*
- *New HPX-Hunters Point Shipyard Express to downtown serving the Hunters Point Shipyard site, traveling from the Hunters Point Shipyard Transit Center, along Innes Avenue, with stops at the India Basin and Hunters View areas, before continuing along Evans Avenue to Third Street, eventually entering I-280 northbound at 25th/Indiana. The HPX would continue non-stop to the Transbay Terminal in Downtown San Francisco.*

Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources. With implementation of the Transit Plan, Project-generated transit trips would be accommodated within the existing and proposed transit capacity, and therefore Project impacts on transit capacity would be less than significant.

Impact TR-18: Project and Cumulative Transit Impacts— Ridership and Capacity Utilization at Study Area Cordons

Impact TR-18 **With full implementation of the Project with proposed transit improvements, the Project demand and the Project's contribution to cumulative demand would not exceed the proposed transit system's capacity at the study area cordons. (Less than Significant with Mitigation) *[Criteria D.f, D.i]***

Full implementation of the Project's transit improvements would result in substantial increases in capacity for both the north/south and east/west lines serving the Project vicinity. Table III.D-16 (Comparison of

Capacity at Study Area Cordons Existing, 2030 No Project and Project Conditions— Weekday AM and PM Peak Hours) presents a comparison of the overall cordon capacity for Muni service for existing conditions, 2030 No Project conditions (with the TEP improvements assumed to be in place), and the Project conditions. Specifically, the Project would more than double overall east/west transit capacity at the cordon just east of Third Street (primarily due to the new BRT route). North-south transit capacity to the north of the Project site would double, and capacity to the south of the Project site would increase by more than 80 percent over the transit service proposed by the TEP.

Table III.D-16 Comparison of Capacity at Study Area Cordons Existing, 2030 No Project and Project Conditions— Weekday AM and PM Peak Hours

Cordon	*Existing Capacity*[a]	*2030 No Project TEP Capacity*[b]	*2030 Project Capacity*[c]
East of Third Cordon	1,715	1,715	3,988
North Cordon	2,085	1,769	3,546
West Cordon	2,033	2,224	4,002

SOURCE: SFMTA, Fehr & Peers

a. Capacity presented in riders per hour. Inbound and Outbound Capacity the same—one direction of capacity presented.
b. Year 2030 No Project reflects implementation of TEP recommendations for lines serving the study area. 19-Polk will no longer serve the study area, but will be replaced by the 48-Quintara, and the 56-Rutland will be eliminated.
c. Project conditions reflect TEP, plus Project improvements.

Table III.D-17 (Project Transit Trips and Capacity Utilization at Study Area Cordons Existing, 2030 No Project and Project Conditions—Weekday AM and PM Peak Hours) summarizes the capacity utilization for each of the three study area cordons for the AM and PM peak hours for the existing, 2030 No Project and Project conditions. With the transit capacity increases proposed by the Project, the total transit travel demand on Muni under Project conditions could be accommodated for each of the three cordons during the AM and PM peak hours. All three cordons would operate at less than Muni's 85 percent capacity utilization standards.

SOURCE: Fehr & Peers.

If Project-related transit capacity improvements are not provided, then only the capacity presented in Table III.D-16 for the 2030 No Project conditions would be available to accommodate Project and cumulative transit ridership. As indicated in Table III.D-17, under 2030 No Project conditions, the capacity utilization at the study area cordons is projected to exceed Muni's 85 percent capacity utilization standard. With the addition of Project-generated transit trips, the severity of the standard exceedance would increase, and would result in significant impacts. Because the final transit plan has not been formally approved by SFMTA, mitigation measure MM TR-17 is required to ensure the final Transit Plan will be prepared and implemented.

With implementation of mitigation measure MM TR-17, the Project's impacts and the Project's contribution to cumulative impacts on transit capacity at the study area cordons would be less than significant.

Impact TR-19: Project and Cumulative Impacts—Transit Capacity Utilization at Downtown Screenlines

Impact TR-19 **Implementation of the Project would add transit trips and the Project's contribution to cumulative transit trips to the Downtown Screenlines would not increase demands in excess of available capacity. (Less than Significant)** ***[Criterion D.f, D.i]***

Project transit improvements would not affect the capacity at the four Downtown Screenlines; however, a portion of the Project trips would cross the Southwest screenline and contribute to total ridership at this location. Table III.D-18 (Project Transit Trips and Capacity Utilization at Downtown Screenlines Existing, 2030 No Project and Project Conditions—Weekday AM and PM Peak Hours) summarizes the capacity utilization for the downtown screenlines for the AM and PM peak hours for the Project conditions. The Project would only add peak-direction riders through the Southeast downtown screenline. Ridership on other screenlines would remain unchanged from 2030 No Project conditions. With the addition of Project

trips all downtown screenlines would continue to operate with Muni's 85 percent utilization standard. Therefore, Project impacts on transit capacity at the Downtown Screenlines would be less than significant.

Impact TR-20: Project and Cumulative Impacts—Transit Capacity and Utilization at Regional Screenlines

Impact TR-20 **Implementation of the Project would add transit trips and the Project's contribution to cumulative transit trips would not contribute significantly to Regional Screenlines conditions where overall ridership is projected to exceed available capacity. (Less than Significant)** ***[Criterion D.f, D.i]***

Project transit improvements would not affect the capacity of the Regional Screenlines; however, a portion of the Project trips would cross the East Bay, North Bay and South Bay screenlines and contribute to total ridership at these locations. Table III.D-19 (Project Transit Trips and Capacity Utilization at Regional Screenlines Project and Project Variants—Weekday AM and PM Peak Hours) summarizes the capacity utilization for the regional transit provider screenlines for the AM and PM peak hours for existing, 2030 No Project, and Project conditions. The Project would contribute small ridership increases to regional transit, with the greatest increase to and from the South Bay. The Project would contribute slightly fewer trips to the South Bay in the off-peak directions (southbound in the AM peak hour and northbound in the PM peak hour) than in the peak directions. Off-peak direction ridership would remain within available capacity in the AM and PM peak hours.

SOURCE: Fehr & Peers.

BART to the East Bay and Golden Gate Transit to the North Bay are projected to exceed operating standards under 2030 conditions during both the weekday AM and PM peak hours. Project contributions to these Screenlines would be minimal (fewer than 50 transit riders). Therefore, the Project impacts and the Project's contribution to cumulative impacts on Regional transit capacity would be less than significant.

Impact TR-21: Project and Cumulative Transit Operations Impacts—9-San Bruno

Impact TR-21 **Implementation of the Project could increase congestion and contribute to cumulative conditions at intersections along San Bruno Avenue, which would increase travel times and impact operations of the 9-San Bruno. (Significant and Unavoidable with Mitigation) *[Criterion D.i]***

Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 9-San Bruno. Within the study area, the 9-San Bruno would experience substantial delays at key intersections along San Bruno Avenue, including at Silver Avenue, Silliman Avenue, Paul Avenue/Dwight Street, and at Mansell Street. Overall, the Project-related congestion would add up to 8 minutes of delay per bus during peak hours. The provision of transit-only lanes on San Bruno Avenue, and other transit-priority treatments would reduce travel time delays and impacts on this line.

MM TR-21.1 *Maintain the proposed headways of the 9-San Bruno. To address Project impacts to the 9-San Bruno, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the San Bruno Avenue corridor, generally between Campbell Avenue and Silver Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 9-San Bruno.*

- *Install a transit-only lane on northbound San Bruno Avenue for the one-block section (400 feet) between Silliman Street and Silver Avenue. This would involve removal of five metered spaces on the east side of San Bruno Avenue, just south of Silver Avenue. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.*
- *Install a transit-only lane on southbound San Bruno Avenue at the approach to Dwight Street/Paul Avenue. This lane would function as a so-called "queue-jump" lane, allowing buses to bypass queues on southbound San Bruno Avenue at the intersection. The lane should begin approximately 200 feet north of Dwight Street and extend one block (about 300 feet) south of Paul Avenue to Olmstead Street. This would involve the removal of up to 20 on-street parking spaces on the west side of San Bruno Avenue. This treatment could be limited to peak hours only, which would minimize the impact of the parking loss. The segment of San Bruno Avenue between Dwight Street and Olmstead Street is designated as Bicycle Routes #705 and 5 (Class III signed routes).*
- *At the intersection of San Bruno/Silver install signal priority treatments on westbound Silver Avenue, where buses waiting to turn left from Silver Avenue onto southbound San Bruno Avenue must currently wait through almost an entire signal cycle due to the heavy oncoming traffic on eastbound Silver Avenue. Installation of a transit signal pre-emption at this location that provides a "green" signal for westbound vehicles but holds eastbound vehicles when buses are present would allow transit vehicles to turn left onto San Bruno Avenue without having to wait for opposing eastbound through traffic to clear.*

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include comprehensive replacement of stop-controlled intersections with interconnected traffic signals equipped with transit priority elements.

MM TR-21.2 *Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Should mitigation measure MM TR-21.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 9-San Bruno. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

- The treatments for Impact TR-21 contained in mitigation measure MM TR-21.1 combined could reduce AM peak hour travel times by 4 minutes and 6 seconds in the northbound direction, and 6 minutes 18 seconds in the southbound direction. During the PM peak hour, these treatments could reduce PM peak hour travel times by 4 minutes 6 seconds in the northbound direction and by 8 minutes in the southbound direction. With the combination of mitigation measures, transit travel times in each direction and during each peak period would be similar to 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

  Implementation of mitigation measure MM TR-21.2, on the other hand, would allow operation of headways as described under MM TR-17. However, given the congestion along the San Bruno Avenue corridor, implementation of MM TR-21.2 alone, without MM TR-21.1, might not be sufficient to reduce the impact to less-than-significant levels.

  Implementation of MM TR-21.1 would exacerbate LOS F conditions at the intersections of San Bruno/Silver, San Bruno/Silliman/US-101 Southbound off-ramp, and San Bruno/Paul that were identified as having significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to impacts addressed in this Section III.D.4 regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation. Impacts of the mitigation measures regarding air quality and noise levels would be similar to those identified in Section III.H (Air Quality) and Section III.I (Noise and Vibration), respectively.

  Because a feasibility study of the improvements contemplated in mitigation measure MM TR-21.1 would be required, implementation of MM TR-21.1 is uncertain. Because implementation of MM TR-21.2 alone, without MM TR-21.1, might not be sufficient to reduce the impacts on the 9-San Bruno to a less-than-significant level, the Project impacts on the 9-San Bruno would remain significant and unavoidable.

Impact TR-22: Project and Cumulative Transit Operations Impacts—23-Monterey, 24-Divisadero & 44-O'Shaugnessy

Impact TR-22 **Implementation of the Project would contribute traffic to cumulative conditions at intersections along Palou Avenue, which would increase travel times and impact operations of the 23-Monterey, 24-Divisadero, and the 44-O'Shaughnessy. (Significant and Unavoidable with Mitigation)** ***[Criterion D.i]***

Project-related transit delays due to congestion on study area roadways and passenger boarding delays associated with increased ridership would result in significant impacts on the operation of the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy. Along Palou Avenue these lines would be affected by the substantial congestion projected at the intersection of Third/Palou and the queues that would extend to the east and west of Third Street. Overall, the Project-related congestion would add up to 9 minutes of delay per bus during peak hours. The provision of transit-only lanes on Palou Avenue would reduce travel time delays and impacts on these lines.

MM TR-22.1 *Maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy. To address Project impacts to the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Palou Avenue corridor, generally between Griffith Street and Newhall Street. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 23-Monterey, 24-Divisidero and the 44-O'Shaughnessy.*

- *Convert one of the two westbound travel lanes on Palou Avenue between Keith Street and Newhall Street (three blocks) to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Because the westbound lanes between Third Street and Newhall Street are relatively narrow, parking would likely need to be prohibited on the north side of Palou Avenue between Third Street and Newhall Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane.*
- *Convert one of the two eastbound travel lanes on Palou Avenue between Newhall Street and Third Street (one block) to a transit-only lane at all times. Because the eastbound travel lanes between Newhall Street are relatively narrow, parking would likely need to be prohibited on the south side of Palou Avenue between Newhall Street and Third Street (approximately 600 feet) during peak periods to maximize the effectiveness of the transit-only lane. In the eastbound direction, east of Third Street, buses would re-enter the single mixed-flow traffic lane at the bus stop on the far (east) side of Third Street.*
- *There are currently pedestrian corner bulbs on the northwest and southwest corners of the intersection of Palou Avenue and Third Street. In order to accommodate the transit-only lanes west of Third Street, these bulbouts would be reconfigured or removed. Although removing pedestrian bulb-outs may increase pedestrian crossing distances and is generally inconsistent with the City's desire to prioritize pedestrian activity, in this case, the improvement would offer substantial benefits to transit travel times by allowing a transit-only lane through a congested intersection. This would be consistent with the City's transit-first policy.*

- *During the PM peak period only, prohibit parking on westbound Palou Avenue for the four-block segment between Griffith Street/Crisp Avenue and Keith Street, to provide for a PM peak period curb transit-only lane along this segment. This would create a continuous westbound transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street during the PM peak period.*
- *As an alternative to the bulleted measures above, narrow the existing sidewalks on Palou Avenue from Third Street to Crisp Avenue (seven blocks) from 15 feet to 12 feet in width. The pedestrian bulb-outs on the west side of Third Street would be removed. The resulting 12-foot-wide sidewalks would be consistent with the Better Streets Plan guidelines. The reduction in sidewalk width would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Palou Avenue. This would preserve on-street parking along the corridor and provide a seven-block transit-only lane on Palou Avenue between Griffith Street/Crisp Avenue and Newhall Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Subsequent to publication of the Draft EIR, SFMTA and the Project Applicant conducted an evaluation of this alternative measure and determined that it is a feasible and viable alternative to the four bulleted items above.*

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include signal priority treatments at other signalized intersections including at Bayshore/Cortland, Bayshore/Industrial, and Bayshore/Oakdale.

MM TR-22.2 *<u>Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O'Shaughnessy.</u> Should mitigation measure MM TR-22.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 23-Monterey, the 24-Divisadero and the 44-O'Shaughnessy. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

Implementation of the transit-only lanes would reduce travel times on the three routes:

- **23-Monterey**—The Project would not result in Project-specific impacts to the 23-Monterey because increases in Project-generated vehicles would not increase intersection delay and transit travel times such that additional transit vehicles would be required to maintain the proposed headways. However, it would contribute to cumulatively significant impacts identified for the 2030 No Project condition. The mitigation measures identified for Palou Avenue would improve service on the 23-Monterey, but the route would continue to experience cumulatively significant impacts.
- **24-Divisadero**—Mitigation measure MM TR-22.1 could reduce AM peak hour travel times by 4 minutes and 43 seconds in the westbound direction and by 4 minutes in the eastbound direction. During the PM peak hour travel times could be reduced by 8 minutes and 16 seconds in the westbound direction and by 4 minutes in the eastbound direction. In each direction during the PM peak hour, the transit travel times with the Project might remain greater than the 2030 No Project travel times by more than ½ headway, and therefore additional transit vehicles may still be required.
- **44-O'Shaughnessy**—The improvements along Palou Avenue between Keith Street and Newhall Street would improve the travel times on the 44-O'Shaughnessy such that in each direction and peak hour, the transit travel times with the Project would not be greater than the 2030 No Project travel

times by more than ½ headway, and therefore additional vehicles would not be required to maintain the proposed headways.

- With the treatments identified in mitigation measure MM TR-22.1, transit travel times in some directions and during some peak periods would be no greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of mitigation measure MM TR-22.2, on the other hand, would allow operation of headways as described under MM TR-17. However, given the congestion along the Palou Avenue corridor, implementation of MM TR-22.2 alone, without MM TR-22.1, might not be sufficient to reduce the impact to less-than-significant levels.

Implementation of MM TR-22.1 would also exacerbate automobile LOS F conditions at the intersection of Third/Palou that would have significant and unavoidable impacts under Project conditions. In addition, these measures may result in new significant and unavoidable impacts at intersections along Palou Avenue (i.e., at Griffith/Crisp, Ingalls, Jennings, Lane, Keith Streets). Additional impacts of these mitigation measures would be similar to impacts addressed in this Section III.D.4 regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation. Impacts of the mitigation measures regarding air quality and noise levels would be similar to those identified in Section III.H and Section III.I, respectively.

Because a feasibility study of the improvements contemplated in mitigation measure MM TR-22.1 would be required, implementation of MM TR-22.1 is uncertain. Because implementation of MM TR-22.2 alone, without MM TR-22.1, might not be sufficient to reduce the impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy to a less-than-significant level, the Project impacts on the 23-Monterey, 24-Divisadero, and 44-O'Shaughnessy would remain significant and unavoidable.

Impact TR-23: Project and Cumulative Transit Operations Impacts—29-Sunset

Impact TR-23 **Implementation of the Project would increase congestion at intersections along Gilman Avenue and Paul Avenue, which would increase travel times and would impact operations of the 29-Sunset. (Significant and Unavoidable with Mitigation) *[Criterion D.i]***

Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 29-Sunset. Within the study area, the 29-Sunset would experience substantial delays at key intersections along Gilman Avenue and Paul Avenue, particularly at Third Street and Bayshore Boulevard. Overall, the Project-related
- congestion would add up to 21 minutes of delay per bus during peak hours. The provision of transit-only lanes on Gilman Avenue and Paul Avenue would reduce travel time delays and impacts on this line.

MM TR-23.1 *<u>Maintain the proposed headways of the 29-Sunset.</u> To address Project impacts to the 29-Sunset, prior*
- *to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements*

which could reduce Project impacts on transit operations along the Gilman Avenue and Paul Avenue corridor, generally between Arelious Walker Drive and Bayshore Boulevard. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 29-Sunset.

- *For the five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, prohibit on-street parking on westbound Gilman Avenue during the AM and PM peak periods to provide for three westbound travel lanes. During the peak periods convert one of the three westbound travel lanes to transit-only. During off-peak periods, parking would be allowed, and buses would travel in one of the two mixed-flow lanes. The peak period transit lanes would impact 90 parking spaces.*
- *For the same five-block segment of Gilman Avenue between Arelious Walker Drive and Third Street, restripe the eastbound direction to provide two travel lanes, one of which would accommodate on-street parking and one of which would be a mixed-flow travel lane. During the AM and PM peak periods, prohibit on-street parking in the eastbound direction, and operate one of the two eastbound lanes as transit-only lanes. The peak period transit lanes would impact 80 parking spaces.*
- *As an alternative to the two bulleted measures above, convert one of the travel lanes in each direction on Gilman Avenue from Third Street to Griffith Street to transit-only. This would allow for the provision of a 7-foot-wide on-street parking lane, an 11-foot-wide transit-only lane, and a 10-foot-wide mixed-flow lane in each direction on Gilman Avenue. This would preserve on-street parking along the corridor and provide four-block transit-only lanes on Gilman Avenue between Griffith Street and Third Street. Treatment for transit-only lanes can range from striping to physical elevation changes to protect right-of-way from mixed-flow traffic. Subsequent to publication of the Draft EIR, SFMTA and the Project Applicant conducted an evaluation of this alternative measure and determined that is a feasible and viable alternative to the two bulleted items above,*
- *Prohibit on-street parking on the north side of Paul Avenue, between Third Street and Bayshore Boulevard to create two westbound through lanes. Convert one westbound through lane to transit-only in the AM and PM peak periods. The peak period transit-only lane would impact 40 parking spaces. At the intersection of Paul Avenue and Bayshore Avenue, provide transit signal priority treatment (i.e., queue jump) to allow transit vehicles to maneuver into the mixed flow left-hand lane, facilitating a left-turn movement immediately west of Bayshore Boulevard from westbound Paul Avenue to southbound San Bruno.*

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include transit priority treatments on San Bruno Avenue, on the portions where the 29-Sunset travels.

MM TR-23.2 *<u>Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset.</u> Should mitigation measure MM TR-23.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 29-Sunset. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

- Implementation of transit-only lanes identified in mitigation measure MM TR-23.1 could reduce AM peak hour transit travel times by 5 minutes and 17 seconds in the westbound direction and 5 minutes and 59 seconds in the eastbound direction. During the PM peak, these measures would reduce transit travel times by 6 minutes and 25seconds in the westbound direction and by 1 minute in the eastbound direction. With the mitigation measures, transit travel times would remain greater than for 2030 No Project conditions. Because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

- Given the congestion along the Gilman Avenue corridor, implementation of MM TR-23.2 alone, without MM TR-23.1, might not be sufficient to reduce the impact to less-than-significant levels.

Implementation of MM TR-23.1 would also exacerbate automobile LOS F conditions at the intersection of Third/Paul and Paul/Bayshore that was identified as having significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to impacts addressed in this Section III.D.4 regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation. Impacts of the mitigation measures regarding air quality and noise levels would be similar to those identified in Section III.H and Section III.I, respectively.

Because a feasibility study of the improvements contemplated in mitigation measure MM TR-23.1 would be required, implementation of MM TR-23.1 is uncertain. Because implementation of MM TR-23.2 alone, without MM TR-23.1, might not be sufficient to reduce the impacts on the 29-Sunset to a less-than-significant level, the Project impacts on the 29-Sunset would remain significant and unavoidable.

Impact TR-24: Project and Cumulative Impacts to Transit Operations—48-Quintara-24th Street

Impact TR-24 **Implementation of the Project would increase congestion at intersections along Evans Avenue, which would increase travel times and impact operations of the 48-Quintara-24th Street. (Significant and Unavoidable with Mitigation)** ***[Criterion D.i]***

Project-related transit delays due to congestion on study area roadways and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the 48-Quintara-24th Street. Within the study area, the 48-Quintara-24th Street would experience substantial delays at key intersections along Evans Avenue, particularly at the key intersections with Third Street, Napoleon/Toland

- Streets and at Cesar Chavez Street. Overall, the Project-related congestion would add up to 8 minutes of delay per bus during peak hours. The provision of transit-only lanes on Evans Avenue and other transit-priority treatments would reduce travel time delays and impacts on this line.

- *MM TR-24.1* *Maintain the proposed headways of the 48-Quintara-24th Street. To address Project impacts to the 48-Quintara-24th Street, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvements which could reduce Project impacts on transit operations along the Evans Avenue corridor, generally between Hunters Point Boulevard and Napoleon Street. The study shall*

create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the 48-Quintara-24th Street.

- *On Evans Avenue, between Jennings Street and Napoleon Street (a nine-block segment—about 6,000 feet), convert one of the two travel lanes in each direction to a transit-only lane at all times. Treatment for transit-only lanes can range from striping to physical elevation changes or barriers to protect transit right-of-way from mixed-flow traffic.*

The Project Applicant shall fully fund the costs of implementing the transit priority improvements (either the improvements identified above, or alternative improvements of equal or greater effectiveness and comparable cost) as determined by the study and the monitoring program. Other options to be evaluated in the study could include extension of transit only lanes in one or both directions between Napoleon Street and Cesar Chavez Street or onto Hunters Point Boulevard and Innes Avenue.

MM TR-24.2 *Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Should mitigation measure MM TR-24.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 48-Quintara-24th Street. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

Provision of the transit-only lane on Evans Avenue, as identified in mitigation measure MM TR-24.1 would reduce AM peak hour transit travel times by 104 seconds in the westbound direction, and by 3 minutes and 50 seconds in the eastbound direction. During the PM peak hour transit travel times would be reduced by 58 seconds in the westbound direction, and by 13 minutes and 31 seconds in the eastbound direction. With the combination of mitigation measures, transit travel times in each direction and during each peak period would be no more than ½ headway greater than for 2030 No Project conditions. However, because 2030 No Project conditions constitute adverse delays to transit service, cumulative adverse delays to transit service would occur even with these Project transit mitigation measures. Because adverse transit delays affecting this line are generated by adverse traffic congestion to which the Project has a considerable contribution, the Project also has a cumulatively considerable contribution to adverse transit delays.

Implementation of mitigation measure MM TR-24.2, on the other hand, would allow operation of headways as described under MM TR-17. However, given the congestion along Evans Avenue, implementation of MM TR-24.2 alone, without MM TR-24.1, might not be sufficient to reduce the impact to less-than-significant levels.

Implementation of mitigation measure MM TR-24.1 would also exacerbate automobile LOS F conditions at some intersections that were identified as significant and unavoidable impacts. In addition, it would ultimately be at SFMTA's discretion whether the transit-only lane would be implemented in the center lanes or in the lanes adjacent to the curb. Implementation of center-running lanes may have some operational benefit (depending on the results of feasibility study to be conducted if conditions warrant implementation of this measure), center-running lanes may result in loss of some additional on-street parking near stop platforms. Additional impacts of these mitigation measures would be similar to impacts addressed in this Section III.D.4 regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation. Impacts of the mitigation measures regarding air quality and noise levels would be similar to those identified in Section III.H and Section III.I, respectively.

Because a feasibility study of the improvements contemplated in mitigation measure MM TR-24.1 would be required, implementation of MM TR-24.1 is uncertain. Because implementation of MM TR-24.2 alone, without MM TR-24.1, might not be sufficient to reduce the impacts on the 48-Quintara-24th Street to a less-than-significant level, the Project impacts on the 48-Quintara-24th Street would remain significant and unavoidable.

Impact TR-25: Project and Cumulative Impacts to Transit Operations: 54-Felton

Impact TR-25 **Implementation of the Project would increase congestion at intersections in the study area, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the 54-Felton. (Significant and Unavoidable with Mitigation) *[Criterion D.i]***

Additional traffic congestion associated with Project vehicle trips would result in significant impacts to the operations of the 54-Felton, particularly during the PM peak hour. Overall, the Project-related congestion would add up to 6 minutes of delay per bus during peak hours. However, unlike many of the other transit routes within the study area, the 54-Felton provides a relatively circuitous neighborhood collector service, which typically includes a number of turns and short distances on individual streets. As a result, mitigation measures that provide transit-only lanes are not practical due to the difficulty of accommodating turning movements at intersections. Further, although the 54-Felton would travel along Third Street between Palou Avenue and Hudson Street, relocating the 54-Felton to the dedicated light rail transit right-of-way in the center of Third Street would not be feasible because the train platforms are high-floor and on the left-hand side and buses load and unload from the right-hand side at low-floor stops. There is not adequate space in the existing right-of-way to provide new platforms to load and unload passengers from a bus in this area.

MM TR-25 *Purchase additional transit vehicles to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. SFMTA shall purchase additional transit vehicles to mitigate the Project impacts and Project contribution to cumulative impacts to headways on 54-Felton. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

While the provision of additional transit vehicles for the 54-Felton would reduce impacts associated with increased travel times, the transit vehicles would still be subject to delays resulting from increased congestion, and therefore Project impacts on the 54-Felton would remain significant and unavoidable.

Impact TR-26: Project and Cumulative Impacts to Transit Operations: T-Third

Impact TR-26 **Implementation of the Project would increase congestion at intersections along Third Street, and make a considerable contribution to cumulative impacts that would increase travel times and impact operations of the T-Third. (Significant and Unavoidable with Mitigation) *[Criterion D.i]***

Project-related transit delays due to congestion on Third Street and passenger loading delays associated with increased ridership would result in significant impacts on the operation of the T-Third. Within the study area, the T-Third would primarily experience delays related to increased traffic volumes within the segment between Thomas Avenue and Kirkwood Avenue where the light rail operates within a mixed-flow travel lane. Along the remainder of Third Street and Bayshore Boulevard, the T-Third operates within an exclusive right-of-way. Overall, the Project-related congestion would add up to 3 minutes of delay per

- vehicle during peak hours. Providing exclusive right-of-way for the T-Third in the segment between Thomas Avenue and Kirkwood Avenue would reduce travel time delays for the T-Third.

- *MM TR-26.1* *Maintain the proposed headways of the T-Third. To address Project impacts to the T-Third, prior to issuance of a grading permit for Development Phase 1, the Project Applicant in cooperation with SFMTA shall conduct a study to evaluate the effectiveness and feasibility of the following improvement that could reduce Project impacts on transit operations along Third Street between Thomas Avenue and Kirkwood Avenue. The study shall create a monitoring program to determine the implementation extent and schedule (as identified below) to maintain the proposed headways of the T-Third.*

  - *Reconfigure the section of Third Street between Thomas Avenue and Kirkwood Avenue (9 blocks) where the light rail vehicles currently share the travel lane with auto traffic to provide a dedicated transit right-of-way, consistent with the rest of the route. This would require either removal of one travel lane in each direction on Third Street, or removal of on-street parking and some sidewalk bulbouts. In addition, left-turns from Third Street in this segment would be restricted in both directions. Treatment for transit-only lanes can range from striping to physical elevation or barriers to protect transit right-of-way from mixed-flow traffic.*

- *Implementation of the roadway reconfiguration shall be the responsibility of SFMTA, and shall be implemented when the results of the study described above indicate transit improvements are necessary. The Project Applicant shall fully fund the costs of implementing the transit priority improvements prior to approval of subsequent phases of development.*

MM TR-26.2 *Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Should mitigation measure MM TR-26.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the T-Third. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

Providing an exclusive right-of-way for the T-Third as identified in mitigation measure MM TR-26.1 above, would reduce all delays associated with traffic congestion on Third Street during both AM and PM peak periods, such that transit travel times in year 2030 with the Project would be less than under than existing conditions.

Implementation of mitigation measure MM TR-26.2, on the other hand, would allow operation of headways as described under MM TR-17. However, given the congestion along Third Street, implementation of MM TR-26.2 alone, without MM TR-26.1, might not be sufficient to reduce the impact to less-than-significant levels.

- Implementation of mitigation measure MM TR-26.1 would also exacerbate automobile LOS F conditions at intersections along Third Street that were identified as significant and unavoidable impacts. Additional impacts of these mitigation measures would be similar to impacts addressed in this Section III.D.4 regarding traffic circulation, parking supply, loading supply and operations, and bicycle circulation. Impacts of the mitigation measures regarding air quality and noise levels would be similar to those identified in Section III.H and Section III.I, respectively.

Because a feasibility study of the improvements contemplated in mitigation measure MM TR-26.1 would be required, implementation of MM TR-26.1 is uncertain. Because implementation of MM TR-26.2 alone,

without MM TR-26.1, might not be sufficient to reduce the impacts on the T-Third to a less-than-significant level, the Project impacts on the T-Third would remain significant and unavoidable.

Impact TR-27: Project Impacts to Transit Operations: 28L-19th Avenue/Geneva Limited

Impact TR-27 **Implementation of the Project could increase congestion at the intersection of Geneva Avenue and Bayshore Boulevard. This would increase travel times and impact operations of the 28L-19th Avenue/Geneva Limited. (Significant and Unavoidable with Mitigation)** ***[Criterion D.i]***

Increased congestion associated with Project vehicle trips would impact the operations of the 28L-19th Avenue/Geneva Limited, which would be a significant impact. In the Project vicinity, the 28L-19th Avenue/Geneva Limited would generally travel in the exclusive BRT lanes, but would be subject to delays at the intersection of Geneva Avenue and Bayshore Boulevard. Overall, the Project-related congestion would add up to 4 minutes of delay per bus during peak hours. The intersection of Bayshore/Geneva would be reconfigured as part of the Geneva Avenue Extension project, and the provision of transit-only lanes on Geneva Avenue on the eastbound and westbound approaches to the intersection would reduce the impact of cumulative congestion.

MM TR-27.1 *Ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension. The City of Brisbane, as part of the Geneva Avenue Extension Project, shall account for existing traffic, background traffic growth, and the most recent forecasts of traffic expected to be associated with each of several adjacent development projects, including the Project. The San Francisco County Transportation Authority (SFCTA) and SFMTA shall coordinate with the City of Brisbane to ensure transit preferential treatment is accounted for in the design of the Geneva Avenue Extension.*

MM TR-27.2 *Purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Should mitigation measure MM TR-27.1 not be feasible or effective, the Project Applicant shall work with SFMTA to purchase additional transit vehicles as necessary to mitigate the Project impacts and Project contribution to cumulative impacts to headways on the 28L-19th Avenue/Geneva Limited. Funds for the implementation of this mitigation measure are expected to be generated from a combination of Project revenues that accrue to the City, and other funding sources.*

Since implementation of mitigation measure MM TR-27.1 would be under the jurisdiction of the City of Brisbane, the implementation of the mitigation measure is uncertain. Implementation of MM TR-27.2, on the other hand, would allow operation of headways as described under MM TR-17. However, given the congestion along Geneva Avenue, implementation of MM TR-27.2 alone, without MM TR-27.1, might not be sufficient to reduce the impact to less-than-significant levels.

Because implementation of mitigation measure MM TR-27.2 alone, without MM TR-27.1, might not be sufficient to reduce the impacts on the 28L-19th Avenue/Geneva Limited to a less-than-significant level, the Project impacts on the 28L-19th Avenue/Geneva Limited would remain significant and unavoidable.

Impact TR-28: Project and Cumulative Impacts to Transit Operations of 9X, 9AX, 9BX- Bayshore Expresses and the 14X-Mission Express when on US-101

Impact TR-28 **Implementation of the Project would increase congestion on US-101 mainline and ramps, which would increase travel times and impact operations of the 9X, 9AX, 9BX-Bayshore Expresses, and 14X-Mission Express. The Project would also contribute to cumulative impacts on these transit routes on US-101. (Significant and Unavoidable)** ***[Criterion D.i]***

As described above in Impact TR-11, the Project would contribute to cumulative traffic impacts on US-101 northbound and southbound. The projected increases in congestion would affect transit lines operating on US-101, notably the 9X, 9AX, and 9BX-Bayshore Expresses, and the 14X-Mission Express (the 14X-Mission Express operates southbound on US-101, and northbound on I-280). The Project's new CPX-Candlestick Express between Candlestick Point and downtown would also use US-101 and be subject to increased travel times due to freeway congestion. The impact on transit travel operations would be considered a significant impact.

Potential strategies to reduce congestion impacts on transit travel times could include bus-only operation on the shoulders of US-101, re-opening of the US-101 northbound Silver Avenue on-ramp for transit only, and creating transit-only lanes on I-280 along with rerouting of the transit lines to I-280. Additional studies and coordination with Caltrans would be required to determine the feasibility of these strategies. As feasibility of these strategies is uncertain, the impact on the 9X, 9AX, 9BX-Bayshore Expresses and the 14X-Mission Express operations would remain significant and unavoidable.

Impact TR-29: Project and Cumulative Impacts on Transit Operations on I-280—: 14X-Mission Express

Impact TR-29 **Implementation of the Project would not contribute to cumulative impacts on the 14X-Mission Express transit route when on I-280. (Less than Significant)** ***[Criterion D.i]***

As described above in Impact TR-11 and Table III.D-13 (Mainline and Weaving Segment LOS Existing, 2030 No Project and 2030 Project Conditions), the Project would not result in any Project-specific impacts on I-280, and would not contribute significantly to cumulative impacts. Project impacts on transit operations on I-280 would be less than significant.

Impact TR-30: Project and Cumulative Impacts on Regional Transit

Impact TR-30 **Implementation of the Project would increase congestion and contribute to cumulative congestion on US-101 and on Bayshore Boulevard, which would increase travel times and adversely affect operations of SamTrans bus lines on these facilities. No feasible mitigation has been identified. (Significant and Unavoidable)** ***[Criterion D.i]***

As described above in Impact TR-5 and Impact TR-11, the Project would increase congestion and contribute to cumulative traffic congestion on Bayshore Boulevard and on US-101, which would impact the travel times of SamTrans buses using these facilities. Potential strategies to reduce transit delay could

include providing transit-only lanes on Bayshore Boulevard, permitting bus-only use of the shoulders of US-101, and providing transit-only lanes on I-280 (and rerouting SamTrans buses from US-101 to I-280).

Additional studies and coordination with SamTrans, Caltrans, and the City of Brisbane would be required to determine the feasibility of these strategies. Since implementation of these strategies is uncertain the impact on SamTrans bus operations would remain significant and unavoidable.

Impact TR-31: Bicycle Network and Circulation

Impact TR-31 **During implementation of the Project, bicycle facilities would be expanded to serve additional users. This would be a beneficial impact of the Project. (No Impact) *[Criterion D.k]***

The street network proposed for Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, which would facilitate access between the new uses and the rest of San Francisco, and provide a connection between existing Bayview Hunters Point neighborhood and the existing and proposed waterfront amenities.

A number of existing and proposed Project roadways would include bicycle facilities in the form of bicycle lanes (Class II facilities) or signed routes (Class III facilities—e.g., roadways with sharrow designations) that would facilitate bicycling within and in the vicinity of the Project. Off-street Class I pathways would be provided around the bayside perimeter of Candlestick Point, across the proposed Yosemite Slough bridge, and into Hunters Point Boulevard via Crisp Road. Within the Project site, the Bay Trail would also be completed.

- Outside of the Project site, street improvements would include striping of bicycle lanes on Innes Avenue, Jamestown Avenue and on Harney Way. As noted in Section III.D.3 (Regulatory Framework), the *San Francisco Bicycle Plan* includes a near-term project on Innes Avenue (Bicycle Route #68) between Donahue Street and Hunters Point Boulevard; however, a preferred option was not identified in the Final EIR for the Bicycle Plan. The Project proposes to provide a bicycle lane in both directions on Innes Avenue between Donahue Street and Hunters Point Boulevard, which would require removal of on-street parking on the south side of Innes Avenue between Earl Street and Hunters Point Boulevard. The Project proposal is consistent with Option 1 in the Bicycle Plan, however, it would not preclude implementation of Option 2 (sharrows added to the existing Class III facility), if that option were determined to be preferable by SFMTA. The Project would improve Gilman Avenue, and a Class III bicycle route with sharrow designations would be provided between Arelious Walker Drive and Third Street.

Overall, bicycle access and the environment for bicycling would improve within and in the vicinity of the Project site. The facilities would be adequate to meet the bicycling demand associated with the Project uses.

Impact TR-32: Project and Cumulative Impact on Bicycle Circulation on Palou Avenue

Impact TR-32 **Implementation of the Project's proposed transit preferential treatments and significant increases in traffic volumes on Palou Avenue could result in impacts on bicycle travel on Bicycle Routes #70 and #170 between Griffith Street and Third Street. (Significant and Unavoidable with Mitigation) *[Criterion D.k]***

Outside of the Project site Bicycle Route #70 and Bicycle Route #170 on Palou Avenue are designated as Class III signed routes, and the combination of the proposed transit preferential treatment and the substantial increase in traffic volumes and congestion would result in potentially significant impacts on bicycle travel on this route. When faced with traffic congestion and a constrained bicycle environment, bicyclists may chose to ride on other streets not designated as part of the bicycle route network. The bicycle route could be relocated to a parallel route, such as either Quesada Avenue or Revere Avenue. Both of these streets provide a more level terrain than Palou Avenue.

MM TR-32 *Determine the feasibility of relocating Bicycle Routes #70 and #170. Prior to issuance of the grading permit for Development Phase 1, the Project Applicant shall fund a study to determine the feasibility of relocating Bicycle Routes #70 and #170. The study of the bicycle route relocation, necessary environmental clearance documentation, and implementation shall be the responsibility of SFMTA.*

Because a feasibility study of the relocation of Bicycle Routes #70 and #170 on Palou Avenue would be required, the implementation of MM TR-32 is uncertain, and therefore the Project impact on bicycle circulation would remain significant and unavoidable.

Impact TR-33: Pedestrian Circulation

Impact TR-33 **During implementation of the Project, pedestrian facilities would be expanded to serve additional users. This would be a beneficial impact of the Project. (No Impact) *[Criterion D.j]***

The street network proposed for Candlestick Point would be an extension of the existing grid of the adjacent Bayview neighborhood, which would facilitate access between the new uses and the rest of San Francisco, and provide a connection between existing Bayview neighborhood and the existing and proposed waterfront amenities. Other pedestrian amenities in both Candlestick Point and Hunters Point Shipyard would include crosswalks at unsignalized intersection, pedestrian crosswalks and signals at all new signalized intersections, corner bulbouts, and completion of sidewalk network where currently incomplete (e.g., Arelious Walker Drive, Palou Avenue). Along Gilman Avenue between Earl Street and Hunters Point Boulevard, and on Palou Avenue and Gilman Avenue between Arelious Walker Drive and Third Street, sidewalks would be reconstructed and landscaping improvements would be implemented.

Sidewalk widths on new or improved streets within the Project site would range from 10 feet to 15 feet in width, with the majority of streets having sidewalks 12 feet or greater in width. The Project would also include new sidewalks, and minor sidewalk narrowing on a number of existing streets, including:

- Griffith Street—narrow east and west sidewalks between Palou Avenue and Thomas Avenue from 12 to 11 feet

- Thomas Avenue—narrow north and south sidewalks between Griffith Street and Ingalls Street from 15 to 12 feet
- Ingalls Street—narrow east and west sidewalks between Yosemite Avenue and Carroll Avenue from 15 to 11 feet
- Carroll Avenue—new 12-foot-wide sidewalks between Ingalls Street and Arelious Walker Drive
- Harney Way—new 15-foot-wide sidewalk on north side from Thomas Mellon Drive to Jamestown Avenue

Overall, with the Project, pedestrian access would improve over the 2030 No Project conditions, except where sidewalks would be narrowed. The proposed narrowing of sidewalks would still allow for maintenance of sufficient clear space for people using walking aids or wheelchairs, as needed to meet ADA requirements. Development of the Project would increase pedestrian presence in the area. Since pedestrian volumes within the Project site are very low, the addition of pedestrian trips associated with the Project would be accommodated within the existing and proposed sidewalk network.

Impact TR-34: Project and Cumulative Pedestrian Safety Impacts Due to Increases in Traffic Volumes

Impact TR-34 **Implementation of the Project would result in traffic volumes on area roadways that would not substantially affect pedestrian circulation and safety in the Project vicinity. (Less than Significant)** ***[Criterion D.j]***

A qualitative assessment was also conducted of potential pedestrian impacts resulting from increased travel demand outside of the Project site. As noted in previous sections, the Project would increase vehicle and bicycle volumes in the Bayview Hunters Point area, which would increase the potential for pedestrian-vehicle and pedestrian-bicycle conflicts particularly in locations where the sidewalk network is incomplete or where vehicles park on sidewalks, causing pedestrians to walk in the roadway and mix with vehicular traffic. The Project-proposed sidewalk network improvements on Innes Avenue, Palou Avenue, Gilman Avenue, and Jamestown Avenue would improve and define the pedestrian network on these roadways. Along Third Street sidewalks have been improved and pedestrian signals and crosswalks were installed as part of the Third Street light rail project. As cumulative development occurs within the area, individual development projects would be required to address any sidewalk deficiencies adjacent to their site.

With the Project, the number of pedestrians on streets outside of the Project site would increase as a result of the expanded recreational uses, extension of transit lines, and overall increase in commercial activity in the area. While the presence of an increased number of pedestrians may partially offset risks associated with increased pedestrian-vehicle and pedestrian-bicycle conflicts, the enhanced pedestrian network and "safety in numbers" conditions due to increased pedestrian presence would cause drivers to expect and adapt to increased interactions with pedestrians.

SFMTA and SFCTA have recognized the existing inadequacies in the Bayview Hunters Point area to the pedestrian network. SFMTA has begun implementing the Bayview Traffic Calming Project, which was developed through a community-based process that identified problem locations with a study area roughly bounded by Jamestown Avenue, Third Street and Evans Avenue, and traffic calming measures. Community concerns included high traffic volumes, numerous trucks, speeding cars, and reckless driving.

The study resulted in a list of traffic calming measures (such as gateway islands, speed humps, speed cushions, and traffic circles) along specific roadways. Implementation of improvements is being phased in, and most cost-efficient solutions are being implemented first. The Project improvements would not preclude implementation of the traffic calming measures and would complement the goals of the community to enhance pedestrian safety. SFCTA has recently initiated the Bayview Hunters Point Neighborhood Transportation Plan (NTP) study that is focusing on the existing needs and concerns of the community, to develop smaller-scale solutions that could be implemented in the near-term. Measures such as better bus stops, brighter lighting, and landscaping, as well as parking management and mobility strategies such as shuttle service will be explored with the community.

The San Francisco Department of Public Health (DPH) analyzes pedestrian injuries in traffic accidents from a public health perspective. DPH notes that traffic accidents in general are a leading cause of death and injury in the United States. Beyond direct injuries and deaths, as matter of public health, DPH states that increased pedestrian safety can encourage walking, which in turn can have direct health benefits such as reducing obesity and indirect benefits such as improved air quality resulting from lesser traffic volumes.

There are a number of factors that contribute to increased pedestrian-vehicle collisions, and the number of collisions at an intersection is a function of the traffic volume, travel speeds, intersection configuration, traffic control, surrounding land uses, location, and number of pedestrians. The Project would result in a substantial change in the street network in the Project site, and includes street improvements that would enhance pedestrian safety in the Project site and beyond. The increased potential for pedestrian-vehicle conflicts and pedestrian injury would be tempered by the "safety in numbers" factor in an area currently characterized by low pedestrian volumes and mix of industrial and residential land uses. Overall, the existing and proposed pedestrian facilities would be adequate to meet the pedestrian demand associated with the Project land uses, and the Project impacts on pedestrian circulation within and in the vicinity of the Project would be less than significant.

Impact TR-35: Project and Cumulative Parking Impacts—Demand and Supply Comparison

Impact TR-35 **Implementation of the Project would not result in significant impacts associated with a lack of an adequate supply of parking that could not be accommodated within alternative modes. (Less than Significant)** ***[Criteria D.e and D.h]***

The parking impact assessment associated with the Project includes the comparison of the parking demand to the maximum off-street parking ratios for the Project as identified in the Project Description, plus the number of new on-street parking spaces that would be provided on new and reconfigured streets in the Project site. Since the Project proposes maximum permitted parking controls (not minimum requirements), the parking demand is also compared to conditions if no off-street parking is provided; that is, if only on-street parking spaces were provided.

Table III.D-20 (Summary of Project Parking Demand and Maximum Permitted Supply) summarizes the aggregate of the parking demand calculated for Project land uses, and also presents the maximum permitted off-street parking for the Project as well as the proposed number of new on-street parking spaces that

would be provided.[125] Figure III.D-12 (Project Parking Supply) presents the estimates of maximum off-street parking supply and on-street supply by area. Table III.D-21 (Summary of Project Parking Shortfalls for No Minimum and Maximum Permitted Supply) summarizes the parking demand, and the resultant parking shortfalls assuming Project parking supply for two scenarios: based on the maximum permitted supply; and, assuming provision of no off-street spaces but that only the on-street parking spaces would be available. Since the Project does not include minimum requirements (instead specifying the maximum parking supply that would be permitted) it is possible that the Project could be constructed without any off-street parking. However, most development projects in San Francisco develop the maximum permitted supply, and therefore the comparison of the parking demand to the maximum permitted off-street supply and to no off-street supply presents the range of potential parking impacts.

Table III.D-20 Summary of Project Parking Demand and Maximum Permitted Supply

	Demand				Supply[a]		
	Residential	Non-Residential		Total	Maximum Permitted	New	
Project Area	Long Term	Long Term	Short Term	Demand	Off Street[b]	On Street	Total
Hunters Point Shipyard	3,110	3,818	996	7,924	6,678	683	7,361

a. Does not include stadium supply or game day demand.

b. Maximum number of spaces permitted per draft Design for Development standard for Candlestick Point Hunters Point Shipyard Phase II Development Plan.

Table III.D-21 Summary of Project Parking Shortfalls for No Minimum and Maximum Permitted Supply

		Minimum Supply		Maximum Supply	
Scenario/Project Area	Total Demand	Supply	Shortfall	Supply	Shortfall
Hunters Point Shipyard	7,924	683	- 7,241	7,361	- 563
Candlestick Point	13,309	1,360	- 11,949	11,556	- 1,753
Total	***21,233***	***2,043***	***- 19,190***	***18,917***	***- 2,316***

SOURCE: CHS Consulting, LCW Consulting

Includes off-street and new on-street supply; does not include stadium supply or game day demand.

As shown in Table III.D-20, the demand analysis indicates a Project need for about 21,233 spaces, compared with a maximum permitted supply of about 18,917 spaces; therefore, the maximum off-street parking supply would be approximately 2,316 spaces less than the estimated peak demand. Residential spaces would comprise approximately 79 percent of the total shortfall spaces, and non-residential commercial spaces the remaining 21 percent of the shortfall:

- The residential parking demand of 12,322 spaces, compared to a maximum permitted of 10,500 spaces (one space per unit), would result in a deficit of 1,822 spaces.

[125] The Project would include some on-street parking in the Project site for both commercial and general/residential uses. About 683 on-street spaces would be provided within Hunters Point Shipyard and 1,360 spaces within Candlestick Point for a total of 2,043 spaces.

FIGURE III.D-12

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROJECT PARKING SUPPLY

- The non-residential demand would be 8,911 spaces, of which 41 percent would be needed for short-term use, while the remaining 59 percent would be needed for long-term use. The non-residential commercial parking demand, compared with a maximum permitted number of about 8,417 spaces, would result in a deficit of 494 spaces.

If no off-street parking is provided, the parking shortfall associated with the Project would increase substantially, and there would be a deficit of about 19,190 spaces. As indicated above, this represents the maximum shortfall, as it is anticipated that most, if not all, maximum permitted parking would likely be constructed.

Due to parking supply constraints and accessibility to transit, future Project parking demand may be somewhat lower than estimated, and therefore the parking space shortfall would also be less than presented above in Table III.D-21. Specifically:

- The parking demand estimates included in Table III.D-20 and Table III.D-21 represent the number of spaces that would be required in order to accommodate all the vehicles anticipated to result from the Project if the proposed parking supply was unconstrained. Since the parking supply would be constrained, the actual parking demand would be expected to be less.
- The parking demand estimates represent the peak parking demand calculated separately for each land use. Since all land uses do not experience the peak parking demands simultaneously, the peak parking demand may be less than presented. The Project-proposed parking ratios are generally less than the existing *Planning Code* requirement for similar uses to discourage auto use and to reflect the potential for shared parking opportunities among the various uses. For example, a restaurant can share parking with an office complex, since restaurant parking demand peaks in the evening, while office parking demand peaks during the middle of the day. Public parking facilities, such as the one proposed in Candlestick Point, and on-street parking spaces can usually be shared efficiently among many destinations. Accounting for the shared parking would reduce the non-residential parking demand, and the excess demand that would not be accommodated within the proposed parking supply would also be less.
- The Project includes a Travel Demand Management program that includes a number of parking strategies to make auto use and ownership less attractive, as well as strategies to encourage alternative modes. While the TDM program was assumed in developing Project travel demand, the residential parking demand was based on standard *SF Guidelines* parking demand rates that are based on Citywide averages.
- Residents within Hunters Point Shipyard and Candlestick Point would have new and improved existing transit routes connecting the Project site with downtown and with Caltrain and BART. Under Project conditions, capacity on local and regional lines would be available to accommodate additional Project transit trips.

As part of its "transit first" policy, the City and County of San Francisco does not require that the supply of parking spaces equals the demand. Consequently, even though it is anticipated that the Project would provide the maximum number of parking spaces permitted, they may not be sufficient to accommodate the actual demand. If fewer spaces than the maximum permitted were to be constructed, the projected shortfall would increase. Therefore, individuals who would prefer to drive may use transit because the perceived convenience of driving is lessened by a shortage of parking. This shortage is not considered a significant environmental effect because it implements a policy intended to reduce citywide traffic congestion and air quality effects. Even with a shortage of off-street parking, measures often are implemented that result in more efficient use of the parking spaces provided. By promoting carpooling,

allowing for the shared use of parking, and implementing pricing strategies designed to encourage short-term parking, the spaces provided for non-residential use would likely be used by more individuals, be vacant for shorter periods of time, and attract drivers needing short-term parking.

Since the proposed parking supply in the Project site would not meet demand, it is possible that some drivers may seek available parking in adjacent Bayview residential areas to the west. The potential increase in parking demand in adjacent neighborhoods would likely spill over to streets with existing industrial uses in the Project vicinity, which could, in turn, increase demand for parking in nearby Bayview residential areas. Residential streets near the Project site do not currently have parking restrictions and are about 70 percent occupied during the weekday midday and evening periods. Commercial and industrial spillover into residential areas is not expected to be a substantial problem because parking demand in residential areas in Bayview would be highest at night, when the commercial and industrial parking demand is lowest. If parking demand is found to exceed supply in the Bayview residential area, the City's residential parking permit program could be introduced to the area to help ensure availability of parking for local residents. The extent of spillover into the nearby industrial and residential neighborhoods to the west would be limited by the existing topography (e.g., steep grades due to the Bayview Hill), the distance between the Project site and available parking supply, and concerns related to safety in the industrial area. Transit service with available capacity and on-site carsharing services would provide an alternative to seeking parking supply further afield.

On days when events were scheduled at the stadium, parking spaces in the Bayview and Candlestick Point area would be in great demand. Those arriving to the Project vicinity on weekends after drivers have started arriving for the stadium event would have difficulty parking on event days unless they have already-reserve parking, such as spaces allocated to residential units.

Additionally, no cumulative parking impacts are expected. Other cumulative projects in the area, such as most of the surrounding existing development, Executive Park, and India Basin, are located too far from the Project site to expect that drivers going to other projects would seek parking on the Project site, or that drivers going to the Project site would park far outside the Project boundaries. Additionally, in some areas, the topography is not conducive to parking beyond the Project site boundaries. Consequently, there is no potential for significant cumulative parking impacts.

As noted above, in San Francisco, parking supply is not considered a permanent physical condition, and changes in the parking supply would not be a significant environmental impact under CEQA, but rather a social effect. The loss of parking may cause potential social effects, which would include cars circling and looking for a parking space in neighboring streets. The secondary effects of drivers searching for parking is typically offset by a reduction in vehicle trips due to some drivers, who are aware of constrained parking conditions in a given area, shifting to other modes. Hence, any secondary environmental impacts that may result from a shortfall in parking would be minor. Therefore, the parking shortfall would not result in significant parking impacts, and Project impacts on parking would be less than significant.

Impact TR-36: Loss of Existing On-Street Parking

Impact TR-36 **Implementation of the Project roadway improvements would displace on-street parking spaces, and the existing demand could be accommodated in the nearby vicinity. (Less than Significant) *[Criteria D.e and D.h]***

Some existing on-street parking spaces would be lost because of Project changes to the existing roadway configuration. The bus transit preferential treatments and streetscape improvements on Palou Avenue between Third Street and Griffith Street would result in a net loss of approximately 60 parking spaces (about 40 spaces due to bus stop improvements and corner bulbouts, and 20 spaces on the north side of the street between Ingalls and Griffith Streets where vehicles park perpendicular off-street within the sidewalk right-of-way). In addition, on the following streets a total of about 77 on-street parking spaces would be displaced:

- Carroll Avenue between Hawes and Ingalls Streets (26 spaces)
- Innes Avenue between Earl Street and Hunters Point Boulevard (51 spaces)

Project intersection improvements and mitigation measures would require removal of some on-street parking at the approaches to intersections. These on-street losses include:

- Evans/Jenning/Middlepoint—8 to 10 spaces on the west side of Jennings Street at the southbound approach to Evans.
- Palou/Griffith/Crisp—8 to 10 spaces on the east side of Griffith Street at the northbound approach.
- Carroll/Ingalls—8 to 10 spaces on the west side of Ingalls Street at the southbound approach.
- Blanken/Tunnel—13 spaces on the east side of Tunnel Avenue at the northbound and southbound approaches.

Project mitigation measures related to transit improvements would also result in peak period parking prohibitions. At some locations, such as on Third Street and Paul Avenue, parking spaces would be eliminated.

- San Bruno Avenue—5 spaces on the east side of San Bruno Avenue south of Silver Avenue, and 20 spaces on the west side of San Bruno Avenue between Woolsey Street and Olmstead Street.
- Palou Avenue—about 140 spaces on the north side and 130 spaces on the south side of Palou Avenue between Newhall Street and Crisp Avenue.
- Gilman Avenue—about 90 spaces on the north side and 80 spaces on the south side of Gilman Avenue between Arelious Walker Drive and Third Street.
- Paul Avenue—about 40 parking spaces on the north side of Paul Avenue between Third Street and Bayshore Boulevard.
- Third Street—about 110 spaces on the east and west curbs of Third Street between Thomas Avenue and Kirkwood Avenue.

The parking demand that would be displaced due to the temporary and permanent parking losses would be accommodated on other streets in the study area. At some locations, residents and visitors to commercial establishments would have to walk further between their parking space and destination, or switch to transit or other modes. The impact related to parking supply would be less than significant.

Impact TR-37: Loading Impacts

Impact TR-37 **Implementation of the Project would not result in significant impacts associated with a lack of adequate supply of loading spaces. (Less than Significant) *[Criterion D.1]***

Loading impacts assessment associated with the Project includes the comparison of the demand for the loading spaces to the minimum number of loading spaces specified in the Project description. As indicated in the "Analytic Method" section in Section III.D.4, the demand for loading spaces was estimated based on the development program and the daily truck trip generation rates for 1,000 gross square feet of use, then converted to hourly demand.

If the loading demand is not met on site and could not be accommodated within on-street loading zones, trucks could temporarily double-park and partially block local streets while loading and unloading goods which could result in disruptions and impacts to traffic and transit operations, as well as to bicyclists and pedestrians. Because any effects of unmet loading demand would be temporary inconveniences, any excess demand would not be a significant impact. The Project would establish a minimum number of loading spaces; more could be provided as part of individual development projects.

In addition to off-street facilities and on-street loading zones, approximately 300 feet of curb space on the Stadium Outer Ring Road would be designated for truck parking. The parking areas would have 17-foot-wide parking lanes that would fully accommodate wider trucks without impeding on adjacent bicycle or travel lanes. This designated truck parking area would meet the needs of truck drivers to take a ten-hour rest period that is governed by federal and state safety rules, and to stage when off-street loading facilities are not ready to accommodate deliveries. The designation of this on-street parking area would reduce the potential for truck drivers to seek long-term parking on residential streets in the Project site and within Bayview Hunters Point.

Table III.D-22 (Summary of Project Loading Demand and Supply) summarizes the estimate of daily truck trips generated by the proposed land uses and the associated demand for loading dock spaces during the peak hour of loading activities (which generally occurs between 10:00 a.m. and 1:00 p.m.) and the estimated supply. The estimated loading supply would be greater than the loading demand during the peak hour of loading operations. Within the Hunters Point Shipyard the loading demand and estimated supply would be similar, while within Candlestick Point the supply would substantially exceed the demand. This is due primarily to the calculation for retail uses, which has the most intensive loading demand. For the regional retail uses within Candlestick Point, loading facilities would be located to meet multiple tenants within the retail development. Project impacts related to loading operations would be less than significant.

Table III.D-22 Summary of Project Loading Demand and Supply

Scenario/Project Area	*Daily Truck Generation*	*Peak Hour Loading Dock Space Demand*	*Supply[a, b]*
Hunters Point Shipyard	713	41	42
Candlestick Point	507	29	59
Total	***1,220***	***70***	***101***

SOURCE: LCW Consulting, 2009

a. Minimum number of loading spaces permitted per draft Design for Development standard for CP-HPS Phase II Development Plan.

b. Does not include stadium loading facilities.

Impact TR-38: Stadium 49ers Game Site Access and Traffic Impacts

Impact TR-38 **For as many as 12 times a year, 49ers games at the proposed stadium would result in significant impacts on study area roadways and intersections. (Significant and Unavoidable with Mitigation) *[Criterion D.a]***

With the Project, the existing traffic management of pre-game and post-game traffic would be adjusted to reflect the new stadium location and access routes. The Project includes a new Traffic Management Center, to be staffed by City employees, to dynamically monitor and operate traffic signals along primary ingress and egress routes to efficiently move traffic into and out of the area prior to and after games. In addition, similar to existing conditions, traffic control officers would be stationed at key locations to ensure efficient traffic movements. The overall game day traffic control plan is shown in Figure III.D-13 (Stadium Game Day Traffic Control Plan).

Similar to existing conditions, the majority of stadium-bound traffic would use a portion of US-101 to access the Project site on game days. Traffic from the south would predominantly use northbound US-101 and access the site via Harney Way, while traffic from the north would predominantly use southbound US-101 and I-280 and access the site via Cesar Chavez Street, Cargo Way, Evans Avenue, and Innes Street. Some trips to the site would use Bayshore Boulevard or Third Street to access the area via Carroll Avenue, Gilman Avenue, and Ingalls Street.

Prior to and after games at the proposed stadium, special measures (similar to those in place for existing football games) would be taken to allow the site's circulation system to accommodate unique game day traffic flows. Figure III.D-14 (Stadium Game Day Ingress Routes) presents the pre-game circulation plan and Figure III.D-15 (Stadium Game Day Egress Routes) present the post-game circulation plan. Prior to games, the site's roadways would be geared towards inbound flow and after games the roadways would be geared towards outbound flow.

Vehicles accessing the new stadium from the south would use Harney Way. Harney Way would be configured to provide four inbound lanes (to the stadium) and one outbound lane between US-101 and Arelious Walker Drive. Arelious Walker Drive, between Harney Way and Crisp Avenue would provide four inbound lanes. Crisp Avenue would provide seven inbound lanes between Arelious Walker Drive and the new stadium. The lane configurations would be reversed for post-game conditions.

Vehicles accessing the new stadium from the south would be routed via the routes described above to Crisp Avenue, where they would be channeled to a Ring Road on the southern portion of the stadium. Access to the internal parking aisles would be from the Ring Road.

Vehicles accessing the new stadium from the north would use Evans Avenue and Cargo Way. These inbound routes would merge at the intersection of Hunters Point Boulevard/Jennings/Evans. From there, the inbound route along Hunters Point Boulevard and Innes Avenue would provide four inbound lanes and one outbound lane. The lane configurations along Hunters Point Boulevard and Innes Avenue would be reversed for post-game conditions.

FIGURE III.D-15

Candlestick Point — Hunters Point Shipyard Phase II EIR

STADIUM GAME DAY EGRESS ROUTES

Under typical traffic conditions, traffic impacts are measured in terms of intersection levels of service. However, due to the unique circumstances following a football game, including manual and dynamic control of intersections by traffic control officers and complex travel patterns, traditional methods of calculating intersection levels of service are not be appropriate. Instead, for post-game conditions, traffic impacts associated with the new stadium are described in terms of the magnitude, duration, and expected locations of congestion.

The one-hour period immediately following the conclusion of a football game is generally the worst-case period. The amount of vehicular traffic associated with the new stadium is expected to be similar to, or even slightly less than, the amount of traffic associated with the existing stadium because of the improved transit service proposed to serve the new stadium. However, because under the Project conditions, there would be additional development around the stadium compared to the 2030 No Project conditions, the additional vehicle trips associated with the new stadium and increased surrounding development would somewhat increase congestion and delays following a football game from 2030 No Project conditions.

As shown on Table III.D-23 (Locations of Congestion Following San Francisco 49ers Football Game), the proposed location of the new stadium would create additional exit routes such that more streets would be congested following a game than under the 2030 No Project conditions. Providing additional egress routes would spread the post-game congestion, and provide a quicker parking lot clearance time. However, it would result in game day traffic congestion along Innes Avenue, Evans Avenue, and Cargo Way, which would not experience substantial congestion following a game under the 2030 No Project condition.

One result of providing additional egress routes from the proposed new stadium is that traffic congestion is expected to clear the area quicker. The projected clearance time for a sell-out game at the proposed stadium would be about one and a half hours, compared to almost three hours for the existing stadium under 2030 No Project conditions. The projected clearance time is based on the number of vehicles parked in the stadium parking lot, which would be less for the proposed stadium than for the existing stadium. Due to the multiple access routes serving the stadium, the number of roadways expected to experience post-game traffic congestion is expected to increase with the Project, however, as noted above the total duration of expected post-game congestion is expected to be considerably less than under the 2030 No Project condition.

SOURCE: Fehr & Peers, June 2009

Analysis based on expected stadium exit routes. Other exit routes identified in Figure III.D-15, but not shown on this table are downstream of major bottlenecks and, although expected to carry additional post-game traffic, are not expected to function at capacity.

Similar to the roadway analysis, because the post-game traffic is expected to be spread out over a greater number of exit routes, more freeway interchanges are expected to handle larger numbers of game day traffic. Two freeway segments, I-280 southbound between the Alemany Street off- and on-ramps and US-101 northbound at the on-ramp from Bayshore Boulevard would actually see improvements, compared to the 2030 No Project conditions. This is because traffic from the proposed stadium location would use different routes to reach the freeway. The Project would impact the segment of I-280 northbound between 25th Street/Indiana Street and Mariposa Street.

The Project would result in new freeway facilities operating unacceptably. However, the duration of expected congestion would likely be less due to the higher level of transit use, the Transportation Management Center housed within the stadium to increase efficiency of exiting traffic, and the greater amount of identified post-game exit routes and freeway access points. Overall, since new facilities, including local streets and freeway facilities, would experience congested traffic following a football game, traffic impacts associated with the new stadium during game days would be significant.

The Project includes measures to reduce the magnitude of the traffic impacts associated with the new stadium, including limiting the parking supply, providing a more robust transit system, and locating the stadium so as to better disperse traffic following a game. As a result, the exit capacity of the new stadium would be greater than that of the existing stadium. Mitigation measures associated with additional roadway widening would have unwanted secondary impacts on pedestrian and bicycle conditions during non-game days, which represent the vast majority of the time, and were therefore not considered further. However, mitigation measure MM TR-38 is required to ensure that a management plan for accommodating the increased vehicle, transit, pedestrian and bicycle demands during game days is prepared and implemented.

MM TR-38 *Transportation Management Plan (TMP) for the stadium. The stadium operators shall develop and maintain a Transportation Management Plan (TMP) for the stadium. The stadium operator shall work with representatives from the SFMTA, the State Highway Patrol, the Police Department, private charter operators, Caltrain and others on a continuing basis to develop and refine the TMP, as determined appropriate by SFMTA. The final stadium TMP shall be approved by SFMTA. Preparation of the TMP shall be fully funded by the stadium operator, and shall be completed in time for implementation on opening day of the stadium.*

The following actions shall be included in the TMP:

- *Information on transportation options to the stadium, including game day service by the various regional service providers shall be distributed to season ticket holders, employees, and other patrons if possible.*
- *A brochure, information packet, and/or web page providing full information on transit access to the stadium, similar to that currently offered at the 49ers website, shall be updated and maintained.*
- *The use of charter buses to the stadium shall be encouraged and expanded. A number of measures shall be considered that could be implemented at low-cost to expand the use of group charters, including reduced parking costs, publicize the groups in 49ers publications and mailings, provide priority parking, provide lounges for bus drivers and provide support services for rooter clubs.*
- *Residential Permit Parking Program and/or additional parking restrictions, such as time limits, during game days, particularly in the Bayview Hunters Point areas, shall be explored with residents to reduce potential for intrusion of stadium vehicles into the adjacent neighborhood during a football game or secondary event.*
- *The stadium operator shall implement measures to encourage carpools of 4-plus persons per vehicle.*

- *The stadium operator shall charge a higher parking cost for low occupancy vehicles.*
- *The stadium operator shall develop a separate TDM plan for employees of the stadium and concessionaires. The plan shall consider measures such as providing employees and concessionaires with free or subsidized transit passes to encourage transit use and reduce vehicular travel to the stadium. Employees shall not receive preferential parking.*
- *The stadium operator shall develop measures with CPSRA to ensure that game day spectators do not park in CPSRA day use parking lots. Strategies to be explored include limiting parking in CPSRA lots to a limited duration during game days (e.g., to a two-hour period), or an increase in parking fees equivalent to game day parking, and ticketing and enforcement.*
- *The TMP shall ensure that regular transit routes operate acceptably near the stadium. The plan should consider providing alternate routes for those transit lines that do not have exclusive right-of-way on game days (48-Quintara-24th Street, 44-O'Shaughnessy, 29-Sunset) onto transit-only facilities such as the BRT right-of-way to the south and Palou Avenue to the north (which would be a transit-only facility on game days).*

Implementing this mitigation measure would likely reduce automobile travel to the stadium and encourage transit usage. However, even with implementation of mitigation measure MM TR-38, the Project's impacts on Sunday pre-game and post-game period traffic conditions would remain significant and unavoidable.

Impact TR-39: Stadium 49er Game Transit Impacts

Impact TR-39 **Implementation of the Project with existing game day service and Project transit improvements would not be adequate to accommodate projected transit demand. (Significant and Unavoidable with Mitigation) *[Criteria D.f, D.i]***

During game days, the regularly scheduled bus service adjacent to the stadium would continue to operate on normal routes, providing direct service to the stadium and into the Hunters Point Shipyard Transit Center. Special game day transit, including charter buses and public transit express service would access the stadium via Palou Avenue, which would be converted to transit-only on game days. These buses would conduct passenger loading and unloading on Crisp Avenue, in front of the stadium. The stadium parking program calls for 340 bus parking spaces to store empty buses during the game. Figure III.D-16 (Stadium Game Day Transit) illustrates the Project's game day transit service.

During sellout games, about 16,388 spectators and 652 game day employees are expected to use transit to access the stadium, a total of 17,040 transit riders. Assuming similar transit ridership from regional providers (including charter service expected to replace service previously provided by Golden Gate Transit, the Santa Clara Valley Transportation Authority, and SamTrans) and other private charters, the expected Muni ridership to the stadium would be 12,040 (an increase of about 5,500 patrons from existing conditions). This ridership includes transit patrons who use regional transit, such as Caltrain and BART, and transfer to Muni to access the stadium.

As presented in Table III.D-24 (Game Day Muni Capacity by Line), the combination of regularly scheduled transit service and game day express routes, similar to what is provided to the existing stadium, is expected to be approximately 8,400 passengers per hour. Therefore, with a projected Muni ridership of 12,040 patrons and capacity of 8,400 passengers per hour, there would be a capacity shortfall of approximately 3,640 passengers per hour. This shortfall in transit capacity would be considered significant.

FIGURE III.D-16

Candlestick Point — Hunters Point Shipyard Phase II EIR

STADIUM GAME DAY TRANSIT

Table III.D-24 Game Day Muni Capacity by Line

Route	*One-Way Hourly Capacity (passengers per hour)*
24-Divisadero	400[a]
28L-19th Avenue/Geneva Avenue	800[a]
44-O'Shaughnessy	450[a]
48-Quintara	250[a]
Game Day Express Service (75X, 77X, 78X, 79X, 86, and 87)	6,500[b]
Total	***8,400***

SOURCE: SFMTA, Fehr & Peers, 2009

a. Assumes Sunday peak hour capacity is 75 percent of typical weekday peak hour capacity, per SFMTA TEP assumptions.
b. Based on existing ridership on these express routes

- *MM TR-39* *Transit Service during Game Days. SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area on game days. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park Station) and Caltrain (Bayshore Station). Although the specific frequencies of individual routes should be determined based on patron characteristics that may evolve over time, the increased transit service, taken as an aggregate, should generally compensate for the projected shortfall of 3,600 passengers per hour on the existing and proposed transit lines.*

  Prior to opening day at the new stadium, the City and stadium operator shall determine costs associated with the increased service and determine funding sources. Examples of funding sources that shall be considered include a surcharge on game tickets or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of mitigation measure MM TR-39, the Project's impacts to transit service on Sundays during a football game could be reduced to less-than-significant levels. However, due to the traffic impacts during post-game conditions (see Impact TR-38 for discussion of traffic impacts) on transit operations, which could not be mitigated, the impact on transit operations would remain significant and unavoidable.

Impact TR-40: Stadium 49ers Game Bicycle Impact

Impact TR-40 **For as many of 12 times per year during game days, bicycle access in the vicinity of the proposed stadium would be constrained, however, accommodations for bicycle access and circulation would be provided. (Less than Significant) *[Criterion D.k]***

The Project would improve bicycle access to the area in terms of new bicycle lanes on existing and reconfigured roadways, and bicycle access within and in the vicinity of the Project site would be maintained on game days. However, bicycle access would be constrained due to the heavy traffic volumes at locations further away from the Project site where bicycle lanes are not provided. At these locations, bicyclists would likely divert to roadways not designated as stadium access routes (e.g., bicyclists may use Revere Avenue instead of Gilman Avenue for access to and from the stadium).

For those patrons arriving by bicycle, the proposed stadium would provide improved amenities compared to the existing stadium. Bicycle racks and lockers would be provided at the stadium entrances. In addition, a bicycle valet, similar to the service operated at AT&T Park for San Francisco Giants baseball games would be provided.

Bicycle access to the stadium on football game days would be difficult, as at present, due to heavy traffic volumes. However, bicycle access to the new stadium would be provided, and impacts on bicycle operations would therefore be less than significant.

Impact TR-41: Stadium 49ers Game Pedestrian Impacts

Impact TR-41 **For as many of 12 times per year during game days, pedestrian access in the vicinity of the proposed stadium would be constrained, however, accommodations for pedestrian access and circulation would be provided. (Less than Significant) *[Criterion D.j]***

Pedestrian access to the stadium from external locations would be provided via 15-foot sidewalks on either side of Crisp Avenue. All other streets leading into the stadium site would provide 12 to 15-foot-wide sidewalks. Near the stadium, game day pedestrians would be allowed to cross the Crisp Avenue at two locations where the Ring Road intersects Crisp Avenue. In addition, pedestrians traveling between the stadium and the 3,000 parking spaces in the Hunters Point Shipyard R&D campus would cross the Ring Road on the south side of Crisp Avenue. Because of the need to balance pedestrian flows with efficient auto egress, temporary pedestrian overcrossings, similar to the one recently installed across Hunters Point Expressway, would be provided. Traffic control officers would also be stationed at the overcrossings, as well as at other at-grade crossings.

Pedestrian travel throughout the Project site may be disrupted by game day traffic, and pedestrian travel near the new stadium, would experience crowding. However, this is expected and understandable for large events, and would be similar to conditions at the existing stadium.

Pedestrian access to the stadium during game days would be difficult, as at present, due to heavy traffic volumes. However, since pedestrian access would be maintained, stadium game day impacts on pedestrian circulation would be less than significant.

Impact TR-42: Stadium 49ers Game State Park Access Impacts

Impact TR-42 **For as many as 12 times per year during game days, access to state park facilities for vehicles, bicyclists and pedestrians would be constrained, and heavy traffic congestion could discourage use of the park. However, access for vehicles, bicyclists, and pedestrians would be maintained. (Less than Significant) *[Criteria D.j, D.k]***

With the Project, the Bay Trail around Yosemite Slough would be completed, and all existing connections to the Bay Trail would be maintained. Pedestrian and bicycle access to the developed state park lands would be maintained, and the Project's extensive improvements to the area bicycle and pedestrian network would facilitate access to the state parks lands. Pedestrian and bicycle access to state park lands on game days would be similar to existing condition; that is, heavy traffic congestion in the pre- and post-game periods could discourage bicycle use to and from CPSRA during these periods, generally during two hours before and after each game.

Because there would be at least one lane open to traffic in each direction during pre- and post-game operations on roadways providing access to CPSRA facilities, vehicle access to state parks would still be accommodated on game days. However, as with bicycle access, heavy traffic congestion during game days could discourage vehicular access to and from the state parks during these periods.

Overall, since vehicle, bicycle and pedestrian access to state park facilities would be maintained during game days, impacts related to access would be less than significant.

Impact TR-43: Stadium 49ers Game Parking Impacts

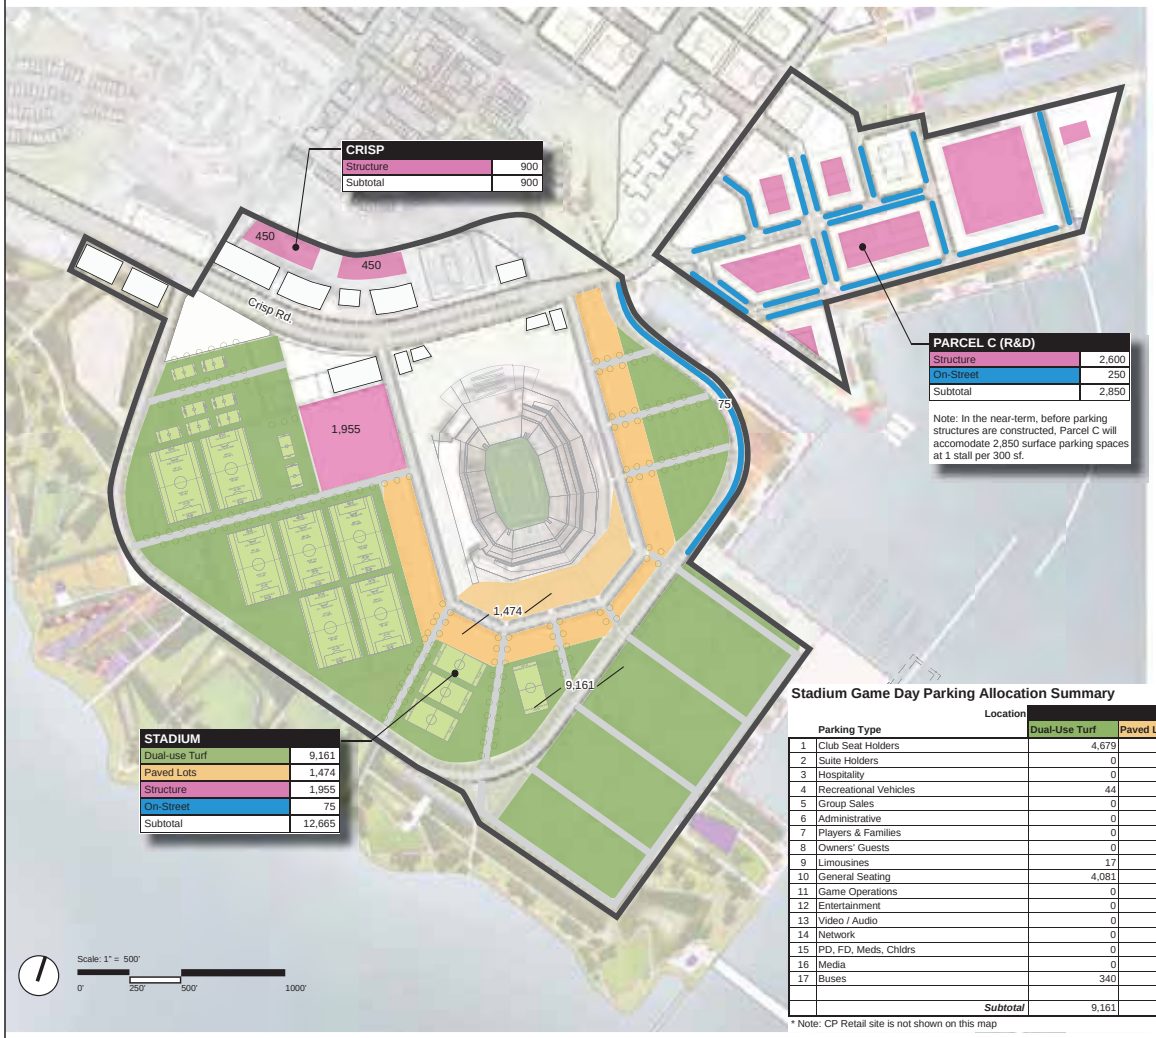
Impact TR-43 **For as many of 12 times per year during game days, parking demand associated with sell-out events would exceed the proposed on-site supply, resulting in a parking supply shortfall. The shortfall would be accommodated within other on-street and off-street parking facilities, and some patrons may elect to take transit to the stadium. (Less than Significant)** ***[Criteria D.e, D.h]***

The 49ers stadium area would have a total supply of 17,415 game day parking spaces, as presented on Figure III.D-17 (Proposed Stadium Game Day Parking). A total of 12,665 of the 17,415 parking spaces would be adjacent to the stadium, and accessible via a new loop road on the southern portion of the stadium. Of the 12,665 spaces, 340 spaces adjacent to the stadium would be reserved for buses, and the remaining 12,325 would be for private autos, RVs, limos, etc. Parking structures on the north side of Crisp Avenue, immediately across from the stadium, would accommodate an additional 750 vehicles, and would be accessible from Crisp Avenue. The R&D campus in Hunters Point Shipyard would provide an additional 3,000 spaces, of which 2,747 would be in structures and 253 would be on street.[126] These spaces would be accessible from internal roadways, which, in turn, would be accessible from Crisp Avenue. An additional 1,000 spaces would be provided in Candlestick Point retail parking structure that on game days would be reserved for stadium spectators.

A sell-out event at the stadium would result in a total game day travel demand of 20,134 vehicles (excluding buses) that would need to be accommodated. The Project would have a total game day parking supply of 17,415 spaces, of which 17,075 would be available for vehicle parking (340 spaces would be designated for buses). The 20,134-space parking demand would not be met within the 17,075-space parking supply, thus resulting in a shortfall of 3,059 spaces.

It is anticipated that the shortfall would be met similar to existing conditions, where spectators park in satellite parking lots, on street, or within private lots in the area. Currently about 4,300 parking spaces are available within satellite lots, and about 3,000 spaces on private lots that are generally restricted for use by residents, customers, and employees of private businesses. The likely result is that many patrons may elect to park in other off-site parking lots and either walk or take transit to the stadium. Some patrons may park within the CPSRA day use parking lots. Additionally, some patrons may also elect to take transit instead. Through effective parking management, including real-time information, public relations campaigns, and parking pricing strategies, the additional parking demand can be effectively managed.

[126] The on-street parking spaces in Area C would be made available for fixed-rate, longer-term parking by football patrons and controlled by City parking control officers on game days.



Stadium Game Day Parking Allocation Summary

	Location	STADIUM					CRISP	PARCEL C			CP RETAIL*	TOTAL

PBS&J 10.30.09 08068 | JCS | 09

FIGURE III.D-17

Candlestick Point — Hunters Point Shipyard Phase II EIR

PROPOSED STADIUM GAME DAY PARKING

The satellite parking lots identified in the parking supply are privately owned and operated and are not under the control of the stadium operator. Some of the satellite and private lots may not be available in the future due to development of other uses on that land (e.g., Executive Park development project). Development of the satellite and private lots would likely occur gradually so that the parking deficit would increase incrementally over time. Without the use of satellite lots, and without the provision of additional parking on-site (such as in a garage) or off-site (on adjacent properties such as Brisbane Baylands), stadium spectators would park on street further from the stadium (such as in the Bayview), or switch to alternative modes of transportation such as transit or charter buses.

As noted above, during game days, 1,000 parking spaces in the Candlestick Point retail parking structure would be reserved for stadium spectators, and as a result fewer spaces would be available for Candlestick Point retail patrons. In general, peak parking demand for shopping centers is lower on Sundays than on Saturdays or weekdays, and it is expected that during game days retail patrons would adjust their shopping trip to outside of the game day period, find short-term parking on-street, or access the shopping center via transit. During December when parking demand at shopping centers increases due to holiday shopping, the number of retail patrons that would be affected would increase. However, these patrons could be accommodated within the transit service provided pre- and post-game days.

Since stadium game day parking demand would be accommodated within the proposed parking facilities, privately owned satellite parking lots, and on street, and since alternative modes of transportation such as transit and charter buses would be available for spectators, stadium game day impacts on parking would be less than significant.

Impact TR-44: Stadium 49ers Game Loading Impacts

Impact TR-44 **Implementation of the Project would result in stadium game day loading demand that would be accommodated within the proposed on-site supply. (Less than Significant) *[Criterion D.1]***

The preliminary design for the new stadium includes loading dock accommodating four semi-trailer trucks and an adjacent TV staging and loading area. The TV staging and loading area would be used for loading/unloading on the days leading up to a game. Separate trash and recycling areas would be provided. The loading facilities for the stadium would be designed based on experience at the existing stadium, and for the needs for large special events such as Monday Night Football games or the Super Bowl.

A total of 100 delivery trucks are expected to serve the stadium in the week prior to a game. The majority of these trucks would serve the concession and food service functions. Stadium-bound delivery trucks would make their deliveries in advance of events to avoid peak travel periods that occur in the hours leading up to a game. Vendors would be notified by the stadium operator of appropriate delivery times.

Based on information obtained from the 49ers for the existing stadium, for a Sunday afternoon game, truck deliveries would occur in the middle of the week, with about 10 percent occurring on Wednesday, 40 percent on Thursday, and 50 percent on Friday. This truck traffic would be spread over the entire day. The peak stadium delivery day would be Friday, when approximately 50 trucks would make deliveries to the stadium. As is currently done, television trucks would arrive in advance of events to allow for appropriate set-up time and to avoid peak travel periods.

The proposed stadium loading facilities would be sufficient to accommodate projected demand, and therefore impacts related to loading would be less than significant.

Impact TR-45: Stadium 49ers Game Emergency Vehicle Access

Impact TR-45 **During game days, accommodation for emergency access would be provided. (Less than Significant) *[Criterion D.m]***

During game days, two-way inbound and outbound vehicular circulation would be provided at all times, via three primary routes. On the Harney Way/Arelious Walker Drive route, emergency vehicles would be allowed to use the BRT-only lanes (the BRT-only lanes break off from the primary auto route and continue on Harney Way, east of Arelious Walker Drive, and on Egbert Street before reconnecting with Arelious Walker Drive immediately south of the Yosemite Slough bridge). Emergency vehicles would also be allowed to use Palou Avenue, which would be transit-only on game days. Both of these routes would be free of congestion, and would offer emergency vehicle access between regional facilities and Crisp Avenue. Emergency vehicles would be able to enter the stadium parking lot via Crisp Avenue. Emergency vehicles would also be able to use Innes Avenue, as there would be at least one lane in each direction on this route open to traffic. However, since immediately following games the outbound direction may be congested, this may not be a desirable route as the Harney Way BRT lanes or Palou Avenue.

Since multiple emergency access routes would be provided, stadium game day impacts on emergency access would be less than significant.

Impact TR-46: Stadium Secondary Event Site Access and Traffic Impacts

Impact TR-46 **Weekday evening secondary events at the stadium would result in increased congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without a secondary event, and result in significant impacts at nine additional intersections and one additional freeway off-ramp. (Significant and Unavoidable with Mitigation) *[Criteria D.a, D.b, D.g]***

The impact analysis of a secondary event at the new stadium assumed a weekday evening event with an attendance of 37,500 spectators. Secondary events could occur at any time of the day, and on any day of the week. Secondary events at the stadium would be limited to 20 total occurrences per year.

After exiting regional freeways, traffic generated by a secondary event would access the site via Cesar Chavez Street, Cargo Way, Evans Avenue, Innes Avenue, Bayshore Boulevard, Third Street, Carroll Avenue, Gilman Avenue, and Ingalls Street. The number of vehicles on the roadways accessing the stadium would vary by route and the size of the event.

During a weekday evening secondary event, it is projected that approximately one half of vehicle trips generated by a secondary event, or 4,688 vehicles would arrive approximately one hour prior to an event start time, likely between 5:00 and 6:00 p.m., coinciding with the weekday evening peak hour. Project vehicle trips would be added to the following freeway facilities that would operate at LOS E or LOS F during the weekday PM peak hour:

- US-101 northbound from Harney Way to Third/Bayshore

- US-101 northbound from Sierra Point Parkway to Harney Way
- US-101 southbound from Mariposa Street to Cesar Chavez
- US-101 southbound off-ramp to Harney Way
- I-280 southbound off-ramp to Pennsylvania/25th

In addition, the secondary event would cause an additional off-ramp to operate at LOS F conditions:

- US-101 southbound off-ramp to Bayshore/Cesar

Table III.D-25 (Intersection Level of Service Project and Secondary Event—Weekday PM Peak Hour—2030 Conditions) compares the intersection LOS operating conditions for the Project weekday PM peak hour conditions without a secondary event to conditions with a secondary event. The table includes only the intersections along the access routes that would be primarily affected by secondary event traffic. Although other study intersections may experience traffic increases immediately preceding and following an event, the increase is not expected to be substantial since those locations would not be on primary routes between regional transportation facilities and the stadium.

With a secondary event, an additional 9 intersections would operate at LOS E or LOS F conditions, beyond those identified for the PM peak hour under Project conditions, including:

- Harney/Jamestown
- Crisp/Palou
- Ingalls/Thomas
- Ingalls/Carroll
- Arelious Walker/Gilman
- Amador/Cargo
- Innes/Arelious Walker
- Evans/Jennings
- Harney/Executive Park East
- Harney/Thomas Mellon

Additionally, traffic associated with a secondary event would exacerbate traffic operations at 11 intersections that would operate at LOS E or LOS F conditions without a secondary event in the PM peak hour, including:

- Third/25th
- Third/Evans
- Third/Carroll
- Third/Paul
- Third/Jamestown
- Cesar Chavez/Evans
- Alana Way/Beatty
- Alana Way/Harney/Mellon
- Amador/Cargo Way
- Innes/Arelious Walker
- Evans/Napoleon/Toland

Table III.D-25 Intersection Level of Service Project and Secondary Event—Weekday PM Peak Hour—2030 Conditions

SOURCE: Fehr & Peers
a. Delay in seconds per vehicle.
b. Intersections operating at LOS E or LOS F conditions highlighted in bold.
c. Year 2030 analysis includes signalization as part of Executive Park Development or new Harney Interchange.
d. Year 2030 analysis includes signalization as part of Project.

Overall, since new facilities, including local streets and freeway facilities, would experience congested traffic following prior to a secondary event, traffic impacts associated with the new stadium during secondary events would be significant.

- *MM TR-46* *Traffic Control Officers. The stadium operator shall develop as part of a stadium Transportation Management Plan (TMP), a strategy for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre-*

and post- event traffic, similar to what would be in place for football game days. The secondary event component of the stadium TMP shall be approved by SFMTA. The stadium operator shall fully fund implementation of the secondary event (i.e., non-49ers football events) measures.

Implementation of this mitigation measure would likely improve vehicle entrance and exit flows to the stadium site, maintain orderly traffic operations, and reduce intrusion onto neighborhood streets near the stadium. However, even with the implementation of mitigation measure MM TR-46, on days when special events are held at the stadium, the Project's impacts to the study roadway network would be significant and unavoidable.

Impact TR-47: Stadium Secondary Event Transit Impacts

Impact TR-47 **With implementation of the Project, the existing transit service and Project improvements would not be adequate to accommodate projected transit demand during secondary events with attendance of 37,500 spectators. In addition, transit lines serving the area would experience additional delays due to traffic generated by the secondary event. (Significant and Unavoidable with Mitigation) *[Criteria D.f, D.i]***

During secondary events, regularly scheduled bus service adjacent to the stadium would continue to operate, providing direct service to the stadium and into the Hunters Point Shipyard Transit Center. Additional secondary event-related transit service is not proposed. Table III.D-26 (Weekday PM Peak Hour One-Way Muni Capacity to Stadium by Line Weekday PM Conditions) presents the total one-way capacity that would be available during the weekday PM peak hour.

Table III.D-26 Weekday PM Peak Hour One-Way Muni Capacity to Stadium by Line Weekday PM Conditions

Route	*Peak Hour Frequency (minutes)*	*One-Way Hourly Capacity (passengers per hour)*
24-Divisadero	6	635
28L-19th Avenue/Geneva Avenue	5	1,130
44-O'Shaughnessy	6	635
48-Quintara	10	380
HPX—Hunters Point Express	12	320
Total		***3,100***

SOURCE: SFMTA, Fehr & Peers

During the weekday evening period, up to 4,688 additional transit riders would be generated by a secondary event during the peak hour prior to the event. These would be in addition to the 1,037 transit trips inbound to the study area in the PM peak hour on routes serving the stadium area (e.g., 24-Divisadero, 28L-19th Avenue Limited, 44-O'Shaughnessey, 48-Quintara-24th Street, and HPX as extended to serve the event). Therefore, the overall one-way transit demand in the PM peak hour on days when a special event is being held at the stadium could be up to 5,725 riders. As shown in Table III.D-26, the total one-way transit capacity serving the stadium site during a typical weekday PM peak hour would be 3,100 passengers per hour, which would result 2,625 riders that would not be accommodated. This would be considered a significant impact.

- *MM TR-47* *Transit Service during Secondary Events. SFMTA shall increase frequency on regularly scheduled Muni routes serving the stadium area prior to large special events. In addition, the stadium operator shall fund additional Muni shuttle service between the stadium and regional transit service, including BART (Balboa Park and/or Glen Park stations) and Caltrain (Bayshore station).*

  - *Routes 24-Divisadero, 28L-19th Avenue Limited, and 44-O'Shaughnessey would already be operating near their maximum frequency. Therefore, this mitigation measure primarily applies to the 48-Quintara-24th Street route and the new HPX service. If each of these routes were increased to have five-minute frequencies (typically considered the maximum frequency that can be regularly maintained), the transit capacity toward the stadium would increase by 828 passengers per hour, for a total of 3,928 passengers. Even with the additional service on these two lines, there would be a shortfall of 1,797 passengers per hour in transit capacity.*
  - *Additional express service to key regional transit destinations and regional charter express service, similar to what is offered on football game days, would offset a portion of the shortfall in transit capacity. The amount and nature of special service to special stadium events would depend on the type and size of the special event. Generally, the capacity of the express service should compensate for the shortfall of 1,797 passengers per hour for a 37,500-person event (transit supply, would of course, be designed on a case-by-case basis depending on the expected size of the secondary event).*
  - *SFMTA and the stadium operator shall implement a stadium transportation systems plan similar to that developed for game-day operations (except that the Yosemite Slough bridge shall not be available for private automobiles), on a case-by-case basis depending on the expected size of the secondary event.*

  Prior to opening day at the new stadium, the City and the stadium operator shall determine costs associated with the increased service and determine funding requirements. Examples of funding sources that shall be considered include a surcharge on game tickets, parking or admission surcharge, or other such revenue mechanism. Implementation of increased transit service would be the responsibility of SFMTA and the stadium operator, and would be implemented when projected attendance warrants additional service.

With implementation of Project mitigation measure MM TR-47, the Project's impacts to transit service on special event days would be reduced, but not to less-than-significant levels. In addition, traffic impacts during secondary events would not be mitigated, and would impact transit operations. Therefore, the impact on transit operations would remain significant and unavoidable.

Impact TR-48: Stadium Secondary Event Bicycle Impacts

Impact TR-48 **With implementation of the Project, bicycle circulation would not be impeded during secondary events at the stadium. (Less than Significant)** ***[Criterion D.k]***

During secondary events, bicyclists would have access to the proposed bicycle facilities on existing and reconfigured roadways, as it is not anticipated that any special roadway network restrictions would be required to accommodate secondary event traffic. Bicycle access would be maintained on all study area roadways.

For those patrons arriving to the stadium by bicycle, the stadium would include bicycle racks and lockers would be provided at the stadium entrances. In addition, a bicycle valet, similar to the service operated at AT&T Park for the San Francisco Giants would also be provided. Overall, while traffic volumes on area roadways would increase during secondary events, the increase would not be sufficient to substantially affect bicycle circulation, and impacts on bicycle operations would therefore be less than significant.

Impact TR-49: Stadium Secondary Event Pedestrian Impacts

- **Impact TR-49** **With implementation of the Project, pedestrian circulation would not be impeded during secondary events at the stadium. (Less than Significant)** ***[Criterion D.j]***

The proposed street and sidewalk network in the vicinity of the stadium is designed to accommodate sell-out football game day crowds accessing and leaving the stadium site. Pedestrian access to the stadium during secondary events would be accommodated within the existing and proposed sidewalk network, although due to large number of pedestrians and vehicles accessing the stadium, pedestrians may experience crowding. However, this is expected and would be managed during large events as part of the stadium operations. Therefore, secondary event impacts on pedestrian circulation would be less than significant.

Impact TR-50: Stadium Secondary Event Parking Impacts

Impact TR-50 **With implementation of the Project, parking demand associated with a secondary event with an attendance of 37,500 spectators would be accommodated within the proposed supply. (Less than Significant)** ***[Criterion D.h]***

The parking supply associated with secondary events would vary, depending on the size of the event. For a secondary event with 37,500 spectators, it is anticipated that the stadium parking supply of 12,665 spaces would be made available. These include the dual-use fields, paved lot, structured parking facilities, and on-street parking.

A stadium secondary event with 37,500 spectators is expected to generate up to 10,100 vehicles, or about one half that of a sell-out football game day. These vehicles would be accommodated within the stadium parking supply. Impacts of stadium secondary events on parking would be less than significant.

Impact TR-51: Project Site Access and Traffic Impacts from Arena uses

Impact TR-51 **With implementation of the Project, weekday evening events at the arena would exacerbate congestion at intersections, freeway mainline, and freeway ramps already operating at unacceptable LOS under Project conditions without an arena event, and result in significant traffic impacts at Harney Way and Jamestown Avenue, which was operating acceptably under Project conditions without an arena event. (Significant and Unavoidable with Mitigation)** ***[Criteria D.a, D.b, D.g]***

The impact analysis of arena events assumed a weekday evening sell-out event at the 10,000-seat arena. Although no specific program has been developed for events at the arena, sell-out events with 10,000 attendees occurring during weekday evenings would likely be infrequent. Smaller-sized events during the weekday evening, and events occurring during the day and on weekends would have fewer impacts due to the lower traffic volumes demands on the study area roadways.

Access to the arena would be via the existing roadway network—US-101, Harney Way, Gilman Avenue, and Third Street—as well as local streets within Candlestick Point. The number of vehicles would vary by route and the size of the event.

During a weekday evening event, it is projected that approximately one half of vehicle trips generated by a sell-out arena event, or 1,333 vehicles, would arrive approximately one hour prior to an event beginning, likely between 5:00 and 6:00 p.m. and therefore would coincide with the weekday evening peak hour. Project vehicle trips would be added to freeway facilities that would operate at LOS E or LOS F during the weekday PM peak hour for Project conditions:

- US-101 northbound from Harney Way to Third/Bayshore
- US-101 northbound from Sierra Point to Harney Way
- US-101 southbound from Mariposa Street to Cesar Chavez
- US-101 southbound off-ramp to Harney Way

Table III.D-27 (Intersection Level of Service Project No Event and Arena Event—Weekday PM Peak Hour—2030 Conditions) presents a comparison of intersection LOS operating conditions for the Project weekday PM peak hour conditions without a sell-out event to conditions with a sell-out event at the arena. Only the intersections along the access routes that would be primarily affected by arena traffic are listed.

During the weekday PM peak hour, the LOS at the intersection of Harney/Jamestown would change from LOS D under Project conditions without an event to LOS F conditions for Project conditions with an event. This would be a significant impact.

Additionally, traffic associated with a sell-out arena event would exacerbate traffic operations at 11 intersections that would operate at LOS E or LOS F conditions under Project conditions without an event, including:

- Third/25th
- Third/Cesar Chavez
- Third/Evans
- Third/Oakdale
- Third/Revere
- Third/Carroll
- Third/Jamestown
- Alana Way/Beatty
- Alana Way/Harney/Mellon
- Third/Williams/Van Dyke
- Third/Jerrold

Overall, since local streets and freeway facilities would experience increased congested prior to an arena event, traffic impacts associated with the new arena would be significant.

Table III.D-27 Intersection Level of Service Project No Event and Arena Event—Weekday PM Peak Hour—2030 Conditions

		Project No Event		*Project with Arena Event*	
	Intersection	*Delay[a]*	*LOS[b]*	*Delay*	*LOS*

a. Delay in seconds per vehicle.
b. Intersections operating at LOS E or LOS F conditions highlighted in bold.
c. Year 2030 analysis includes signalization as part of Executive Park Development or new Harney Interchange.
d. Year 2030 analysis includes signalization as part of Project.

MM TR-51 *Transportation Management Plan (TMP). The arena operator shall develop a Transportation Management Plan (TMP) for coordinating with representatives of SFMTA and the SF Police Department for deploying traffic control officers in the Project vicinity to increase efficiency of pre- and post- event traffic, and for developing incentives to increase transit ridership to the arena. If Variants 1, 2, or 2A are implemented the TMP shall provide for SFMTA to increase the frequency on regularly scheduled Muni routes (primarily the CPX-Candlestick Express) serving the arena area prior to large events at the arena and for the arena operator to provide additional shuttle service to key regional transit destinations, such as BART, Caltrain, and the T-Third light-rail route. Implementation of this mitigation measure would likely speed vehicle entrance and exit to the arena site as well as maintain orderly traffic and transit operations and reduce intrusion onto minor routes to and from the arena. Traffic control officers would facilitate traffic flow at the intersection of Harney/Jamestown which would operate at LOS F conditions with a sell-out arena event. The final arena TMP shall be approved by*

SFMTA. Preparation of the TMP Plan shall be fully funded by the arena operator, and shall be completed in time for implementation on opening day of the arena.

However, even with the implementation of MM TR-51, the Project's impacts to the study roadway network during a sell-out event at the arena would be significant and unavoidable.

Impact TR-52: Transit Impacts from Arena uses

- **Impact TR-52** **With implementation of the Project, sell-out weekday evening events at the arena could impact existing and proposed transit service. (Significant and Unavoidable with Mitigation) *[Criteria D.f, D.i]***

Arena events would be served by the existing and proposed transit routes serving Candlestick Point. Additional transit service is not planned as part of special events at the arena. Table III.D-28 (Weekday PM Peak Hour One-Way Muni Capacity to Arena by Line) presents the total one-way capacity that would be available during the weekday PM peak.

Table III.D-28 Weekday PM Peak Hour One-Way Muni Capacity to Arena by Line

Route	*Peak Hour Frequency (minutes)*	*One-Way Hourly Capacity (passengers per hour)*
29-Sunset	5	768
28L-19th Avenue/Geneva Avenue	5	1,130
CPX—Candlestick Point Express	10	380
Total		***2,278***

SOURCE: SFMTA, Fehr & Peers

During the weekday evening period, up to 1,000 transit riders would be generated in the peak hour prior to an event. These would be added to the 1,023 transit trips inbound to the study area during the PM peak hour on routes serving the arena (e.g., 29-Sunset, 28L-19th Avenue Limited, and the proposed CPX service). Therefore, the overall one-way transit demand in the PM peak hour on days when an event is being held at the arena could be up to 2,023. As shown in Table III.D-28, the total one-way transit capacity serving the arena during a typical weekday PM peak hour would be 2,278 passengers per hour, which would be adequate to serve the arena event and background demand generated by the Project land uses.

As described in Impact TR-51 above, traffic associated with a sell-out event at the arena would add to already congested conditions on the study area roadway network, and these conditions could not be mitigated to less-than-significant levels. Therefore, traffic impacts would impact transit service accessing the Project site. Providing transit-priority treatments on Gilman Avenue, as described in MM TR-23.1 would reduce travel time impacts on the 29-Sunset (the 28L-19th Avenue/Geneva Avenue and the CPX would be traveling with the proposed transit-only lanes and would not be subject to increased traffic congestion).

The impact of traffic congestion on transit service could be avoided with implementation of mitigation measure MM TR-23.1 identified above. Implementation of this mitigation measure would reduce impacts on transit operations to less-than-significant. However, due to the uncertainty of this mitigation, the impact would remain significant and unavoidable.

Impact TR-53: Bicycle Impacts from Arena uses

Impact TR-53 **With implementation of the Project, bicycle circulation would not be impeded during arena events. (Less than Significant) *[Criterion D.k]***

During arena events, bicyclists would have access to the proposed bicycle facilities on existing and reconfigured roadways, as it is not anticipated that any special roadway network restrictions would be required to accommodate arena event traffic. Bicycle conditions would be similar to those described in Impact TR-29.

For those patrons arriving to the arena by bicycle, the arena would include bicycle racks and lockers would be provided at the stadium entrances. Overall, while traffic volumes on area roadways would increase during arena events, the increase would not be sufficient to affect bicycle circulation, and impacts on bicycle operations would therefore be less than significant.

Impact TR-54: Pedestrian Impacts from Arena uses

Impact TR-54 **With implementation of the Project, pedestrian circulation would not be impeded during arena events. (Less than Significant) *[Criterion D.j]***

In the vicinity of the arena, 12- to 15-foot-wide sidewalks would be provided. In addition, the arena would be set back from the street to provide a pedestrian plaza area for gathering pedestrians. Pedestrian access to the arena events would be accommodated within the proposed sidewalk network, although due to large number of pedestrians and vehicles accessing the arena during a sell-out event, pedestrians may experience crowding. However, this is expected and would be managed during large events by the arena operator. Therefore, arena event impacts on pedestrian circulation would be less than significant.

Impact TR-55: Parking Impacts from Arena uses

Impact TR-55 **With implementation of the Project, arena parking demand would be accommodated on street and within proposed off-street parking facilities. (Less than Significant) *[Criteria D.e, D.h]***

No separate parking facilities would be provided for arena patrons. Visitors would utilize proposed public off-street and on-street parking spaces in the vicinity of the proposed arena. A sell-out arena event would generate a demand for 2,860 vehicles (including patrons and employees), which would be accommodated within the approximately 2,300 parking spaces within structured parking in Candlestick Point, and within the approximately 1,000 on-street parking spaces in the Candlestick Point North, South and Central areas (refer to Figure III.D-12).

During the weekday evenings, parking demand associated with the commercial uses in Candlestick Point that would utilize the public parking garage would be less than during the day, and spaces would be available for arena events. There would generally be a shortfall in parking supply, compared to Project parking demand, and therefore depending on the time of day of the arena event, surplus capacity may not be available to accommodate the arena parking demand. Arena events during peak periods of commercial activity would increase the shortfall in parking spaces. It is possible that some drivers may seek available parking in the available Bayview area, or others may shift to transit. As discussed in Impact TR-35, the secondary effects of drivers searching for parking is typically offset by a reduction in vehicle trips due to

some drivers, who are aware of constrained parking conditions in a given area, shifting to other modes. Hence, any secondary environmental impacts that may result from a shortfall in parking would be minor. Therefore, the parking shortfall would not result in significant parking impacts, and Project impacts on parking would be less than significant.

Impact TR-56: Air Traffic Impacts

Impact TR-56 **Implementation of the Project would not impact air traffic. (No Impact) *[Criterion D.c]***

The Project site is not near an airfield; San Francisco International Airport is about seven miles to the south. This distance is outside of the limit for objects near airports in the guidance published by the Federal Aviation Administration (FAA) (within 20,000 feet or less than 4 miles from an airport). The FAA requires notice of construction for any structures within 20,000 feet what would extend 200 feet above ground level.[127] The proposed height of the tallest buildings (420 feet) would be approximately 30 feet higher than the crest of the adjacent Bayview Hill (which reaches an elevation of about 390 feet). The Project applicant will notify FAA prior to construction of buildings exceeding 200 feet to ensure compliance with FAA requirements. For those reasons, the heights of the Project buildings would not interfere with or result in any changes to air traffic. Therefore, Project impacts on air traffic safety would be less than significant.

Impact TR-57: Hazards due to Design Features

Impact TR-57 **Implementation of the Project would not create hazards due to any proposed design features. (Less than Significant) *[Criterion D.d]***

The Project includes construction of new roadways within the Project site, the construction of the Yosemite Slough bridge, and streetscape and intersection improvements outside of the Project site. New and reconfigured roadways would be designed in accordance with City standards, and would need to be reviewed and approved by the City prior to construction. Therefore, Project impacts related to hazards would be less than significant.

Impact TR-58: Emergency Access

Impact TR-58 **Implementation of the Project would not result in significant emergency access impacts. (Less than Significant) *[Criterion D.m]***

The Project includes the construction of new roadways to facilitate emergency access. Existing emergency response routes would either be maintained in their existing locations or rerouted as necessary. Further, all development would be designed in accordance with City standards, which include provisions that address emergency access (e.g., minimum street widths, minimum turning radii). In addition, emergency vehicles would be able to utilize transit lanes when streets are congested. Therefore, Project impacts on emergency access would be less than significant.

[127] Federal Aviation Administration, Advisory Circular AC 70/7460-2K, Proposed Construction or Alteration of Objects that May Affect the Navigable Airspace, March 1, 2000, available at http://www.airweb.faa.gov/Regulatory_and_Guidance_Library/rgAdvisoryCircular.nsf/0/22990146db0931f186256c2a00721867/$FILE/ac70-7460-2K.pdf, accessed October 28, 2008.

Cumulative Impacts

The geographic context for the analysis of cumulative transportation impacts is the study area, as shown in Figure III.D-1, which, as explained above, includes all aspects of the transportation network that may be measurably affected by the Project. While cumulative impacts associated with the Project have been discussed above, together with Project-specific impacts, they are restated here for ease of reference. Several of the Project's transportation impacts would also make significant contributions to cumulative impacts in the study area.[128]

The Project would make significant contributions to the following cumulative traffic impacts: construction-related transportation impacts (Impact TR-1); traffic congestion (Impact TR-2); intersection traffic impacts at several intersections (Impact TR-3, Impact TR-4, Impact TR-5, Impact TR-6, Impact TR-7 and Impact TR-8); traffic impacts at several freeway mainline segments, weaving segments, ramps, and freeway diverge queue storage (Impact TR-11, Impact TR-13, Impact TR-15); and traffic spillover to adjacent neighborhoods (Impact TR-10). In addition, the Project would contribute to cumulative traffic volumes on Harney Way (Impact TR-16). Mitigation measures have been identified for many of these cumulative traffic impacts. Specifically, mitigation measures have been identified for Impact TR-1, Impact TR-2, Impact TR-4, Impact TR-6, Impact TR-7, Impact TR-8, Impact TR-10, Impact TR-15, and Impact TR-16. Most of these mitigation measures, however, are either uncertain at this time, or would be effective only to reduce, but not to completely avoid, these cumulative traffic impacts. Of these mitigation measures, and MM TR-16, related to the widening of Harney Way, would be effective to reduce Project-related contributions to cumulative traffic impacts on Harney Way to a less-than-significant level. Other mitigation measures that would be implemented and would reduce but not avoid significant effects are MM TR-1 [Construction Traffic Management Plan] to reduce construction traffic effects, MM TR-2 [Transportation Demand Management Plan] to reduce the Project's overall contribution to traffic, and MM TR-4 to reduce impacts at the intersection of Tunnel/Blanken. Implementation of MM TR-6 [Harney/US-101 Interchange], MM TR-7 [Amador/Cargo/Illinois], and MM TR-8 [Geneva/Bayshore] remains uncertain. Thus, cumulative traffic impacts associated with Impact TR-1, Impact TR-2, Impact TR-4, Impact TR-6, Impact TR-7, Impact TR-8, Impact TR-10 and Impact TR-15 for which mitigation measures have been identified would remain significant and unavoidable with mitigation. On the other hand, for cumulative traffic Impact TR-3, Impact TR-5, Impact TR-11, and Impact TR-13 no feasible mitigation measures have been identified. Therefore, these cumulative traffic impacts would also be significant and unavoidable.

The Project would make significant contributions to the following cumulative transit impacts: transit capacity (Impact TR-17); ridership and capacity utilization at study area cordons (TR-18); transit operation impacts on several transit lines (Impact TR-21, Impact TR-22, Impact TR-23, Impact TR-24, Impact TR-25, Impact TR-26 and Impact TR-27); transit operations on US-101 (TR-28); and regional transit operations on US-101 and Bayshore Boulevard (Impact TR-30). The Project would not make significant contributions to cumulative transit impacts regarding transit capacity utilization at downtown and regional screenlines (Impact TR-19 and Impact TR-20). Mitigation measures (MM TR-17, MM TR-21.1, MM TR-21.2, MM TR-22.1, MM TR-22.2, MM TR-23.1, MM TR-23.2, MM TR-24.1,

[128] These impacts are described in more detail above. The calculations to support these impact conclusions are located in the Transportation Study, attached as Appendix D to this EIR.

MM TR-24.2, MM TR-25, MM TR-26.1, MM TR-26.2, MM TR-27.1, MM TR-27.2) have been identified for most of the Project's cumulative transit impacts (Impact TR-17, Impact TR-18, Impact TR-21, Impact TR-22, Impact TR-23, Impact TR-24, Impact TR-25, Impact TR-26, and Impact TR-27). The identified mitigations would reduce two of the identified Project-related cumulative transit impacts to less-than-significant levels: transit capacity (Impact TR-17) and ridership and capacity utilization at study area cordons (Impact TR-18). For the rest of the cumulative transit impacts for which mitigations have been identified, the mitigations are either uncertain at this time, or would be effective to reduce, but not to completely avoid, the cumulative transit impacts related to the Project. Specifically, this would be the case for all the mitigation measures that have been identified to alleviate congestion-related transit operation impacts on several Muni lines (Impact TR-21, Impact TR-22, Impact TR-23, Impact TR-24, Impact TR-25, Impact TR-26, and Impact TR-27). These cumulative transit impacts, therefore, would remain significant and unavoidable, even with mitigation. There are only two cumulative transit impacts for which no mitigation measures have been identified: transit operations on US-101 (Impact TR-28); and regional transit operations on US-101 and Bayshore Boulevard (Impact TR-30). These cumulative transit impacts associated with the Project would remain significant and unavoidable.

With one localized exception, the Project would make no significant contributions to cumulative bicycle circulation impacts in the area. On the contrary, the Project would have a beneficial impact on bicycle circulation (Impact TR-31). The Project would connect the existing Bayview Hunters Point neighborhood (and the rest of the City) with the proposed waterfront amenities. Specifically, the Project would provide a number of roadways which would facilitate bicycling within and in the vicinity of the Project, including off-street Class I pathways along the Bay, at Candlestick Point, across the proposed Yosemite Slough bridge, and into Hunters Point Boulevard. The Project site would also facilitate completion of the Bay Trail. Overall, bicycle access and the environment for bicycling would improve within and in the vicinity of the Project site, and the facilities would be adequate to meet the bicycling demand associated with the Project and adjacent uses. The one exception would be that of bicycle circulation on Bicycle Routes #70 and #170 along Palou Avenue, between Griffith Street and Third Street. As described above, these bicycle routes may be adversely affected by the combination of the proposed transit preferential treatment and vehicular congestion in the area (Impact TR-32). A mitigation measure has been identified for this impact (MM TR-32), but since its implementation is uncertain at this time, this impact would remain significant and unavoidable.

Pedestrian circulation impacts by their very nature are site-specific and would not contribute to impacts from other development projects. The Project would contribute to cumulative traffic conditions that would affect pedestrian safety but the Project and Project contribution to cumulative pedestrian safety impacts would be less-than significant. The Project would lessen impacts that would otherwise result to cumulative pedestrian safety through its beneficial effects on pedestrian circulation in the area. The Project would provide a connection between the Bayview neighborhood (and the rest of the City) and the waterfront, and would include many pedestrian amenities that would, overall, enhance the pedestrian experience in the Project site and its vicinity (Impact TR-33 and Impact TR-34). Thus, there would be no cumulative pedestrian impacts associated with the Project.

Similarly, the Project would make no significant contribution to cumulative parking impacts. As explained above, other cumulative projects in the area, such as most of the surrounding existing development, Executive Park, and India Basin, are located too far from the Project site to expect that drivers going to

those projects would park at the Project site, or that drivers going to the Project site would park at those sites. Additionally, the topography is not conducive to parking beyond the Project site boundaries. Consequently, there is no potential for significant cumulative parking impacts (Impact TR-35).

Loading impacts, like pedestrian impacts, are by their very nature localized and site-specific, and would not contribute to impacts from other development projects near the Project site. Moreover, the Project would have no loading impacts, as the estimated loading supply would be generally greater than the loading demand, and any effects of unmet loading demand would be temporary inconveniences and not rise to the level of a significant impact (Impact TR-37).

Finally, the Project would contribute to cumulative traffic and transportation impacts associated with 49ers games at the stadium (Impact TR-38 and Impact TR-39); secondary events to be held at the stadium (Impact TR-46 and Impact TR-47), and events at the arena (Impact TR-51 and Impact TR-52). Mitigation measures have been identified for these impacts (MM TR-38, MM TR-39, MM TR-46, MM TR-47, and MM TR-51). However, these mitigation measures would reduce, but not completely avoid the Project's contributions to these cumulative impacts. Therefore, these cumulative impacts would remain significant and unavoidable. The Project would not contribute to cumulative bicycle, pedestrian and parking impacts at these facilities for the reasons explained previously concerning the Project contribution to bicycle, pedestrian and parking impacts (Impact TR-40, Impact TR-41, Impact TR-42, Impact TR-48, Impact TR-49, Impact TR-50, Impact TR-53, Impact TR-54, and Impact TR-55).

SECTION III.E AESTHETICS

III.E.1 Introduction

This section examines the potential aesthetic impacts of the Project, including light and glare. The section describes the visual context of the Project site and vicinity, including important view corridors and vistas, distinctive visual landmarks (both natural and built), scenic resources, and the overall visual character of the area.

The section identifies visual changes that Project development would create. These changes are demonstrated through computer-generated simulations that show the proposed height, bulk, and massing of the Project's buildings. The analysis focuses on changes from public viewpoints and from existing development and scenic areas in the Project vicinity. The section assesses the Project's potential visual effects based on field reconnaissance by consultants and City/Agency staff and photographs of existing conditions from key viewpoints. The selected viewpoints represent a range of locations where visual changes that would result from the development of the Project would be visible from major roadways, existing public open space or nearby neighborhoods. The viewpoints also include locations outside the immediate Project vicinity where changes would be visible in long-range views.

Photographs within the Project site and from key view locations near the site illustrate the existing Project site conditions. Figure III.E-1 (Viewpoint Locations of Existing Conditions Photographs) through Figure III.E-9 (Existing Shoreline Conditions) include a key map and photographs of the Project site existing conditions.

A key map and short-, mid-, and long-range locations from which photographs of the Project site were taken are illustrated on Figure III.E-10 (Viewpoint Locations) through Figure III.E-30 (View 20: Southeast from Heron's Head Park). Each existing view (denoted as "Existing") is shown with a computer-generated visual simulation of post-Project conditions from the identified viewpoints (denoted as "Proposed").

On the basis of Project plans, relevant urban design policies and guidelines, and analysis of the selected viewpoints, the section provides conclusions on the Project's potential impacts on scenic resources, overall visual character of the Project site and vicinity, and light and glare. This section identifies both Project-level and cumulative environmental impacts, as well as feasible mitigation measures that could reduce or avoid the identified impacts.

III.E.2 Setting

Existing Visual Character and Views in the Project Vicinity

The Project site is located in the southeastern portion of the City, approximately four miles south of downtown San Francisco. The Project vicinity is defined as the Bayview Hunters Point neighborhood, Candlestick Point, HPS, and India Basin.

The topography of the area varies from flat areas near the San Francisco Bay (the Bay) to undulating slopes and prominent hills, most notably Bayview Hill and Hunters Point Hill. Existing development in the

Project vicinity is generally sited on flat or moderately sloped areas. Steeper slopes are generally undeveloped and vegetated with native and non-native trees, shrubs, and grasses.

Mature trees are also a prominent visual feature on the crests of hills and in other clustered locations in the Project vicinity. As the name Bayview implies, the Bay is visible from many locations throughout the area. The East Bay hills are visible in the distance looking towards the east from locations near the Bay or in hilly neighborhoods.

The Project vicinity is surrounded by visually heterogeneous neighborhoods, including Visitacion Valley to the south, Portola to the west, Bernal Heights to the northwest, and Potrero Hill to the north. The Bay lies to the east (refer to Figure III.E-1). The neighborhoods include single-family houses and apartment buildings, typically from one to four stories, parks and open space, undeveloped properties, a variety of retail and commercial buildings, and industrial structures.

The overall character of the Bayview Hunters Point neighborhood consists of urbanized, moderate-density development. Building heights range from one to four stories, and building massing ranges from small-scale residences to block-scale warehouses. The architectural character includes nineteenth century and early twentieth century residential buildings, commercial buildings (including wood frame and brick structures), World War II–era industrial and commercial facilities, and more recently built warehouses and industrial development. Other recent residential development is found in the Third Street corridor, and other sites on Hunters Point and Bayview Hills.

Transportation corridors are also visual features. Third Street is the major north-south commercial street, with Muni Metro Light-Rail Vehicle (LRV) service. Mixed-use developments, including multi-family housing, are also being developed along the Third Street corridor. The US-101 and I-280 freeways, generally on elevated structures, define neighborhood boundaries further west. Other features include billboards and commercial signage, overhead utility lines, the Caltrain rail corridor, and large public facilities, such as the Southeast Water Pollution Control Plant west of Third Street and the US Postal Service distribution center on Evans Avenue.

Residential neighborhoods in the Bayview Hunters Point neighborhood are east and west of Third Street from US-101 to HPS. A majority of the existing residential uses are single-family units. There are multi-family units distributed on the lower slopes of Bayview Hill and on Hunters Point Hill and newer three- to four-story multi-family units along Jamestown Avenue, Williams Avenue, and Innes Avenue.

Public open space, including public parks and recreation areas along the Bay shoreline, is distributed throughout the Bayview Hunters Point neighborhood. Public parks in the Project vicinity include, but are not limited to, Bayview Playground, Bayview Park, India Basin Shoreline Park, Gilman Playground, other smaller neighborhood parks, the Yosemite Slough area, and the Candlestick Point State Recreation Area (CPSRA). Bayview Hill is west of Candlestick Point and is mostly undeveloped Recreation and Park Department land. Refer to Section III.P (Recreation) for a detailed discussion of public parks, recreation areas, and open space in the Project vicinity.

Land uses immediately surrounding Candlestick Point are varied. Light industrial uses, such as metal fabrication and distribution facilities, are located north of Carroll Avenue. West of Hawes Street and west and south of Candlestick Park, the predominant land use is single-family residential, with new residential

units being constructed south of Jamestown Avenue at Executive Park and other locations. At present, the existing development at Executive Park consists of three office buildings with associated parking and two residential buildings containing 128 units. Three other residential buildings, containing 176 units, are near completion. The area adjacent to the HPS Phase II site to the southwest contains multi-family housing and single-family attached units. Milton Meyer Recreation Center, west of HPS Phase II, is a multi-purpose facility used for afterschool programs, arts and crafts, indoor games, and other training, with game courts and an indoor gym. Uses in the area immediately surrounding the HPS Phase II site, such as industrial uses on Crisp Road, historically provided a buffer between the HPS Phase II site activities and nearby residential uses. Large setbacks and street blocks and a lack of pedestrian amenities were designed to discourage traffic near the shipyard. As discussed in Chapter II (Project Description), HPS Phase II would be adjacent to the under-construction HPS Phase I. The HPS Phase II site surrounds the HPS Phase I development area, a 63-acre site, to the north, east, and south. The HPS Phase I site has been approved for up to 1,600 residential units and 132,000 square feet of commercial development.

Photographs show existing views of the Project site and of existing conditions of neighborhoods in the Project vicinity. Figure III.E-1 through Figure III.E-9 include a viewpoint location key map and photographs of Project site conditions and of nearby neighborhoods. Figure III.E-10 through Figure III.E-30 include a viewpoint location key map, and short-, mid-, and long-range locations of photographs of the Project site. Figure III.E-11 through Figure III.E-30 illustrate existing views (denoted as "Existing"), and a computer-generated visual simulation of post-Project conditions from the identified viewpoints (denoted as "Proposed").

Important scenic vistas available from the Project site and vicinity are overall views of the Bay, of the East Bay hills, of the hills on the San Francisco peninsula, and views to downtown San Francisco. More local scenic vistas and scenic resources are open space on Bayview Hill, the open space and shoreline of the CPSRA and Yosemite Slough, and India Basin Shoreline Park.

Existing Visual Character and Views in the Project Site

Candlestick Point

The Candlestick Point site contains several land uses: the Candlestick Park stadium, the CPSRA, residential uses on Jamestown Avenue, the Alice Griffith Public Housing site, and a Recreational Vehicle (RV) park. Views of San Francisco Bay are prevalent from all those areas. Overall, the Candlestick Point area appears as a group of disparate features, the stadium surrounded by paved parking, the open space of CPSRA fronting the Bay, other unimproved open space, and residential uses at Alice Griffith Public Housing and on Jamestown Avenue. Privately owned parking lots are adjacent to Candlestick Park parking lots. The vacant, undeveloped lots on Jamestown Avenue are used for overflow stadium parking. Figure III.E-5A (Candlestick Point Existing Conditions) and Figure III.E-5B (Candlestick Point Existing Conditions) illustrate existing conditions at Candlestick Point.

FIGURE III.E-5B

Candlestick Point — Hunters Point Shipyard Phase II EIR

CANDLESTICK POINT EXISTING CONDITIONS

Access to most of the site is limited to an arterial loop road (Gilman Avenue/Jamestown Avenue/Bill Walsh Way/Ingerson Avenue) that encircles the Candlestick Park stadium and parking lot. Gilman Avenue and Hawes Street provide access to the Alice Griffith Public Housing site. However, most non-arterial streets from the residential neighborhoods to the west of Candlestick Point reach a dead end before entering the Candlestick Point site. Streets within the Alice Griffith Public Housing complex are internally oriented, and for the most part, do not connect to surrounding streets. In addition, Bayview Hill limits access from the south, except at Harney Way. The lack of street connectivity, combined with Candlestick Point's large, barren parcels, lack of sidewalks, existing storage yards, and low level of on-site activity, contribute to making Candlestick Point relatively unwelcoming from a visual perspective. Vacant parcels appear to be used for illegal dumping, or for spillover parking when the Stadium has sold-out crowds for major events.

Candlestick Park stadium is an oval structure that is approximately 120 feet tall. The stadium sits in the southwestern corner of the Candlestick Point site and is surrounded by surface parking lots. Mature trees, stadium lighting poles, and small structures, such as maintenance, ticketing, and vendor sheds, line the stadium walls. The upper bowl of the stadium is framed by a curved canopy that partially shelters the upper rows of seating. This canopy is a characteristic feature of the stadium when viewed from a distance.

CPSRA within the project boundary is a 120-acre open space that wraps around the Candlestick Point shoreline from Arelious Walker Drive on the north to Harney Way on the south. An additional 34 acres of CPSRA land is outside the project boundary. The CPSRA includes parking areas, a shoreline area with trails providing access to the Bay for water-dependent recreation, picnic areas, a fitness course, bike path, and rocky beaches. Vegetation consists mainly of low-lying shrubs and grasses, with trees interspersed throughout the CPSRA. The shoreline area is lined by beaches and rock armoring. About 30 acres of CPSRA land is currently undeveloped or is leased as parking for Candlestick Park stadium and does not function as public open space. Other portions of the CPSRA contain construction rubble and debris, although some has recently been removed.

The Alice Griffith Public Housing site is bounded by Gilman Avenue on the southwest, Hawes Street on the northwest, Carroll Avenue on the northeast, and Arelious Walker Drive on the southeast. The housing consists of 33 two-story, rectangular apartment buildings sited on a small hill overlooking surrounding development. Although the buildings vary, the architectural character of the buildings is simple and uniform, with stucco facades and metal detailing. Shared open courtyards are interspersed among the buildings. Overhead power and telephone lines are very visible. This area is deteriorated, with broken fencing, graffiti, and trash. Figure III.E-6 (Alice Griffith Public Housing Site Existing Conditions) contains photographs of this area of the Project site.

To the east, the Candlestick RV Park occupies a site on Gilman Avenue. The RV park includes a large paved area surrounded by a low concrete wall. The Jamestown Avenue area, west of and uphill from the stadium, is a residential street, with some undeveloped areas fronting on Jamestown Avenue. Bayview Hill rises immediately west of Jamestown Avenue.

None of the buildings located at Candlestick Point is identified as a scenic resource or a feature of the built environment that contributes to a scenic public setting; however, they are visible and may provide a visual point of reference. Scenic resources at or near Candlestick Point include the CPSRA, Bayview Hill, Yosemite Slough, and the shoreline, as further described below under Analytic Method.

FIGURE III.E-6

Candlestick Point — Hunters Point Shipyard Phase II EIR

ALICE GRIFFITH PUBLIC HOUSING SITE EXISTING CONDITIONS

Hunters Point Shipyard Phase II

The HPS Phase II site appears as an abandoned and deteriorated waterfront industrial setting, with large industrial and administrative buildings, piers, drydocks, and the prominent structure of the Re-Gunning crane,[129] which is located at the end of the Re-gunning Pier. Much of the area is currently in a degraded condition. The scale of the structures contrasts with the slopes of Hunters Point Hill to the west and surrounding waters of the Bay. Most of the structures are in various states of disrepair and a large portion of the shipyard consists of vacant parcels. There are piles of debris in some areas. Vegetation is sparse, consisting primarily of ruderal grasses and shrubs, with a small number of trees, generally located near the former offices, training centers, and barracks in the north. Large expanses of asphalt paving are visible.

The northernmost cluster of development includes a number of single-story sheds and warehouses characterized by simple architecture, corrugated metal or wooden facades, and gabled or flat roofs. Buildings include a number of two- to three-story barracks, training facilities, and office buildings; other Shipyard buildings range from one up to six to nine stories. Between Drydocks 2 and 3, there are a number of pre-War buildings, including Building 205, a former pump house/substation dating to 1901. The architectural character of Building 205 stands out from other structures on site due to the age of the building, its prominent waterfront location, and its red brick façade. This building includes characteristic architectural details such as large arched windows, ornamental overhangs, and a gabled roof. The first building built by the Navy in World War II was Building 231 (1942–1945), the Inside Machine Shop, which was constructed in 1942 by the San Francisco-based firm of Barrett & Hilp and situated adjacent to Drydock 2. Building 211 was also one of the first erected by the Navy. The building was the original Shipfitters Shop and is a good representation of the typical semi-permanent, monitor-roof shop building constructed throughout the Shipyard during the World War II era. Building 224, a concrete air raid/bomb shelter building built in 1944, and later used as an annex for the NRDL, is a unique representative of its type at the Shipyard. The only building within the district completed after World War II is the Optical, Electronics and Ordnance Building, Building 253, finished in 1947 and attached to the west elevation of Building 211. This concrete frame curtain-wall building, designed for the Navy by local architect Ernest J. Kump, was a highly specific repair and research facility. Refer to Figure III.J-1 (HPS Phase II Structures) for the location of the various buildings located on the HPS Phase II site and Figure III.J-3 (Potential Historic Structures) for a photograph of Buildings 211, 231, and 253. Both of these figures are contained in Section III.J (Cultural Resources and Paleontological Resources). Other wood and concrete framed structures range from one to four stories in height. These structures do not possess any unique distinguishing characteristics, save for varied massing and rooftop appurtenances. Most of the site remains fenced off, prohibiting public access from surrounding neighborhoods for public safety reasons. As with Candlestick Point, the HPS Phase II site lacks pedestrian amenities, such as sidewalks. Figure III.E-7A (HPS Phase II Existing Conditions) and Figure III.E-7B (HPS Phase II Existing Conditions) illustrate the existing conditions at Hunters Point.

None of the buildings or structures located at HPS Phase II is designated as a scenic resource or a feature of the built environment that contributes to a scenic public setting; however, they are visible and may provide a visual point of reference, and, in some cases, may be considered historic (refer to Section III.J for a discussion

[129] Re-gunning cranes are a type of cranes used in shipbuilding and repair that are particularly suited to lift heavy objects such as ship engines.

of historic buildings). Scenic resources at or near Hunters Point Phase II include the Yosemite Slough, the Re-gunning crane, and the shoreline, as further described below under Analytic Method.

The topography of the HPS Phase II site is generally flat, except for the area around Building 101. The Bay is visible between and beyond structures throughout the site. HPS Phase I, now under development, occupies higher ground west of the HPS Phase II site.

Drydocks and piers, many of which are in disrepair, create a pattern of inlets along the Bay. On the 405-foot-wide Re-gunning Pier, the Re-gunning crane supported on four towers straddles the pier and rises to 182 feet. Much of the HPS shoreline is armored by a concrete seawall. The seawall does not rise above the existing shoreline.

Yosemite Slough

The Yosemite Slough is a slow-moving tidal channel that winds through a marsh between Hunters Point and Candlestick Point. Except for the mouth of the slough across which the bridge would be constructed, the Slough is not within the Project site. The Slough contains narrow patches of salt marsh habitat, varying in length from 20 to 100 feet,[130] as well as mud flats that are exposed at low tides once or twice a day along its shorelines. The Slough is habitat and feeding grounds for adult fish and invertebrates, water and shorebirds, and some mammals. The Slough operates to bring in fresh nutrients at high tide and flush out pollution and detritus at low tide. Ruderal vegetation occurs on both sides of the Slough. There are also some areas with dirt and debris piles, old fencing, and riprap along the shoreline. Figure III.E-8 (Yosemite Slough Existing Conditions) contains photographs of the Slough.

Shoreline

The Candlestick Point shoreline is characterized by slopes protected by riprap or concrete debris and beach-fronted, unprotected slopes (refer to Figure III.E-9 [Existing Shoreline Conditions]). The top of the bank in this area ranges from a localized low spot of four feet to as much as 22 feet above sea level. Active erosion was observed in higher portions of the embankment.[131] The existing shoreline on the HPS Phase II site is characterized by a combination of riprap-protected slopes, unprotected embankments fronted by a beach, concrete submarine drydocks, pile-supported wharf, dilapidated piers, quay-wall structures, unprotected natural shoreline with debris (broken concrete, broken bricks, and random pieces of rock) lining the edges, and beach-fronted, unprotected slopes. The shoreline shows areas of erosion as well as areas of vegetation and habitat growth within the intertidal zone.[132]

FIGURE III.E-9

Candlestick Point — Hunters Point Shipyard Phase II EIR

EXISTING SHORELINE CONDITIONS

Existing Light and Glare Conditions

Existing light and glare conditions at the Project site and in the vicinity are typical of urban areas, with street lighting and exterior lighting at residential, public, and commercial structures. Lighting is seen during night periods along street corridors and on buildings throughout the area. Night parking lot lighting is also visible at the occupied portions of the Project site. The night lighting patterns are visible from residential neighborhoods on hillside areas such as Jamestown Avenue or Hunters Point Hill.

Candlestick Park stadium lighting is operated during evening or night events. Depending upon time of day and weather conditions, stadium lighting operates for up to eleven San Francisco 49ers home football games per year. Stadium lighting typically does not operate after 10:00 P.M. for night games. The stadium light is visible from nearby areas, including residential uses at Executive Park, the Bayview Hunters Point neighborhood west of Candlestick Park, and Hunters Point Hill. Parking lots associated with the stadium are lighted during night events, which adds to the ambient light from the stadium area during those periods.

Public Viewpoints

To determine the potential changes to the visual character in the Project vicinity, PBS&J photographed the site from various important public viewpoints, determined in coordination with City staff. Figure III.E–10 (Viewpoint Locations) is a key map illustrating viewpoint locations. Important public viewpoints toward the Project site include vantage points such as the following:

- Twin Peaks (Figure III.E-11 [View 1: Southeast from Twin Peaks])
- Bernal Heights Park (Figure III.E-12 [View 2: Southeast from Bernal Heights])
- McLaren Park (Figure III.E-13 [View 3: East from McLaren Park])
- Potrero Hill (Figure III.E-14 [View 4: South from Potrero Hill])
- San Bruno Mountain (Figure III.E-17 [View 7: Northeast from San Bruno Mountain])
- Oyster Point (Figure III.E-18 [View 8: North from Oyster Point])
- the CPSRA (Figure III.E-19 [View 9: North from CPSRA South of Harney Way], Figure III.E-21 [View 11: Northwest from CPSRA], and Figure III.E-23 [View 13: West from CPSRA])
- Bayview Hill (Figure III.E-20 [View 10: Northeast from Bayview Hill])
- Hunters Point Hill (Figure III.E-28 [View 18: South from Hilltop Open Space] and Figure III.E-29 [View 19: East from Hunters Point Hill Open Space])
- Heron's Head Park (Figure III.E-30 [View 20: Southeast from Heron's Head Park])

Because significant views of the Project site from neighboring residential and commercial areas would change, views from adjacent neighborhoods are also documented in photographs in Figure III.E-22 (View 12: Southeast from Gilman Avenue) and Figure III.E-26 (View 16: Southwest from Mariner Village]). It should be noted that the "existing" views do not include already approved projects that have not yet been completed (HPS Phase I, Executive Park) but would be built by the time the Project is built out. The following describes existing views of the Project site as seen from these viewpoints.

Prominent Features

There are several features and landmarks within the Project site that are visible from distant viewpoints. These features are summarized to assist the reader in identifying the location of the HPS and Candlestick Point portions of the Project site in the photos and simulations:

- The location of HPS is marked by the 182-foot-tall Re-gunning crane and former Navy buildings up to nine stories in height. Prominent structures include the six-story Building 253 in the eastern portion of the site and the nine-story officer's quarters in the south of the site.
- Candlestick Park is a notable feature from many viewpoints. The height of the stadium is 120 feet. The stadium's light towers reach heights of 240 feet. Bayview Hill, while not part of the site, is immediately west of Candlestick Park and can be used in the photos to locate the Candlestick Point site.

View 1: Southeast from Twin Peaks (Figure III.E-11)

This viewpoint provides a long-range view of the Project site facing southeast from a position on Twin Peaks, approximately 4 miles northwest of the Project site. Low-rise, medium-density urban development that is characteristic of the southeastern portion of San Francisco is visible in the foreground. Major topographical features that are visible from this viewpoint include Bernal Heights (elevation 433 feet) in the foreground and Hunters Point Hill (elevation 275 feet) and Bayview Hill (elevation 413 feet) near the shoreline.

Views of the Project site are visible along the shoreline between Hunters Point Hill and Bayview Hill. At this distance, the Re-gunning crane at HPS and Candlestick Park is only faintly visible. The Bay and the East Bay hills are visible in the distance.

View 2: Southeast from Bernal Heights (Figure III.E-12)

This viewpoint provides a long-range view of the Project site facing southeast from about 2 miles northwest of the Project site. From this viewpoint, low-rise, medium-density residential, commercial, and industrial development characteristic of the BVHP neighborhood is visible. Interstate 280 (I-280), which crosses the northern portion of the BVHP neighborhood, and US-101, which provides the western boundary of the BVHP neighborhood, are also prominently visible in the mid-ground. The Project site is visible along the shoreline between Hunters Point Hill and Bayview Hill. Candlestick Park is faintly visible from this viewpoint, while HPS is partially obstructed by Hunters Point Hill. Yosemite Slough and the South Basin, which bisect the Project site, are also visible. (Figure E.III-12 illustrates the location of the Yosemite Slough and the South Basin relative to Candlestick Point and HPS Phase II.) The Bay and the East Bay hills are visible in the distance.

View 3: East from McLaren Park (Figure III.E-13)

This viewpoint provides a long-range view of the Project site facing east from approximately 1 mile west of the Project site. From this viewpoint, low-rise, medium-density residential development characteristic of the Bayview Hunters Point neighborhood is visible. HPS is visible from this viewpoint, although somewhat obscured by intervening development and Bayview Hill. Candlestick Point is not directly visible from this line of sight. The Bay and the East Bay hills are visible in the distance.

View 4: South from Potrero Hill (Figure III.E-14)

This viewpoint provides a long-range view of the Project site facing south from a position about 1 mile north of the Project site. From this viewpoint, low-rise, medium-density residential, commercial, and industrial development, characteristic of the Bayview Hunters Point neighborhood is visible, as is a large stretch of US-101. The Re-gunning crane and buildings at HPS are visible to the east of Hunters Point Hill. Views of Candlestick Point are obscured by intervening development, with the exception of Candlestick Park, which is visible. The Bay and the East Bay hills are visible in the distance.

View 5: Northeast from Northbound US-101 (Figure III.E-15)

This viewpoint provides a long-range view of the Project site facing northeast from approximately 1 mile to the southwest, with the Bay as the major foreground. From this viewpoint, the Project site is visible along the shoreline of Candlestick Cove. Candlestick Point, Bayview Hill, and Candlestick Park are prominently visible in the mid-ground. Residential and commercial development to the west of Candlestick Park is also visible. Views of HPS, marked by the Re-gunning crane, are further in the distance. The continuing Bay and the East Bay hills are visible in the distance.

View 6: Northeast from US-101 at Harney Way Off-Ramp (Figure III.E-16)

This viewpoint provides a closer view of the Project site facing northeast from about a half mile to the southwest. From this viewpoint, Bayview Hill appears in the background, with residential and commercial development at Executive Park at the base of hill. The heights of the residential structures are five stories, while the heights of the commercial structures vary from three to eight stories. Views of grassland and vegetation that are a part of the CPSRA are also visible from this viewpoint, along with a partial view of Candlestick Park. The Bay and the East Bay hills are visible in the distance.

View 7: Northeast from San Bruno Mountain (Figure III.E-17)

This viewpoint provides a long-range view of the Project site facing northeast from approximately 3 miles to the southwest. The structures within HPS, including wharfs and docks, storage and maintenance facilities, administrative and support facilities, and base housing, are visible to the northeast of Bayview Hill. Similarly, a prominent view of Candlestick Point, including residential and office development at Executive Park, a partial view of Candlestick Park and lands within the CPSRA are also available. The Bay and the East Bay hills are visible in the distance.

View 8: North from Oyster Point (Figure III.E-18)

This viewpoint provides a view of the Project site from approximately 2 miles to the south. The view north from the Oyster Point peninsula in the City of South San Francisco provides a view of the Bay in the foreground, with Bayview Hill, Candlestick Point (including Candlestick Park stadium), and the Shipyard visible in the background. The East Bay hills are visible in the distance. Existing development in San Francisco west of Bayview Hill, at Executive Park, and on Hunters Point Hill are also visible. The upper portions of structures in downtown San Francisco are visible to the east of Bayview Hill. The location of Candlestick Point is marked by Candlestick Park stadium; the location of HPS is marked by the Re-gunning crane. Other facilities within HPS are also visible.

View 9: North from CPSRA South of Harney Way (Figure III.E-19)

This viewpoint provides a prominent southern upslope view of Candlestick Park from the CPSRA. The upper tier of the reinforced concrete structure, along with four light towers, is visible from this viewpoint. Residential development at Executive Park to the west of the stadium is also visible along with grassland and vegetation that is part of the CPSRA. No long-distance views to the north are available from this vantage point.

View 10: Northeast from Bayview Hill (Figure III.E-20)

This viewpoint provides a view of the Project site from public open space on Bayview Hill, between existing trees in the foreground, and includes Jamestown Avenue at the base of the Bayview Hill, areas south of Yosemite Slough within the CPSRA, currently operated as parking for Candlestick Park stadium, and, north of the Slough, the Shipyard and the approved HPS Phase I development area. The Bay is visible in the distance.

View 11: Northwest from CPSRA (Figure III.E-21)

This viewpoint provides a view of Candlestick Park and its vicinity looking northwest from the CPSRA. Candlestick Park and Bayview Hill across South Basin are visible. A view of grassland and vegetation in the CPSRA is also available along the shoreline. A partial view of Bernal Heights is visible in the distance.

View 12: Southeast from Gilman Avenue (Figure III.E-22)

This viewpoint provides a view of the Project site looking southeast down Gilman Avenue towards Candlestick Point. Views of the streetscape dominate the foreground. The most prominent views are of single-family residential development consisting of two-story blockhouses of various architectural styles. Utility poles (about 40 feet high) connecting overhead wires and parked cars along the street are also visually prominent. Medium-range views consist of additional residential development and an overhead pedestrian bridge. The Bay and the East Bay hills are visible in the distance.

View 13: West from CPSRA (Figure III.E-23)

This viewpoint provides a view from the east corner of Candlestick Point looking west towards Bayview Hill. Views of an unpaved parking area (within the CPSRA), parking barriers, and utility poles dominate the foreground. There are views of the two-story residential buildings that are a part of the Alice Griffith Public Housing site to the northwest. Medium-range views encompass other two- to three-story apartment buildings at the base of Bayview Hill. There are limited long-range views of development to the northwest in the distance.

View 14: Southeast from CPSRA (Figure III.E-24)

This viewpoint faces southeast along Yosemite Slough, which is between Candlestick Point and HPS. The inlet to Yosemite Slough and grassland dominate the foreground. Medium-range views consist of various structures associated with the shipyard, including storage and maintenance facilities and the Re-gunning crane. Views of the former Naval Radiological Defense Laboratory building and the former Officer's Quarters building are present. To the east, the East Bay hills are visible in the distance.

View 15: Southeast from Palou Avenue (Figure III.E-25)

This viewpoint provides a view southeast down Palou Avenue towards HPS. Views of the streetscape dominate the foreground. The most prominent views are of two-story, single-family residential homes. Medium-range views are of structures within the shipyard, including storage and maintenance facilities and the former Officer's Quarters building. The Bay and the East Bay hills are visible in the distance.

View 16: Southwest from Mariner Village (Figure III.E-26)

This viewpoint provides a view southwest across the Project site from the Mariner's Village area on Hunters Point Hill north of the Shipyard. Foreground views consist of a grass field and ancillary structures associated with HPS. Medium-range views consist of the South Basin, the CPSRA, and Candlestick Park. Medium-range views also consist of residential development located at the base of Bayview Hill. San Francisco Bay shoreline and San Bruno Mountain are visible in the background.

View 17: Northeast from CPSRA (Figure III.E-27)

This viewpoint provides a view of the HPS Phase II site north from the eastern tip of Candlestick Point. Structures within HPS, including storage and maintenance facilities and the Re-gunning crane, are visible. The most prominent on-site structure visible from this viewpoint is the nine-story officer's quarters. To the west is the seven-story, former Naval Radiological Defense Laboratory Headquarters. The Bay and the East Bay hills are visible in the distance.

View 18: South from Hilltop Open Space (Figure III.E-28)

This viewpoint provides a view south across the southern portion of HPS, from open space that would be completed as part of HPS Phase I. Close-range views consist of abandoned storage and maintenance facilities that range from one to five stories in height. The Re-gunning crane is prominently visible from this viewpoint. Views of paved roadways/lots, fences, and utility poles in various stages of disrepair are also present from this viewpoint. Medium-range views consist of wharfs and docks at the southeastern point of HPS. The Santa Cruz Mountains along the San Francisco Peninsula are visible in the distance.

View 19: East from Hunters Point Hill Open Space (Figure III.E-29)

This viewpoint provides a view east across the northern portion of HPS. The foreground includes a large paved lot, storage buildings, and abandoned HPS buildings, which range from one to four stories in height, within the shipyard. Views of paved roadways, fences, and utility poles in various stages of disrepair are present from this viewpoint, as well as a view of a wharf along the shoreline. A prominent stand of trees approximately 30 to 50 feet tall is in the center of the shipyard. The Bay and the East Bay hills are visible in the distance.

View 20: Southeast from Heron's Head Park (Figure III.E-30)

This viewpoint provides a view southeast from Heron's Head Park across India Basin towards HPS. Views consist of structures in the shipyard, including storage and maintenance facilities and the Re-gunning crane. Low-rise residential development (approximately three stories) is visible on Hunters Point Hill to the west. San Francisco Bay and the East Bay hills are visible in the distance.

III.E.3 Regulatory Framework

Federal

There are no federal regulations, plans, or policies applicable to the aesthetics issues of the Project.

State

Candlestick Point State Recreation Area General Plan

The CPSRA General Plan provides general guidelines and identifies conceptual land uses, facilities, and park improvements within the CPSRA area. The CPSRA General Plan addresses enhanced appreciation of the natural resources of the Bay. The Plan seeks to manage the resources of the CPSRA in conformity with maintaining a desirable physical setting on the Bay shore. Design guidelines for proposed land uses and SRA improvements were established to "create an environment that supports the physical, social, psychological, economic, and aesthetic needs of humanity." The design criteria further guide development for compatibility with the land form. Refer to Section III.B (Land Use and Plans) for a full description of these policies and objectives.

Local

San Francisco General Plan

The *San Francisco General Plan* Urban Design Element is concerned with the physical character and environment of the City with respect to development and preservation. The Urban Design Element addresses issues related to City pattern, guidelines for major new development, and neighborhood environment. This element also promotes the preservation of landmarks, structures, and natural features with notable historic, architectural, or aesthetic value. The following policies would be relevant to the Project.

Objective 1 Emphasis of the characteristic pattern which gives to the city and its neighborhoods an image, a sense of purpose, and a means of orientation.

- Policy 1.1 Recognize and protect major views in the city, with particular attention to those of open space and water.
- Policy 1.2 Recognize, protect and reinforce the existing street pattern, especially as it is related to topography.
- Policy 1.3 Recognize that buildings, when seen together, produce a total effect that characterizes the city and its districts.
- Policy 1.4 Protect and promote large-scale landscaping and open spaces that define districts and topography.
- Policy 1.5 Emphasize the special nature of each district through distinctive landscaping and other features.
- Policy 1.6 Make centers of activity more prominent through design of street features and by other means.

Policy 1.7 Recognize the natural boundaries of districts, and promote connections between districts.

Objective 2 Conservation of resources which provide a sense of nature, continuity with the past, and freedom from overcrowding.

Policy 2.1 Preserve in their natural state the few remaining areas that have not been developed by man.

Policy 2.2 Limit improvements in other open spaces having an established sense of nature to those that are necessary, and unlikely to detract from the primary values of the open space.

Policy 2.3 Avoid encroachments on San Francisco Bay that would be inconsistent with the Bay Plan or the needs of the city's residents.

Policy 2.4 Preserve notable landmarks and areas of historic, architectural, or aesthetic value, and promote the preservation of other buildings and features that provide continuity with past development.

Policy 2.6 Respect the character of older development nearby in the design of new buildings.

Policy 2.7 Recognize and protect outstanding and unique areas that contribute in an extraordinary degree to San Francisco's visual form and character.

Objective 3 Moderation of major new development to complement the city pattern, the resources to be conserved, and the neighborhood environment.

Policy 3.1 Promote harmony in the visual relationships and transitions between new and older buildings.

Policy 3.2 Avoid extreme contrasts in color, shape and other characteristics which will cause new buildings to stand out in excess of their public importance.

Policy 3.3 Promote efforts to achieve high quality of design for buildings to be constructed at prominent locations.

Policy 3.4 Promote building forms that will respect and improve the integrity of open spaces and other public areas.

Policy 3.5 Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development.

Policy 3.6 Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction.

Policy 3.8 Discourage accumulation and development of large properties, unless such development is carefully designed with respect to its impact upon the surrounding area and upon the city.

Objective 4 Improvement of the neighborhood environment to increase personal safety, comfort, pride, and opportunity.

Policy 4.5 Provide adequate maintenance for public areas.

Policy 4.6 Emphasize the importance of local centers providing commercial and government services.

Policy 4.12 Install, promote, and maintain landscaping in public and private areas.

Policy 4.13 Improve pedestrian areas by providing human scale and interest.

Policy 4.14 Remove and obscure distracting and cluttering elements.

Policy 4.15 Protect the livability and character of residential properties from the intrusion of incompatible new buildings.

San Francisco Bay Conservation and Development Commission (BCDC) Public Access Design Guidelines for the San Francisco Bay

Along the Bay shoreline, BCDC's land use authority relates primarily to public access; however, some of the public access objectives specifically seek to provide, maintain, and enhance visual access to the Bay and shoreline, and maintain and enhance the visual quality of the Bay, shoreline, and adjacent development. In addition, Chapter IV (Site-Specific Public Access Improvements) of BCDC's Design Guidelines contain specific strategies for development to enhance the visual experience along the Shoreline. Refer to Section III.B (Land Use and Plans) for a full description of these Design Guidelines.

Bayview Hunters Point Area Plan

The *Bayview Hunters Point Area Plan* (BVHP Area Plan) is an adopted component of the *San Francisco General Plan* that serves as a guide to the future development of the BVHP community.[133] It includes sections on Land Use, Transportation, Housing, Industry, Urban Design, Recreation and Open Space, Community Facilities and Services, and Public Safety. The BVHP Area Plan excludes HPS. BVHP Area Plan objectives and policies are designed to preserve and enhance existing residential neighborhoods, enhance the distinctive and positive features of Bayview Hunters Point, and improve the definition of the overall urban pattern of Bayview Hunters Point.

Specific BVHP Area Plan objectives and policies that pertain to visual resources include the following:

Objective 5 Preserve and enhance existing residential neighborhoods.

Policy 5.1 Preserve and enhance the existing character of residential neighborhoods.

[133] San Francisco Planning Department, *San Francisco General Plan, Bayview Hunters Point Area Plan*, March 2006. The Area Plan, formerly named the *South Bayshore Area Plan*, was adopted in February 1970 (Board of Supervisors Resolution No. 6486). Subsequently, the Area Plan was updated in July 1995 (Resolution No.13917). The current 2006 Area Plan was renamed the *Bayview Hunters Point Area Plan* at the community's request to reflect its historic name for itself.

Objective 10 Enhance the distinctive and positive features of Bayview Hunters Point.

Policy 10.1 Better define Bayview's designated open space areas by enabling appropriate, quality development in surrounding areas.

Objective 11 Improve definition of the overall urban pattern of Bayview Hunters Point.

Policy 11.1 Recognize and enhance the distinctive features of Bayview Hunters Point as an interlocking system of diverse neighborhoods.

Refer to Section III.B (Land Use and Plans) for a full description of these policies and objectives.

San Francisco Bay Plan

The *San Francisco Bay Plan* contains policies and objectives designed to enhance the visual quality of development around the Bay, to enhance the pleasure of the viewer, and to take maximum advantage of the attractive setting it provides. The San Francisco Bay Plan contains policies regarding appearance, design, and scenic views, applicable to the Project as follows:

Policy 1 To enhance the visual quality of development around the Bay and to take maximum advantage of the attractive setting it provides, the shores of the Bay should be developed in accordance with the Public Access Design Guidelines.

Policy 2 All bayfront development should be designed to enhance the pleasure of the user or viewer of the Bay. Maximum efforts should be made to provide, enhance, or preserve views of the Bay and shoreline, especially from public areas, from the Bay itself, and from the opposite shore. To this end, planning of waterfront development should include participation by professionals who are knowledgeable of the (Planning) Commission's concerns, such as landscape architects, urban designers, or architects, working in conjunction with engineers and professionals in other fields.

Policy 3 In some areas, a small amount of fill may be allowed if the fill is necessary—and is the minimum absolutely required—to develop the project in accordance with the Commission's design recommendations.

Policy 4 Structures and facilities that do not take advantage of or visually complement the Bay should be located and designed so as not to impact visually on the Bay and shoreline. In particular, parking areas should be located away from the shoreline. However, some small parking areas for fishing access and Bay viewing may be allowed in exposed locations.

Policy 6 Additional bridges over the Bay should be avoided, to the extent possible, to preserve the visual impact of the large expanse of the Bay. The design of new crossings deemed necessary should relate to others nearby and should be located between promontories or other land forms that naturally suggest themselves as connections

reaching across the Bay (but without destroying the obvious character of the promontory). New or remodeled bridges across the Bay should be designed to permit maximum viewing of the Bay and its surroundings by both motorist and pedestrians. Guardrails and bridge supports should be designed with views in mind.

Policy 8 Shoreline developments should be built in clusters, leaving open area around them to permit more frequent views of the Bay. Developments along the shores of tributary waterways should be Bay-related and should be designed to preserve and enhance vies along the waterway, so as to provide maximum visual contact with the Bay.

Policy 9 "Unnatural" debris should be removed from sloughs, marshes, and mudflats that are retained as part of the ecological system. Sloughs marshes, and mudflats should be restored to their former natural state if they have been despoiled by human activities.

Policy 10 Towers, bridges, or other structures near or over the Bay should be designed as landmarks that suggest the location of the waterfront when it is not visible, especially in flat areas. But such landmarks should be low enough to assure the continued visual dominance of the hills around the Bay.

Policy 12 In order to achieve a high level of design quality, the Commission's Design Review Board, composed of design and planning professionals, should review, evaluate, and advise the Commission on the proposed design of developments that affect the appearance of the Bay in accordance with the Bay Plan findings and policies on Public Access; on Appearance, Design, and Scenic Views; and the Public Access Design Guidelines. City, county, regional, state, and federal agencies should be guided in their evaluation of bayfront projects by the above guidelines.

Policy 14 Views of the Bay from vista points and from roads should be maintained by appropriate arrangements and heights of all developments and landscaping between the view areas and the water. In this regard, particular attention should be given to all waterfront locations, areas below vista points, and areas along roads that provide good views of the Bay for travelers, particularly areas below roads below roads coming over ridges and providing a "first view" of the Bay (shown in Bay Plan Map No. 8, Natural Resources of the Bay).

Refer to Section III.B (Land Use and Plans) for a full description of these policies and objectives.

III.E.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to aesthetics, but generally consider that implementation of the Project would have significant impacts if it were to:

E.a Have a substantial adverse effect on a scenic vista

E.b Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting

E.c Substantially degrade the existing visual character or quality of the site and its surroundings

E.d Create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties

Analytic Method

Aesthetics in an urban setting is described by elements such as building scale, height, architectural features and materials, patterns of buildings along street frontages, and views of public open space or plazas or of more distant landscape features such as hills, the Bay, or built landmarks, such as bridges. In general, individual responses to aesthetics and changes in aesthetics are subjective. The analysis of visual impacts in this section focuses on the nature and magnitude of changes in the visual character of the Project site and identifies Project impacts on scenic views. This section also evaluates whether the Project would result in damage to scenic resources or substantially degrade the existing visual character or quality of the site, or result in impacts from increased light and glare.

Visual character refers to the aesthetic character or quality of a streetscape, building, group of buildings, or other manmade or natural feature that creates an overall impression of an area. The Project would be considered to degrade the existing visual character if it would result in substantial, demonstrable, negative aesthetic effects on a site or its surroundings. In this analysis, the discussion of visual character addresses the visual compatibility of the Project with surrounding land uses, as reflected by short- and mid-range views of the Project site.

Scenic vistas may be generally described as panoramic views of a large geographic area, for which the field of view can be wide, extend into the distance, and associated with vantage points that provide an orientation not commonly available. Examples of scenic vistas include urban skylines, valleys, mountain ranges, or large bodies of water. Significant impacts on a scenic vista would occur if the Project would substantially degrade or obstruct important scenic views from public areas. Scenic vistas are defined in the introduction to Impact AE-4, below.

Damage to scenic resources would occur if a project would directly affect environmental features, such as topographic features, landscaping, or a built landmark that contribute to a scenic public setting. In this analysis, scenic resources include the CPSRA, the Re-gunning crane, Yosemite Slough, the shoreline, the Bay, San Bruno Mountain, and Bayview Hill. Lastly, impacts from increased light and glare would be considered significant if they were to interfere with daytime or night views in the area or substantially impact other people or property.

To demonstrate the changes in visual character that would result with implementation of the Project, visual simulations of the Project from each of the viewpoints identified in Section III.E.2 (Setting) in Figure III.E-10 through Figure III.E-30 as well as other photographs contained in this section were used to evaluate changes in both views and visual character based on height, bulk, massing, and type of development when compared to existing conditions. Where appropriate, the simulations also include views of the approved HPS Phase I development, currently under construction, and the approved Visitacion Valley Redevelopment Plan. For the purpose of analyzing cumulative impacts, the simulations also include potential development under the proposed India Basin Shoreline Plan and the Executive Park Sub Area Plan.

The visual simulations are distinguished as long-range views (Figure III.E-11 through Figure III.E-18), and short- and mid-range (Figure III.E-19 through Figure III.E-30) depictions. The visual simulations include development with the Project and with other development noted, above. The analysis determines whether the Project would result in substantial blockage of or other substantial negative changes to existing views from the public viewpoints identified in Figure III.E-11 through Figure III.E-18, particularly to views of scenic open space and water, as well as whether the Project would result in degradation of the visual character or quality of the setting (refer to Figure III.E-19 through Figure III.E-30). The simulations are taken from fixed viewpoints and do not show all possible views of the Project site. For example, they do not provide the dynamic views that would be experienced while driving, walking, or cycling in the Project vicinity. In addition, the simulations depict the overall location, height, and dimension of development, with general exterior features or materials, window patterns, landscaping, or other details. The new buildings shown in views of Candlestick Point and HPS Phase II represent building types, heights, and dimensions that would reflect the Project land use plan and urban design guidelines. The simulations do not represent final architectural design that would occur with the Project. However, the simulations are sufficient for an adequate analysis of changes in scenic vistas, scenic resources, and visual character.

Construction Impacts

Impact AE-1: Effect on a Scenic Vista or Scenic Resources

Impact AE-1 **Construction activities associated with the Project would not have a substantial adverse effect on a scenic vista or scenic resources. (Less than Significant) *[Criteria E.a and E.b]***

- Construction activities would occur throughout the 702-acre Project site over the 20-year construction period of the Project (ending in 2031). During construction, four basic types of activities would be expected, and some activities could occur simultaneously.

Demolition of existing structures would occur. The site would be prepared, excavated, and graded to accommodate the new building foundations. Over-excavation and recompaction of near-surface soils would occur during grading to provide appropriate soil characteristics for the support of structures. The proposed development would then be constructed, including buildings, the stadium, parking structures, surface parking, and project-related infrastructure. New landscaping would also be planted around the new facilities and the development would be readied for use, including the application of architectural coatings and paving (although these two activities would not occur simultaneously).

Construction activities associated with infrastructure improvements would also occur on site and in areas adjacent to the Project site, such as at roadway intersections or to provide utility infrastructure. Specific activities would generally include demolition (scraping and/or cutting) of existing asphalt and concrete, grading to establish a new base for roadways, actual median and sidewalk elements, and replacement of signals and other infrastructure. In the case of water line and sewer connections, trenching would also be necessary to access the existing line to which the Project infrastructure would connect. Shoreline improvements would include grading in some areas, planting where appropriate, renovation of some existing shoreline structures, including addition of riprap, and removal of debris.

Construction workers and equipment would be parked and staged within the 702-acre Project construction site. Visual impacts associated with construction activities would include exposed pads and staging areas for grading, excavation, and construction equipment. In addition, temporary structures could be located in the Project site during various stages of demolition or construction, within materials storage areas, or associated with construction debris piles on and off site. Also, exposed trenches, roadway bedding (soil and gravel), spoils/debris piles, and possibly steel plates would be visible for the proposed utilities and infrastructure improvements, as well as for roadway improvements.

Although these activities would take place primarily within the Project site, they would be visible to surrounding land uses. However, these visual conditions would be temporary visual distractions typically associated with construction activities and commonly encountered in developed areas. Further, temporary conditions (e.g., bulldozers, trenching equipment, generators, trucks, etc.) associated with Project construction would not result in obstruction of a scenic vista, as construction equipment is not tall enough to interfere with views of the Bay, the East Bay hills, or the San Francisco downtown skyline. The only scenic or potential scenic resources on or near the Project site would be the Re-gunning crane, the CPSRA, and Yosemite Slough. There are no rock outcroppings or major areas of landscaping on the site, although some ruderal vegetation would be removed. Construction of the Project would not affect the Re-gunning crane, which would remain intact after implementation of the Project. The Project would retain structures at the identified Drydock Historic District. Construction of the Yosemite Slough bridge would change the appearance of the Slough as the bridge structure was constructed; however, this would not be considered a significant impact, as the overall view of the Slough would remain as a scenic resource. Therefore, construction activities would have a less-than-significant impact on scenic vistas and scenic resources. No mitigation is required.

Impact AE-2: Degradation of Visual Character or Quality

Impact AE-2 **Construction activities associated with the Project would not result in temporary degradation of the visual character or quality of the site. (Less than Significant with Mitigation) *[Criterion E.c]***

As previously stated, visual impacts associated with construction activities would include exposed pads and staging areas for grading, excavation, and construction equipment. In addition, temporary structures could be located on the Project site during various stages of construction, within materials storage areas, or associated with construction debris piles on site. Exposed trenches, roadway bedding (soil and gravel), spoils/debris piles, and possibly steel plates would be visible during construction of the utility infrastructure improvements.

Although these activities would take place primarily on site, these visual impacts could affect surrounding land uses. Automobiles traveling along US-101, Harney Way, Arelious Walker Drive, Innes Avenue, and other streets in the immediate vicinity of the Project site would have short-term views of the Project site and adjacent street areas during construction activities and infrastructure improvements. Adverse visual impacts arising from construction activity would be temporary. Although the Project would be constructed through the year 2031, construction activity would not occur all at once and would be phased, as described Chapter II. Temporary screening of a particular construction or staging site (usually consisting of fabric screening stretched over temporary construction fencing) as required by mitigation measure MM AE-2 would serve to partially relieve the visual distractions typically associated with construction activities and commonly encountered in developed areas, particularly during excavation and foundation construction. Moreover, areas of construction would vary within the Project area such that areas of temporary visual distraction would change throughout the implementation phase of the Project.

Additional temporary visual impacts could occur from construction equipment traveling along local roadways and inadvertently depositing dirt and debris on the streets. Mitigation measure MM AE-2 would require the Applicant to stage all construction equipment on the Project site and to keep all construction equipment leaving the site free of mud. In addition, the Applicant would be required to sweep area streets of mud and debris caused by construction vehicles during the construction period.

The following mitigation measure shall be implemented:

MM AE-2 *Mitigation for Visual Character/Quality Impacts During Construction. Construction documents shall require all construction contractors to strictly control the staging of construction equipment and the cleanliness of construction equipment stored or driven beyond the limits of the construction work area. Construction equipment shall be parked and staged on the Project site. Staging areas shall be screened from view at street level with solid wood fencing or green fence. Prior to the issuance of building permits, the Applicant (through the construction contractor[s]) shall submit a construction staging, access, and parking plan to the San Francisco Department of Building Inspection for review and approval. On-street parking of construction worker vehicles shall be prohibited. Vehicles shall be kept clean and free of mud and dust before leaving the Project site. Project contractors shall be required to sweep surrounding streets used for construction access daily and maintain them free of dirt and debris.*

Mitigation measure MM AE-2, which would be incorporated as part of the Project's construction documents, would ensure that this impact is less than significant by requiring the Applicant to screen construction sites from public view at street level and provide for appropriate staging of construction equipment, keep the surrounding streets clean and free from construction debris, and maintain the cleanliness of construction equipment. Compliance with this mitigation measure would ensure that construction equipment would be confined to the Project site and ensure routine cleaning of construction equipment so mud and dirt are not spread onto adjacent streets when equipment exits the Project site to minimize adverse visual impacts from construction activities. This impact would, therefore, be considered less than significant.

Impact AE-3: Effect of Light or Glare on Day or Night Views

Impact AE-3 **Construction activities associated with the Project would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties. (Less than Significant) *[Criterion E.d]***

Construction would occur during daylight hours, generally between 7:00 A.M. and 8:00 P.M. or as otherwise allowed by the City (*San Francisco Police Code*, Article 29, Section 2908). A minimal amount of glare could result from reflection of sunlight off windows of trucks, but this would be negligible and would not affect daytime views in the area. Security lighting would be provided after hours on all construction sites, but this lighting would be minimal, restricted to the Project site, and would not exceed the level of existing night lighting levels in urban areas. Therefore, the Project's construction activities would have less-than-significant light and glare impacts. No mitigation is required.

Operational Impacts

Impact AE-4: Effects on Scenic Vistas

Scenic vistas, which have been defined as panoramic views of a large geographic area, for which the field of view can be wide, extend into the distance, and which are associated with vantage points that provide an orientation not commonly available, include views of the Bay, the East Bay hills, San Bruno Mountain, and the San Francisco downtown skyline, as well as views of the Re-gunning crane, Bayview Hill, the Yosemite Slough, and the CPSRA. Figure III.E-11 through Figure III.E-18 depict long-range scenic views from Twin Peaks, Bernal Heights, McLaren Park, Potrero Hill, the northbound US-101, San Bruno Mountain, and Oyster Point. Mid-range views would be views of about one-half mile; short-range views would be less than one-half mile to adjacent streets or viewpoints. The focus of this discussion is on impacts to scenic vistas/views across the Project site. Mid-range and short-range views (as illustrated on Figure III.E-19 through Figure III.E-30) are related to the visual character of the site, rather than scenic vistas, and are discussed in Impacts AE-6a, AE-6b, and AE-6, below. Impact AE-6 also discusses the relationship of the Project's proposed towers to the rest of the on-site development.

Impact AE-4 **Implementation of the Project would not have a substantial adverse effect on a scenic vista. (Less than Significant) *[Criterion E.a]***

View 1: Southeast from Twin Peaks (Figure III.E-11)

As shown in Figure III.E-11, the long-range view from Twin Peaks to the south and the Bay beyond would include residential towers at Candlestick Point between Hunters Point Hill and Bayview Hill. The towers, ranging from 240 feet to a maximum 420 feet in height, would replace distant views of existing Candlestick Park stadium, surrounding parking areas, and some views of CPSRA lands. The towers would appear relatively separated, with building heights descending from Bayview Hill to the east. The new 49ers stadium would be distantly visible at the HPS Phase II site, south of Hunters Point Hill, and beyond Bernal Heights. In this view, the stadium would partially block the existing distant view of the Re-gunning crane. Other approved projects would be seen in this view and the HPS Phase I development would be visible at the north end of the Shipyard. Although the Project would also be visible from this location, against the Bay

as a background, the Project would not substantially obstruct the views of the Bay or the East Bay hills. The Project would not substantially alter or degrade the scenic quality of the view, which already includes the urban setting of San Francisco as the foreground to the Bay. Bayview Hill, Hunters Point Hill, and Bernal Heights would continue as landmarks in this view.

View 2: Southeast from Bernal Heights (Figure III.E-12)

As shown in Figure III.E-12, the long-range view from Bernal Heights to the south and the Bay beyond would include residential towers at Candlestick Point, ranging from 240 feet to a maximum 420 feet in height, between Hunters Point Hill and Bayview Hill. The towers would replace distant views of existing Candlestick Park stadium, surrounding parking areas, and some views of CPSRA lands. The towers would appear relatively separated, with building heights descending from Bayview Hill to the east. The new 49ers stadium would be distantly visible at HPS Phase II, south of Hunters Point Hill. In this view, the stadium would partially block the existing distant view of the Re-gunning crane.

Although the Project would be visible from this location against San Francisco Bay as a background, the Project would not substantially obstruct the views of the Bay or the East Bay hills. The Project would not substantially alter or degrade the scenic quality of the view, as the view already includes the urban setting of San Francisco as the foreground to the Bay. Bayview Hill and Hunters Point Hill would continue as landmarks in this view.

View 3: East from McLaren Park (Figure III.E-13)

As shown in Figure III.E-13, from this location in McLaren Park, Bayview Hill would block most views of development at Candlestick Point; the upper stories of the residential towers would be distantly visible, but would not substantially change the existing views of the Bay and the East Bay hills. The upper stories of two towers at HPS Phase II would also be distantly visible. Other approved projects would be seen in the distance in this view and the HPS Phase I development would be distantly visible at the north end of the Shipyard.

Although the Project would be visible from this location against San Francisco Bay as a background, the Project would not substantially obstruct views of the Bay or the East Bay hills. The Project would not substantially alter or degrade the scenic quality of the view, as the view already includes the urban setting of San Francisco as the foreground to the Bay. Bayview Hill would continue as a landmark in this view.

View 4: South from Potrero Hill (Figure III.E-14)

As shown in Figure III.E-14, the long-range view from Potrero Hill to the south and the Bay beyond would include residential towers at Candlestick Point, ranging from 240 feet to a maximum 420 feet in height, between Hunters Point Hill and Bayview Hill. The towers would replace distant existing views of Candlestick Park stadium and surrounding parking areas. The towers would appear relatively separated, with building heights descending from Bayview Hill to the east. Development of HPS Phase II, including two towers, would be distantly visible east of Hunters Point Hill. The Project would be visible from this location, against San Francisco Bay as a background, and the residential towers at Candlestick Point would be a new built element between Bayview Hill and Hunters Point Hill. The views of the Bay or the East Bay hills would be partially blocked, but a substantial portion of the view would remain. HPS Phase II would also be a new element seen against the Bay and the East Bay hills.

The Project would not substantially alter or degrade the scenic quality of the view, as the view already includes the urban setting of San Francisco as the foreground to the Bay and East Bay hills. Bayview Hill and Hunters Point Hill would continue as landmarks in this view.

View 5: Northeast from Northbound US 101 (Figure III.E-15)

As shown in Figure III.E-15 from northbound US-101 south of the Project site, the Project would introduce high-rise structures that would be visible on the Candlestick Point portion of the site, ranging from 240 feet to a maximum 420 feet in height, with lower-scale development to the west. The high-rise buildings would be prominent, but would not obstruct views of Bayview Hill. The easterly towers in this view would be on land that was formerly part of the CPSRA. The shoreline of CPSRA would be visible as the foreground. Development of HPS Phase II would be visible to the east, including the new 49ers Stadium and the proposed marina, as would the approved HPS Phase I development that is currently under construction. Bayview Hill would continue as a landmark and the Bay would continue as foreground in this view.

Although the Project would be visible from this location, the Project would not substantially obstruct existing views of Bayview Hill and the Bay. The Project would not substantially alter or degrade the scenic quality of the view, for the same reason.

View 6: Northeast from US 101 at Harney Way Off-Ramp (Figure III.E-16)

As shown in Figure III.E-16, from northbound US-101, at Harney Way, the Project would introduce high-rise structures that would be visible on the Candlestick Point portion of the site, ranging from 240 feet to a maximum 420 feet in height, with lower-scale development to the west. The high-rise buildings would be prominent, but would not obstruct views of Bayview Hill. The easterly towers in this view would be on part of the land exchanged with the CPSRA. The shoreline of CPSRA would be visible as the foreground. Development of HPS Phase II, including the new 49ers Stadium, would be visible to the east. The proposed residential development at Executive Park (not a part of the Project), west of Candlestick Point, would be visible against the background of Bayview Hill. The Bay would continue to be visible in the foreground. Bayview Hill would continue as a key visual feature in this view.

Although the Project would be visible from this location, the Project would not substantially obstruct existing views of Bayview Hill and the Bay. The Project would not substantially alter or degrade the scenic quality of the view, for the same reason.

View 7: Northeast from San Bruno Mountain (Figure III.E-17)

As shown in Figure III.E-17, the view from the upper slopes of San Bruno Mountain provides a panoramic view of the Bay and the East Bay hills beyond. Public open space on San Bruno Mountain and on Bayview Hill is visible in the foreground, and existing residential and office development in the City of Brisbane and the Visitacion Valley neighborhood of San Francisco can be seen. The Project would introduce new structures, including high-rise buildings, ranging from 240 feet to a maximum 420 feet in height, at Candlestick Point, and the 49ers Stadium, new marina, and two towers, up to 240 feet to 370 feet high, at HPS Phase II. Some of the towers in this view would be on land that was formerly part of the CPSRA. From this viewpoint, the towers on Candlestick Point appear to cluster, and would block a portion of the view of the small area of water between Candlestick Point and Hunter Point. However, this obstruction is relatively small when compared to the sweeping panoramic view of the Bay that would still be held from

this viewpoint. The shoreline of CPSRA would be visible as the foreground. West of US-101, and development under the approved Visitacion Valley Redevelopment Plan would remain visible.

With the Project, the Candlestick Point area would appear more intensely urbanized. However, the Project would not substantially obstruct, alter or degrade the scenic quality of the view. The CPSRA shoreline and the Bay would continue as the foreground. The view of the Re-gunning crane would remain a key visual feature.

View 8: North from Oyster Point (Figure III.E-18)

As shown in Figure III.E-18, the view north from the Oyster Point peninsula in the City of South San Francisco provides a view of the Bay in the foreground, with Bayview Hill, Candlestick Point (including Candlestick Park stadium), and the Shipyard visible in the background. The East Bay hills are visible in the distance. Existing development in San Francisco west of Bayview Hill at Executive Park and on Hunters Point Hill is visible. The upper portions of structures in downtown San Francisco are visible to the east of Bayview Hill. The Project would introduce new structures, including high-rise buildings, ranging from 240 feet to a maximum 420 feet in height, at Candlestick Point. The easterly towers in this view would be on part of the land exchanged with the CPSRA. The shoreline of CPSRA would be visible in the foreground. The view includes the 49ers Stadium and other new structures at the Shipyard. To the north, the approved HPS Phase I development (not part of this Project), currently under construction, would be visible. West of US-101, development under the approved Visitacion Valley Redevelopment Plan would also be visible. The open space in the CPSRA would continue as the foreground.

Although the Project would be visible from this location, the Project would not substantially obstruct existing views of Bayview Hill and the Bay or the distant view of downtown San Francisco. The Project would not substantially alter or degrade the scenic quality of the view, for the same reason.

Other Views

Views of the Project site are also available from Alameda and Oakland, across the Bay. Daytime views of the site would change from a relatively low-level or vacant condition to more intense urban development. However, because of the intervening distance, individual characteristics of the Project site are not readily distinguishable to the naked eye, except Bayview Hill, Hunters Point Hill, and the Re-gunning crane, and these three visual features would not be disturbed by Project implementation. Views of Bayview Hill and Hunters Point Hill would be partially obstructed from Alameda and the Oakland area by Project structures; however, the obstruction would not be so great as to be considered to be significant. Views of the Bay and the CPSRA shoreline would remain. The Project would not obstruct or degrade the quality of views held from the East Bay.

Summary

As shown by Figure III.E-11 through Figure III.E-18 and the accompanying discussions, above, development of the Project would change views from public viewpoints, but would not substantially obstruct, alter, or degrade the quality of any scenic vistas. With development of Candlestick Point, residential towers would be predominant in the views from and to the north and would represent a substantial change in the existing low-scale pattern on the site. The scale of development would be similar to other areas of San Francisco, such as parts of downtown or Rincon Hill. The existing low-rise structures and open space (including parking lots) would be replaced with development of varying heights, but none

of the new development would substantially obstruct existing long-range views across the site. Views of the Bay and the CPSRA shoreline would remain. Project development at Jamestown would have maximum heights of 65 and 85 feet, below the crest of Bayview Hill, and would not substantially obstruct, alter, or degrade the quality of views of Bayview Hill.

Overall, development of the Project would not block publicly accessible views of the Bay or other scenic vistas. The Project would provide a continuation of the existing street grid, thereby maintaining existing view corridors to the Bay and East Bay hills. Public access areas, both City and State parks, would maintain views from the Project site toward the East Bay and the Bay. While development of the Project would include several high-rise towers, these towers are not clustered, and would not substantially obstruct, alter, or degrade the quality of views of the Bay or beyond from any long-range viewpoints. Views of Bayview Hill and Hunters Point Hill from the East Bay would be partially obstructed from Alameda and the Oakland area by Project structures; however, the amount of the obstruction would be minimal and not considered to be significant because of the distance across the Bay. Project development would not obstruct, alter, or degrade the quality of any existing views of the site from these locations.

The Project would be consistent with General Plan policies that promote enhanced access to the San Francisco Bay shoreline, a distinctive feature at the Candlestick Point site, and protect major views of open space and water by providing expanses of open space that preserve these views as well as providing increased connectivity to the shoreline. As the Project would not substantially obstruct any scenic vistas, this impact would be less than significant. No mitigation is required.

Impact AE-5: Effects on Scenic Resources

Impact of Candlestick Point

Impact AE-5a **Implementation of the Project at Candlestick Point would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting. (Less than Significant)** ***[Criterion E.b]***

As shown by the various photographs and simulations depicted in Figure III.E-2 through Figure III.E-9, and Figure III.E-11 through Figure III.E-18, development at Candlestick Point would include redevelopment of Candlestick Park stadium and associated paved and unpaved parking lots by replacing degraded urban areas and outdated residential development with new, well-designed urban development and with integrated public parks. The Project would include new housing and replacement of existing housing on undeveloped parcels on the Alice Griffith Public Housing site and remove other existing uses, such as the Candlestick RV Park. Most of these sites include ruderal vegetation and little landscaping, and are visually unappealing or degraded.

The Project proposes a reconfiguration of CPSRA, coupled with improvements within the park and the provision of an ongoing source of park operation and maintenance funding. The CPSRA would be improved on 91 acres, increased by 5.7 new acres, and reduced by net 23.5 acres on Candlestick Point. (refer to Figure II-8 [Existing and Approved Parks and Open Space] and Figure II-9 [Proposed Parks and Open Space] in Chapter II). The acres to be removed include CPSRA land primarily in gravel and paved areas, leased for parking at Candlestick Park stadium, and some acreage in non-native vegetation

contiguous with other open space at the CPSRA. (Figure III.E-5A and Figure III.E-5B illustrate existing conditions, including paved areas and typical vegetation conditions found in other areas of the CPSRA.) Removal of the parking areas at the CPSRA would not be an adverse effect on a scenic resource, because 91 acres of the CPSRA would be improved. Removal of other planted CPSRA areas would reduce the open space between the new development in Candlestick Point and the CPSRA shoreline, compared to the current boundaries of the CPSRA. However, other CPSRA areas would be maintained or improved. The CPSRA would continue as publicly accessible shoreline around Candlestick Point. Because of the improvements planned for the CPSRA under the Project, the loss of all or a part of the degraded portion of the CPSRA would not substantially damage a resource that contributes to a scenic public setting.

- The Yosemite Slough bridge would change the appearance of a portion of the slough, with the addition of a bridge structure and roadway approaches (refer to Figure III.E-8). The bridge would replace some views of open water as seen from nearby locations. The bridge would contain "green" auto lanes, with plantings in the middle providing a green boardwalk. The bridge would be low profile and integrated into the open space on either side of the slough, and would contain piers and lookout points for a pedestrian viewing experience. Yosemite Slough would continue as a waterway bordered by open space opening from a narrow channel to the west to the wider South Basin to the east and would remain a scenic resource on the site. The Project would complete the Bay Trail along the waterfront, make shoreline improvements, and provide substantial areas of parks and open space that would complement the slough restoration. The Project's proposed roadway and bridge through an otherwise entirely recreational open space area would have some adverse impact on the aesthetic experience, when compared to a natural open space area with no roadway or bridge running through it. The introduction of a roadway and bridge, together with activity on and use of those features, would adversely affect the natural feel of this portion of the park. Nevertheless, the EIR does not consider the proposed roadway and bridge to result in a significant adverse impact on the proposed improved recreation area for a variety of reasons. The slough is presently, and would continue to be, located within an urban environment, bordered in part by developed lots and roads. Hence, even without the proposed roadway and bridge, park users would be aware of and in close proximity to the roads and developed areas bordering the park. While the proposed road and bridge would cut through the open space in one location, the majority of the restored slough area would remain unaffected and available for its intended use. In addition, the proposed road and bridge would provide some benefits to the restored park in terms of access and new vantage points for views. Overall, the bridge would not substantially damage a resource that contributes to a scenic public setting.

The proposed shoreline improvements would improve the aesthetic quality of the shoreline along Candlestick Point, reducing erosion, including marsh plantings where appropriate, and removing debris. These improvements would represent a beneficial impact of the development, improving the overall visual character of the shoreline.

Therefore, Project development at Candlestick Point would not have significant adverse impacts on scenic resources or other features that contribute to a scenic public setting and the impact would be less than significant. No mitigation is required.

Impact of Hunters Point Shipyard Phase II

Impact AE-5b **Implementation of the Project at HPS Phase II would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting. (Less than Significant)** ***[Criterion E.b]***

As shown by the various photographs and simulations depicted in Figure III.E-2 through Figure III.E-9, and Figure III.E-11 through Figure III.E-18, the Project would include redevelopment of HPS and would remove old, deteriorating structures associated with ship repair, piers, dry-docks, storage, and administrative uses.

Currently, HPS contains limited landscaping and is primarily a degraded industrial setting. Hunters Point Hill is a prominent scenic resource west of the HPS Phase II site and would remain intact with Project development. Views of Bayview Hill would not be significantly obstructed by Project development in HPS Phase II except from close-in vantage points. The Project would demolish Building 253, a highly visible structure, but this structure is not identified as a scenic resource, even though some viewers might use the building as a visual orientation. The Project would retain structures at the potential HPS Drydock Historic District, as well as the Re-gunning crane, a highly visible feature. Development of the HPS Phase II site would also include about 240 acres of new and renovated parkland with improved public access, thereby improving the scenic quality of the area. The proposed shoreline improvements and construction of the new marina would improve the aesthetic quality of the shoreline along HPS Phase II, reducing erosion, including marsh plantings where appropriate, and removing debris. These improvements would represent a beneficial impact of the development, improving the overall visual character of the shoreline. The Project would complete the Bay Trail along the waterfront and provide substantial areas of parks and open space that would complement the slough restoration. While the Yosemite Slough bridge would alter the visual character of the slough by placing a structure across the neck of the slough, this change would not be substantially adverse. The bridge would be designed to be low in height and blend as much as possible into the environment through the use of openwork, materials, and color. The Project's proposed roadway and bridge through an otherwise entirely recreational open space area would have some adverse impact on the aesthetic experience, when compared to a natural open space area with no roadway or bridge running through it. The introduction of a roadway and bridge, together with activity on and use of those features, would adversely affect the natural feel of this portion of the park. Nevertheless, the EIR does not consider the proposed roadway and bridge to result in a significant adverse impact on the proposed improved recreation area for a variety of reasons. The slough is presently, and would continue to be, located within an urban environment, bordered in part by developed lots and roads. Hence, even without the proposed roadway and bridge, park users would be aware of and in close proximity to the roads and developed areas bordering the park. While the proposed road and bridge would cut through the open space in one location, the majority of the restored slough area would remain unaffected and available for its intended use. In addition, the proposed road and bridge would provide some benefits to the restored park in terms of access and new vantage points for views. Therefore, development at the HPS Phase II site would not have significant adverse impacts on scenic resources or other features that contribute to a scenic public setting, and the impact would be less than significant. No mitigation is required.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact AE-5 **Implementation of the Project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment that contribute to a scenic public setting. (Less than Significant) *[Criterion E.b]***

As shown by the various photographs and simulations and the discussions provided in Impact AE-5(a) and Impact AE-5b, above, development of the Project would not damage or remove any identified scenic resources that contribute to a scenic public setting. The Project would complete the Bay Trail along the waterfront and provide substantial areas of parks and open space. While the Yosemite Slough bridge would alter the visual character of the slough by placing a structure across the neck of the slough, this change would not be substantially adverse. The bridge would be designed to be low in height and blend as much as possible into the environment through the use of openwork, materials, and color. The change would not be considered adverse, as the bridge would be part of an overall urban setting on either side of the slough. The Project's impact would be less than significant. No mitigation is required.

Impact AE-6: Effects on Visual Character

For the purposes of the analysis of the Project's potential to substantially degrade the existing visual character of the site and its surroundings, Figure III.E-19 through Figure III.E-30 illustrate mid- and short-range views of the Project site from various vantage points. These figures depict the before-and-after conditions with regard to the visual character of the Project site. The impact analysis is structured to convey the before and after conditions represented by the visual simulations. However, in addition, refer to Figure III.E-2 through Figure III.E-9 for photographs of existing conditions on the Project site and surrounding neighborhoods. It should be noted that these figures do not include already approved development, including HPS Phase I (not part of the Project), which would increase the amount of development even more compared to that depicted in the photographs. The discussion provided in the analysis of the Project's consistency with the Urban Design Element of the City's General Plan supplements this impact analysis by providing a narrative discussion of visual character of each of the Project's districts with respect to design patterns, connectivity, neighborhood image, and visual compatibility with existing development.

Impact of Candlestick Point

Impact AE-6a **Implementation of the Project at Candlestick Point would not substantially degrade the existing visual character or quality of the site or its surroundings. (Less than Significant) *[Criterion E.c]***

View 9: North from CPSRA South of Harney Way (Figure III.E-19)

Figure III.E-19 represents a short-range view from CPSRA towards Candlestick Park stadium, the upper sections of which are visible. The planted areas in the foreground are within the CPSRA. With the Project, Candlestick Park stadium would be demolished and residential towers would be visible to the east of the stadium site. Existing CPSRA planting would limit views of other new Candlestick Park structures from this location in the CPSRA. Short- and mid-range views of the stadium would be replaced with Project development and landscaping. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 10: Northeast from Bayview Hill (Figure III.E-20)

As shown in Figure III.E-20, the view from public open space on Bayview Hill, between existing trees in the foreground, includes Jamestown Avenue at the base of the Bayview Hill, areas south of Yosemite Slough within the CPSRA, currently operated as parking for Candlestick Park stadium, and, north of the Slough, the Shipyard and the approved HPS Phase I development area. From this location, residential uses on Jamestown Avenue, and, with the proposed CPSRA land agreement relative to sites south of the Slough, would be visible in the foreground, replacing views of paved parking lots. Shoreline open space would be developed north of the residential uses. To the east, residential towers at Candlestick Point would be visible. The view would include improved Arelious Walker Drive leading to the Yosemite Slough bridge, which is proposed as a Bus Rapid Transit (BRT), pedestrian and bicycle route, and a vehicle route on game days at the new stadium. North of Yosemite Slough proposed open space at the Shipyard would front the shoreline. Other Shipyard development would be visible beyond the open space. To the north, the approved HPS Phase I development (not part of the Project), currently under construction, would be visible. West of the proposed bridge, the view would include restored open space at the CPSRA. Short- and mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 11: Northwest from CPSRA (Figure III.E-21)

Figure III.E-21, from the easterly area of CPSRA, includes an expanse of the Bay, Bayview Hill, and Candlestick Point stadium. The Project would introduce residential towers and other structures at Candlestick Point, as seen beyond the shoreline of the CPSRA, and would obstruct the view of portions of Bayview Hill. West of Candlestick Point, existing and approved residential development at Executive Park would be visible.

The Candlestick Point towers, ranging from 240 feet to a maximum 420 feet in height, would be a substantial change in the existing low-scale pattern in this view, and would block distant views of neighborhoods to the north. The shoreline of CPSRA would be visible as the foreground.

Views of the Bay and the CPSRA shoreline and partial views of Bayview Hill would remain. The scale of development would be similar to other areas of San Francisco, such as parts of downtown, or Rincon Hill. The Project would replace deteriorating structures, vacant parcels, expanses of asphalt and dirt, and piles of rubble and debris with a high-quality environment that would include a variety of architectural styles and open space. Short- and mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 12: Southeast from Gilman Avenue (Figure III.E-22)

Figure III.E-22 shows the residential streetscape on Gilman Avenue looking southeast toward the Project site. The Project would introduce mid- and high-rise buildings up to 320 feet in height visible in the distance at Candlestick Point. The Project would include roadway and streetscape improvements, also illustrated in Figure III.E-22. Short- and mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 13: West from CPSRA (Figure III.E-23)

Figure III.E-23 shows a view of an open expanse of unpaved parking area looking west from the CPSRA toward the Alice Griffith Public Housing site, with residential uses and Bayview Hill beyond. The existing Alice Griffith Public Housing is seen to the west. The foreground parking area is within the CPSRA and is currently operated as parking for Candlestick Park stadium. The Alice Griffith Public Housing site would be redeveloped and would be visible from this location, replacing views of parking lots and other undeveloped areas (with the proposed CPSRA land agreement). The Project would include improvement of CPSRA lands remaining at this location, as conceptually illustrated in Figure III.E-23. The Alice Griffith redevelopment, with buildings up to 65 feet high, would limit the views of Bayview Hill and existing residential development. Short- and mid-range views of degraded and unmaintained areas and older residential development would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 14: Southeast from CPSRA (Figure III.E-24)

Figure III.E-24 shows grasslands of the CPSRA and Yosemite Slough in the foreground, with shipyard structures in the background, from a location on CPSRA outside the Project site looking northeast. The East Bay hills are visible in the long-range view. The Project would introduce new structures at HPS Phase II, including the 49ers Stadium and residential towers up to 370 feet. The Yosemite Slough bridge would be visible, crossing from Candlestick Point to the Shipyard, as well as the new marina. Figure III.E-24 also illustrates potential landscaping along roadways at the Shipyard. To the north, the approved HPS Phase I development (not part of the Project), currently under construction, would be visible. The new structures would not obstruct existing views of the distant East Bay hills. The Yosemite Slough bridge would limit some foreground views of the Slough; however, overall views of the Bay would remain. Short- and mid-range views of the Slough would be somewhat altered with the inclusion of the proposed bridge. However, short- and mid-range views of the remainder of the Slough would remain as under current conditions. Building 253, a prominent visual feature in this view, would be demolished with the Project. Building 253 does not make a substantial contribution to the public scenic setting, and would not be considered an individual scenic resource. The Re-gunning crane would remain prominent in this view. The Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 15: Southeast from Palou Avenue (Figure III.E-25)

Figure III.E-25 shows the residential streetscape on Palou Avenue near Ingalls Street, looking southeast toward the Shipyard. There are distant views of the Bay and the East Bay hills. With the Project, a part of the 49ers Stadium would be visible in the distance. Figure III.E-25 illustrates streetscape improvements proposed on Palou Avenue, including parking, bicycle lanes, pavement treatments, and street trees, and would be considered to improve the visual character of the Palou corridor. Only a small portion of the Project development would be visible at the end of this view, which would not substantially obstruct, alter, or otherwise degrade the existing visual character or quality of the site or its surroundings.

View 16: Southwest from Mariner Village (Figure III.E-26)

Figure III.E-26 shows a view south from Mariner Village on LaSalle Avenue on Hunters Point Hill. The foreground includes undeveloped areas of the Shipyard south of Crisp Road. The existing buildings south

of Crisp are UCSF facilities that are not part of the HPS Phase II site. South Basin, CPSRA, residential development at the base of Bayview Hill, and Candlestick Park stadium are visible to the south. The Bay shoreline and San Bruno Mountain are in the background.

With the Project, Candlestick Point towers, ranging from 240 feet to a maximum 420 feet in height, would be a substantial change in the existing low-scale pattern in this view. The shoreline of CPSRA would be visible as the foreground. Other Candlestick Park development would be visible to the north and on Jamestown Avenue at the base of Bayview Hill. The view would also include the Yosemite Slough bridge, improved open space at HPS Phase II, and buildings on Crisp Road. Mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

Other Views

Views of the Project site are also held from Alameda and Oakland, across the Bay. Daytime views of the site would change from a relatively low-level or vacant condition to more intense urban development. However, because of the intervening distance, individual characteristics of the Project site are not readily distinguishable to the naked eye, except Bayview Hill, Hunters Point Hill, and the Re-gunning crane, and these three site features would not be disturbed by Project implementation. The increased density of development as a result of the Project would be consistent with the pattern of development in San Francisco, even along the shoreline. The scale of development would be similar to other areas of San Francisco, such as parts of downtown, or Rincon Hill. While the Project would change the character of the site, it would not be considered a significant adverse change in the visual character of the setting.

Summary

Under current conditions, Bayview Hill, Candlestick Park, residential buildings up to five stories, and three- to eight-story commercial structures are visible from mid-range viewpoints. As shown by the various photographs and simulations and the accompanying discussions, above, development at Candlestick Point, including the residential towers ranging from 240 feet to 420 feet in height, would change the visual character of the Project site. Some of these towers would be similar to the height of Bayview Hill. Candlestick Park stadium would be demolished and buildings ranging from 40 feet to 420 feet would occupy the site.

Although the Project would change the visual character of the site, it would be designed to be compatible with existing neighborhoods. New uses would be consistent with other development occurring in the Project vicinity. For example, development at Candlestick Point would be similar in character to the proposed mixed-use commercial and high-density residential development at Executive Park and development along Jamestown Avenue. Project buildings proposed on Jamestown Avenue would be approximately three stories tall and would be similar in scale to structures in the Jamestown and Candlestick Point South districts. Development would be compatible with the type, scale, and form of nearby land uses in the Bayview Hunters Point neighborhood. Although residential densities in the Alice Griffith Public Housing district would be higher than the density of existing off-site residential uses to the west and south, there would be a gradual transition in density and massing from existing to proposed uses. Future building heights would be limited to 65 feet, and building façades would feature articulated massing that would feature vertical and horizontal setbacks to break up the mass of the building and minimize view obstruction

from comparably smaller buildings. The Project would transition from existing adjoining neighborhoods primarily through the use of building scale and compatibility of uses, providing the lowest building height at existing neighborhood edges, stepping up in height as one travels into the development.

Future uses in the Candlestick Point North district would include residential uses, although densities would be higher, ranging from 50 to 175 units per net acre. The Candlestick Point North district would contain up to three residential towers with heights of up to 270 feet. This district, which would include some of the tallest proposed structures at Candlestick Point, would be separated from existing off-site residential uses by the Alice Griffith district. Lower-density uses at Alice Griffith would provide a transition between existing development and the high-density residential uses in this district. The towers would be spaced to preserve views and a sense of openness from existing residential areas. Therefore, the heights and massing of the proposed towers would not overwhelm existing uses.

The Jamestown district would include two-story townhomes and low-rise flats, similar to existing two-story and three-story units currently being constructed to the west, also on Jamestown Avenue. Maximum heights would range from 65 feet (about five stories) at the north end of the district to 85 feet (about six stories) at the south end. Thus, the proposed development in this district would be similar in scale and type to the surrounding land use pattern of multi-family development.

Candlestick Point Center would include 275 residential units at 15 to 75 units per net acre along the perimeter of the blocks, above base floors containing commercial uses and parking areas. The 150,000 gsf, 220-room hotel would be at the western edge of the district. Candlestick Point Center would include buildings up to 65 and 85 feet in height. Parking structures would be interior to blocks and consist of up to four floors, including up to one sub-grade level.

These uses would generally be compatible with moderate- and high-density residential uses. Parking along Arelious Walker Street would provide a large setback between the Candlestick Point Center district and existing uses on Bayview Hill.

The Candlestick Point South district would include residential uses similar in scale to uses proposed in the Alice Griffith Public Housing district, with the exception of residential towers, with heights generally limited to 65 feet (five to seven stories tall). Two residential towers on the south half of this district would have maximum heights of up to 370 feet (approximately 40 stories) and one tower on the south end of the district would have a maximum height of 420 feet (approximately 42 stories). The north half of the district would have five residential towers, one with maximum height up to 220 feet, two with maximum heights up to 270 feet and two with maximum heights up to 320 feet. This area would not be adjacent to any existing adjacent neighborhoods. The scale and type of development in this area would be designed to be compatible with the reconfigured CPSRA, along the shoreline of Candlestick Point. A row of townhomes two blocks deep would line the open space area along the San Francisco Bay. Thus, building scale would be moderate and would provide a gradual transition between the open space area and the denser core of the site.

The BVHP neighborhood to the northeast of Candlestick Point is characterized by two-story, single-family row houses and some taller multi-family structures of various architectural styles, fronting relatively wide streets. Development at the Alice Griffith Public Housing site would have a similar land use as adjoining areas. The taller and higher density uses would be sited at a greater distance from the lower scale neighborhood to the north. Public open space within Candlestick Point districts would be a visual amenity,

and would connect to existing and reconfigured open space at CPSRA. Larger-scale uses at the regional retail center and the arena would be located near the current site of Candlestick Park stadium, an existing large structure. The new street grid would extend the existing block pattern of the BVHP neighborhood, and would include streetscape features such as street trees, sidewalk plantings, furnishing, and paving treatments.

The Yosemite Slough bridge would change the open water character along the bridge route across a relatively narrow portion of the Slough. This would not be considered a substantial adverse change in the overall visual character of Yosemite Slough, as the bridge would occupy only a small footprint relative to the entire Slough. The remainder of the Slough would remain visible as an open area.

The Project would alter the scenic nature of the Project site in that it would create a dense urbanized setting where one does not currently exist. On the north side, the bridge would cross the extreme eastern edge of the CPSRA area and would cross a small portion of the CPSRA on the south side. The bridge would be designed to integrate with the environment to the maximum extent feasible through openwork, materials, and color, in addition to being designed as a low structure. While the bridge would insert a structure into an improved open space area, it would connect two urbanized areas immediately adjacent. Taking into consideration the context of the entire site, not just the slough, the bridge would not be an element that is substantially out of character or scale with surrounding development. Therefore, this change in character would not represent a degradation of scenic quality. Tall Project structures would be located so that views of sky, topography, the Bay, and shoreline would be maintained. The towers are designed to create a scenic skyline, with the tallest towers toward the center of the development. The composition of the towers would be shaped into a pyramid form to shape the skyline. Key gateways would have taller, more distinct profiles, and important views and open spaces would be around and shaped by the towers.

The Project would replace degraded urban areas, vacant parcels, expanses of asphalt and dirt, and outdated residential development with new, well-designed urban development. The Project would improve the existing quality of the site by providing new areas of open space, enhanced connectivity to the shoreline, and pedestrian amenities such as outdoor plazas, walking paths, outdoor eating areas, sidewalks, street-side landscapes, and improved lighting. Urban design policies would ensure that there is appropriate transition from the existing neighborhoods to the Project's new neighborhoods. Therefore, the Project would not substantially degrade the visual character or quality of the Candlestick Point area or its surroundings. The Project would improve the visual quality of the Candlestick Point area, which contains vacant properties, expanses of parking lot, deteriorated structures, and piles of rubble. Therefore, the Project's overall impact on visual character at Candlestick Point would be less than significant. No mitigation is required.

Impact of Hunters Point Shipyard Phase II

Impact AE-6b **Implementation of the Project at HPS Phase II would not substantially degrade the visual character or quality of the site or its surroundings. (Less than Significant) *[Criterion E.a]***

View 17: Northeast from CPSRA (Figure III.E-27)

Figure III.E-27, from the easterly area of CPSRA looking northeast to the Shipyard, includes the Bay in the foreground and existing buildings at the Shipyard. Views of Project development at the Shipyard would include 49ers Stadium, the new marina, and Research & Development buildings. A residential tower, up to

370 feet in height, would be visible beyond the stadium. The Re-gunning crane would continue as a highly visible landmark, although Building 253, also a prominent structural feature, would be demolished. However, Building 253 is not considered a scenic resource, as noted, above, and its removal would not substantially degrade the existing visual character of the site. To the north, the approved HPS Phase I development, not part of the Project and currently under construction, would be visible. Mid-range views of degraded, vacant, and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 18: South from Hilltop Open Space (Figure III.E-28)

Figure III.E-28 shows a view from hilltop open space to be completed as part of HPS Phase I (not a part of this Project). Existing structures are visible in the mid-ground, with the Re-gunning crane prominent to the south. The Bay and the Santa Cruz Mountains on the San Francisco Peninsula are in the distance.

With the Project, this view would include the 49ers Stadium, and surrounding parking areas and dual-use playfields, serving as parking during stadium events. During football events, the parking area and dual-use fields seen from the open space would be generally filled with vehicles. The new stadium would be taller than the existing structures. The stadium would partially obstruct the long-range view of the Santa Cruz Mountains. The waterfront area near the Re-gunning crane would become a recreation area. The view of the Re-gunning crane would continue as a landmark and the new marina would be visible. Mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 19: East from Hunters Point Hill Open Space (Figure III.E-29)

Figure III.E-29 shows a view from open space on Northridge Road on Hunters Point Hill towards the Project looking southeast Structures and cleared areas at HPS Phase I are visible. The Project would replace the existing structures in the mid ground with mid-rise and two residential towers, up to 370 feet in height. New open space at the Shipyard would be visible at the base of the hill. To the south, the approved HPS Phase I development, not part of the Project and currently under construction, would be visible. Mid-range views of degraded and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

View 20: Southeast from Heron's Head Park (Figure III.E-30)

Figure III.E-30 shows a view from Heron's Head Park, north of India Basin, towards the Shipyard. This view includes wetlands at Heron's Head Park, Shipyard structures in the middle ground, and long-range views of the Bay and the East Bay hills. The Project would replace existing development on HPS with new low-, mid-, and high-rise development up to 370 feet in height. The approved HPS Phase I development, not part of the Project and currently under construction, would be visible above India Basin. Building 253, a structural landmark in this view, would be demolished; however, the Re-gunning crane would remain as a landmark in this view. Building 253 is not considered a scenic resource, as noted, above, and its removal would not substantially degrade the existing visual character of the site. Mid-range views of degraded, vacant, and unmaintained areas would be replaced with well-designed development. Therefore, the Project would not substantially degrade the existing visual character or quality of the site or its surroundings.

Summary

As shown by the various photographs and simulations, the Project would alter the visual character at HPS Phase II, with new development of residential uses, R&D, neighborhood retail, the 49ers Stadium, and parking facilities, including dual-use parking and athletic fields, and other public open space. The Project would demolish all existing industrial structures at the Shipyard, with the exception of the potential HPS Drydock Historic District and the Re-gunning Crane. The Project would extend a street grid and block pattern into the HPS Phase II North, Village Center, and R&D districts. The Project would include an open space network from India Basin to the north along the waterfront to Yosemite Slough, and open space proposed to be added to the CPSRA as part of the land agreement. HPS Phase II would also include a new marina.

The proposed HPS Phase II development would be compatible with the type, scale, form, and location of nearby land uses in the Bayview Hunters Point neighborhood. The Project would include Redevelopment Plan documents that would specify development standards for setbacks, heights, massing, hillside development, and other building features at HPS Phase II. These standards would prevent juxtaposition of incompatible uses, ensure a gradual transition of density and bulk, and provide connectivity between existing and proposed uses and between each of the districts.

Design elements would enhance the identity of the Project districts. This would be accomplished through visual elements, such as compatible architectural styles, that would provide a transition from existing development into the Project. Other elements would be included to create a distinct sense of place, such as landscaping, transit shelters, street trees, sidewalk plantings, and pedestrian amenities, such as outdoor eating areas, plazas, and seating areas. Street-side plantings and distinctive pavement treatments would be extensive throughout the Project and designed to enhance building architecture and emphasize public and commercial areas. Continuous and well-appointed shop windows and arcades would be designed to act as invitations to movement and providing human scale at lower levels through use of texture and details. Parks and open space areas would be extensively landscaped to provide a visually pleasing recreational experience.

Uses in the HPS Phase II North district would generally consist of residential uses, ranging from densities of 15 to 175 units per net acre, with maximum heights ranging from 35 to 85 feet. Moderate-density townhomes and apartment blocks, with maximum heights ranging from 40 to 65 feet (three to seven stories tall), would line a proposed open space corridor along the San Francisco Bay shoreline. These uses would be adjacent to, and similar in scale and character, to adjacent residential uses at the HPS Phase I site, which would have heights ranging from 35 to 65 feet (three to six stories). One residential tower with a maximum height up to 370 feet (approximately 40 stories) would be at the southeast corner of the HPS Phase II North district, adjacent to the Village Center district. That tower would have approximately 15,000 gsf of neighborhood retail uses on the lower floors, continuing the neighborhood retail pattern in the Village Center district. While this tower would be taller than adjacent development, the uses it would contain—neighborhood retail—would be consistent with adjacent retail and residential land uses.

The HPS Phase II Village Center district would include neighborhood retail and upper-story residential units in five-story buildings. New buildings would have height limits of up to 65 feet (up to seven stories tall). Those uses would be similar in type and scale to surrounding mixed-use and residential development at the adjacent HPS Phase I. Building heights and massing would be similar, and uses would gradually

transition from residential uses in the HPS Phase II Village Center to mixed residential and commercial/Research & Development (R&D) uses in the HPS Phase II and R&D districts.

Uses in the R&D district would have a small area of mixed residential and neighborhood retail uses bordering on the HPS Phase II North district to the north, which, as stated above, would contain residential buildings ranging from three to eight stories tall, and the HPS Phase II Center district to the west, which would contain mixed retail and residential uses. Structures in the center of this district would range from 85 to 105 feet tall. The R&D district would not be adjacent to existing developed land uses.

The HPS Phase II South district would contain a new 69,000-seat 49ers stadium, as well as dual-use fields that would serve as stadium parking and athletic fields. The top row of stadium seating would be at an elevation of approximately 156 feet (about 15 stories) above the playing field. This would be similar to the scale of the existing Candlestick Park stadium. While the stadium site would be substantially changed with the Project, the stadium site would include landscaping and open space/turf areas and, therefore, would represent an improvement over the existing stadium. The change from an industrial appearance to a stadium use would not be considered adverse. The HPS Phase II South district would be surrounded by new open space to the west, south, and east, and by new R&D uses to the north, replacing waterfront industrial facilities and vacant lots. With respect to adjacent neighborhoods, the HPS Phase II North district would be south of the mixed-use India Basin neighborhood.

The HPS Phase II North district, near existing neighborhoods of India Basin, Hunters Point Hill, and HPS Phase I, would provide a new residential area with buildings heights up to 65 feet. Proposed open space would also separate HPS Phase II North from India Basin. Up to two residential towers in HPS Phase II Village Center would range from 220 feet to 270 feet in height. The R&D uses would range from 65 feet to 105 feet in height.

Public open space within HPS Phase II would be a visual amenity and would connect to reconfigured open space at CPSRA. The new street grid would include streetscape features such as street trees, sidewalk plantings, furnishing, and paving treatments.

As identified in the BVHP Area Plan (of the City's General Plan), there are a number of somewhat incompatible existing uses adjacent or in close proximity to one another at the eastern edge of the Project site, including the Yosemite Canal, the CPSRA, Bayview residential neighborhoods, the Alice Griffith Public Housing site, industrial uses, and the Candlestick Park stadium. The Project has been designed to remove most of these conflicts and to provide for a walkable, pedestrian-friendly community of compatible uses. Height, massing, and setback restrictions at the areas where the new development would connect with existing development would provide for a transition zone that would maximize compatibility with existing uses. Residents of existing neighborhoods would be directly connected to the new development and would be anticipated to utilize the Project's commercial and open space uses. The architecture of the new stadium would be designed to be visually pleasing and landscaping would be utilized to help soften the structure's appearance. Relocating the stadium, redeveloping vacant and underutilized parcels, and removing the deteriorating conditions on the Project site would eliminate the incompatibility of the existing industrial and residential uses. The new stadium would be placed on the site in a more compatible location than the existing stadium, located adjacent to large open space areas and away from residential uses.

The BVHP Redevelopment Plan seeks to alleviate blight throughout the Project area and promote inclusion of affordable housing, economic development, and community enhancements. The Project would revitalize and redevelop deteriorated, vacant, and underutilized parcels into a vibrant, connected complex of districts that would connect to each other and to existing area neighborhoods. Heights and massing of Project structures that are adjacent to existing neighborhoods would be limited to provide a pleasing visual transition from the existing neighborhoods through the Project by concentrating taller and more massive structures nearer the interior of the Project site. The project would provide extensive areas of open space integrated with new development and existing open space that would enhance the positive features of Bayview Hunters Point, with its immediate proximity to the shoreline, and would not substantially obstruct views of the Bay, the East Bay hills, and the San Bruno Mountains from adjacent neighborhoods. Overall, the Project would improve the visual appearance of the Project site by removing deteriorated conditions and replacing them with vibrant, mixed uses that would enhance neighborhood connectivity and access to the shoreline and provide neighborhood- and regional-serving amenities. The existing street grid would be extended and expanded, preserving the overall urban pattern of Bayview Hunters Point.

- The Project would alter the scenic nature of the Project site in that it would create a dense urbanized setting where one does not currently exist. On the north side, the bridge would cross the extreme eastern edge of the CPSRA area and would cross a small portion of the CPSRA on the south side. The bridge would be designed to integrate with the environment to the maximum extent feasible through openwork, materials, and color, in addition to being designed as a low structure. While the bridge would insert a structure into an improved open space area, it would connect two urbanized areas immediately adjacent. Taking into consideration the context of the entire site, not just the slough, the bridge would not be an element that is out of character or scale with surrounding development. Therefore, this change in character would not represent a substantial degradation of scenic quality.

The Project would replace deteriorating structures, vacant parcels, expanses of asphalt and dirt, and piles of rubble and debris with a high-quality environment that would include a variety of architectural styles and open space. Therefore, the Project, in replacing existing uses and structures, and in light of the analysis of changes in visual conditions presented throughout this section, would not substantially degrade the visual quality or character of the HPS Phase II site or its surroundings and the impact would be less than significant. No mitigation is required.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact AE-6 **Implementation of the Project would not substantially degrade the existing visual character or quality of the site or its surroundings. (Less than Significant) *[Criterion E.c]***

As shown by the various photographs and simulations and the accompanying discussions, above, the Project, in replacing existing uses and deteriorating structures, and in light of the analysis of changes in visual conditions presented throughout this section, would not substantially degrade the visual character or quality of the Project site area or its surroundings. In fact, the Project would improve the degraded and deteriorated condition of much of the Project site. The Project would revitalize and redevelop deteriorated, vacant, and underutilized parcels into a vibrant, connected complex of districts that would connect to each other and to existing area neighborhoods. Heights and massing of Project structures that are adjacent to existing neighborhoods would be limited to provide a pleasing visual transition from the existing

neighborhoods through the Project by concentrating taller and more massive structures nearer the interior of the Project site. The project would provide extensive areas of open space integrated with new development and existing open space that would enhance the positive features of Bayview Hunters Point, with its immediate proximity to the shoreline, and would not substantially obstruct views of the Bay, the East Bay hills, and the San Bruno Mountains from adjacent neighborhoods. On the north side, the bridge would cross the extreme eastern edge of the CPSRA area and would cross a small portion of the CPSRA on the south side. The bridge would be designed to integrate with the environment to the maximum extent feasible through openwork, materials, and color, in addition to being designed as a low structure. While the bridge would insert a structure into an improved open space area, it would connect two urbanized areas immediately adjacent. Taking into consideration the context of the entire site, not just the slough, the bridge would not be an element that is substantially out of character or scale with surrounding development. Although the Project would replace the existing conditions with a more dense urban setting, this would not represent an adverse change. The proposed shoreline improvements and new marina would improve the aesthetic quality of the shoreline along the Project frontage, reducing erosion, including marsh plantings where appropriate, and removing debris. These improvements would represent a beneficial impact of the development, improving the overall visual character of the shoreline. The Project would not substantially degrade the visual character or quality of the Project site or its surroundings. The impact would be less than significant. No mitigation is required.

Impact AE-7: Effects of Light and Glare

This analysis assesses spill light and obtrusive light and glare that might be associated with Project lighting for security and parking and from lighting at the 49ers Stadium. As the lighting design has not yet been formulated, it is not possible to calculate the actual output that would be generated by Project lighting. Therefore, this analysis is qualitative, and further lighting analysis may be required when the final design of the Project is completed.

The following terms are used in this discussion:

- *Spill light*—The light emitted from an installation that falls outside the boundaries of the property on which the lighting system is installed
- *Obtrusive light*—Spill light that causes annoyance, discomfort, distraction, or a reduction in the ability to see essential information such as traffic signals
- *Foot-candle*—The recognized international unit for the measure of light (luminance) falling onto a surface

Spill light can be accurately calculated and the effects of spill light can be measured for general understanding and comparison. The effects of obtrusive light are, however, the subject of debate and technical discussion. Attempts have been made to quantify obtrusive light, but this has proven to be difficult, as individuals have a range of reactions to the perceived effects of lighting on the environment. Typical night street lighting requirements are 1 to 3 foot-candles, which is considered to be unobtrusive.

A typical example of glare effects is the car headlight. When viewed directly in front of a vehicle with the headlights on full beam, vision is impaired, resulting in disabling glare. However, when viewed from the side, the same headlights would not impair vision.

The following are examples of light levels, expressed in foot-candles:

- Bright and sunny day: 3,000 foot-candles
- Professional sports field lighting: 300 foot-candles
- Office: 50 to 75 foot-candles
- Residential lighting at night: 7 to 10 foot-candles
- Main road junction street lighting: 2.5 to 3 foot-candles
- Bright moonlight: 0.1 foot-candle

Night illumination of outdoor areas can affect people in several ways. For example, where intense lighting is viewed against a dark background, the contrast attracts the attention of the viewer and could be considered annoying. Under low-light conditions, the human eye adjusts to the brightest light within the field of view. If the range of light intensity to which the eye is exposed is large, the eye will be relatively insensitive to the more dimly lighted areas within the field of view. In addition, increased illumination can affect the suitability of sleeping areas, use of outdoor areas at natural light levels, and privacy. The degree of impacts may be related to the degree of change from the illumination levels to which people have become accustomed.

Impact of Candlestick Point

Impact AE-7a **Implementation of the Project at Candlestick Point would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties. (Less than Significant with Mitigation) *[Criterion E.d]***

The Project would eliminate light associated with night events at the existing Candlestick Park stadium, but would include new sources of light associated with regional retail and arena use during the evening and from residential uses at night. Street lighting and lighting for public areas would increase ambient light, as would security lighting and lighting for parking areas. The new sources of light would be typical of urban development elsewhere in San Francisco and would not generate obtrusive lighting that would adversely affect day or night views or negatively affect other neighborhoods.

There is currently some night lighting on the site from Candlestick Park during night events and from existing uses on the site. Night lighting in the immediate area is produced by street lights and vehicular headlights along US-101, Harney Way, Hawes Street, Innes Avenue, Carroll Avenue, Gilman Avenue, and other local streets, as well as exterior lighting from the residential and commercial/industrial uses on and adjacent to Candlestick Point. In particular, there are existing moderate to high lighting levels from the Alice Griffith Public Housing site. Thus, moderate lighting levels characterize the existing ambient night lighting in the Project area and on Candlestick Point.

Project lighting would be used to highlight architectural elements, landscaping, and building tenant and Project signage. Project signage would be regulated by the Agency through the permit and plan review process and applicable City codes. The types of signs that could contribute to an increase in lighting would generally be restricted to entrance signage and marquee building signs in the commercial areas. In addition, security and safety lighting would be provided, as necessary, in parking areas, service passages, and common areas of the Project utilized by employees and visitors. Further, increased vehicular traffic resulting from the Project could result in more opportunities for vehicular headlights to affect adjacent residences.

Final lighting design has not been completed. As the Project proceeds through the design process, a lighting plan would include the types and locations of all fixtures. The intent of the lighting design would be to provide varied ambiance to the night appearance while providing a general overall level of illumination consistent with customary municipal safety standards. Lighting structures need to be in scale with the surrounding buildings. Also, while on-site lighting needs to be bright enough to promote the general safety of new uses, great care must be taken to prevent "spillage" of lighting and glare into nearby residential neighborhoods. Area lighting sources would be subject to fixture height requirements, oriented toward the ground, or screened to minimize illumination into off-site areas and to prevent glare or interference with vehicular traffic. Very limited and low-level lighting would be provided in open space areas. In these areas, lighting would be limited to decorative lighting along walkways.

Area lighting would illuminate larger areas that are well-traveled so as to promote way-finding and provide for a safe environment. In addition to area lighting, building lighting would be provided. Building lighting would be angled towards building surfaces for aesthetic purposes and/or to illuminate signs. Both types of lighting would be designed to avoid direct visibility of the light source. Because much of Candlestick Point is open space and currently minimally lighted, the transition to a more intense urban environment as a result of the Project would in some areas of the site substantially increase ambient lighting from Project structures and vehicle headlights. However, this increase in ambient light would be consistent with the urban character and associated ambient lighting of the City as a whole. Because the Project site is located immediately adjacent to a developed urban area, existing views of the night sky are diminished as is typical in all urban areas. Nighttime lighting would not affect users of the Yosemite Slough/CPSRA, as the CPSRA is closed after dark. Therefore, the light and glare as a result of the Project would not substantially interfere with these currently limited views.

Long-range views of a partial downtown skyline are available from various vantage points at Candlestick Point and Bayview Hunters Point (refer to Figure III.E-18). At night, some downtown illumination is visible against the dark waters of the Bay. Project development at Candlestick Point could somewhat diminish the visual effect of downtown illumination by providing a new source of lighting in the foreground. However, because only a very small portion of an illuminated downtown skyline is seen at night and because it is already substantially blocked by intervening topography, any reduction in the visibility of the downtown night skyline from south of the Project site would be less than significant.

Views of the Project site are also available from Alameda and Oakland, across the Bay. Night views would change from a relatively unlighted or moderately lighted condition to a high level of illumination. However, because of the intervening distance of at least 5 miles, the increased lighting from the Project would not interfere with any existing views of the night sky from these locations, nor would glare affect those viewers.

The following mitigation measures would be implemented to reduce any potential significant lighting impacts to a less-than-significant level:

MM AE-7a.1 *Lighting Direction/Fixtures and Screening Walls to Minimize Glare and Light Spill. The Applicant shall ensure that all parking lot and other security lighting shall be directed away from surrounding land uses and towards the specific location intended for illumination. State-of-the-art fixtures shall be used, and all lighting shall be shielded to minimize the production of glare and light spill onto surrounding use. All parking structures shall be constructed with screening walls of sufficient height to block spill light from vehicle headlights.*

MM AE-7a.2 *Low-level/Unobtrusive Light Fixtures. The Applicant shall ensure that landscape illumination and exterior sign lighting shall be accomplished with low-level, unobtrusive fixtures.*

- *MM AE-7a.3* *Lighting Plan. The Developer shall prepare a lighting plan for each sub-phase of the Project and submit it approval of a sub-phase. Outdoor lighting shall maintain a minimum required illumination, as determined appropriate by the Agency for all parking and pedestrian areas. In addition, the plan shall include details such as beam spreads and/or photometric calculation, location and type of fixtures, exterior colors, details on foundations, and arrangement of exterior lighting such that it does not create glare, hazardous interference on adjacent streets, or properties or result in spill light that would adversely impact sensitive receptors in the project area.*

Glare is considered the discomfort or impairment of vision experienced when the image is excessively bright in relation to the general surroundings. Implementation of the Project would create new sources of daytime glare if new building surfaces include the use of reflective materials. These new sources of glare could affect sensitive uses in adjacent residential neighborhoods as well as residents of the Project itself.

Numerous sources of daytime glare currently exist in the Project area from building surfaces and windows. Some additional glare could be produced by the increased amount of surface area of the proposed structures, which could reflect or concentrate sunlight and result in a potentially significant impact. Exterior building surfaces and windows can be a source of glare, particularly if highly reflective surfaces are utilized. City Resolution 9212 prohibits the use of highly reflective or mirrored glass in new construction. The Project would use finish materials such as stucco and wood framing. Glass surfaces would not be mirrored, highly reflective, or densely tinted glass, as directed by planning guidelines. In addition, landscaping adjacent to the structures would soften and diffuse glare from the structure surfaces and windows. Use of nonreflective textured surfaces on building exteriors, as well as avoidance of the use of reflective glass, would reduce impacts related to daytime glare to a less-than-significant level.

The following mitigation measure would be implemented to reduce any potential significant glare impacts to a less-than significant-level.

MM AE-7a.4 *Non-reflective Exterior Surfaces to Minimize Glare Impacts. The Applicant shall ensure that design of the proposed structures shall include the use of textured or other nonreflective exterior surfaces and nonreflective glass.*

Implementation of the identified mitigation measures and compliance with Resolution 9212 would reduce impacts from light and glare to a less-than-significant level by shielding lighting fixtures, minimizing spill light from Project lighting, screening vehicle headlights to the maximum extent feasible, and eliminating or minimizing increased glare through the use of nonreflective glass and nonreflective textured surfaces in the proposed development.

Impact of Hunters Point Shipyard Phase II

Impact AE-7b **Implementation of the Project at HPS Phase II would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties. (Less than Significant with Mitigation)** ***[Criterion E.d]***

HPS Phase II would include new sources of light associated with neighborhood retail use during the evening and from residential uses at night. Although the new stadium would be included in this area, the light effects from the new stadium would be similar to the existing lighting effects from Candlestick Park stadium. Street lighting and lighting for public areas would increase the ambient light, as would security lighting and lighting for parking areas. The new sources of light would be typical of urban development elsewhere in San Francisco and would not generate obtrusive lighting that would adversely affect day or night views or negatively affect other neighborhoods.

Views of the Project site are also available from Alameda and Oakland, across the Bay. Night views would change from a relatively unlighted or moderately lighted condition to a high level of illumination. However, because of the intervening distance, the increased lighting from the Project would not interfere with any existing views of the night sky from these locations, nor would glare affect those viewers.

Like the current stadium at Candlestick Point, the San Francisco 49ers stadium would be used primarily for professional football games, but could also be used for other events, such as concerts, festivals, international soccer games, or other sporting events. The National Football League schedule includes four preseason games and 16 regular-season games generally beginning in August and running through December. Post-season play occurs in January. In one season, the San Francisco 49ers would play up to three pre-season and eight regular season games at home.[134] The majority of NFL games would occur during the day, beginning at 1:00 P.M., but some night games, typically on Thursday, Sunday, or Monday nights, could occur. Other events could be held during the day or night, but as with football games, day events would be more common. It is estimated that there would up to 20 evening or night events at the stadium.

Lighting for the stadium would be required to be consistent with NFL Sports Lighting Design Criteria. Lighting would consist of event field lighting, exterior stadium lighting (i.e., building perimeter lighting and parking lot lighting), and emergency lighting. The exact type and quantity of light bulbs and fixtures would be determined by the manufacturer's ability to achieve the performance criteria required for players, spectators, and television broadcasts, which would apply to the entire playing field including an additional 15 feet beyond the end zones and sidelines. Lighting levels in the stands would gradually taper off from the maximum light intensity levels on the playing field. Field lighting would only be required for large events during evening hours such as a late afternoon or evening sporting events or a concert. Modern field lights are designed for specific directional light and reduction of spill light. Data have shown that less than three foot-candles can be achieved one block away from the stadium and less than one foot-candle of illumination two blocks away from the stadium.[135] Three and one foot-candles are comparable to normal street lighting in most residential streets. While the overall ambient

[134] Each NFL team typically plays four preseason games. The NFL has a 17-week regular season. Each season, all NFL teams have one bye week where the team does not play. Therefore, each team plays 16 regular season games during the 17-week period.
[135] ME Engineers of Wheatridge, Colorado, December 16, 2004.

light levels on the site would noticeably increase when the field lights are in use, the lighting would not spill over or directly impact residences in the neighborhoods west and northwest of the HPS Phase II site, or the residences within the Project itself. Users of the Yosemite Slough/CPSRA would not be affected by nighttime lighting, as the CPSRA is closed after dark.

The top row of stadium seating would be at an elevation of approximately 156 feet above the playing field; the top of the stadium light towers would be at an approximate elevation of 192 feet. As noted, the lighting system for the stadium has not been designed at this time. The stadium lighting would meet criteria for lighting for players, spectators and television broadcasts, and would likely provide 250 foot-candles to 300 foot-candles at the field level. The 192-foot tall lighting units would allow the light to be angled downward and would use fixtures that focus light on the field and reduce glare. In addition, because the stadium would height would reach 156 feet above the playing field, the illuminated portion of the playing field would not be visible from adjacent areas. Scoreboards and lighted signage would also be a source of night illumination.

Parking area lighting would be closest to the proposed R&D development, which would not be considered sensitive to evening lighting from the parking lots. The nearest residential uses would be in HPS Phase I, approximately 500 feet north of the northernmost parking area. Those residences would be approximately 50 to 200 feet above the grade of the parking facilities for the stadium and, although the lighted parking areas would be visible from HPS Phase I, the residents would not be exposed to direct lighting from the parking areas. This would be a less-than-significant impact.

Information on lighting effects for the San Francisco Giants Ballpark provides a comparison of potential of off-site light effects. The EIR for the San Francisco Giants Ballpark[136] analyzed the effects of stadium lighting on off-site receptors at varying distances from the stadium. For example, computer modeling of light generated by stadium lighting resulted in light levels of 1.0 foot-candle[137] at 300 feet, 0.2 foot-candle at 800 feet, and 0.0 foot-candle at 1,500 feet.[138] As noted above, the nearest residential use to the proposed 49ers Stadium would be HPS Phase I residential uses, approximately 650 feet north of the stadium. Based on the light levels for the Giants Ballpark, light levels at this location would be between 0.2 and 1.0 foot-candle. Such a change in the light level at this location would be less than that associated with typical street lighting, which would not be substantial. Light levels from the stadium at other locations, such as Mariner Village, approximately 1,250 feet away, and the proposed HPS Phase I development along Crisp Road, and residential development within HPS Phase II, each approximately 1,500 feet or more away, also would not be substantial. As noted, users of the Yosemite Slough/CPSRA would not be affected by stadium lighting, as the CPSRA is closed after dark. Nonetheless, the light fixtures themselves would be directly visible from some locations, and could diminish night views from these areas, which some residents could find obtrusive. However, night events would occur up to about 20-25 days per year (including night football games and other events that might be held at the stadium), and the impact, if any, would be intermittent and infrequent.

---

136 *San Francisco Giants Ballpark at China Basin Final Environmental Impact Report*, 96.176E, certified June 26, 1997.

137 A foot-candle is a unit of light intensity that represents the illumination given off by a single candle at a distance of one foot. For comparison, the light level of a bright sunny day would be approximately 3,000 foot-candles, lighting at a professional stadium would be 300 foot-candles, street lighting on a main road junction would be 2.5 to 3.0 foot-candles, and bright moonlight would be 0.1 foot-candle.

138 *San Francisco Giants Ballpark at China Basin Final Environmental Impact Report*, 96.176E, certified June 26, 1997, pp. IV.36 to IV.41.

To reduce impacts from light and glare from the San Francisco 49ers stadium, the following mitigation measures would be implemented:

MM AE-7b.1 *Testing of the Field-Lighting System. Prior to opening the stadium, the Stadium Operator shall test the installed field-lighting system to ensure that lighting meets operating requirements in the stadium and minimizes obtrusive spill lighting in the ballpark facility. Testing shall include light-meter measurements at selected locations in the vicinity to measure spill lighting from stadium field-lighting fixtures, permit adjustment of lighting fixtures, and confirm that spill-lighting effects shall be within an acceptable range and compatible with typical street lighting fixtures.*

MM AE-7b.2 *Stadium Lighting Orientation and Cut-Off Shields. Prior to opening the stadium, the Stadium Operator shall ensure that stadium lighting is oriented in such a manner to reduce the amount of light shed onto sensitive receptors and incorporate "cut-off" shields as appropriate to minimize any increase in lighting at adjacent properties, providing that it still meets the standard of lighting for football operations.*

Implementation of the identified mitigation measures would reduce impacts from light and glare to a less-than-significant level by shielding lighting fixtures, minimizing spill light from Project lighting, screening vehicle headlights to the maximum extent feasible, and eliminating or minimizing increased glare by the use of nonreflective glass and nonreflective textured surfaces in the proposed development. Mitigation measures MM AE-7b.1 and MM AE-7b.2 would ensure that the impact of stadium lighting would be less than significant by requiring that the stadium operator test the installed field-lighting system to ensure that lighting meets the operating requirements in the stadium and minimizes obtrusive spill lighting from the facility.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact AE-7 **Implementation of the Project would not create a new source of substantial light or glare that would adversely affect day or night views in the area or that would substantially impact other people or properties. (Less than Significant with Mitigation) *[Criterion E.d]***

The Project would include new sources of light associated with neighborhood retail use during the evening and from residential uses at night and would change an area of low- to moderate-level illumination to an area of moderate to high illumination. Project lighting would be used to highlight architectural elements, landscaping, and building tenant and project signage. In addition, the new San Francisco 49ers stadium on HPS Phase II would provide a source of illumination in a different location from the existing Candlestick Park stadium.

Area lighting would illuminate larger areas that are well traveled so as to promote way finding and provide for a safe environment. In addition to area lighting, building lighting would be provided. Building lighting would be angled towards building surfaces for aesthetic purposes and/or to illuminate signs. Both types of lighting would be designed to avoid direct visibility of the light source. Because a large portion of the Project site is open space or vacant parcels and currently minimally lighted, the transition to a more intense urban environment as a result of the Project would in some areas of the site substantially increase ambient lighting from Project structures and vehicle headlights. However, this increase in ambient light would be consistent with the urban character and associated ambient lighting of the City as a whole. Because the Project site is located immediately adjacent to an intensively developed urban area, views of the night sky are diminished as they are in all urban areas, and the light and glare as a result of the Project would not substantially interfere with these currently limited views.

Long-range views of a partial downtown skyline are held from various vantage points at Candlestick Point and Bayview Hunters Point (refer to Figure III.E-18). At night, downtown illumination is visible against the dark waters of the Bay. Project development would somewhat diminish the visual effect of the downtown illumination by providing a new source of lighting in the foreground. However, because only a small portion of an illuminated downtown skyline is seen at night, and because it is already blocked by intervening topography, any reduction in the view of downtown illumination would be less than significant.

Views of the Project site are also held from Alameda and Oakland, across the Bay. Night views would change from a relatively unlighted or moderately lighted condition to a high level of illumination. However, because of the intervening distance, the increased lighting from the Project would not interfere with any existing views of the night sky from these locations, nor would glare affect those viewers.

Increased lighting on the site relative to existing outdoor lighting and new building surfaces would increase the level of illumination in the area. Implementation of mitigation measures MM AE-7a.1 through MM AE-7a.4 would reduce impacts from light and glare to a less-than-significant level by shielding lighting fixtures, minimizing spill light from Project lighting, screening vehicle headlights to the maximum extent feasible, and eliminating or minimizing increased glare by the use of nonreflective glass and nonreflective textured surfaces in the proposed development. Mitigation measures MM AE-7b.1 and MM AE-7b.2 would ensure that the impact of stadium lighting would be less than significant by requiring that the stadium developer test the installed field-lighting system to ensure that lighting meets the operating requirements in the stadium and minimizes obtrusive spill lighting from the facility.

Cumulative Impacts

The geographic context for the analysis of visual impacts varies depending on the threshold analyzed. For example, the context for an analysis of scenic vistas would necessarily encompass a broader geographic area than an analysis of visual character or light and glare. For each threshold analyzed, below, the applicable geographic context is described.

Construction Impacts

The geographic context for an analysis of construction impacts is the same limited geographic area as the Project, as visual construction impacts are generally site-specific. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. Reasonably foreseeable future development includes existing development at Candlestick Point and Hunters Point, extending generally to the east of US-101 between Candlestick Cove and India Basin, which includes Executive Park, as well as the Yosemite Slough Restoration Project, which has been approved and will restore tidal wetlands in a 34-acre parcel of the CPSRA.

Construction impacts on aesthetics are site-specific, as construction activities are temporary. Therefore, the geographic context for an analysis of cumulative construction impacts to aesthetics would be limited to projects in the immediate vicinity of the Project that could be seen together with the Project, assuming that construction activities were to be concurrent. These projects would include the Yosemite Slough Restoration Project, Executive Park, and HPS Phase I, which have been approved and/or are under construction.

Construction activities associated with development of cumulative projects in the defined area would not obstruct any scenic vistas, such as views of the Bay or the San Bruno Mountains, as most construction equipment is not tall or wide enough to physically interfere with views. Other visual impacts associated with construction of related projects, such as exposed pads and staging areas for grading, excavation, and construction equipment, would occur. In addition, temporary structures could be located on the construction sites during various stages of construction, within materials storage areas, or associated with construction debris piles on site. Exposed trenches, roadway bedding (soil and gravel), spoils/debris piles, and possibly steel plates would be visible during construction of utility infrastructure improvements. As part of the environmental review process, most or all of the cumulative projects would be required to temporarily screen, to the maximum extent feasible, any unsightly views during construction to minimize the impact on scenic vistas and on visual character. Because these visual intrusions are temporary, they would not be considered significant.

Construction would occur during daylight hours, generally between 7:00 A.M. and 8:00 P.M. or as otherwise allowed by the City. A minimal amount of glare could result from reflection of sunlight off windows of trucks, but this would be negligible and would not affect daytime views in the area. Security lighting would be provided after hours on all construction sites, but this lighting would be minimal, restricted to the Project site, and would not exceed the level of existing night lighting levels in urban areas. Therefore, the Project's construction activities would have less-than-significant light and glare impacts

The Project would result in less-than-significant construction-related impacts to visual character and light and glare, and would not have any construction-related impacts on scenic vistas. Therefore, the Project would not contribute to any potentially significant impact on visual resources that could result from development of the cumulative projects, and the Project's construction-related cumulative impact on visual resources would be less than significant.

Operational Impacts

Effects on Scenic Vistas

The geographic context for an analysis of cumulative impacts on scenic vistas is the area covered by the BVHP Redevelopment Plan, the HPS Redevelopment Plan, and the BVHP Area Plan (of the City's General Plan), as development in these Plan areas could affect the same scenic vistas analyzed for the Project as identified in Figure III.E-11 through Figure III.E-18. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation

- of cumulative impacts. Reasonably foreseeable future development includes development at Candlestick Point and Hunters Point, extending generally to the east of US-101 between Candlestick Cove and India Basin, which includes the Yosemite Slough Restoration Project, Executive Park, Jamestown, Hunters Point Shipyard Phase I, Hunters View, and India Basin Shoreline Area C.

- The areas described by these plans contain a mixture of land uses, including open space, residential, commercial, and industrial. The past and present development in these areas is described in Section III.E.2 (Setting) of this section, representing the baseline conditions for evaluation of cumulative impacts to scenic vistas. Scenic vistas may be generally described as panoramic views of a large geographic area, for which the field of view can be wide, extend into the distance, and associated with vantage points that provide an orientation not commonly available. Examples of scenic vistas include urban skylines, valleys, mountain

ranges, or large bodies of water. For the Project, the scenic vistas that could be affected are of the downtown skyline, the San Francisco Bay, the East Bay hills, and San Bruno Mountains. Significant impacts on a scenic vista would occur if a project would substantially degrade or obstruct important scenic views from public areas.

Policy 1.1 in the Urban Design Element of the San Francisco General Plan emphasizes the City's desire to recognize and protect major views in the City, with particular attention to those of open space and water. While each cumulative project would be required to comply with design review requirements, development of one or more cumulative projects could result in obstruction of scenic vistas held from various vantage points in the City toward the Bay, the East Bay hills, and San Bruno Mountains, depending on the height, massing, and density of future development in the Plan areas. This is a potentially significant impact.

- Overall, development of the Project would not substantially block publicly accessible views of the Bay or other scenic areas. The Project would provide a continuation of the existing street grid, thereby maintaining existing view corridors to the Bay and East Bay hills. The Project would also provide new parks and open space facilities. Public access areas (City and State parks) would provide views from the Project site toward the East Bay and the Bay. The Yosemite Slough Restoration Project would restore tidal wetlands in a 34-acre parcel of the CPSRA immediately adjacent to the Project site and would include continuation of the Bay Trail and viewpoints/interpretative signage. The bridge component of the Project would place a low bridge structure across the neck of the slough that would partially obstruct a scenic view from the slough toward the Bay from some vantage points. Views of the Bay and the remainder of the slough would be retained from numerous other vantage points, including along the shoreline, from the view corridors within the Project site, the CPSRA, and the proposed bridge itself. The Project would improve access to the entire area, allowing a greater number of people to take advantage of the scenic resources at CPSRA and the slough. The General Plan Urban Design Element contains policies that guide development in order to protect scenic views and promote visual harmony. The cumulative projects would conform to these guiding principles, the same as the Project, and all projects are subject to design review by the Planning Department to ensure consistency with the General Plan. Since development of cumulative projects within the defined geographic context would not likely result in an adverse impact on scenic vistas, there would be no cumulative impact to which the Project could contribute. Even if there were an adverse impact on scenic vistas due to the cumulative development, however, the Project's incremental contribution would not be cumulatively considerable, as the Project would not result in a substantial adverse impact on any scenic vista. Therefore, the Project's cumulative impact would be less than significant.

Effects on Scenic Resources

The geographic context for an analysis of cumulative impacts on scenic resources is the area covered by the BVHP Redevelopment Plan, the HPS Redevelopment Plan, and the BVHP Area Plan (of the City's General Plan), as development in these Plan areas could affect the same scenic vistas analyzed for the Project as identified in Figure III.E-11 through Figure III.E-18. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation

- of cumulative impacts. Reasonably foreseeable future development includes the Yosemite Slough Restoration Project and development at Candlestick Point and Hunters Point, extending generally to the east of US-101 between Candlestick Cove and India Basin, which includes Executive Park, Jamestown, Hunters Point Shipyard Phase I, Hunters View, and India Basin Shoreline Area C.

- Damage to scenic resources would occur if a project would directly affect environmental features, such as topographic features, landscaping, or a built landmark, that contribute to a scenic public setting. There are no identified built landmarks topographic features, or landscaping that contributes to a scenic public setting in the Plan area except for Double Rock, Bayview Hill, Hunters Point Hill, the Re-gunning crane, CPSRA, and the Yosemite Slough. The General Plan Urban Design Element contains policies that guide development near major topographic features such as substantial hills to prevent development from overwhelming the land form and adversely affecting these features. The cumulative projects would conform to these guiding principles, the same as the Project. The Project would include redevelopment of Candlestick Park stadium and associated paved and unpaved parking lots; the Project would also include new housing and replacement of existing housing on undeveloped parcels on the Alice Griffith Public Housing site, and remove other existing uses, such as the Candlestick RV Park. The majority of these sites include limited landscaping. Those areas of Candlestick Point do not contain natural or built features that would be considered scenic resources or other features that contribute to the scenic public setting. The Yosemite Slough bridge would change the setting of the Slough, with the bridge structure and roadway approaches, and the bridge would replace some views of open water as seen from nearby locations. Yosemite Slough would continue to be a scenic resource as a waterway bordered by open space opening from a narrow channel to the west to the wider South Basin to the east. Overall, the bridge would not substantially damage a resource that contributes to a scenic public setting. On completion of the Yosemite Slough Restoration Project, publicly held views from the proposed bridge would include the improved slough area, as well as the Bay, and provide additional viewing opportunities that would not exist without the Project. The Project would retain structures at the identified Drydock Historic District and the Re-gunning crane, a landmark visible from short and long-range views. The HPS Phase II site does not contain other features that would be considered scenic resources that contribute to the scenic public setting. The proposed shoreline improvements would improve the aesthetic quality of the shoreline along the Project frontage, reducing erosion, including marsh plantings where appropriate, and removing debris. These improvements would represent a beneficial impact of the development, improving the overall visual character of the shoreline.

  Since development of cumulative projects within the defined geographic context would not likely result in an adverse impact on scenic resources, there would be no cumulative impact to which the Project could contribute. Even if there were an adverse impact on scenic resources due to the cumulative development, however, the Project's incremental contribution would not be cumulatively considerable, as the Project would not result in an adverse impact on any scenic resource. Therefore, the Project's cumulative impact would be less than significant.

Effects on Visual Character

The geographic context for an analysis of cumulative impacts on visual character is the area covered by the BVHP Redevelopment Plan, the HPS Redevelopment Plan, and the BVHP Area Plan (of the City's General Plan), as development in these Plan areas could affect the same scenic vistas analyzed for the Project as identified in Figure III.E-11 through Figure III.E-18. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation

- of cumulative impacts. Reasonably foreseeable future development includes development under the Yosemite Slough Restoration Project and at Candlestick Point and Hunters Point, extending generally to the east of US-101 between Candlestick Cove and India Basin, which includes Executive Park, Jamestown, Hunters Point Shipyard Phase I, Hunters View, and India Basin Shoreline Area C.

Visual character refers to the aesthetic character or quality of a streetscape, building, group of buildings, or other manmade or natural feature that creates an overall impression of an area. A project would be considered to degrade the existing visual character if it would result in substantial, demonstrable, negative aesthetic effects on a site or its surroundings.

It is anticipated that future development within the defined geographic area would result in changes to the existing land use environment through conversion of vacant land to developed uses or through conversions of existing land uses (e.g., from residential to commercial or industrial to residential) that could result in a change in visual character.

The goals and objectives of the BVHP Redevelopment Plan are to improve land use conditions. The HPS Redevelopment Plan contemplates development of a range of uses under the broad categories of industrial, research and development, mixed use, cultural and educational, residential, and open space. The BVHP Area Plan is an adopted component of the San Francisco General Plan that serves as a guide the future development of the BVHP community.

Each of these plans contains guidelines for urban design that would ensure compatibility with adjacent land uses and a pleasing visual character. While development in these geographic areas would likely change the existing land use character, the existing condition in many parts of these Plan areas is deteriorated. Change in visual character in and of itself is not adverse and can, in fact, be beneficial. A change from a blighted industrial development to mixed uses, with new housing and commercial areas, would likely be perceived as a positive change in the visual character of the area, as these uses would help implement the objectives of the applicable land use plans and offer increased landscaping, visual integration of structures, and coordinated design schemes. It is anticipated that all future projects proposed in these areas would be consistent with the adopted goals, policies, and objectives of the area Plans and would improve rather than degrade the existing visual character of the land uses.

The Project would result in a substantially different built environment compared to the existing character of the site and vicinity, but would develop new uses that would be well designed and consistent with other development occurring in the Project vicinity. Development patterns would include transitions from low-density residential uses to higher density residential and commercial uses. As noted, above, the Project would increase residential and non-residential densities at the Project site, which would be compatible with existing land uses, in that the Project would eliminate less compatible uses such as industrial and replace them with mixed uses, including residential. The Project would provide connectivity between the existing neighborhoods and the shoreline. Project edges would be designed with lower building heights adjacent to existing neighborhoods and open spaces, stepping up toward the middle of the development. Consistent with the objectives and policies for major new development, the Project would relate new buildings to existing and new open space. The height and bulk of new buildings would range in scale to relate to existing nearby development. The Project would develop a large property intended to be carefully designed with respect to impacts on surrounding areas.

The proposed shoreline improvements would improve the aesthetic quality of the shoreline along the Project frontage, reducing erosion, including marsh plantings where appropriate, and removing debris. These improvements would complement the improvements to the tidal wetlands planned under the Yosemite Slough Restoration Project to provide expanded open space opportunities, including recreational

trails linked to other regional trails and wildlife viewing. These improvements would represent a beneficial impact of the development, improving the overall visual character of the shoreline.

The transition in scale between adjacent neighborhoods and the Project and the varied range of proposed uses would not result in a substantial adverse change in the existing land use character. Since development of cumulative projects within the defined geographic context would not likely result in an adverse impact on existing visual character, there would be no cumulative impact to which the Project could contribute. Even if there were an adverse change in existing visual character due to the cumulative development, however, the Project's incremental contribution would not be cumulatively considerable, as the Project would not result in an adverse change in visual character. Therefore, the cumulative impact would be less than significant.

Effects of Light and Glare

The geographic context for an analysis of cumulative impacts on light and glare is the area covered by the BVHP Redevelopment Plan, the HPS Redevelopment Plan, and the BVHP Area Plan (of the City's General Plan), as development in these Plan areas could affect the same scenic vistas analyzed for the Project as identified in Figure III.E-11 through Figure III.E-18. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. Reasonably foreseeable future development includes development under the Yosemite Slough Restoration Project and at Candlestick Point and Hunters Point, extending generally to the east of US-101 between Candlestick Cove and India Basin, which includes Executive Park, Jamestown, Hunters Point Shipyard Phase I, Hunters View, and India Basin Shoreline Area C.

Development of cumulative projects in the identified Plan areas would result in increased sources of light and glare from building and street lighting, parking lot lighting, vehicle headlights, and increased building surfaces. The new sources of light would be typical of urban development elsewhere in San Francisco, but could generate obtrusive lighting that could adversely affect day or night views or negatively affect other neighborhoods, depending on location and project design. For example, if project driveways were oriented such that vehicle lights would shine on adjacent sensitive receptors, this could be considered an adverse effect. The addition of more numerous sources of illumination would also change the night views onto the Project site from various vantage points, including Oakland and Alameda across the Bay. However, as noted in the Project-level analysis, the intervening distance would mean that this increased illumination would not result in adverse effects on sensitive receptors or interfere with views of the night sky.

Moreover, like the Project, all new development would conform to the guidelines and policies contained in the *Planning Code*, the applicable land use plans and the applicable Redevelopment Plans, which would result in implementation of lighting design and use of non-reflective building surfaces to the maximum extent feasible so as to avoid any adverse light and glare impacts on sensitive receptors. Therefore, as the geographic area is located within an urban context, and projects would conform to the design guidelines contained in the applicable planning documents, there would not be a significant adverse cumulative effect with regard to light and glare from development of cumulative projects. Even if the cumulative projects would result in an adverse light and glare impact, however, the Project's incremental effect would not be cumulatively considerable, as mitigation measures have been included in the Project to avoid spillover light and reduce impacts on sensitive receptors to a less-than-significant level. The Project's cumulative impact with regard to light and glare would be less than significant.

SECTION III.F SHADOWS

III.F.1 Introduction

This section of the EIR examines the potential impacts of shadows cast by buildings that would be developed with the Project. New shading could occur on existing and proposed open space, parks, and recreation areas. The section describes the extent of potential new shading on existing open space owned by or under the jurisdiction of the San Francisco Recreation and Park Department (SFRPD), consistent with *Planning Code* Section 295, The *Planning Code* prohibits the issuance of building permits for structures over 40 feet in height that would cast shade on SFRPD park land that would have a significant effect on the use of the property. Section 295 is further discussed in Regulatory Framework, below. In addition, this section describes the extent of potential new shading on the Candlestick Point State Recreation Area (CPSRA) and on open space proposed as part of the Project at Candlestick Point and at Hunters Point Shipyard Phase II (HPS Phase II). The section evaluates the effects of new shading on the basis of changes in shadow patterns on open space and on the current and expected uses of the existing and proposed open space. The analysis in this section concludes that no potentially significant or significant environmental impacts would result from the Project; therefore, no mitigation measures are included.

The analysis in this section is based on a shadow modeling study completed by CADP, LLC, to evaluate the Project's potential effects on the Project site and in the Project vicinity.[139] The section also uses information on existing conditions and uses in the potentially affected public open space.

III.F.2 Setting

Figure III.F-1 (Existing and Proposed Parks and Open Space) illustrates existing public parks and open space on the Project site and in the Project vicinity.[140] Parks and open space owned by or under the jurisdiction of the Recreation and Park Department include:

- **Candlestick Park**, bounded by Jamestown, Ignacio, and Gilman Avenues on the southwest, northwest, and northeast, respectively; Giants Drive on the northwest; and Hunters Point Expressway to the east. The 83-acre Candlestick Park is the site of Candlestick Park stadium, which is owned by the SFRPD and leased by the San Francisco 49ers National Football League team. The existing stadium, built in 1960, occupies 14.5 acres, seats 70,000, and is used for football games and other non-football entertainment events. The rest of the site is devoted to ancillary uses such as parking, driveways, and service areas.
- **Gilman Park** is a 4.6-acre playground owned by SFRPD immediately northwest of Candlestick Park. It includes plastic and metal play equipment with restrooms, picnic tables, a dog area, and a baseball diamond.

[139] The CADP analysis prepared the graphic shadow output presented in DEIR Figure III.F2 thru Figure III.F27 herein.
[140] The Project vicinity is defined by the Bay and US-101 and includes the nearby surrounding areas of the Bayview Hunters Point neighborhood, CPSRA, Candlestick Point, Hunters Point, and India Basin.

SOURCE: Lennar Urban, RHAA, CADP, 2009.

Clement Designs 11-2-09

Candlestick Point — Hunters Point Shipyard Phase II EIR

EXISTING AND PROPOSED PARKS AND OPEN SPACE

FIGURE III.F-1

- **Bayview Park** is a 44-acre park off Third Street and Key Avenue immediately west of the Project site. It is primarily open space on Bayview Hill, rising to about 420 feet. It includes picnic areas, natural habitat areas, and recreational trails. There are no active or developed uses such as playgrounds or recreation facilities.
- **India Basin Shoreline Park**, which is 11.8 acres, is on the India Basin Shoreline north of HPS Phase II and Innes Avenue and includes two children's playgrounds, picnic areas, shoreline access to the Bay for water-dependent recreation, and recreational trails.
- **India Basin Open Space** (about 4.5 acres) is unimproved SFRPD property located along the shoreline of the India Basin Flats, northwest of the Project site, off of Innes Avenue.

Other SFRPD open space within a quarter-mile of the Project site includes:

- **Le Conte Avenue Mini Park** (0.5 acre) is adjacent to Bayview Park.
- **Little Hollywood Park** (0.3 acre) is west of the Project site across US-101.
- **Bayview Playground** is a children's playground on Third Street between Armstrong and Carroll Streets.
- **Milton Myer Recreation Center** at Kiska Road is a multipurpose facility with meeting spaces, an indoor gymnasium, outdoor game courts, and a children's playground.
- The **Bayview Hunters Point Multipurpose Senior Center**, at Yosemite Avenue and Third Street, offers a range of services and activities for seniors.

Heron's Head Park (24 acres), formerly known as Pier 98, is a restored wetland owned by the Port of San Francisco and used for research, education, after school activities, and natural habitat.

CPSRA, totaling 154 acres, is generally bounded by the southeastern extent of the San Francisco shoreline, Harney Way, Jamestown Avenue, Hunters Point Expressway, Donahue Street, Egbert Avenue, and Arelious Walker Drive. Approximately 120.2 acres of the CPSRA is located within the Project site, and an additional approximately 34 acres are located off site, adjacent to the Yosemite Slough. CPSRA is a former landfill on the shoreline of Candlestick Point that was purchased by the State in 1977 for development as a state recreation area. CPSRA includes picnic areas, a fitness course for seniors, a bike path, shoreline access to the Bay for water-dependent recreation, and recreational trails, but much of the land within the CPSRA is not improved enough to support intensive recreational use. For example, land to the north and east of the Candlestick Park stadium is currently used for stadium parking. Other portions of the CPSRA site contain construction rubble and debris, such as the Last Rubble disposal site. Until recently, the Last Rubble area was characterized by large piles of debris, remnants of the site's previous use as a dumping ground. The Integrated Waste Management Board completed a rubble and debris removal project in April 2009. As a result of this, the majority of the rubble and debris was either removed or crushed on site.

III.F.3 Regulatory Framework

Federal

There are no applicable federal regulations relating to solar access or shading effects.

State

There are no applicable state regulations relating to solar access or shading effects.

Local

San Francisco General Plan

The Recreation and Open Space Element of the *City of San Francisco General Plan* (1996) includes the following policy applicable to potential solar access or shading impacts of the Project:

Policy 2.3 Solar access to public open space should be protected.

The policy promotes solar access and avoiding shade to maintain the usability of public open space, and states that the requirements of *Planning Code* Section 295 apply to the review of projects that could shade SFRPD property. (*Planning Code* Section 295 is discussed further below). Policy 2.3 further states that:

> A number of other open spaces designated in this Element or elsewhere in the General Plan are under the jurisdiction of other public agencies, or are privately owned and therefore not protected by the Planning Code amendments. These spaces should be given other forms of protection to assure they are not shaded during the hours of their most intensive use. Any new shading should be remedied to the extent feasible by expanding opportunities for public assembly and recreation in indoor and outdoor settings.

San Francisco Planning Code

Planning Code Section 295, adopted in 1984 pursuant to voter approval of Proposition K, "The Sunlight Ordinance," prohibits the issuance of building permits for structures over 40 feet in height that would cast shade or shadow on property under the jurisdiction of, or designated to be acquired by, the Recreation and Park Commission between one hour after sunrise to one hour before sunset at any time of year, unless the Planning Commission determines that the shade or shadow would have an insignificant adverse impact on the use of such property. *Planning Code* Section 295 provides that:

> The City Planning Commission shall conduct a hearing and shall disapprove the issuance of any building permit governed by the provisions of this Section if it finds that the proposed project will have any adverse impact on the use of the property under the jurisdiction of, or designated for acquisition by, the Recreation and Park Commission because of the shading or shadowing that it will cause, unless it is determined that the impact would be insignificant. The City Planning Commission shall not make the determination required by the provisions of this Subsection until the general manager of the Recreation and Park Department in consultation with the Recreation and Park Commission has had an opportunity to review and comment to the City Planning Commission upon the proposed project.

As required by *Planning Code* Section 295, the Recreation and Park Commission and the Planning Commission adopted criteria in 1987 and 1989 for the review of shade, solar access, and shadow effects.[141] According those adopted criteria, shadow is measured by multiplying the area of the shadow by the amount of time the shadow is present on the park, in units called "square foot-hours." Determining the shadow impact caused by a project begins with a calculation of the number of square foot-hours the project casts on a protected property over the course of a year during the each day an hour after sunrise to an hour

[141] San Francisco Planning Department. *Planning Code Section 295, Presentation for Planning Commission Hearing on October 23, 2003*. This report is an overview of current procedures for Planning Department review of applications that are subject to Section 295, and includes a review of the *Planning Code* requirements and of the implementation document adopted jointly by the Recreation and Park and the Planning Commissions, and a description of the technical methodology for analysis of shadow impacts on protected properties.

before sunset summed over the course of a year, ignoring shadow from any surrounding structures, and from clouds, fog, and solar eclipses. This is called the "Annual Available Sunlight" (AAS) for that park. The shadow impact of the project is defined as the shadow in square foot-hours cast by the project divided by the AAS, expressed as a percentage. Further, in addition to quantitative criteria, the adopted criteria set forth qualitative criteria for evaluation of shadow. Those criteria for assessing new shadow would be based on existing shadow profiles, important times of day, important seasons in the year, location of the new shadow, size, and duration of new shadows and the public good served by buildings casting new shadow.

Also, the adopted criteria state that small parks, less than two acres in area, with existing shadow loads of 20 percent or larger should not be subjected to additional shadow by new development. Larger parks (two acres or more), with shadow loads between 20 percent and 40 percent would have an additional new shadow budget of 0.1 percent. Larger parks with existing shadow loads of less than 20 percent would have an additional new shadow budget of 1.0 percent. (The adopted criteria also include absolute cumulative limits for increase in percent shading for 14 parks in the downtown. However, none of those parks are in the Project vicinity; therefore, the limits for smaller and larger parks noted above would apply to SFRPD property.)

As noted above, parks and open space within the Project site or in the Project vicinity that are under the jurisdiction of the SFRPD include Candlestick Park, Bayview Park, Gilman Park, India Basin Shoreline Park, and India Basin Open Space. Development near these parks is subject to shadow review under *Planning Code* Section 295, except for Candlestick Park, which would be removed from the jurisdiction of the Recreation and Park Department as a result of the Project.

III.F.4 Impacts

Significance Criteria

The CCSF and Agency have not formally adopted significance standards for impacts related to shadows, but generally consider that implementation of the Project would have significant impacts if it were to:

F.a Create new shadow in a manner that substantially affects outdoor recreation facilities or other public areas

In addition, shadow effects would be significant if they would affect, in an adverse manner, the use of any park or open space under the jurisdiction of the SFRPD, or significantly detract from the usability of other existing publicly accessible open space.

Analytic Method

For purposes of this analysis, "outdoor recreation areas or other public areas," as described in the above significance criteria, refers to parks, outdoor recreational facilities (i.e., sports fields), or other public open space. The term "open space" is used herein generally to refer to such public areas that may be affected by shadows. The analysis considers the Project's potential effects on SFRPD property subject to *Planning Code* Section 295, including Bayview Park, Gilman Park, India Basin Shoreline Park, and India Basin Open Space. In addition, the analysis considers the Project's potential effects on other existing publicly accessible open space (CSPRA) and the new parks and open space that would be provided by the Project.

As noted above, a shadow modeling study was completed by CADP, which depicts the shadows that would be cast by buildings that would result from the Project. This analysis accounts the effects of existing topography, but does not include shadows caused by existing buildings on the site, as they would either be demolished (e.g., Candlestick Park stadium and Alice Griffith Housing) or if retained (e.g., Building 101 and certain historic buildings as described in Section III.J, Cultural and Paleontological Resources) are generally all less than 40 feet and would only cast limited shadows. In addition, in order to identify Project impacts, the analysis does not include shadows cast by any existing or proposed development in the project vicinity.

The results of the shadow modeling analysis are depicted in two types of illustrations: (1) "shadow fans" or "shadow traces" that identify the maximum extent of all project-related shadows from one hour after sunrise to one hour before sunset over an entire year (per the review requirements of *Planning Code* Section 295); and (2) time-specific shadow patterns for 10:00 A.M., noon, and 3:00 P.M. Pacific Standard Time (PST) in December (the winter solstice) and March (the vernal equinox), and at 10:00 A.M., noon, and 3:00 P.M. Pacific Daylight Time (PDT) in June (the summer solstice) and September (the autumnal equinox), which depict shadow impacts at specific times of the day for the minimum, midpoint, and maximum elevations of the sun.

Figure III.F-2 (Candlestick Point Proposed Project Year-Round Shadow Trace) and Figure III.F-15 (Hunters Point Shipyard Phase II Proposed Project Year-Round Shadow Trace) identify the maximum extent of all Project-generated shadows from one hour after sunrise to one hour before sunset over an entire year. The year-round shadow trace provides a conservative assessment in that it includes shadow from all buildings within the Project site, including buildings that would not exceed 40 feet in height and therefore would not require review under the requirements of Section 295. While the shadow trace provides information on parks and open space that could be affected by new shading from Project structures over an entire year, it does not provide information on the specific shadow effects experienced by a park or open space at any particular time of the day or year.

Figure III.F-3 through Figure III.F-14 (Candlestick Point Shadow Patterns) and Figure III.F-16 through Figure III.F-27 (Hunters Point Shipyard Phase II Shadow Patterns) depict Project-generated shadow patterns for particular times of the day during the four seasons: at the winter and summer solstices, when the elevation of sun is at its lowest and highest point, and at the spring and fall equinoxes, when the elevation of the sun is at its midpoint.

Planning Code Section 295 identifies both a quantitative methodology for assessment of shadow impacts (for land under the jurisdiction of the SFRPD, as discussed above in Regulatory Framework) and provides qualitative criteria for determining whether impacts would be adverse. If the quantitative assessment determines that the standards established in *Planning Code* Section 295 would be exceeded, this EIR provides additional analysis of the shadow effects for a variety of qualitative factors, which may include: open space usage; time of day and/or time of year during which the shadow occurs; physical layout and facilities affected by the shadow; intensity, size, shape, and location of shadow; and proportion of open space affected by shadow. If, upon balancing the above factors, the qualitative analysis determines that the enjoyment of the park or public space by users would be substantially and adversely affected, then the Project would be determined to have a significant shadow impact under CEQA.

Candlestick Point — Hunters Point Shipyard Phase II EIR

CANDLESTICK POINT: PROPOSED PROJECT YEAR-ROUND SHADOW TRACE

FIGURE III.F-2

- For parks and open space that are not subject to the review requirements of *Planning Code* Section 295, only a qualitative assessment of shadow effects is provided, to determine whether enjoyment of the park or public space by users would be substantially and adversely affected by shadow effects. The specific times selected for analysis and depiction on the shadow pattern figures (10:00 A.M., noon, and 3:00 P.M.) are customarily evaluated to identify effects on use of open space as they represent the midday periods of the most intensive use of parks and open space areas. It is acknowledged that park users could be present before 10:00 A.M. or after 3:00 P.M. when additional Project shadows may occur, but levels of use at those times would be lower than the midday periods. Therefore, shadow effects before 10:00 A.M. or after 3:00 P.M. would affect fewer uses and open space and would not be considered to be significant adverse impacts for this analysis.

Figure III.F-2 indicates that the Project would add shade to two SFRPD parks, Gilman Park and Bayview Park. However, as discussed herein, the effects on Gilman Park would result from Project buildings up to 40 feet in height. Those effects would not be subject to review under Section 295. The Project would not include other structures over 40 feet in height close enough to Gilman Park to cause such effects. As noted above, Bayview Park consists of open space, including steep topography and informal trails. There are no active uses (such as playgrounds and recreational fields) and access is only provided via a gated road off of Key Avenue, north of Bayview Hill. The Project would shade an area of Bayview Park that does not provide any active uses, and is relatively steep. Based on the shadow trace, the Project would only shade Bayview Park during the first hour after sunrise in spring, summer, and fall months, and would not create any new shadow by 10:00 A.M. at any time of year.

The analysis of Project effects presented below discusses shadow effects on Gilman Park and Bayview Park, when they would occur, and whether those effects would be adverse impacts on the open space.

The other public parks and open space in the Project vicinity that would continue to be subject to *Planning Code* Section 295 include India Basin Shoreline Park and India Basin Flats; however, no Project structures in excess of 40 feet in height are planned sufficiently close to these parks to create shadow effects. Refer to Figure III.F-1.

Parks and Open Space not Subject to Section 295 of the Planning Code

The CPSRA is not owned by or under the jurisdiction of SFRPD and is, therefore, not subject to *Planning Code* Section 295. The other public parks and open space included as part of the Project would not be owned by or under the jurisdiction of the SFRPD and, therefore, would also not be subject to *Planning Code* Section 295.

The ownership of the existing Candlestick Park would be transferred as part of the Project and the existing stadium, ancillary structures, and parking areas would be removed. As such, the area of the former stadium and associated parking lots, which are not typical parks or open space, would no longer be under the jurisdiction of SFRPD and would not be subject to *Planning Code* Section 295.

As shown in Figure III.F-1, the Project would develop new parks and open space, including neighborhood parks, destination parks, boulevard barks, and waterfront trails. The parks would include a range of passive and active recreation facilities, playgrounds, walks, and other features. While new Project buildings would add shade new Project open space, the Project would increase public open space that would serve Project residents visitors, and employees, compared to existing conditions. Therefore, the impact analysis herein discusses those shadow effects, but does not consider those to be adverse impacts.

Construction Impacts

Construction of the Project features would not create adverse shadow effects on open space, because construction activities and equipment, would not cast substantive shadows on existing open spaces such as the CPSRA. Although some construction equipment, such as cranes, would exceed 40 feet in height, the shadows cast by this equipment would not be substantial in size (due to the crane's lack of bulk) and would be temporary and limited to the period of construction.

Operational Impacts

Impact SH-1: Shadow Effects on Public Open Space

Impact of Candlestick Point

Impact SH-1a **Implementation of the Project at Candlestick Point would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space. (Less than Significant) *[Criterion F.a]***

Project structures would range from 40 feet up to 420 feet in height would extend above surrounding buildings and would cast shadows on nearby public open space. The proposed building heights would be 40 feet near the shoreline of Candlestick Point, with buildings exceeding 40 feet and extending to 85 feet throughout the majority of the rest of the Candlestick Point site. Buildings between 85 feet and 140 feet in height would be located in the central part of the site. The Project would also include up to ten residential towers ranging from 220 feet to 420 feet in height as shown on Figure II-5 (Proposed Maximum Building Heights). Project plans have identified the locations of towers, but tower designs are preliminary. The length and duration of shadows cast would be influenced by elements of building design, such as building height, shape, massing, and setbacks.

Figure III.F-3 through Figure III.F-14 show shadow conditions at Candlestick Point with the Project at 10:00 A.M., noon, and 3:00 P.M. Pacific Standard Time (PST) on December 21 and March 21, and Pacific Daylight Time (PDT) on June 21 and September 21. December 21(Winter Solstice), 10:00 A.M.

December 21 (Winter Solstice), 10:00 A.M.

As shown in Figure III.F-3 (Candlestick Point: Shadow Patterns—December 21 [10 AM PST]), on December 21, the Project would cast new shadow on approximately 5 percent of Gilman Park along the southeastern border. As noted above, new shadows cast on Gilman Park would be from Project buildings that would not exceed 40 feet in height and are, therefore, not subject to Section 295 of the *Planning Code*. Gilman Park includes a playground, a softball diamond, and a dog run area. The park has mature trees along its perimeter. On the basis of available observations of Gilman Park, the park is primarily used during midday and afternoon periods, by neighborhood residents and students at adjacent Bret Hart Harte Elementary School. The park is relatively less patronized in morning hours. Therefore, Project shadows on limited areas of the park in morning hours would not adversely affect the use of the park, and would not be considered significant adverse shadow impacts.

Candlestick Point — Hunters Point Shipyard Phase II EIR

CANDLESTICK POINT: SHADOW PATTERNS — DECEMBER 21 (10 AM PST)

FIGURE III.F-3

The Project would not shade Bayview Park at this time.

The Project would shade less than 1 percent of the CPSRA at this time.

The Project parks and open space would receive shadow on the winter solstice. The Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park, and Mini-Wedge Park would have shadow on approximately 15 percent, 51 percent, 79 percent, and 17 percent of their areas, respectively. The relatively narrow Alice Griffith Neighborhood Park would be shaded by buildings on the southwestern boundary of the park. The 22-story tower southeast of Candlestick Point Neighborhood Park would cast shade on the northeast portion of that park.

December 21 (Winter Solstice), Noon

As shown in Figure III.F-4 (Candlestick Point: Shadow Patterns—December 21 [Noon PST]), the Project would not shade Gilman Park or Bayview Park at this time.

New shadow on the CPSRA would be approximately 2 percent with new shadow being cast by a 27-story residential tower.

The relatively low angle of the winter sun would cast shadow on Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park and Mini-Wedge Park, approximately 37 percent, 12 percent, 37 percent, and 46 percent of their area, respectively.

December 21 (Winter Solstice), 3:00 P.M.

As shown in Figure III.F-5 (Candlestick Point: Shadow Patterns—December 21 [3 PM PST]), as the afternoon progresses, the Project would not shade Gilman Park or Bayview Park at this time.

New shadow would cover approximately 12 percent of the CPSRA, primarily in the northerly area. The Project would shade about 4 percent of Yosemite Slough lands outside the Project site.

Approximately 85 percent, 24 percent, 1 percent, and 86 percent respectively of Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park, and Mini-Wedge Park would be affected by Project shadow.

The Hillside Open Space along Jamestown Avenue would have approximately 15 percent of shade in the northernmost area.

March 21 (Vernal Equinox), 10:00 A.M.

As shown in Figure III.F-6 (Candlestick Point: Shadow Patterns—March 21 [10 AM PST]), new shadow would be cast on less than 1 percent of Gilman Park along the southeastern fringe. As noted above, new shadows cast on Gilman Park would be from Project buildings that would not exceed 40 feet in height and are, therefore, not subject to *Planning Code* Section 295. As noted above, Gilman Park is primarily used during midday and afternoon periods, by neighborhood residents, and students at adjacent Bret Hart Harte Elementary School. The park is relatively less patronized in morning hours. Therefore, Project shadows on limited areas of the park in morning hours would not adversely affect the use of the park, and would not be considered significant adverse shadow impacts.

FIGURE III.F-6

The Project would not shade Bayview Park at this time.

Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, and Bayview Gardens/Wedge Park would have shadow cast on approximately 10 percent, 21 percent, and 51 percent, respectively. This would affect the southern section of Alice Griffith Neighborhood Park, a central portion of Candlestick Point Neighborhood Park, and Bayview Gardens/Wedge Park along its length.

March 21 (Vernal Equinox), Noon

As shown in Figure III.F-7 (Candlestick Point: Shadow Patterns—March 21 [Noon PST]), the Project would not shade Gilman Park or Bayview Park at this time.

The Project would shade less than 1 percent of the CPSRA at this time.

Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park, and Mini-Wedge Park would have shadow on approximately 12 percent, 4 percent, 26 percent, and 7 percent, respectively.

March 21 (Vernal Equinox), 3:00 P.M.

Refer to Figure III.F-8 (Candlestick Point: Shadow Patterns—March 21 [3 PM PST]). The Project would not shade Gilman Park or Bayview Park at this time.

At CPSRA, approximately 1 percent would be affected by new shadow cast by a 27-story residential tower.

The low angle of the spring sun in the afternoon sky would cast shadow on Alice Griffith Neighborhood Park and Mini-Wedge Park, 17 percent, and 42 percent, respectively.

The Hillside Open Space would be approximately 6 percent shaded, primarily in the northernmost section.

June 21 (Summer Solstice), 10:00 A.M.

As shown in Figure III.F-9 (Candlestick Point: Shadow Patterns—June 21 [10 AM PDT]), the Project would not shade Gilman Park or Bayview Park at this time.

Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park, and Mini-Wedge Park would have shade on approximately 9 percent, 5 percent, 14 percent, and 15 percent of their area, respectively.

June 21 (Summer Solstice), Noon

By midday, the sun would be at its highest points and cause limited shadows. As shown in Figure III.F-10 (Candlestick Point: Shadow Patterns—June 21 [Noon PDT]), the Project would not shade Gilman Park or Bayview Park at this time.

The Project would not shade the CPSRA at this time.

Alice Griffith Neighborhood Park and Bayview Gardens/Wedge Park would have shadow on approximately 7 percent and 5 percent of their area, respectively.

FIGURE III.F-10

June 21 (Summer Solstice), 3:00 P.M.

As shown in Figure III.F-11 (Candlestick Point: Shadow Patterns—June 21 [3 PM PDT]), the Project would not shade Gilman Park or Bayview Park at this time.

The Project would shade less than 1 percent of the CPSRA at this time.

There would be shadow on approximately 9 percent of Alice Griffith Neighborhood Park and about 8 percent of Mini-Wedge Park.

September 21 (Autumnal Equinox), 10:00 A.M.

New shadow would be cast on less than 1 percent of Gilman Park along the southeastern fringe. As noted above, new shadows cast on Gilman Park would be from Project buildings that would not exceed 40 feet in height and are, therefore, not subject to *Planning Code* Section 295. As noted above, Gilman Park is primarily used during midday and afternoon periods, by neighborhood residents, and students at adjacent Bret Hart Harte Elementary School. The park is relatively less patronized in morning hours. Therefore, Project shadows on limited areas of the park in morning hours would not adversely affect the use of the park, and would not be considered significant adverse shadow impacts. Refer to Figure III.F-12 (Candlestick Point: Shadow Patterns—September 21 [10 AM PDT]).

Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, and Bayview Gardens/Wedge Park would have shadow on approximately 10 percent, 21 percent, and 51 percent of their area, respectively. Shadow would fall on the southern portion of Alice Griffith Neighborhood Park and on the central area of Candlestick Point Neighborhood Park while the residential towers east of Bayview Gardens/Wedge Park would cast shade along its length.

September 21 (Autumnal Equinox), Noon

As shown in Figure III.F-13 (Candlestick Point: Shadow Patterns—September 21 [Noon PST]), the Project would not shade Gilman Park or Bayview Park at this time.

The Project would shade less than 1 percent of the CPSRA at this time.

Alice Griffith Neighborhood Park, Candlestick Point Neighborhood Park, Bayview Gardens/Wedge Park, and Mini-Wedge Park would have shadow on approximately 12 percent, 4 percent, 26 percent, and 7 percent, respectively. Shadow would be cast on sections of Bayview Gardens/Wedge Park by the 32-story residential tower to its south and the twenty-one-story residential tower on its northern. Mini-Wedge Park would be similarly affected by shade due to the 30-story residential tower to its west.

September 21 (Autumnal Equinox), 3:00 P.M.

As shown in Figure III.F-14 (Candlestick Point: Shadow Patterns—September 21 [3 PM PDT]), the Project would not shade Gilman Park or Bayview Park at this time.

At CPSRA, approximately 1 percent would be affected by new shadow cast by a 27-story residential tower.

The low angle of the spring sun in the afternoon sky would cast shadow on Alice Griffith Neighborhood Park and Mini-Wedge Park, 17 percent, and 42 percent, respectively.

The Hillside Open Space would be approximately 6 percent shaded, primarily in the northernmost section.

Conclusions

Effects on SFRPD Open Space

The existing SFRPD open space in the Project vicinity, including Gilman Park and Bayview Park would have limited shadow effects from the Project. Gilman Park would not experience shading from Project structures exceeding 40 feet in height; consequently, any shadows cast by Project buildings would not be subject to *Planning Code* Section 295. On the basis of available observations of Gilman Park, the park is primarily used during midday and afternoon periods, by neighborhood residents, and students from adjacent Bret Hart Harte Elementary School. The park is relatively less patronized in morning hours. Therefore, Project shadows on limited areas of the park in morning hours would not adversely affect the use of the park, and would not be considered significant adverse shadow impacts.

The Project would shade an area of Bayview Park that does not provide any active uses, and is relatively steep. Based on Figure III.F-2, the Project would only shade Bayview Park during the first hour after sunrise in spring, summer, and fall months, and would not create any new shadow by 10:00 A.M. at any time of year. This would not be considered a significant adverse shadow impact.

Effects on CPSRA Open Space

The CPSRA would be affected by new shade in the afternoons, but most areas would experience limited to no new shadow from the Project. Other areas of the CPSRA would largely continue to remain in sun throughout the year. Project shadow would not interfere with the public's use or enjoyment of the CPSRA. Activities in these areas, such as windsurfing launching, walking, jogging, and fishing, would not be affected by the new shade.

Effects on New Project Open Space

Shadows cast by the Project on proposed new parks throughout the year would range from little or no shading to large areas of certain parks receiving new shade, particularly in the late afternoon during the vernal and autumnal equinoxes. The orientation of the relatively narrow Alice Griffith Neighborhood and Mini-Wedge Parks with respect to the path of the sun and the close proximity of Project buildings along the parks' southwestern boundaries combine to make them most susceptible to new shade.

Overall, given the heights, layouts, and orientations of the Project buildings, the neighborhood parks would experience variable levels of shading throughout the day, generally receiving some new shade from morning until noon in spring, summer, and fall with a less increase in the afternoons in winter, spring, and fall. Public use of these proposed new parks would not be expected to be adversely affected by the shade conditions.

The extent and duration of shadow on new public sidewalks would increase along street corridors in the Project. However, this new shadow would not be in excess of that which would be expected in a highly urban area.

Development at Candlestick Point would have less-than-significant shadow effects on use of existing and proposed open space. No mitigation is required.

Impact of Hunters Point Shipyard Phase II

Impact SH-1b **Implementation of the Project at HPS Phase II would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space. (Less than Significant) *[Criterion F.a]***

The proposed building heights would be 65 feet in most portions of HPS Phase II, with 85 to 105 foot limits farther east. The Project would include up to two residential towers ranging from 270 to 370 feet. The new 49ers Stadium would be approximately 156 feet to the top row of seating. HPS Phase II would include new open space at Grasslands Ecology Park, Dual-Use Sports Fields and Multi-Use Lawn near the proposed 49ers stadium, the Waterfront Recreation Pier, the Waterfront Promenade, Heritage Park, and Northside Park.

The HPS Phase II buildings would not add shade to existing SFRPD public open space in the Project vicinity throughout the year (Figure III.F 15 [Hunters Point Shipyard Phase II: Proposed Project Year-Round Shadow Trace]). These include India Basin Shoreline Park and India Basin Open Space. No Project structure in excess of 40 feet in height would be sufficiently close to these parks to create shadow effects on them (refer to Figure II-5 [Proposed Maximum Building Heights]). The HPS Phase II buildings would also not shade to existing CPSRA lands. Thus, the discussion of HPS Phase II shadow effects below presents information on Project effects on open space proposed in the Project itself.

December 21 (Winter Solstice), 10.00 A.M.

The Project would cast new shadow on Grasslands Ecology Park at Hunters Point Parcel E-2, on approximately 1.7 percent of its area in the northeast part of the park along Crisp Road. Refer to Figure III.F-16 (Hunters Point Shipyard Phase II: Shadow Patterns—December 21 [10 AM PST]).

Heritage Park and the Waterfront Promenade would be shaded on approximately 17 percent and 3.3 percent of their areas, respectively. The new shade in Heritage Park would occur primarily on the northern side. New shadow on Waterfront Promenade would occur along the southern flank toward the middle of the park.

The Hillside Parks and Open Space at HPS Phase II would be affected by new shadow on approximately 7 percent of its eastern boundary

December 21 (Winter Solstice), Noon

As shown in Figure III.F-17 (Hunters Point Shipyard Phase II: Shadow Patterns—December 21 [Noon PST]), the Project would add shadow to approximately 2 percent of Grasslands Ecology Park in the area of the park along Crisp Road.

The Project would add shadow to approximately 14 percent of Heritage Park.

December 21 (Winter Solstice), 3:00 P.M.

As shown in Figure III.F-18 (Hunters Point Shipyard Phase II: Shadow Patterns—December 21 [3 PM PST]), The Project would cast shadows on about 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 near Crisp Road. The Project would cast shadows across Heritage Park and Waterfront Promenade, on approximately 28 percent and 3 percent, respectively.

FIGURE III.F-18

HUNTERS POINT SHIPYARD PHASE II:
SHADOW PATTERNS — DECEMBER 21 (3 PM PST)

The 49ers stadium would shade a small portion of the Sports and Recreation Fields northeast of the stadium. The Project would cast shadows on approximately 6 percent of the Hillside Open Space at HPS Phase II.

March 21 (Vernal Equinox), 10:00 A.M.

As shown in Figure III.F-19 (Hunters Point Shipyard Phase II: Shadow Patterns—March 21 [10 AM PST]), the Project would cast shadow on Grasslands Ecology Park at Hunters Point Parcel E-2, on approximately 2 percent of its area along Crisp Road. The Project would cast new shadows on approximately 2 percent of Heritage Park. The Project would cast shadows on approximately 7 percent on of the Hillside Parks and Open Space in HPS Phase II along its eastern boundary.

March 21 (Vernal Equinox), Noon

As shown in Figure III.F-20 (Hunters Point Shipyard Phase II: Shadow Patterns—March 21 [Noon PST]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road. The Project would cast new shadows on approximately 4 percent of Heritage Park.

March 21 (Vernal Equinox), 3:00 P.M.

As shown in Figure III.F-21 (Hunters Point Shipyard Phase II: Shadow Patterns—March 21 [3 PM PST]), the Project would cast shadows on about 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 near Crisp Road. The Project would cast shadows across Heritage Park and Waterfront Promenade, on approximately 26 percent and 3 percent, respectively. The Project would cast shadows on approximately 6 percent of the Hillside Parks and Open Space in HPS Phase II along its eastern boundary.

June 21 (Summer Solstice), 10:00 A.M.

As shown in Figure III.F-22 (Hunters Point Shipyard Phase II: Shadow Patterns—June 21 [10 AM PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road. The Project would cast new shadows on approximately 4 percent of Heritage Park. The Project would cast shadows on approximately 4 percent of the Hillside Parks and Open Space in HPS Phase II along its eastern boundary.

June 21 (Summer Solstice), Noon

As shown in Figure III.F-23 (Hunters Point Shipyard Phase II: Shadow Patterns—June 21 [Noon PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road. The Project would cast shadows on approximately 2 percent of Heritage Park.

June 21 (Summer Solstice), 3:00 P.M.

As shown in Figure III.F-24 (Hunters Point Shipyard Phase II: Shadow Patterns—June 21 [3 PM PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road, and on approximately 2 percent of Heritage Park.

September 21 (Autumnal Equinox), 10:00 A.M.

As shown in Figure III.F-25 (Hunters Point Shipyard Phase II: Shadow Patterns—September 21 [10 AM PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road, and on approximately 6 percent of Heritage Park. The Project would cast shadows on approximately 6 percent of the Hillside Parks and Open Space in HPS Phase II along its eastern boundary.

September 21 (Autumnal Equinox), Noon

As shown in Figure III.F-26 (Hunters Point Shipyard Phase II: Shadow Patterns—September 21 [Noon PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road. The Project would cast shadows on approximately 3 percent of Heritage Park.

September 21 (Autumnal Equinox), 3:00 P.M.

As shown in Figure III.F-27 (Hunters Point Shipyard Phase II: Shadow Patterns—September 21 [3 PM PDT]), the Project would cast shadows on approximately 2 percent of Grasslands Ecology Park at Hunters Point Parcel E-2 along Crisp Road. The Project would cast new shadows on approximately 20 percent of Heritage Park. The Project would cast shadows on approximately 5 percent of the Hillside Parks and Open Space in HPS Phase II along its eastern boundary.

Conclusions

SFRPD open space in the vicinity of HPS Phase II includes India Basin Shoreline Park and India Basin Open Space. HPS Phase II would not add shade to existing SFRPD open space in the Project vicinity throughout the year.

The majority of proposed public open space at HPS Phase II would experience little to no new shade throughout the year. Heritage Park, due to its waterfront location to the east of the Project, would experience up to 27 percent new shade from the afternoon sun throughout the year however use of this resource is not expected to be adversely affected.

The extent and duration of shadow on new public sidewalks could increase along new street corridors in the Project. However, this shadow would not be in excess of that which would be expected in a highly urban area.

Development of HPS Phase II would have less-than-significant shadow effects on use of existing and proposed open space. No mitigation is required.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact SH-1 **Implementation of the Project would not result in new structures with the potential to cast shadows on existing or proposed parks and open space in a manner that would have an adverse effect on the use of the open space. (Less than Significant) *[Criterion F.a]***

As shown by Figure III.F-3 through Figure III.E-27 and the accompanying discussions, above, the Project would add shade to existing and proposed open space. The new shade would occur at limited times of day and year, and would not substantially affect the use of outdoor recreational facilities or open space. The impact would be less than significant. No mitigation is required. Refer to the discussions of Impact SH-1a and Impact SH-1b, above.

Cumulative Impacts

The geographic context for an analysis of cumulative new shadow impacts on outdoor recreation facilities or other public space is limited to the immediate Project site and vicinity. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. Reasonably foreseeable future development in this geographic area includes approved or under construction development as part of the Yosemite Slough Restoration Project, at Hunters Point Phase I, proposed development at Executive Park, and future development at India Basin Shoreline Area C. Such development could include structures that would add shade to existing public open space, or to Project open space. A significant impact would result if cumulative development combined to create new shade on open space that would have a substantial adverse effect on the use of the open space.

Because of the extent of the Project site encompassing the Candlestick Point and HPS Phase II site, cumulative development outside the Project site would be relatively distant from the Project open space or CPSRA and would not have the potential to combine with the Project to create new shadows on open spaces within the Project site.

Reasonably foreseeable development would include future projects in this geographic area. Structures over 40 feet in height could have shadow effects on open space under the jurisdiction of SFRPD. Such projects could affect shading of Bayview Park or Gilman Park. However, *Planning Code* Section 295 would require that such proposed development could not be approved unless the Planning Commission found that the project would have an insignificant effect on the use of the park. This would avoid significant cumulative shadow effects on SFRPD open space. In addition, the analysis found that the Project would not have significant adverse shadow effects on SFRPD open space at Gilman Park or Bayview Park, and would have no effect on shadow conditions at SFRPD sites at India Basin Shoreline Park or India Basin Flats; therefore, the Project would not contribute to any cumulative effects on SFRPD open space.

The shadow analysis has determined that the extent and duration of new shadow cast by the Project on public open space would not substantially affect outdoor recreation facilities or other public facilities, including the newly restored Yosemite Slough when that project is completed. The analysis did not identify potential cumulative shadow effects from other potential development. Therefore, the Project would not result in considerable contribution to cumulative impacts with respect to shadows on open space.

SECTION III.G WIND

III.G.1 Introduction

This section of the EIR discusses the existing wind conditions on and around the Project site and identifies factors that determine wind exposure and changes that would result in adverse effects on pedestrian-level wind. Wind conditions can affect pedestrian safety. The analysis in this section uses wind data from studies in the Project vicinity, historic climate data, and the Final Preliminary Pedestrian Wind Assessment prepared for the Project (CPP, Inc. 2007, 2008 Addendum; refer to Appendix G). This section identifies both Project-level and cumulative environmental impacts, as well as feasible mitigation measures that could reduce or avoid the identified impacts. Project and cumulative wind conditions that could affect offshore recreation activities, such as windsurfing in the Bay near the Project site, are discussed in Section III.P (Recreation).

III.G.2 Setting

Planetary wind systems, normally called prevailing winds, are great moving air masses that dominate whole areas and show constant directional characteristics, varying only with the movement of high or low-pressure systems and with the seasons of the year. In many locations these are the dominant winds, particularly on exposed hilltops, shorelines facing the prevailing winds, an open plain, or plateau; the floor of an open valley running parallel to the prevailing winds, or the windward side of a gently sloping hill.[142] Local winds, by contrast, are caused by temperature differences created by local topographic conditions. Land-sea breezes, for example, will blow from the land towards the sea by night, simply because land temperatures are more subject to change than the great mass of the ocean. Mountain and valley breezes are caused by the same local effects. On a warm sunny day, winds may rise strongly off the floor of a valley and up the slopes of adjacent hills.[143]

Long-term wind data in San Francisco are available from historical wind gauge records from the US Weather Bureau weather station above the old Federal Building at 50 United Nations Plaza and San Francisco International Airport (SFO). Everyday wind climatology is defined using wind statistics of anemometers (that measure wind speed) in the northern portion of the San Francisco Bay. Limited wind data is also available from wind data recorded at HPS as part of *Comprehensive Environmental Response, Compensation, and Liability Act* (CERCLA) monitoring.[144] For wind analysis along the San Francisco Peninsula, it is customary to use data from SFO. HPS and downtown Civic Center data indicate a lesser influence of northwesterly winds than at SFO. The SFO data is affected by wind northwesterly through the San Bruno Gap in San Mateo County about four miles south of the Project site.

Existing development on the Candlestick Point site includes the Candlestick Park stadium and associated paved parking areas, the CPSRA, a recreational vehicle park on Gilman Avenue, and 256 housing units on the Alice Griffith public housing site. The HPS Phase II site includes many structures associated with ship repair, piers, dry-docks, ancillary storage, administrative, and other former Navy uses, largely from the

[143] Butz, Stephen D., 2007.
[144] Refer to Section III.K (Hazards and Hazardous Materials) for description of the CERCLA monitoring process required as part of the Navy Hunters Point Shipyard remediation effort.

World War II era. Most structures are vacant. The only structure on the Project site greater than 100 feet tall is Candlestick Park stadium, which is approximately 120 feet tall. The Alice Griffith housing consists of 33 two-story, rectangular apartment buildings sited on a small hill overlooking surrounding development. Bayview Hill rises immediately west of Jamestown Avenue, west of and uphill from the stadium. Existing development on the HPS Phase II site consists of shipyard structures ranging from one to nine stories in height. The topography of HPS is generally flat, except for the area around Building 101 at the lower slope of Hunters Point Hill (refer to Figure II-2 [Project Site and Context]).

Wind Patterns

Wind patterns at SFO indicate that the dominant wind direction is west-northwest, with winds coming out of this direction 23 percent of the time. Two-thirds of winds from this direction exceed 12 miles per hour (mph). Winds come from directly west and northwest 13 percent of the time each, so that these three wind directions (west, northwest, and west-northwest) account for roughly half of the wind patterns.[145] Although reliable wind data indicate that the dominant wind direction at SFO is west-northwest, it should be noted that the dominant wind direction is known to shift with locations around the Bay, including at the Project site.[146]

Winds can fluctuate greatly depending on the time of year and the time of day. During the winter months winds change markedly, becoming milder and less dominated by the west-northwesterly winds. Winds also change significantly during the day, typically intensifying from late morning until reaching an average peak of 20 knots (23 mph) in the late afternoon, diminishing in the evening. High winds in the San Francisco Bay are most common in the late afternoon between March and October.[147]

Wind data were recorded over a 16-month period from the anemometer at HPS. Those data indicate a dominance of westerly winds, a result of local topography. On the basis of available data from the sources noted above, the predominant wind directions affecting the Project site would be westerly and west-northwesterly. Given the sensitivity of street orientation to wind direction, additional data were obtained for a three-month period from downtown San Francisco wind monitoring, which data were overlain with the SFO data. These data indicate that winds from the northwest are of less concern than winds from directly west.[148]

Hunters Point and Candlestick Point are known to be windy locations. Wind conditions at Candlestick Point and Hunters Point are influenced by the presence of the Bayview Hill and Hunters Point Hill, both of which are directly upwind of the Project site for prevailing westerly winds. These hills tend to accelerate the wind and change its direction from west towards west-northwest, resulting in eddying (a circular motion of wind that interrupts the flow and causes turbulence), resulting in gustiness (wind speeds that momentarily increase in speed). Accelerated wind flows around these hills are most pronounced at the crests and near the slopes. For dominant west winds, the primary location of concern in the Project vicinity is at the south end of the hills. The average wind speed east of these hills would be expected to be somewhat reduced, with increased turbulence because of the variable wind speed.[149]

147 CPP, Inc., June 2007.
148 CPP, Inc., *June, 2007*.
149 CPP, Inc., *June, 2007*.

The full effects of the hills on local wind patterns are difficult to predict. However, one identifiable effect is that Candlestick Point is in the wake (a downwind area of weak wind caused by a "split" of wind around a substantial obstacle) of Bayview Hill. During most afternoons and evenings from spring to fall, wake areas tend to feature lower mean wind speeds but higher turbulence or gustiness. The wake effect typically diminishes with distance from the hill. The wake effect below Hunters Point Hill is less pronounced than the same effect below Bayview Hill because of its lower elevation.[150]

An example of the wind effects in the Project vicinity are the wind conditions at the existing Candlestick Park Stadium. A wind tunnel study of Candlestick Park performed shortly after the existing stadium was built revealed that the turbulence resulting from Bayview Hill causes wind gusting problems at Candlestick Park stadium. This study also noted that many of the wind problems experienced in the stadium could have been avoided if the stadium and the parking lot locations had been reversed, because that would have placed the stadium farther away from the wake area of Bayview Hill, where the effect would be diminished compared to its current location. This would have resulted in a decrease in gustiness at the stadium.[151]

Wind Effects

Winds vary at pedestrian levels within an urban area. In San Francisco, wind speeds are generally greater, on average, along streets that run east/west, as buildings are oriented with respect to the prevailing wind direction such that they tend to funnel winds along this street orientation. Wide streets bordered by tall buildings are especially vulnerable to wind funneling. The impact of wind funneling can often be reduced by the presence of tall, bushy trees along streets susceptible to wind to force the wind to stay above street level. Streets running north-south tend to have lighter winds, on average, due to the shelter from prevailing winds offered by buildings on the west side of the street. Winding streets that do not follow a grid pattern also tend to have lighter winds at pedestrian level, as the building orientations generally keep high winds above the buildings.[152]

Wind conditions can affect pedestrian safety on sidewalks and in other public areas. Winds up to 4 mph have no noticeable effect on pedestrians. Winds from 4 to 8 mph are felt on the face. Winds from 8 to 13 mph disturb hair, cause clothing to flap, and extend a light flag mounted on a pole. Winds from 13 to 19 mph raise loose paper, dust and dry soil, and disarrange hair. The force of winds from 19 to 26 mph is felt on the body. With winds of 26 to 34 mph, umbrellas are used with difficulty, hair is blown straight, walking steadily is difficult, and wind noise is unpleasant. Winds over 34 mph make it difficult for a person to maintain balance, and gusts can blow a person over.[153]

III.G.3 Regulatory Framework

Federal

There are no applicable federal regulations relating to wind.

State

There are no applicable state regulations relating to wind.

Local

San Francisco Planning Code

The *San Francisco Planning Code* (*Planning Code*) establishes wind comfort and wind hazard criteria used to evaluate new development in four areas of the City: the C-3 Downtown Commercial Districts (Section 148), the Van Ness Avenue SUD (Section 243(c)(9)), the Folsom-Main Residential/Commercial SUD (Section 249.1), and the Downtown Residential District (Section 825). As none of these areas includes the Project site, the wind comfort and wind hazard criteria established in the *Planning Code* would not be applicable. The cited *Planning Code* sections provide that any new building or addition in these areas of the City that would cause wind speeds to exceed the hazard level of 26-mph-equivalent wind speed (as defined in the *Planning Code*) more than one hour of any year must be modified to meet this criterion. (The 26 mph standard accounts for short-term—3-minute averaged—wind observations at 36 mph as equivalent to the frequency of an hourly averaged wind of 26 mph. As noted above, winds over 34 mph make it difficult for a person to maintain balance, and gusts can blow a person over.) The San Francisco Planning Department generally refers to the wind hazard criterion to determine the significance for CEQA purposes evaluate wind effects of new development in all areas of the City.

III.G.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to wind, but generally consider that implementation of the Project would have significant impacts if it were to:

G.a Alter wind in a manner that substantially affects public areas

To assess whether a project would result in a significant impact under this criterion, the City and Agency uses the Planning Code's hazard standard, that is, it determines whether a project would cause equivalent wind speeds to reach or exceed the hazard level of 26 mph for a single hour of the year. If a project would cause such an exceedance, the City and Agency requires a mitigation measure requiring that the project buildings be designed to avoid an exceedance.

Analytic Method

Ground-level wind accelerations near buildings are controlled by exposure, massing, and orientation. The Project's potential for accelerated winds was evaluated based on a review of proposed street layout, building

heights, and building orientations to identify locations where exposure, massing or orientation to the prevailing winds would suggest that increased winds could affect pedestrian spaces.

Tall, slab-like buildings tend to deflect wind downward. As wind flow comes over the edge of a roof or around a corner, it separates into streams at about three-quarters of the building height.[154] Above this, the air flows up the face of the building and over the roof; below, it flows down to form a vortex in front of the building before rushing around the windward corners.[155] The resulting increased wind speeds and turbulence at ground level can represent a hazard to pedestrians. This phenomenon is greatest with a single tall building in an open area with no surrounding structures, and can vary substantially by building orientation, massing, and adjacency of other structures. A building that is surrounded by taller structures is not likely to cause adverse wind accelerations at ground level, while even a comparatively small building 100 feet tall could cause wind effects if it were freestanding and exposed.[156]

Massing is important in determining wind impacts because it controls how much wind is intercepted by the structure and whether building-generated wind accelerations occur above ground or at ground level. In general, slab-shaped buildings have the greatest potential for wind acceleration effects. Buildings that have an unusual shape, rounded faces, or utilize set-backs have a less noticeable wind effect. A general rule is that the more complex the building is geometrically, the less noticeable the probable wind impact at ground level.

Building orientation also affects how much wind is intercepted by the structure, a factor that directly determines wind acceleration. In general, buildings that are oriented with the wide axis across the prevailing wind direction will have a greater impact on ground-level winds than a building oriented with the long axis along the prevailing wind direction.

Typically, for new buildings that would be taller than 80 feet to 100 feet, compliance with the wind thresholds can be determined through wind-tunnel testing of a scale model of a Project building and its surroundings. Project tower designs are preliminary, and wind-tunnel testing, if any, will occur prior to design approval of buildings over 100 feet. Accordingly, this EIR analysis qualitatively evaluates the Project's potential to create hazardous wind conditions at pedestrian level.

The wind assessment prepared for the Project evaluated the proposed street alignments, overall massing of structures and location of taller buildings to identify potential wind problems, and suggested means of mitigating adverse wind impacts.[157,158]

Additionally, the Project's potential contribution to cumulative wind impacts are evaluated in the context of existing, proposed, and reasonably foreseeable future development expected in the Project vicinity.

---

[154] The exact location of this region of wind divergence depends on the effects of adjacent structures as well as the orientation of the building to the predominant wind direction; this is given as an example of potential wind action only.

[158] CPP, Inc., *Preliminary Pedestrian Wind Assessment: Response to Comments Candlestick Point and Hunters Point Development, CPP Project 4139, Addendum 1*, March 10, 2008.

Construction Impacts

The potential construction impacts due to wind have been analyzed in other sections of this EIR, where appropriate. For example, Section III.H (Air Quality) analyzes fugitive dust air emissions, and Section III.M (Hydrology and Water Quality) analyzes erosion from Project construction that could cause fugitive dust emissions.

Operational Impacts

Impact W-1: Wind Hazard Criterion

Impact of Candlestick Point

Impact W-1a **Implementation the Project at Candlestick Point would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces. (Less than Significant with Mitigation) *[Criterion G.a]***

As explained above, building structures near or greater than 100 feet in height could create pedestrian-level conditions such that the wind hazard criterion of 26-mph-equivalent wind speed for a single hour of the year would be exceeded. There is no threshold height that triggers the need for wind-tunnel testing to determine whether the building design would result in street-level winds that exceed the standard. It is generally understood, however, from many prior wind-tunnel tests on a variety of projects in San Francisco that most, if not all, buildings under 100 feet do not result in adverse wind effects at street level, barring unusual circumstances.

The proposed building heights in the Candlestick Point development would range from 65 feet in the northwest and western portions of the Candlestick Point site, and 85 feet to 140 feet further east. The Project would also include up to 11 residential towers ranging from 170 feet to 420 feet in height (refer to Figure II-5 [Proposed Maximum Building Heights]). Based on the site map, due to the orientation of the street grid, buildings in the 65- to 85-foot height areas would not be substantially exposed to predominant west and northwest winds, nor would buildings in that height range create substantial wind funneling effects.[159]

Project structures approaching or over 100 feet would be located toward the interior of the development to maximize compatibility with existing adjacent neighborhoods. The CP North district would contain up to five residential towers with heights from 170 feet to 270 feet. The CP South district would include six residential towers, consisting of two residential towers on the south half of the district with a maximum heights of up to 370 feet (approximately 40 stories) and one tower on the south end of the district with a maximum height of 420 feet (approximately 42 stories). The north half of the district would have three residential towers, one with maximum height up to 270 feet and two with maximum heights up to 320 feet.

The site design ensures that the towers on the Project site are not clustered, which would mitigate a number of wind effects.[160] In addition, the Project street pattern would have most streets oriented northwest/southeast and northeast/southwest, rather than north/south and east/west. That street pattern

[159] Donald J. Ballanti, Certified Consulting Meteorologist, personal communication, August 31, 2009.
[160] CPP, Inc., *June, 2007*.

would not be directly exposed to prevalent westerly wind directions. The northwest–oriented streets would be exposed to northwesterly winds, but the streets would alignment would encourage the wind to flow over the top of the buildings, reducing wind speed at street level.[161] In the retail areas, Project features such as awnings, locating outdoor eating areas away from main crossroads areas, street plantings, articulated building façades, and screenings would reduce the effect of these winds at street level.[162]

Since the Project street grid would not align directly with predominant west and west-northwest wind directions, it would, not result in channeling of winds along street corridors. The street grid would orient building faces such that they would not face into the prevailing wind direction; that orientation would reduce potentially significant pedestrian-level wind acceleration. However, project structures between 100 feet and 420 feet in height would extend well above surrounding buildings and would intercept a large volume of wind. Because of that exposure, the tower structures would have the potential to accelerate winds in nearby pedestrian sidewalk areas or public open space. Project towers could affect pedestrian-level wind conditions in proposed parks—Candlestick Point Neighborhood Park; Bayview Gardens/Wedge Park; and Mini Wedge-Park—and in CPSRA areas near the towers (refer to Figure II-9 [Proposed Parks and Open Space] for Project open space areas.) Project plans have identified locations of towers, but tower designs are preliminary. The extent of changes in pedestrian-level wind conditions would be influenced by building design, such as building height, shape, massing, setbacks, and location of pedestrian areas.

As described below in MM W-1a, the design review process would include a preliminary evaluation by Agency staff to determine whether further specific study would be required. To ensure that this potential impact is reduced to a less-than-significant level, the following mitigation measure shall be implemented:

- *MM W-1a* <u>*Building Design Wind Analysis.*</u> *Prior to design approval of Project buildings, for high-rise structures above 100 feet, the Applicant shall retain a qualified wind consultant to provide a wind review to determine if the exposure, massing, and orientation of the building would result in wind impacts that could exceed the threshold of 26-mph-equivalent wind speed for a single hour during the year. The wind analysis shall be conducted to assess wind conditions for the proposed building(s) in conjunction with the anticipated pattern of development on surrounding blocks to determine if the Project building(s) would cause an exceedance of the wind hazard standard. The analysis shall be conducted as directed by the City's wind study guidelines, including, if required, wind tunnel modeling of potential adverse effects relating to hazardous wind conditions. The Agency shall require the Applicant to identify design changes that would mitigate the adverse wind conditions to below the threshold of 26-mph-equivalent wind speed for a single hour of the year. These design changes could include, but are not limited to, wind-mitigating features, such as placing towers on podiums with a minimum 15-foot setback from street edges, placement of awnings on building frontages, street and frontage plantings, articulation of building facades, or the use of a variety of architectural materials.*

Implementation of appropriate design changes required by mitigation measure MM W-1a would reduce hazardous wind effects at pedestrian level by forcing wind downwash to tops of podium areas and/or into the street and away from pedestrian areas. These design changes would reduce the wind hazard to below the established threshold and would ensure safety in pedestrian-access areas. With implementation of mitigation measure MM W-1a, the potential impact would be reduced to a less-than-significant level.

[162] CPP, Inc., *June, 2007.*

Impact of Hunters Point Shipyard Phase II

Impact W-1b **Implementation of the Project at HPS Phase II would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces. (Less than Significant with Mitigation) *[Criterion G.a]***

As discussed above, building structures near or greater than 100 feet in height could have effects on pedestrian-level conditions such that the wind hazard criteria of 26-mph-equivalent wind speed for a single hour of the year would be exceeded. There is no threshold height that triggers the need for wind-tunnel testing to determine whether the building design would result in street-level winds that exceed the standard. It is generally understood, however, from years of wind-tunnel testing on a variety of projects in San Francisco, that most, if not all, buildings under 100 feet do not result in adverse wind effects at street level barring unusual circumstances.

The proposed building heights for HPS Phase II would be 65 feet in most portions of the HPS Phase II site, with 85- to 105-foot limits farther east. HPS Phase II would include up to two residential towers ranging from 270 to 370 feet (refer to Figure II-5 [Proposed Maximum Building Heights]). The new 49ers Stadium would be approximately 156 feet to the top row of seating. Buildings in 65- to 85-foot height limit areas would not be substantially exposed to predominant west and northwest winds or wind funneling effects due to the orientation of the street grid, and would not have a significant impact on pedestrian-level wind conditions.

One residential tower with a maximum height up to 370 feet (approximately 40 stories) would be at the southeast corner of the HPS Phase II North district, adjacent to the Village Center, and a second tower, up to 270 feet would be located in the Research and Development district. Structures in the center of the Research and Development district in HPS Phase II would range from 85 to 105 feet tall. With regard to the new stadium, the top row of stadium seating would be at an elevation of approximately 156 feet (about 15 stories) above the playing field. These structures could cause acceleration of winds in nearby pedestrian sidewalk areas or public open space. Project plans have identified the locations of towers, but tower designs are preliminary. The degree of changes in pedestrian-level wind conditions would be influenced by building design, such as building height, shape, massing, setbacks, and location of pedestrian areas.

The Project street pattern would have most streets oriented northwest/southeast and northeast/southwest, rather than north/south and east/west. That street pattern would not be directly exposed to prevalent westerly wind directions. The streets in each of the sections are aligned in a manner to encourage the wind to flow over the top of the buildings, reducing wind speed at street level. In the retail areas, Project features such as awnings, locating outdoor eating areas away from main crossroads areas, street plantings, and screenings would reduce the potential adverse effects of these winds at street level.

As with development at Candlestick Point, the HPS Phase II street grid would not align with predominant west and west-northwest wind directions and would reduce the channeling of winds along street corridors. The street grid would orient building faces such that they would not face into the prevailing wind direction; that orientation would reduce potential pedestrian-level wind acceleration.

Implementation of mitigation measure MM W-1a and the appropriate design changes it requires would reduce hazardous wind effects at pedestrian level by forcing wind downwash to tops of podium areas and/or into the street and away from pedestrian areas. These design changes would reduce the wind hazard to below the established threshold, and would ensure safety in pedestrian-access areas. With implementation of mitigation measure MM W-1a, the potential impact would be reduced to a less-than-significant level.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact W-1 **Implementation of the Project would not include tall structures that would result in ground-level-equivalent wind speed exceeding 26 mph for a single hour of the year in pedestrian corridors and public spaces. (Less than Significant with Mitigation) *[Criterion G.a]***

Please refer to the discussion for Impact W-1a and Impact W-1b, above. Structures above 100 feet in height and ranging up to 420 feet would extend well above surrounding buildings and would intercept a large volume of wind. Because of that exposure, the tower structures would have the potential to accelerate winds in nearby pedestrian sidewalk areas or public open space. The degree of changes in pedestrian-level wind conditions would be influenced by building design, such as building height, shape, massing, setbacks, and location of pedestrian areas. Structures nearing or over 100 feet in height could have effects on pedestrian-level conditions such that the wind hazard criteria of 26 mph for a single hour of the year would be exceeded. This is a potentially significant impact.

As discussed above, the Project street grid would not align with predominant west and west-northwest wind directions and would, therefore, not result in channeling of winds along street corridors. The street grid would orient building faces such that they would not face into the prevailing wind direction; that orientation would reduce potentially significant pedestrian-level wind acceleration. The Project street grid would not align with predominant west and west-northwest wind directions and would reduce the channeling of winds along street corridors. The street grid would orient building faces such that they would not face into the prevailing wind direction; that orientation would reduce potential pedestrian-level wind acceleration.

Implementation of mitigation measure MM W-1a would reduce the potential wind impact by requiring review by a qualified wind consultant for all buildings determined by Agency staff as potentially problematic with respect to wind and, where necessary, design changes to reduce any impact below the established threshold. Implementation of required design changes, if any, would reduce potential hazardous wind effects at pedestrian level by forcing wind downwash to tops of podium areas and/or into the street and away from pedestrian areas and would ensure pedestrian safety in pedestrian-access areas. With implementation of mitigation measure MM W-1a, the potential impact would be less than significant.

Cumulative Impacts

The geographic context for an analysis of cumulative impacts with regard to wind effects is limited to the immediate Project area. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. Reasonably foreseeable future development includes the Project site, the Executive Park site (located immediately west of Candlestick Point), Bayview Hill, and all of Hunters Point. None of the related projects located in these

areas include structures with heights greater than 100 feet, except for Executive Park, where demolition of 3 existing buildings and construction of 13 new buildings (with roof heights ranging from approximately 86 to 293 feet) is proposed.[163] As that development includes structures with heights greater than 100 feet, towers at the Executive Park site would intercept a large volume of wind which could have the potential to accelerate winds in nearby pedestrian sidewalk areas or public open spaces.

As noted above, the dominant wind direction in the project vicinity is west-northwest, and winds from the west, northwest, and west-northwest account for roughly half of the local wind patterns.[164] As the Executive Park site is directly west of the Candlestick Point, west-northwest and northwest winds would not have the potential to contribute to cumulative wind conditions within the Project site. However, west winds, which occur approximately 13 percent of the time,[165] could have the potential to contribute to cumulative wind conditions within the Project site. As discussed in Section III.P (Recreation), a cumulative wind analysis provided in a Technical Memorandum prepared for the Executive Park development concluded that cumulative development generally results in wind speed changes near the shoreline (generally within 300 feet) ranging from no change to a 10 to 20 percent decrease in wind speed.[166]

In addition, the distance between the Executive Park development (located at 150 and 250 Executive Park Boulevard and 5 Thomas Mellon Circle[167]), is approximately 1,000 feet west of the western border of the Candlestick Point Center and Candlestick Point districts, and approximately 1,500 feet would separate the eastern edge of the Executive Park development and closest residential tower within the Project site (a 360-foot residential tower located at Candlestick Point South). Given the presence of intervening structures between these two locations (The Cove residential development) and the orientation of the street grid pattern in Candlestick Point South, and the likely presence of street trees in all of these areas, winds generated by towers within the Executive Park development would not be funneled by development along the streets in the Project site, and the Project's contribution to cumulative wind impacts would not be considerable. Cumulative impacts would be less than significant.

SECTION III.H AIR QUALITY

III.H.1 Introduction

This section of the EIR evaluates the potential impacts on air quality resulting from implementation of the Project. This includes the potential for the Project to conflict with or obstruct implementation of the applicable air quality plan, to violate an air quality standard or contribute substantially to an existing or projected air quality violation, to result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in nonattainment, expose sensitive receptors to substantial pollutant concentrations, or create objectionable odors that would affect a substantial number of people. This section identifies both Project-level and cumulative environmental impacts, as well as feasible mitigation measures that could reduce or avoid the identified impacts.

The analyses includes an (1) evaluation of criteria air pollutant mass emissions including emissions by construction workers and equipment (refer to Appendix H2 [Construction Workers and Equipment]) using methodology provided in Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines; (2) operational emissions from project-related and mobile sources; and (3) ambient carbon monoxide concentration from mobile sources (refer to Appendix H1 [Air Quality Model Input/Output]).[168,169] In addition, this section provides a summary of the human health risk assessments (HRAs) conducted for (1) diesel particulate matter (DPM) emissions; (2) potentially contaminated dust emissions; (3) fine particulate matter ($PM_{2.5}$) emissions; and (4) potential emissions of toxic air contaminants (TAC) from stationary sources at proposed Research and Development (R&D) uses at the Project. Those four topics are based on a report prepared by ENVIRON International Corporation (ENVIRON) entitled *Ambient Air Quality Human Health Risk Assessment: Candlestick Point–Hunters Point Shipyard Phase II Development Plan* (refer to Appendix H3 [Ambient Air Quality and Human Health Risk Assessment]).

Section III.S (Greenhouse Gas Emissions) evaluates Project greenhouse gas (GHG) emissions and their potential contribution to climate change.

III.H.2 Setting

Environmental Background

The Project is located in the City and County of San Francisco, which is within the San Francisco Bay Area Air Basin (SFBAAB). The SFBAAB also comprises all of Alameda, Contra Costa, Marin, Napa, San Mateo, and Santa Clara Counties, the southern half of Sonoma County, and the southwestern portion of Solano County.

Ambient air quality is influenced by climatological conditions, topography, and the quantity and type of pollutants released in an area. The major determinants of transport and dilution of a given pollutant are wind, atmospheric stability, terrain; sunshine can impact the concentrations of photochemical pollutants.

---

[168] Bay Area Air Quality Management District (BAAQMD). 1999. BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans. December.

[169] BAAQMD. 2009. California Environmental Quality Act, Draft Air Quality Guidelines. September & November Drafts.

Climate, Topology, and Meteorology

The regional climate in the SFBAAB is considered semi-arid and is characterized by mild, dry summers and mild, moderately wet winters (about 90 percent of the annual total rainfall is received in the November-April period), moderate daytime onshore breezes, and moderate humidity. The climate is dominated by a strong, semi-permanent, subtropical high-pressure cell over the northeastern Pacific Ocean. Climate is also affected by the moderating effects of the adjacent oceanic heat reservoir. In summer, when the high-pressure cell is strongest and farthest north, fog forms in the morning, and temperatures are mild. In winter, when the high-pressure cell is weakest and farthest south, occasional rainstorms occur.

The Project is located in the San Francisco Peninsula (Peninsula) climatological subregion that extends northwest from San Jose to the Golden Gate. The Santa Cruz Mountains run up the center of the Peninsula, creating an area of warmer temperatures and fewer foggy days to the east where the ridgeline blocks the marine layer. In San Francisco, the mean maximum summer temperatures are in the mid-60s degrees Fahrenheit, while mean minimum temperatures during the winter months are in the high-30s to low-40s degrees Fahrenheit. Annual average wind speeds range from 4 to 9 knots throughout the Peninsula with prevailing winds from the west, although local wind patterns are often influenced greatly by local topographic features.

In summer, the northwest winds to the west of the Pacific coastline are drawn into the interior through the Golden Gate and over the lower portions of the San Francisco Peninsula. This channeling of the flow through the Golden Gate produces a jet that sweeps eastward but widens downstream producing southwest winds at Berkeley and northwest winds at San Jose. Wind speeds may be locally strong in regions where air is channeled through a narrow opening such as the Golden Gate or San Bruno Gap. For example, the average wind speed at San Francisco International Airport from 3:00 P.M. to 4:00 P.M. in July is about 17 knots, compared with only about 9 knots at San Jose and less than 6 knots at the Farallon Islands.

The sea breeze between the coast and the Central Valley commences near the surface along the coast in late morning or early afternoon; it may be first observed only through the Golden Gate. Later in the day the layer deepens and intensifies while spreading inland. As the breeze intensifies and deepens it flows over the lower hills farther south along the Peninsula. This process frequently can be observed as a bank of stratus "rolling over" the coastal hills on the west side of the Bay. The depth of the sea breeze depends in large part upon the height and strength of the inversion. The generally low elevation of this stable layer of air prevents marine air from flowing over the coastal hills. It is unusual for the summer sea breeze to flow over terrain exceeding 2000 feet in elevation.

In winter, the Bay Area experiences periods of storminess and moderate-to-strong winds and periods of stagnation with very light winds. Winter stagnation episodes are characterized by outflow from the Central Valley, nighttime drainage flows in coastal valleys, week onshore flows in the afternoon and otherwise light and variable winds.

Onshore winds from the west dominate at the Project such that emissions from the Project would be blown eastward over the San Francisco Bay.

Existing Air Quality Conditions

In addition to climate, topology, and meteorology, a wide range of emissions sources—such as dense population centers, heavy vehicular traffic, and industry—influences the air quality within the SFBAAB. Air pollutant emissions within the Bay Area are generated by stationary (or point), area wide and mobile sources. Stationary sources exist at identified locations and are usually associated with specific large manufacturing and industrial facilities; examples include fossil-fuel power plants or large boilers that provide industrial process heat. Area wide sources consist of many smaller point sources that are widely distributed spatially; examples include residential and commercial water heaters, painting/coating operations, power lawn mower use, agricultural operations, landfills, and the use of consumer products such as barbeque lighter fluid, hair spray, etc. Mobile sources include on-road motor vehicles and other transportation sources like aircraft, ships, trains, and self-propelled construction equipment. Air pollutants can also be generated by natural sources such as fine dust particles suspended in the air by high winds.

Criteria Pollutants

The federal and state governments have established ambient air quality standards (National Ambient Air Quality Standards [NAAQS] and California Ambient Air Quality Standards [CAAQS]) for outdoor concentrations of a number of pollutants to protect the health and welfare of the people most sensitive to their effects. Such pollutants are called "criteria" pollutants, the most common of which are listed below in Table III.H-1 (State and Federal Criteria Air Pollutant Standards, Effects, and Sources), which includes NAAQS and CAAQS and the known health effect for these pollutants. Table III.H-1 also discloses the health effects of each criteria pollutant, and the federal and state attainment status for each.

- **Ozone** (O_3) is a gas that is not directly emitted into the air but formed when reactive organic gases (ROG) and nitrogen oxides (NO_X)—both byproducts of internal combustion engine exhaust (ROG can also originate from the evaporation of chemical solvents or fuels)—undergo slow photochemical reactions in the presence of sunlight. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are conducive to its formation. Because of the reaction time involved in forming ozone, peak ozone concentrations are often found far downwind of precursor emissions. Therefore, ozone is seen as a regional pollutant where emissions and generation occur over large areas.

  Emissions of the ozone precursors ROG and NO_X from both mobile (vehicle) and stationary sources have decreased in the SFBAAB since 1975 and are projected to continue declining through 2020. Reasons include the implementation of strict motor vehicle emissions controls, new controls on oil refinery fugitive emissions, and new rules for control of ROG from industrial coatings and solvent operations.[170] Concomitantly, the peak 1-hour and 8-hour concentrations have declined by nearly 18% during the last 20 years.[171]

- **Carbon Monoxide** (CO) is a colorless, odorless gas produced by the incomplete combustion of fuels, primarily from transportation sources though also from wood-burning stoves, incinerators and other industrial sources. CO concentrations tend to be the highest during the winter morning, with little to no wind, when surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines—unlike ozone—and motor vehicles operating at slow speeds are the primary source of CO in the Bay Area, the highest ambient CO concentrations

[170] California Air Resources Board. 2009. The 2009 California Almanac of Emissions and Air Quality. Sacramento, CA.
[171] Ibid.

are generally found near congested transportation corridors and intersections. In contrast to ozone issues, which tend to be regional in nature, CO issues tend to be localized.

- **Nitrogen Dioxide** (NO_2) is a brownish, highly reactive gas that is present in all urban environments. The major human-made NO_2 sources are combustion devices, such as boilers or turbines, and internal combustion engines, such as automobile or generator engines. Combustion devices emit primarily nitrogen oxide (NO), which reacts through oxidation in the atmosphere to form NO_2. NO and NO_2 are collectively referred to as NO_X. As NO_2 is formed and depleted by reactions associated with photochemical smog, the NO_2 concentrations in a particular geographical area may not be representative of the local NO_X emissions sources.
- **Sulfur dioxide** (SO_2) is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal, and from chemical processes occurring at chemical plants and refineries.
- **Respirable Particulate Matter** (PM_{10}) and **Fine Particulate Matter** ($PM_{2.5}$) consist of extremely small, suspended particles or droplets 10 microns and 2.5 microns or smaller in diameter, respectively. Some sources of particulate matter, like pollen, forest fires, and windblown dust, are naturally occurring. However, in populated areas, most particulate matter is caused by road dust, combustion products, abrasion of tires and brakes, and construction activities. Particulate matter can also be formed in the atmosphere by condensation of SO_2 and ROG.
- **Lead** (Pb) occurs in the atmosphere as particulate matter. Historically, the combustion of leaded gasoline was the primary source of airborne lead in the Bay Area, though the use of leaded gasoline is no longer permitted for on-road motor vehicle. Other sources of lead include the manufacturing and recycling of batteries, paint, ink, ceramics, ammunition, and secondary lead smelters.
- **Sulfates** (SO_4) are the fully oxidized ionic form of sulfur. Emissions of sulfur compounds occur primarily from the combustion of petroleum-derived fuels (e.g., gasoline and diesel fuel) that contain sulfur. This sulfur is oxidized to sulfur dioxide (SO_2) during the combustion process and subsequently converted to sulfate compounds in the atmosphere. The conversion of SO_2 to sulfates takes place comparatively rapidly and completely in urban areas of California due to regional meteorological features.
- **Hydrogen Sulfide** (H_2S) is a colorless gas with the odor of rotten eggs. It is formed during bacterial decomposition of sulfur-containing organic substances. Also, it can be present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation.
- **Vinyl Chloride** (chloroethene) is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents. While the California ambient air quality standard for vinyl chloride is still in existence, since 1990 (when the California Air Resources Board [ARB] identified it as a TAC) the compound is typically evaluated using risk assessment methods.
- **Visibility-Reducing Particles** consist of suspended particulate matter, which is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary greatly in shape, size, and chemical composition, and can be made up of many different materials such as metals, soot, soil, dust, and salt. The Statewide standard is intended to limit the frequency and severity of visibility impairment due to regional haze. A separate standard for visibility-reducing particles that is applicable only in the Lake Tahoe Air Basin is based on reduction in scenic quality.

Table III.H-1 State and Federal Criteria Air Pollutant Standards, Effects, and Sources

		State Standard[a]		*Federal Standard[b]*			
Pollutant	***Averaging Time***	***Concentration***	***Attainment Status***	***Concentration***	***Attainment Status***	***Pollutant Health and Atmospheric Effects***	***Major Pollutant Sources***
Ozone	1-Hour 8-Hour	0.09 ppm 0.070 ppm	N N	—[c] 0.075 ppm	—[c] N	High concentrations can directly affect lungs, causing irritation. Long-term exposure may cause damage to lung tissue.	Formed when ROG and NO_X react in the presence of sunlight. Major sources include on-road motor vehicles, solvent evaporation, and commercial industrial mobile equipment.
Carbon Monoxide	1-Hour 8-Hour	20 ppm 9.0 ppm	A A	35 ppm 9 ppm	A A	Classified as a chemical asphyxiate, CO interferes with the transfer of fresh oxygen to the blood and deprives sensitive tissues of oxygen.	Internal combustion engines, primarily gasoline-powered motor vehicles.
Nitrogen Dioxide	1-Hour Annual	0.18 ppm 0.030 ppm	A A	— 0.053 ppm	A A	Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown.	Motor vehicles, petroleum-refining operations, industrial sources, aircraft, ships, and railroads.
Sulfur Dioxide	1 Hour 24-Hour Annual	0.25 ppm 0.04 ppm —	A A	— 0.14 ppm 0.030 ppm	 A A	Irritates upper respiratory tract; injurious to lung tissue. Can yellow the leaves of plants, destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
Particulate Matter (PM_{10})	24-Hour Annual	50 µg/m^3 20 µg/m^3	N N	150 µg/m^3 —[d]	U	May irritate eyes and respiratory tract, decreases in lung capacity, cancer, and increased mortality. Produces haze and limits visibility.	Dust and fume-producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
Fine Particulate Matter ($PM_{2.5}$)	24-Hour Annual	— 12 µg/m^3	 N	35 µg/m^{3,e} 15 µg/m^3	A A	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and results in surface soiling.	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning. Also formed from photochemical reactions of other pollutants, including NO_X, $S0_2$, and organics.
Lead	Monthly Quarterly 3-Month Rolling	1.5 µg/m^3 — —	A	— 1.5 µg/m^3 0.15 µg/m^3	 A U	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurological dysfunction.	Present source: lead smelters, battery manufacturing and recycling facilities. Past source: combustion of leaded gasoline.
Sulfates	24-Hour	25 µg/m^3	A	No Federal Standard		Decrease ventilatory function, aggravate asthmatic symptoms, and increase risk of cardio-pulmonary disease. Degrade visibility, and, due to fact that they are usually acidic, can harm ecosystems and damage materials and property.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
Hydrogen Sulfide	1-Hour	0.03 ppm (42 µg/m^3)	U	No Federal Standard		Primarily an odor nuisance at ambient concentrations.	Present in sewer gas and some natural gas, and can be emitted as the result of geothermal energy exploitation.

Table III.H-1 State and Federal Criteria Air Pollutant Standards, Effects, and Sources

		State Standard[a]		*Federal Standard*[b]			
Pollutant	***Averaging Time***	***Concentration***	***Attainment Status***	***Concentration***	***Attainment Status***	***Pollutant Health and Atmospheric Effects***	***Major Pollutant Sources***
Vinyl Chloride	24-Hour	0.01 ppm (26 µg/m^3))	U	No Federal Standard		Short-term exposure to high levels causes central nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation and oral exposure causes in liver damage. Cancer is a major concern from exposure to vinyl chloride via inhalation.	Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products. Vinyl chloride has been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents.
Visibility Reducing Particles	8-Hour	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more because of particles when the relative humidity is less than 70%.	U	No Federal Standard		Limits visibility.	Combustion processes in motor vehicles, industrial and commercial boilers and incinerators, power generating plants, solid fuel domestic heating, domestic incineration. Natural sources of airborne particles include fine soil particles and smoke particles from bushfires.

SOURCE: BAAQMD's Air Quality Standards and Attainment Status internet site http://hank.baaqmd.gov/pln/air_quality/ambient_air_quality.htm, ARB's California Ambient Air Quality Standards (CAAQS) internet site http://www.arb.ca.gov/research/aaqs/caaqs/caaqs.htm, and the United States Environmental Protection Agency's (USEPA's) National Ambient Air Quality Standards (NAAQS) internet site http://www.epa.gov/air/criteria.html, (accessed October 12, 2009)

A = Attainment; N = Nonattainment; U = Unclassified (insufficient data collected to determine classification; generally indicates low concern for the pollutant levels); ppm = parts per million; µg/m^3 = micrograms per cubic meter

a. California standards for O_3, CO (except Lake Tahoe), SO_2 (1-hour and 24-hour), NO, suspended particulate matter—PM_{10}, and visibility-reducing particles are values that are not to be exceeded. The standards for sulfates, Lake Tahoe CO, lead, hydrogen sulfide, and vinyl chloride are not to be equaled or exceeded. If the standard is for a 1-, 8-, or 24-hour average (i.e., all standards except for lead and the PM_{10} annual standard), some measurements may be excluded. In particular, measurements are excluded that California ARB determines would occur less than once per year on the average. The Lake Tahoe CO standard is 6.0 ppm, a level one-half the national standard and two-thirds the state standard.

b. Federal standards other than for ozone, particulates and those based on annual averages are not to be exceeded more than once a year. The 1-hour ozone standard is attained if, during the most recent 3-year period, the average number of days per year with maximum hourly concentrations above the standard is equal to or less than one. The 8-hour ozone standard is attained when the 3-year average of the 4th highest daily concentrations is 0.08 ppm or less. The 24-hour PM_{10} standard is attained when the 3-year average of the 99th percentile of monitored concentrations is less than 150 µg/m^3. The 24-hour $PM_{2.5}$ standard is attained when the 3-year average of 98th percentiles is less than 65 µg/m^3.

c. The federal 1-hour ozone standard was revoked on June 15, 2005.

d. Because of lack of evidence linking health problems to long-term coarse particle exposure, the USEPA revoked the annual PM_{10} standard on September 21, 2006.

e. USEPA lowered the 24-hour $PM_{2.5}$ standard from 65 µg/m^3 to 35 µg/m^3 in 2006 and issued attainment status designations for the 35 µg/m^3 standard on December 22, 2008. USEPA designated the SFBAAB as nonattainment for the 35 µg/m^3 $PM_{2.5}$ standard; however, that designation has not yet been published in the Federal Register and is, therefore, not yet effective.

Regional Emissions Inventory

With the assistance of the BAAQMD, the California ARB compiles inventories of CO, ROG (reactive organic gases, which are ozone precursors), NO_2, PM_{10}, and $PM_{2.5}$ emissions for the SFBAAB. Table III.H-2 (San Francisco Bay Area Air Basin and San Francisco County Criteria Pollutant Emissions Inventory and Projections, 2008 [Tons/Day—Annual Average]) presents a summary of the most recent year of emissions data for the SFBAAB and San Francisco County.

Table III.H-2 San Francisco Bay Area Air Basin and San Francisco County Criteria Pollutant Emissions Inventory and Projections, 2008 (Tons/Day—Annual Average)

	CO	*ROG*	*NO_X*	*SO_X*	*PM_{10}*	*$PM_{2.5}$*
SFBAAB						
2008 Estimated						
Total Emissions	1,748	378	448	62	212	81
Mobile Source Emissions	1,542	183	381	15	20	16
San Francisco						
2008 Estimated						
Total Emissions	148	34	79	15	17	7.5
Mobile Source Emissions	142	18	74	15	4.6	4.1

Natural source are excluded from this inventory.

Monitoring Station Data and Attainment Area Designations

The SFBAAB has instances of recorded violations of federal and state AAQS for ozone, CO, and PM_{10} over the last 30 years. Since the early 1970s, substantial progress has been made toward controlling these pollutants. Emissions and ambient concentrations of CO decreased in the SFBAAB with the introduction of the catalytic converter in 1975, and with subsequent improvements in motor vehicle engine technology and the introduction of oxygenated fuel. No violations of the state AAQS or federal AAQS for CO have been recorded in the Bay Area since 1991. The Bay Area is in attainment for all state and federal standards except those for ozone, PM_{10}, and $PM_{2.5}$. For ozone, the SFBAAB does not meet either the state or federal standards. For PM_{10} and $PM_{2.5}$, the SFBAAB does not meet the state standards but does meet the current federal standards.[172]

- The BAAQMD operates many air quality monitoring stations throughout the Bay Area. While the monitoring network is designed to measure air quality on a regional level, the locations of the monitors may not capture variations in air quality conditions on the sub-regional level. The closest monitoring station to the Project operated by the BAAQMD is the San Francisco-Arkansas Street monitoring station, which is located

[172] United States Environmental Protection Agency (USEPA) lowered the 24-hour $PM_{2.5}$ standard from 65 $\mu g/m^3$ to 35 $\mu g/m^3$ in 2006 and issued attainment status designations for the 35 $\mu g/m^3$ standard on December 22, 2008. USEPA designated the SFBAAB as nonattainment for the 35 $\mu g/m^3$ $PM_{2.5}$ standard; however, that designation has not yet been published in the Federal Register and is, therefore, not yet effective.

approximately three miles to the north of the Project on Potrero Hill. Table III.H-3 (Summary of Local Ambient Air Quality in the Project Vicinity) shows recent data taken at this monitoring station (i.e., 2006 through 2008).[173] During this period at this station, the state and federal ozone standards were not exceeded. The state 24-hour PM_{10} standard was exceeded five times while the federal 24-hour PM_{10} standard was not exceeded. For this time period, the annual average was above the state standard of 20 $\mu g/m^3$. The federal 24-hour standard for $PM_{2.5}$ standard was exceeded eight times over this period at this station; however, over this period, the annual average was below both the state 12 $\mu g/m^3$ and federal 15 $\mu g/m^3$ standards.

Table III.H-3 Summary of Local Ambient Air Quality in the Project Vicinity

Air Pollutants[a]	*Year* 2006	2007	2008
Ozone			
Maximum 1-hour concentration measured[b]	0.053 ppm	0.060 ppm	0.082 ppm
Days exceeding state 0.09 ppm 1-hour standard	0	0	0
Maximum 8-hour concentration measured[c]	0.046 ppm	0.049 ppm	0.066 ppm
Days exceeding state 0.07 or federal 0.075 ppm 8-hour standard	0	0	0
Respirable Particulate Matter (PM_{10})			
Annual average concentration measured[a]	22.9 $\mu g/m^3$	21.9 $\mu g/m^3$	22.0 $\mu g/m^3$
Maximum 24-hour concentration measured[d]	61.4 $\mu g/m^3$	69.8 $\mu g/m^3$	41.3 $\mu g/m^3$
Days exceeding federal 150 $\mu g/m^3$ 24-hour standard	0	0	0
Days exceeding state 50 $\mu g/m^3$ 24-hour standard	3	2	0
Fine Particulate Matter ($PM_{2.5}$)			
Annual average concentration measured[a]	9.7 $\mu g/m^3$	8.7 $\mu g/m^3$	9.8 $\mu g/m^3$
Maximum 24-hour concentration measured	54.3 $\mu g/m^3$	45.2 $\mu g/m^3$	29.4 $\mu g/m^3$
No. of days exceeding federal 35 $\mu g/m^3$ 24-hour standard[e]	3	5	N/A[f]
Carbon Monoxide (CO)			
Maximum 8-hour concentration measured	2.09 ppm	1.60 ppm	2.3 ppm
Number of days exceeding federal and state 9.0 ppm 8-hour standard	0	0	0
Nitrogen Dioxide (NO_2)			
Annual average concentration measured[a]	0.016 ppm	0.016 ppm	0.016 ppm
Maximum 1-hour concentration measured	0.11 ppm	0.069 ppm	0.062 ppm
Days exceeding state 0.18 ppm 1-hour standard	0	0	0

SOURCE: BAAQMD *Annual Bay Area Air Quality Summaries*, 2006 through 2008, (http://www.baaqmd.gov/~/~/link.aspx?_id=7BE01D796A3644E2B0BC30BDD4665912&_z=z, Accessed October 2009)

a. Data is taken from the BAAQMD San Francisco-Arkansas Street monitoring station.
b. ppm = parts by volume per million of air.
c. The California 8-hour ozone standard was implemented on May 17, 2005.
d. $\mu g/m^3$ = micrograms per cubic meter.
e. On December 17, 2006, the USEPA implemented a more stringent federal 24-hour $PM_{2.5}$ standard revising it from 65 $\mu g/m^3$ to 35 $\mu g/m^3$. $PM_{2.5}$ exceedance days for 2006 to 2008 reflect the new 35 $\mu g/m^3$ standard.
f. Insufficient data available per California ARB.

[173] BAAQMD formerly maintained a Bayview monitoring station, but monitoring activities ceased in 2005.

The Bayview Community Air Monitoring Project (BayCAMP) was a joint project conducted by the San Francisco Department of the Environment, the California ARB, and the BAAQMD to measure air pollutants (i.e., criteria pollutants and air toxics) for a one-year period in the Bayview Hunters Point community and compare them to measurements collected at Arkansas Street in San Francisco and the Cities of San Jose and Fremont.[174] Measurements were collected from mid-2004 to mid-2005 from a monitoring station located at the Earl P. Mills Community Center on Whitney Young Circle. Criteria pollutants measured in the Bayview-Hunters Point neighborhood were below federal and state standards and similar to or less than those collected in at other locations, with the exception of $PM_{2.5}$ and ozone. Peak ozone concentration (0.096 ppm) in the Bayview-Hunters Point neighborhood were slightly above state standards but were comparable to the other sites. The maximum 24-hour average $PM_{2.5}$ concentration (~50 $\mu g/m^3$) was comparable to the other sites, but exceeded the federal standard. Conversely, the annual average $PM_{2.5}$ (10.3 $\mu g/m^3$) concentration was well below the federal and state standards and was much lower than the concentrations reported for the other sites.

In 2005 and 2006, air quality monitoring associated with the San Francisco Electric Reliability Project[175] was conducted to compare the BAAQMD air quality monitoring data, as noted above, to several community stations located in the Potrero Hill and Bayview Hunters Point neighborhoods. This study involved measuring annual average concentrations of PM_{10} and $PM_{2.5}$ at five locations including Arkansas Street, the Southeast Community Center, the Muni Maintenance Yard, Potrero Recreation Center, and Malcolm X Academy. The measured annual average PM_{10} concentrations at these five locations ranged from 16.9 to 20 $\mu g/m^3$, with the minimum and maximum measurements reported at the Potrero Recreation Center and Muni Maintenance Yard, respectively. The measured annual average $PM_{2.5}$ concentrations ranged from 7.6 to 9.3 $\mu g/m^3$, with the minimum and maximum measurements reported at the Potrero Recreation Center and Southeast Community Center, respectively.

Toxic Air Contaminants and $PM_{2.5}$

TACs are a regulatory designation that includes a diverse group of air pollutants that can adversely affect human health. They are not fundamentally different from the criteria pollutants, but they have not had ambient air quality standards established for them for a variety of reasons (e.g., insufficient dose-response data, association with particular workplace exposures rather than general environmental exposure, etc.). The health effects of TACs can result from either acute or chronic exposure; many types of cancer are associated with chronic TAC exposures, but TAC exposures can also cause other adverse health effects. Consequently, the BAAQMD has established both a cancer and a non-cancer health risk threshold for TAC emissions.

Significant sources of TACs in the environment include industrial processes, such as petroleum refining, chemical manufacturing, electric utilities, metal mining/refining and chrome plating; commercial operations, such as gasoline stations, dry cleaners and buildings with boilers and/or emergency generators; and transportation activities, particularly diesel-powered vehicles, including trains, buses, and trucks. The California ARB has determined that the 10 compounds which pose the greatest known health risk in

[174] Sierra Research, Inc., *State of the Air in Bayview/Hunters Point, Results of the Bayview Community Air Motoring Project (BayCAMP)*, November 2006.
[175] Rajiv Bhatia and Thomas Rivard, *Assessment and Mitigation of Air Pollutant Health Effects from Intra-urban Roadways: Guidance for Land Use Planning and Environmental Review*, 2008.

California, based primarily on ambient air quality data, are benzene, 1,3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, para-dichlorobenzene, formaldehyde, methylene chloride, perchloroethylene, and DPM.[176]

Diesel Particulate Matter

DPM is generated when an engine burns diesel fuel and consists of a mixture of gases and fine particles (also known as soot) that can penetrate deeply into the lungs, where they can contribute to a range of health problems. In 1998, the California ARB identified particulate matter from diesel-powered engines as a TAC based on its potential to cause cancer and other adverse health effects.[177] Diesel exhaust is a complex mixture that includes hundreds of individual constituents and as a mixture, is identified by the State of California as a known carcinogen.[178] However, under California regulatory guidelines, DPM is used as a surrogate measure of exposure for the mixture of chemicals that make up diesel exhaust as a whole.[179]

Based on receptor modeling techniques, the California ARB estimated the background DPM health risk in the SFBAAB in 2000 to be approximately 500 cancer cases per million people, which reflects a drop of approximately 36 percent from estimates for 1990.[180]

- ***Fine Particulate Matter ($PM_{2.5}$)***

Though $PM_{2.5}$ is a criteria pollutant, as discussed above, its human health impacts are also of concern as these particles can deposit deep in the lungs and can contain substances that are particularly harmful to human health. Extended exposure to particulate matter can reduce lung function, aggravate respiratory and cardiovascular disease, increase mortality rate and reduce lung function growth in children. Motor vehicles are currently responsible for about half of the particulates in the SFBAAB and wood burning in fireplaces and stoves is another large source.[181] Many scientific studies link fine particulate matter and traffic-related air pollution to respiratory illness. California ARB has established that $PM_{2.5}$ is associated with dose-dependent adverse health effects below existing federal and state air quality standards and in a 2008 study that a 10 percent increase in $PM_{2.5}$ concentrations increased the non-injury mortality by 10 percent.[182]

Naturally Occurring Asbestos

Asbestos is the common name for a group of naturally occurring fibrous silicate minerals that can separate into thin but strong and durable fibers. Naturally occurring asbestos (NOA), which the California ARB identified as a TAC in 1986, is found in many parts of California and commonly associated with serpentine rock (serpentinite).

[182] BAAQMD, *California Environmental Quality Act Guidelines Update: Proposed Thresholds of Significance*, December 7, 2009.

As described in Section III.K (Hazards and Hazardous Materials) and Section III.L (Geology and Soils) Franciscan serpentinite and mélange (a mixed assemblage of rock types including serpentinite, shale, chert, sandstone, and greenstone) form most of the bedrock underlying the project area. Both rock types are known to contain small amounts of chrysotile asbestos. Serpentinite has been mapped in Parcels A, B, C, and G of HPS Phase II and may underlie portions of the proposed roadway. Mélange occurs throughout the Hunters Point shear zone, which underlies parts of all the HPS Phase II parcels, but has not been mapped separately. Chrysotile is a NOA mineral that can be a human health hazard if it becomes airborne. The other serpentine minerals found in serpentinite do not form fibrous crystals and are not asbestos minerals.

Exposure to airborne asbestos poses a potential health hazard. The issues related to NOA and naturally occurring metals-containing materials at the Project are addressed in Section III.K (Hazards and Hazardous Materials).

TACs Associated with Contaminated Dust

Historic operations by the US Department of the Navy (Navy) and its tenants at the HPS Phase II area resulted in a number of hazardous materials release sites and associated areas with contaminated soils. The types, levels, and extent of contamination of soils and other environmental media have been identified for the HPS Phase II area through a series of comprehensive environmental investigations conducted at the direction of the Navy. The Navy is currently remediating the contaminated soils under the oversight of federal and state regulatory agencies. Although there are no known hazardous materials release sites at Candlestick Point (CP), soil investigations were conducted at this area in the late 1990s at the direction of DeBartolo Entertainment, Inc. These investigations revealed limited areas with elevated concentrations of metals and/or organic chemicals.

As some of the required remedial actions at HPS may be conducted after the Navy transfers the property, there is a potential for Project-related construction activities to generate dust which have particulate bound chemicals which could impact human health in the surrounding community. As discussed later in this section, ENVIRON evaluated this potential exposure in a human health risk assessment.

Monitoring Station Data for TACs

The BAAQMD measures ambient levels of TACs at a number of monitoring stations in the region. Table III.H-4 (Ambient Concentrations of Carcinogenic TACs in the Bay Area Basin) summarizes district-wide monitored concentrations of carcinogenic TACs for the SFBAAB in 2003, the most recent year for which data are available. Sources include industry, business, agriculture, vehicles, household products, wood stoves, barbecues, and more. Whether air toxics have a harmful effect on an individual's health depends upon a number of factors, including the concentration of toxics in the air and the length of exposure.

Table III.H-4 Ambient Concentrations of Carcinogenic TACs in the Bay Area Air Basin

Compound	Concentration[a] (ppb)	Concentration[a] (µg/m³)	Unit Risk (per µg/m³)	Cancer Risk[b] (Chances in one million)
1,3-Butadiene	0.09	0.21	1.7×10^{-4}	36.0
Benzene	0.40	1.30	2.9×10^{-5}	37.7
Carbon tetrachloride	0.11	0.70	4.2×10^{-5}	29.1
Formaldehyde	2.18	2.72	6.0×10^{-6}	16.3
Acetaldehyde	0.72	1.32	2.7×10^{-6}	3.6
Perchloroethylene	0.03	0.18	5.9×10^{-6}	1.1
Methylene chloride	0.36	1.27	1.0×10^{-6}	1.3
Methyl tert-butyl ether (MTBE)	0.53	1.95	2.6×10^{-7}	0.5
Chloroform	0.02	0.12	5.3×10^{-6}	0.6
Trichloroethylene	0.02	0.12	2.0×10^{-6}	0.2
Particulate TACs				
Chromium (hexavalent)	0.10	1.00×10^{-4}	1.5×10^{-1}	14.4
Dioxin	0.000025	2.50×10^{-8}	38	1.0
Nickel	3.30	3.30×10^{-3}	2.6×10^{-4}	0.8
Polycyclic aromatic hydrocarbons (PAHs)	0.47	4.70×10^{-4}	1.1×10^{-3}	0.5
Lead	7.80	7.8×10^{-3}	1.2×10^{-5}	0.1
Total for all TACs (excluding DPM)				***143***

SOURCE: BAAQMD, *Toxic Air Contaminants 2003 Annual Report*, August 2007.

ppb = parts per billion; µg/m³ = micrograms per cubic meter.

a. The concentration used in the risk calculation is the mean of all daily samples taken for the BAAQMD monitoring network in 2003; however, for some compounds the concentration represents data collected at a subset of the stations in the network. See the BAAQMD Toxic Air Contaminants 2003 Annual Report (issued August 2007) for more details.

b. Cancer risks are calculated for the inhalation pathway using the Unit Risk Factors adopted by OEHHA for the Air Toxics Hot Spots Program, and assuming 70-year continuous exposure. While this risk estimate is representative of the average measured concentrations in urban areas of the Air District, this value does not reflect the potential spatial variation of TAC emissions and/or exposure. Localized TAC "hot spots" can occur.

Cancer risks were also estimated in the Bayview Hunters Point neighborhood as part of the monitoring efforts in the BayCAMP project (Sierra Research, Inc. 2006). The reported cancer risks from TACs based on the monitoring results were estimated to be 219 in one million. However, the authors of the report noted that "more than half of the measured risk (113 in a million out of 219 in a million) is due to acrylonitrile.[183] However, this estimate is probably not very accurate because most of the measurements were below the limit of detection." This means that the risk estimates were calculated using the high detection limit, not measured concentrations. As explained by the authors, "most of the estimated risk comes from this assumed (not measured) concentration." Thus, "the estimated risk would be 106 in a million from the remaining compounds," which is lower than the cancer risk estimates reported for the Bay Area Basin in Table III.H-4.

[183] "Acrylonitrile is primarily used in the manufacture of acrylic and modacrylic fibers, which may be used in products such as apparel and carpets. Acrylonitrile may be released to the ambient air during its manufacture and use." The source of acrylonitrile detected is not known as there are no permitted sources. http://www.epa.gov/ttn/atw/hlthef/acryloni.html.

The BAAQMD reports that combining the California ARB estimates of the population-weighted average ambient air concentration of DPM in the SFBAAB for 2003 with the cancer potency factor adopted by California Environmental Protection Agency's (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) results in an approximate cancer risk associated with exposure to DPM of about 500 to 700 in one million excess cancer risks.[184] Most of the DPM risks are from exposure to exhaust from diesel trucks where the emission sources are relatively close to receptors at businesses and residences near freeways.

Odors

Typically, odors are regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache).

With respect to odors, the human nose is the sole sensing device. The ability to detect odors varies considerably among the population and overall is quite subjective. Some individuals have the ability to smell very minute quantities of specific substances; others may not have the same sensitivity but may have sensitivities to specific odors. In addition, people may have different reactions to the same odor; an odor that is offensive to one person (e.g., from a fast-food restaurant) may be perfectly acceptable to another. An unfamiliar odor is more easily detected and more likely to cause complaints than a familiar one because of the phenomenon known as "odor fatigue," in which a person can become desensitized to almost any odor so that recognition occurs only with an alteration in the intensity.

Quality and intensity are two properties of any odor. The quality of an odor indicates the nature of the smell experience. For instance, if a person describes an odor as "flowery" or "sweet," the person is describing the quality of the odor. Intensity refers to the strength of the odor. For example, a person may use the word "strong" to describe the intensity of an odor. Odor intensity depends on the odorant concentration in the air. When an odorous sample is progressively diluted, the odorant concentration decreases, and the odor intensity weakens and eventually becomes so low that detection or recognition is difficult. At some point during dilution, the concentration of the odorant falls below a detection threshold. An odorant concentration below the detection threshold means that the concentration in the air is not detectable by the average human.

III.H.3 Regulatory Framework

Air quality within the Bay Area is maintained and improved through the efforts of various federal, state, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, regulations, planning, policy-making, education, and a variety of other programs.

Federal

At the federal level, the United States Environmental Protection Agency (USEPA) is responsible for implementing national air quality programs. The USEPA enforces the federal *Clean Air Act* (federal CAA) and associated NAAQS. As shown in Table III.H-1, the USEPA has established NAAQS for the following

[184] BAAQMD, Toxic Air Contaminants 2003 Annual Report, August 2007.

criteria air pollutants: ozone, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead. The standards are established to protect the public health and welfare. The CAA also required each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The federal CAA Amendments of 1990 (CAAA) added requirements for states with non-attainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The SIP is modified periodically to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins as reported by their jurisdictional agencies. The USEPA must review all SIPs to determine whether they conform to the mandates of the federal CAA and its amendments and to determine whether implementing the SIPs will achieve air quality goals. If the USEPA determines a SIP to be inadequate, a Federal Implementation Plan that imposes additional control measures may be prepared for the non-attainment area. Failure to submit an approvable SIP or to implement the plan within the mandated time frame may result in sanctions being applied to transportation funding and stationary air pollution sources in the air basin.

The Project must comply with all required elements of the federal CAA and regulatory requirements of the USEPA.

State

The California ARB, a part of the Cal/EPA, is responsible for the coordination and administration of both federal and state air pollution control programs within California and for implementing the *California Clean Air Act* (CCAA). The CCAA, which was adopted in 1988, required the California ARB to establish CAAQS (Table III.H-1). The California ARB has established CAAQS for sulfates, hydrogen sulfide, vinyl chloride, visibility-reducing particulate matter, and the previously mentioned criteria air pollutants. In most cases the CAAQS are more stringent than the NAAQS. Differences in the standards are generally explained by the health effects studies considered during the standard-setting process and the interpretation of those studies.

The CCAA requires that all local air districts in the state endeavor to achieve and maintain the CAAQS by the earliest practical date. The act specifies that local air districts should focus particular attention on reducing emissions from transportation and areawide emission sources and gives districts the authority to regulate indirect sources of emissions.

Among the California ARB's other responsibilities are overseeing local air district compliance with California and federal laws, approving local air quality plans, submitting SIPs to the USEPA, monitoring air quality, determining and updating area designations and maps, and setting emissions standards for new mobile sources, consumer products, small utility engines, off-road vehicles, and fuels.

In 2000, the California ARB began a program of identifying and reducing risks associate with the particulate matter emissions from diesel-fueled vehicles in order to reduce diesel-related health risks. The California ARB plan consists of promulgating new regulatory standards for all new on-road, off-road and stationary diesel-fueled engines and vehicles, new retrofit requirements for existing on-road, off-road and stationary diesel-fueled engines and vehicles and new diesel fuel regulations to reduce the sulfur content of diesel fuel as required by advanced diesel emissions control systems. Under the plan, the overall risk reduction program is expected to result in a 75 percent reduction in diesel particulate emissions by 2010 (compared to 2000 levels) and an 85 percent reduction by 2020.

The *Air Quality and Land Use Handbook: A Community Health Perspective* (2005) provides California ARB recommendations for the siting of new sensitive land uses (i.e., residences, schools, daycare centers, playgrounds, and medical facilities) near recognized major sources of TACs (e.g., freeways, large warehouses/distribution centers, rail yards, etc.), as shown in Table III.H-4a (Recommendations on Siting New Sensitive Land Uses Such As Residences, Schools, Daycare Centers, Playgrounds, or Medical Facilities [from CARB 2005]).

Table III.H-4a Recommendations on Siting New Sensitive Land Uses Such As Residences, Schools, Daycare Centers, Playgrounds, or Medical Facilities (from CARB 2005)

Source Category	*Advisory Recommendations*
Freeways and High-Traffic Roads	■ Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day. ■ Avoid siting new sensitive land uses within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units (TRUs) per day, or where TRU unit operations exceed 300 hours per week). ■ Take into account the configuration of existing distribution centers and avoid locating residences and other new sensitive land uses near entry and exit points.
Rail Yards	■ Avoid siting new sensitive land uses within 1,000 feet of a major service and maintenance rail yard. Within 1 mile of a rail yard, consider possible siting limitations and mitigation approaches.
Ports	■ Avoid siting of new sensitive land uses immediately downwind of ports in the most heavily impacted zones. Consult local air districts or the ARB on the status of pending analyses of health risks.
Refineries	■ Avoid siting new sensitive land uses immediately downwind of petroleum refineries. Consult with local air districts and other local agencies to determine an appropriate separation. ■ Chrome Platers: Avoid siting new sensitive land uses within 1,000 feet of a chrome plater.
Dry Cleaners Using Perchloroethylene	■ Avoid siting new sensitive land uses within 300 feet of any dry cleaning operation. For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult with the local air district. ■ Do not site new sensitive land uses in the same building with perc dry cleaning operations.
Gasoline Dispensing Facilities	■ Avoid siting new sensitive land uses within 300 feet of a large gas station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gas dispensing facilities.

These recommendations are advisory. Land use agencies have to balance other considerations, including housing and transportation needs, economic development priorities, and other quality-of-life issues.

Regional

The BAAQMD is the primary agency responsible for air pollution control in the SFBAAB. To that end, the BAAQMD works directly with the Association of Bay Area Governments (ABAG), the Metropolitan Transportation Commission (MTC), and local governments and cooperates actively with all federal and state government agencies. The BAAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emissions sources, and enforces such measures through educational programs or fines, when necessary.

The BAAQMD is directly responsible for reducing emissions from stationary (area and point) sources and for assuring that state controls on mobile sources are effectively implemented, although BAAQMD has no direct authority to regulate mobile source emissions. It has responded to these requirements by preparing a series of Ozone Attainment Plans and Clean Air Plans that comply with the federal CAA and

the CCAA to accommodate growth, reduce the pollutant levels in the SFBAAB, meet NAAQS and CAAQS, and minimize the fiscal impact that pollution control measures have on the local economy. The Ozone Attainment Plans are prepared for the federal ozone standard, and the Clean Air Plans are prepared for the state ozone standards. The BAAQMD Board of Directors adopted the most recent Ozone Attainment Plan in October 2001 and in April 2004 the USEPA made the final finding that the SFBAAB had attained the 1-hour standard. Since then, the 1-hour ozone standard has been replaced by 8-hour ozone standard and the SFBAAB was designated a marginal non-attainment area. Although certain elements of the 8-hour implementation rule are undergoing legal challenge, it is not currently anticipated that marginal areas will be required to prepare attainment demonstrations for the 8-hour standard.

Nonetheless, the BAAQMD continues to work with the MTC and ABAG to update the Bay Area Ozone Strategy (BAOS). The updated BAOS will describe current conditions, review the SFBAAB's progress in reducing ozone levels to attain state 1-hour and 8-hour ozone standards, and describe how the SFBAAB's proposed control strategy will fulfill the CCAA planning requirements for the state 1-hour ozone standard and mitigation requirements for transport of ozone and ozone precursors to neighboring air basins.

The Board of Directors adopted the current regional Clean Air Plan in December 2000. The Clean Air Plan identifies the control measures that would be implemented through 2006 to reduce major sources of pollutants. Those planning efforts have substantially decreased the population's exposure to unhealthful levels of pollutants, even while substantial population growth has occurred within the SFBAAB. The Clean Air Plan predicts that regional ozone concentrations will decrease by 1.2 percent per year or 9.0 percent over the 12 years after it was adopted. The BAAQMD is in the process of preparing a new Clean Air Plan that will address ozone precursors, particulate matter, air toxics, and green house gases.

In 2003, the Legislature enacted Senate Bill 656 (SB 656) to reduce public exposure to PM_{10} and $PM_{2.5}$. SB 656 required the California ARB, in consultation with local air districts, to develop and adopt, by January 1, 2005, a list of the most readily available, feasible, and cost-effective control measures that could be used by the California ARB and the air districts to reduce PM_{10} and $PM_{2.5}$.

Although the BAAQMD is responsible for regional air quality planning efforts, it does not have the authority to directly regulate the air quality issues associated with plans and new development projects within the SFBAAB. However, the BAAQMD has prepared the BAAQMD CEQA Guidelines (1999) to indirectly address these issues in accordance with the projections and programs of the Ozone Attainment Plan and Clean Air Plan. The BAAQMD CEQA Guidelines assists Lead Agencies, as well as consultants, Project proponents, and other interested parties, in evaluating potential air quality impacts of projects and plans proposed in the SFBAAB. Specifically, the BAAQMD CEQA Guidelines explain the procedures that the BAAQMD recommends be followed during environmental review processes required by CEQA. The BAAQMD CEQA Guidelines provide direction on how to evaluate potential air quality impacts, how to determine whether these impacts are significant, and how to mitigate these impacts. The BAAQMD intends that by providing this guidance, the air quality impacts of plans and development proposals will be analyzed accurately and consistently throughout the SFBAAB, and adverse impacts will be minimized.

- As of the date of this Final EIR, the BAAQMD is in the process of revising their CEQA guidelines and is currently planning for the Board of Directors to consider the draft in June 2010.In December 2009, the BAAQMD released its most recent draft table of Staff-Recommended CEQA Thresholds of Significance

which indicates a number of modifications to existing guidelines, including changes to the maximum daily emissions thresholds for criteria pollutants emissions from operational sources as well as requirements for the quantification of criteria pollutant and TAC emissions from construction activities and comparison to mass emission or risk thresholds, respectively. As these draft guidelines have not been adopted by the BAAQMD's Board of Directors, the Project is not subject to the draft requirements; however, a brief analysis of these proposed guidelines in relation to the Project emissions is included at the end of the impact analysis.

Local

San Francisco General Plan

The goal of the Air Quality Element of the *San Francisco General Plan* is to reduce the level of air pollutants and to protect and improve public health, welfare, and quality of life of the citizens of San Francisco and the residents of the metropolitan region. To do so, the *General Plan* designates policies designed to:

- Adhere to state and federal AAQS and programs, reduce mobile sources of air pollution through implementation of the transportation element of the *General Plan*
- Decrease the air quality impacts of development by coordination of land use and transportation decisions
- Improve air quality by increasing public awareness regarding the negative health effects of pollutants generated by stationary and mobile sources
- Minimize particulate matter emissions from road and construction sites
- Link the positive effects of energy conservation and waste management to emission reductions
- Exercise air quality modeling in building design for sensitive land uses, such as residential developments that are located near the sources of pollution such as freeway and industries

City of San Francisco Health Code

Construction Dust Control

San Francisco Health Code Article 22B, Construction Dust Control, requires, for construction projects within 1,000 feet of sensitive receptors (residence, school, childcare center, hospital or other health-care facility or group-living quarters), preparation of a site-specific dust control plan. That plan must include a number of equivalent measures to minimize visible dust. These measures contain all the dust control measures presented in the BAAQMD CEQA Guidelines; however the *San Francisco Health Code* requirements increase the watering frequency as well as adding monitoring, recordkeeping, third-party verification, and community outreach requirements not found in the BAAQMD guidelines.

Air Quality Assessment and Ventilation Requirement for Urban Infill Residential Developments

As explained earlier, exposure to $PM_{2.5}$ can result in adverse health effects. SFDPH has developed a strategy for addressing exposures in the siting of new residential buildings.[185] *San Francisco Health Code* Article 38 requires an air quality assessment to evaluate the concentration of $PM_{2.5}$ from local roadway traffic sources

[185] San Francisco Department of Public Health, *Assessment and Mitigation of Air Pollutant Health Effects from Intra-urban Roadways: Guidance for Land Use Planning and Environmental Review*, May 6, 2008.

that may impact new residential development containing 10 or more dwelling units on a site. If the air quality assessment indicates that the estimated concentration of $PM_{2.5}$ at the site attributable to all roadway vehicle emissions within 500 feet (approximately 150 meters) of the site would be greater than 0.2 $\mu g/m^3$ (micrograms per cubic meter), Section 3807 requires development on the site to be designed or relocated to avoid exposure greater than 0.2 $\mu g/m^3$, or a ventilation system to be installed that would be capable of removing 80 percent of ambient $PM_{2.5}$ from habitable areas of the residential units. An Article 38 analysis done for the Project area identified three locations along Arelious Walker between Harney Way and Carroll Avenue, within 50 to 100 feet from the roadway, where total $PM_{2.5}$ roadway concentrations would be expected to exceed 0.2 $\mu g/m^3$ assuming 2030 traffic conditions.[186] Residential structures planned in these locations will be required to comply with Article 38 provisions, which could include redesign or setback of structures to avoid residential exposure or installation of a ventilation system in new residential units, all of which would reduce exposures below the 0.2 $\mu g/m^3$ level.

III.H.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to air quality, but generally consider that implementation of the Project would have significant impacts if it were to:

- H.a Conflict with or obstruct implementation of the applicable air quality plan
- H.b Violate any air quality standard or contribute substantially to an existing or projected air quality violation
- H.c Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal, state, or regional ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors)
- H.d Expose sensitive receptors to substantial pollutant concentrations
- H.e Create objectionable odors affecting a substantial number of people

Criteria Pollutants

Construction

The BAAQMD does not recommend any significance thresholds for the emissions of fugitive dust during construction. Instead, the BAAQMD bases the criteria on a consideration of the control measures to be implemented. If all appropriate emissions control measures recommended by the *BAAQMD CEQA Guidelines* are implemented for a project, construction emissions are not considered significant.[187] The City takes a similar approach. As discussed above, *San Francisco Health Code* Article 22B, Construction Dust Control, also requires preparation of a site-specific dust control plan (with mandatory control measures similar to the BAAQMD's) for construction projects within 1,000 feet of sensitive receptors (residence, school, childcare center, hospital or other health-care facility or group-living quarters).

[186] ENVIRON, *Community Hazards and San Francisco Health Code Article 38 Analyses*, May 2010 (also contained in Appendix H4 of the EIR).
[187] BAAQMD, *BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans*, December 1999.

Operation

The BAAQMD recommends that projects with operational emissions that exceed any of the following mass criteria pollutant thresholds be considered significant. These thresholds apply to the operational emissions associated with individual projects only; they do not apply to construction-related emissions. The operational emissions that are generated by individual projects and exceed these thresholds are also considered to be a cumulatively considerable contribution to cumulative air quality by the BAAQMD:

- 80 pounds per day (ppd) or 15 tons per year (tpy) of ROG
- 80 ppd or 15 tpy of NO_X
- 80 ppd or 15 tpy of PM_{10}

Carbon Monoxide

Operational emissions of CO are considered significant if they cause or contribute to violations of the federal or state ambient air quality standards for CO (i.e., 35 ppm and 20 ppm, respectively, for one-hour averages; 9 ppm for eight-hour averages).

Toxic Air Contaminants

Construction

Though not explicitly required by BAAQMD CEQA Guidelines,[188], a HRA was conducted to evaluate the human health effects from emissions of DPM and TAC-containing soil-PM_{10} associated with Project construction activities. This analysis was deemed appropriate due to the scale (multi-year time horizon utilizing extensive construction equipment over a large area) and location (e.g., brownfield redevelopment on land which may contain residual chemicals in soil) of the Project. Therefore, the BAAQMD CEQA significance thresholds as described below were used to evaluate the possibility that emissions of DPM or soil-PM_{10} emissions from Project construction activities would expose the public to potential airborne health risks:

- Probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 1 x 10^{-5} (10 in a million)
- Ground level concentrations of noncarcinogenic air contaminants/pollutants resulting in a HI greater than 1 for the MEI

Operation

Pursuant to BAAQMD CEQA Guidelines,[189] projects that would expose the public to potential airborne health risks in excess of the following thresholds would be considered to have a significant air quality impact:

- Probability of contracting cancer for the MEI exceeds 1 x 10^{-5} (10 in a million)
- Ground level concentrations of noncarcinogenic air contaminants/pollutants resulting in a HI greater than 1 for the MEI

---

[188] Ibid.

[189] BAAQMD, *BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans*, December 1999.

$PM_{2.5}$

- BAAQMD does not currently recommend a threshold of significance for determining impacts associated with localized exposures to $PM_{2.5}$, but is addressing this issue in its draft CEQA guidelines. California ARB also has not established a health-protective threshold for $PM_{2.5}$. In the absence of an agency-recommended health-based $PM_{2.5}$ standard, annual average exposures from roadway vehicles within a 150-meter buffer of a sensitive receptor below an action level (0.2 $\mu g/m^3$) identified by SFDPH[190] were considered less than significant for CEQA purposes. The rationale provided by SFDPH for the 0.2 $\mu g/m^3$ action level included studies suggesting that "a change in ambient concentrations of $PM_{2.5}$ by 0.2 $\mu g/m^3$, independent of other vehicle pollutants would result in significant forecasted health impacts" (2008).

- The 0.2 $\mu g/m^3$ identified level is in accord with proposed CEQA guidelines developed by BAAQMD for $PM_{2.5}$.[191] According to BAAQMD, "emissions from a new source or emissions affecting a new receptor would be considered significant where ground-level concentrations of $PM_{2.5}$ from any source would result in an average annual increase greater than 0.3 $\mu g/m^3$."[192] This determination is based on the lower range of a USEPA proposed Significant Impact Level (SIL) for stationary sources, which is interpreted by the USEPA as the level of ambient impact that is considered to represent a "significant contribution" to regional nonattainment. The BAAQMD goes on to indicate that the USEPA did not design this threshold for addressing community risks and hazards, but it was designed to protect human public health at a regional level by helping an area to maintain the NAAQS. The BAAQMD determined this SIL to be a reasonable goal at the local scale and, therefore, a useful reference for comparison. The BAAQMD states that this proposed threshold (0.3 $\mu g/m^3$) is consistent with the SFDPH threshold of 0.2 $\mu g/m^3$. The BAAQMD reached that conclusion based on an ARB report that determined an increase in mortality from a 0.3 $\mu g/m^3$ increment of $PM_{2.5}$ was consistent with the estimated increase in mortality assumed by SFDPH in identifying the 0.2 $\mu g/m^3$ increment. BAAQMD further states that "On balance, the Air District estimates that the SFDPH threshold and the [District proposed threshold of 0.3 $\mu g/m^3$], in combination with the cumulative threshold for $PM_{2.5}$, will afford similar levels of health protection." BAAQMD is recommending a cumulative threshold for $PM_{2.5}$ of 0.8 $\mu g/m^3$, which is the mid-range USEPA proposed SIL.

Proposed BAAQMD CEQA Thresholds

As presented under the "Regional" discussion in Section III.H.3 (Regulatory Framework), as of the date of this Draft EIR, the BAAQMD is in the process of revising their CEQA guidelines and expects the draft to be approved by their Board of Directors by the end of 2009. On October 7, 2009, the BAAQMD released a draft table of Staff-Recommended CEQA Thresholds of Significance which indicates a number of modifications to existing guidelines, including changes to the maximum daily emissions thresholds for criteria pollutants emissions from operational sources as well as requirements for the quantification of criteria pollutant and TAC emissions from construction activities and comparison to mass emission or risk thresholds, respectively. As these draft guidelines have not been adopted by the BAAQMD's Board of

[192] BAAQMD, *California Environmental Quality Act Guidelines Update: Proposed Thresholds of Significance*. December 7, 2009, page 43.

Directors, the Project is not subject to the draft requirements. However, the potential impacts of the Project with respect to the draft requirements are discussed at the end of this section.

Analytic Method

Criteria Pollutants

Construction

This analysis takes into account that the Project would implement all PM_{10} control measures recommended by the BAAQMD and required under the *San Francisco Health Code* Article 22B; these will be documented in a Project-specific dust control plan.

Operation

The Project's operational mass emissions of criteria air pollutants were estimated with the URBEMIS 2007[193] model initialized with land use specifications taken from the Project Description and traffic data taken from the Transportation Study.[194]

The Project would generate criteria pollutant emissions from on-site area sources (i.e., natural gas combustion for space and water heating, combustion of other fuels by building and grounds maintenance equipment, etc.). Those area-source emissions were also estimated by the URBEMIS 2007 model based the Project's mix of land uses as defined in the Project Description.

- The Project, at full build-out (2032), would also generate 78,109 daily external motor vehicle trips.[195] The URBEMIS 2007 model was used to calculate the criteria pollutant emissions associated with these trips. For purposes of this analysis, all trips associated with the Project were assumed to be new trips within the SFBAAB, although some portion of the trips attributed to the Project would be likely occur in the region whether or not the Project were developed. Thus, the Project emission estimates represent a conservative analysis of potential new emissions from mobile sources. The Project would incorporate features intended to reduce motor vehicle trips, designed as a dense, compact development with mixed land uses that would facilitate pedestrian, bicycle, and transit travel. As such, the Project vehicle trip generation would be substantially greater without these trip-reduction features. The Project's transportation analysis estimates that a similar development that did not include the Project's trip reduction features would generate 137,282 daily external motor vehicle trips (about 76 percent more than the Project's daily external motor vehicle trips).[196]

The URBEMIS 2007 files used to develop the criteria pollutant emissions inventory for the Project can be found in Appendix H1.

[195] Ibid.
[196] Ibid.

Carbon Monoxide

The Project's effects on CO concentrations were estimated with the California Department of Transportation's CALINE4 model,[197] as recommended by the BAAQMD for Bay Area conditions, and initialized with traffic data taken from the Transportation Study.[198] The CALINE4 modeling files used to evaluate CO concentrations for the Project can be found in Appendix H1.

Toxic Air Contaminants

Construction

The methods used to analyze the human health effects from emissions of DPM and TAC-containing PM_{10} associated with Project construction activities were developed consistent with BAAQMD, Cal/EPA, and USEPA risk assessment guidance. The analysis incorporates conservative (i.e., health-protective) methodologies for the following: (1) the estimation of emissions, (2) the calculation of airborne concentrations of either DPM or TACs bound to soil-PM_{10} emitted during construction activities at receptor locations, and (3) the estimation of excess lifetime cancer risks and noncancer health effects or HIs. Details of these analyses can be found in Appendix H3, Attachments I (Human Health Risk Assessment of Construction-related DPM) and II (Human Health Risk Assessment of Chemicals Bound to Airborne PM_{10}).

Construction activities associated with the development of Candlestick Point include asbestos and lead paint abatement inside buildings, demolition, grading, excavation, and foundation and structure construction, all of which could generate DPM and some of which could generate dust (PM_{10}) containing contaminated soil. Specifically, construction sources of DPM could include off-road construction equipment such as lifts, loaders, excavators, dozers, and graders spread over a 281-acre area. In addition, the following types of vehicle traffic could contribute to construction-related DPM emissions: equipment and material delivery, spoils and debris hauling, and employee commute. PM_{10} emissions evaluated include demolition and soil grading activities associated with Project construction activities. Those Project areas where PM_{10} emissions were from soils with chemicals present at concentrations above residential cleanup goals were included in the evaluation and chemical concentrations associated with the airborne PM_{10} were estimated based on the chemical concentrations in soils.

Cancer risks and noncancer HIs were evaluated for off-site receptors in the Project vicinity including residents (child and adult), workers and other sensitive receptors (schoolchildren) located in the surrounding community and along the expected travel routes of on-road delivery and haul trucks, including residents at the HPS Phase I location as well as schoolchildren attending schools to the west of the Project area. Additionally, health impacts were evaluated for existing on-site sensitive receptors, including residents at the Alice Griffith Public Housing site. The Project would include redevelopment of Alice Griffith Public Housing to provide one-for-one replacement units, and eligible Alice Griffith Public Housing residents would have the opportunity to move to the new units directly from their existing Alice Griffith Public

[197] California Department of Transportation. CALINE4 – A Dispersion Model for Predicting Air Pollutant Concentrations Near Roadways, FHWA/CA/TL-84/15, Final Revision June 1989. http://www.dot.ca.gov/hq/env/air/pages/CO.htm.
[198] Candlestick Point-Hunter Point Shipyard Phase II Development Plan Transportation Study. Prepared by CHS Consulting Group, Fehr & Peers and LCW Consulting, October 2009.

Housing units without having to relocate to any other area. Therefore, while construction would occur at one parcel, residents would continue to reside at the remaining parcels. As such, these residents have been identified as on-site receptors during Project construction.

Airborne concentrations of DPM and TACs bound to soil-PM_{10} were estimated at receptor locations using the emissions estimates and the USEPA–recommended air dispersion model American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD), version 07026. Based on the results of the exposure evaluation and air dispersion modeling, quantitative estimates of excess lifetime cancer risks and noncancer HIs associated with potential exposure to Project-related emissions were developed. The methods used to estimate excess lifetime cancer risks and noncancer HIs are consistent with risk assessment guidance from BAAQMD, Cal/EPA, and USEPA.

For the purposes of conducting the HRA of DPM, the Project, with construction of a new 49ers stadium, would involve the longest construction period and the heaviest use of construction equipment and would represent the greatest increase in potential human health risks from construction activities as compared to all other variants and alternatives (refer to Chapter IV [Project Variants] for further discussion of Project variants). It would be assumed that if exposures and associated risk estimates for the Project were below BAAQMD thresholds, the risks associated with the Project variants development program would also be below thresholds.

Since the HRAs for DPM or TACs bound to soil-PM_{10} emitted during construction activities were completed, changes were made to the Project Description including the addition of roadway improvements on Ingerson and Jamestown Avenues, change in the Candlestick Point construction schedule (completion in 2031), and slight changes to the Candlestick Point phasing boundaries. These changes to the Project Description were found not to change the HRA conclusions significantly, as documented in a technical memorandum included in Appendix H3, Attachment VI.

Operation

Based on the type of uses permitted under the Project, the potential for TACs to be emitted by the Project and affect nearby receptors would likely only occur within areas designated for R&D uses, which would be restricted to HPS Phase II. Because the Project land use designations provide that a wide range of development can operate in the R&D areas within the HPS Phase II site, the exact type of stationary sources and quantity of the emissions from those sources are not known. As a result, a conservative scenario was established so that the impact of the potential aggregate emissions from all future TAC emission sources in these R&D areas could be evaluated at surrounding receptor locations. Details regarding this assessment can be found in Appendix H3, Attachment III.[199]

For this prospective screening-level analysis, a series of conservative assumptions was made:

- A wide range of stationary sources could operate in the R&D area; thus, the identity and amounts of the TACs emitted from these sources cannot be determined at this time.
- In order to approximate the maximum potential number of facilities with TAC emitting sources, the area designated for proposed R&D development would be divided into one-acre plots, which is

[199] ENVIRON, *Ambient Air Quality Human Health Risk Assessment: Candlestick Point–Hunters Point Shipyard Phase II Development Plan*, Attachment III, May 4, 2010. See Appendix H3.

- generally consistent with the minimum size of a parcel based on the expected land uses within the R&D parcels.
  - A single R&D facility (or a stationary source such as a collection of emitting sources like boilers, emergency generators, etc.) would be constructed on the one-acre plot.
  - The cancer risk at the boundary of each one-acre plot was set not to exceed a designated cancer risk level or chronic noncancer HI threshold (in this case a residential cancer risk of 10 in one million and a chronic noncancer HI of 1.0, in accordance with BAAQMD thresholds of significance).
  - It was conservatively assumed that all receptor locations surrounding the R&D area were residential.

Potential health impacts of this scenario were evaluated at receptor locations within approximately 500 meters (about a third of a mile) of the R&D areas. Impacts would be lower beyond this distance. In addition, the TAC analysis conservatively used a total of 5 million square feet of R&D uses, the amount proposed in Variant 1. Refer to Chapter IV for further discussion of Project variants. It would be assumed that if exposures and associated risk estimates for that total R&D use were below health risk thresholds, the risks associated with the Project R&D program of 2.5 million square feet would also be below thresholds. For this screening evaluation, all surrounding receptors were conservatively evaluated as residential receptors (i.e., potential exposures/risks for other populations would be less, as the exposure frequency and duration would be less than a residential scenario).

Although excess lifetime cancer risk and chronic noncancer HIs were explicitly evaluated, acute risks were not evaluated, as it would be highly unlikely that all emissions sources would be operating at their maximum emission rate at the same time (e.g., for any single hour).

$PM_{2.5}$

- Although not required as part of the criteria pollutant analysis, the incremental increase in the concentration of vehicular emissions of $PM_{2.5}$ associated with the Project that would occur along selected roadways were compared to the 0.2 $\mu g/m^3$–identified action level. The details of the HRA for $PM_{2.5}$ can be found in Appendix H3, Attachment IV.

Emissions from vehicle exhaust, tire wear, and brake wear were estimated using the most recent version of the Emission Factor model (EMFAC), developed by the California ARB, modified to account for emission reduction regulations recently implemented by California ARB which have not yet been incorporated into EMFAC. Vehicle traffic data for the Project were taken from the transportation technical report.[200]

The concentration of $PM_{2.5}$ from vehicular emissions was characterized by developing exposure point concentrations at residential receptors surrounding the thoroughfares and roadways evaluated: Third Street; Innes Avenue/Hunters Point Boulevard/Evans Avenue; Palou Avenue; Gilman Avenue/Paul Avenue; Jamestown Avenue; Ingerson Avenue; and Harney Way. Those thoroughfares would connect the Project and major arterials to US-101 or downtown San Francisco. In addition, Innes Avenue/Hunters

- Point Boulevard/Evans Avenue and Harney Way were identified as streets with truck traffic and thus would be expected to yield more $PM_{2.5}$ compared to other roads. Palou Avenue and Gilman Avenue/Paul Avenue were evaluated quantitatively as there are residences in the vicinity of these roads where individuals

[200] Candlestick Point-Hunter Point Shipyard Phase II Development Plan Transportation Study. Prepared by CHS Consulting Group, Fehr & Peers and LCW Consulting, October 2009.

may incur exposure to $PM_{2.5,}$ while Jamestown and Ingerson Avenues were evaluated in a semi-quantitative manner as they are immediately adjacent to residences; however, have much lower expected Project-related vehicle traffic than Palou and Gilman/Paul.

- Annual average airborne concentrations of $PM_{2.5}$ attributable to Project-related traffic emissions were estimated by applying a Gaussian air dispersion model, CAL3QHCR, which has been approved by the USEPA and California ARB for use in the environmental documentation of transportation projects. Both free flowing traffic and queuing at intersections were evaluated.

Construction Impacts

Impact AQ-1: Criteria Pollutants

Impact AQ-1 **Construction activities associated with the Project would not result in short-term increases in emission of criteria air pollutants and precursors that exceed BAAQMD CEQA significance criteria. (Less than Significant with Mitigation)** ***[Criteria H.b and H.d]***

Construction of the Project is anticipated to occur continuously for approximately 20 years. Construction activities would include site preparation, grading, placement of infrastructure, placement of foundations for structures, and fabrication of structures. Demolition, excavation and construction activities would require the use of heavy trucks, excavating and grading equipment, concrete breakers, concrete mixers, and other mobile and stationary construction equipment. Emissions during construction would be caused by material handling, traffic on unpaved or unimproved surfaces, demolition of structures, use of paving materials and architectural coatings, exhaust from construction worker vehicle trips, and exhaust from diesel-powered construction equipment.

Heavy construction activity on dry soil exposed during construction phases would cause emissions of dust. Throughout construction, pollutant emissions could vary day to day, depending on the specific phase. When considered in the context of long-term Project operations, demolition and construction-related emissions would be temporary, but these activities still could cause potentially significant effects on local air quality.

According to the BAAQMD, PM_{10} is the pollutant of greatest concern with respect to construction-related emissions.[201] Although heavy-duty equipment, material transport, and employee commutes result in emissions of criteria air pollutants (e.g., CO) and precursors (e.g., ROG and NO_X), these emissions are included in the regional emissions inventory, which serves as the basis for the air quality plans, and are not expected to impede attainment of the ozone standard or maintenance of the CO standard in the SFBAAB. Consequently, the BAAQMD has not adopted mass emission thresholds for construction-related emissions of ROG and NO_X and bases its determination of significance on consideration of the fugitive PM_{10} dust control measures to be implemented.[202]

To minimize dust emissions, *San Francisco Health Code* (Article 22B) and the BAAQMD[203] have identified a set of control measures. Implementation of MM HZ-15, which would require the Applicant to ensure that

[201] Ibid.
[202] Ibid.
[203] Ibid.

construction contractors comply with the dust control strategies included in an approved dust control plan as part of a site-specific dust control plan, would reduce the impacts caused by construction dust to a less-than-significant level.

Impact AQ-2: DPM from Construction Activities

As described earlier, an HRA[204] evaluated potential human health effects due to exposure to DPM from heavy equipment exhaust that may be emitted during Project-related construction activities including abatement, demolition, grading, excavation, and foundation and structure construction. Specifically, the construction sources of DPM evaluated include off-road construction equipment such as lifts, loaders, excavators, dozers, and graders. Potential exposures to DPM from on-road diesel trucks that transport construction materials and debris from the Project to the nearest freeways were also evaluated. On-road sources of DPM include on-road equipment such as haul trucks, and on-road support vehicles (e.g., pick-ups) as well as emissions associated with workers commuting to the Project site. DPM emissions from these activities were estimated assuming the following mitigation were in place:

- Construction equipment used for the Project would utilize a phased-in emission control technology in advance of a regulatory requirement such that 50 percent of the fleet will meet USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) during the first two years of construction activities, increasing to 75 percent of the fleet in the third year and 100 percent of the fleet starting in the fourth year and for the duration of the Project
- Construction equipment used in the Alice Griffith parcels (CP01 through CP06) would utilize equipment which meets the USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) throughout the entire duration of construction activities on those parcels.

Potential exposures to DPM from proposed Project construction activities were evaluated for off-site receptors in the vicinity of the Project and the expected travel routes of on-road diesel haul trucks (e.g., (adult and child residents, workers, and schoolchildren). Potential exposures to DPM by potential on-site residents within the Alice Griffith Housing area were also evaluated. As discussed earlier, airborne concentrations of DPM were estimated at receptor locations using the emissions estimates and the USEPA–recommended air dispersion model, AERMOD. Based on the results of the exposure evaluation and air dispersion modeling, quantitative estimates of excess lifetime cancer risks and noncancer HIs associated with potential exposure to Project-related emissions were developed. The methods used to estimate excess lifetime cancer risks and noncancer HIs are consistent with risk assessment guidance from BAAQMD, Cal/EPA, and USEPA.

[204] ENVIRON, *Ambient Air Quality Human Health Risk Assessment: Candlestick Point–Hunters Point Shipyard Phase II Development Plan*, May 4, 2010. See Appendix H1.

Impact of Candlestick Point

Impact AQ-2a **Construction at Candlestick Point would not result in impacts to off-site populations from Project-generated emissions of DPM. (Less than Significant with Mitigation) *[Criterion H.d]***

As noted earlier, BAAQMD CEQA Guidelines has an established threshold of 10 in one million for carcinogenic health risks. The HRA which took into account the mitigation measures described above concluded that the cancer risk at the MEI would be 3.3 in one million. This represents the maximum level of DPM experienced by all off-site sensitive receptors during Candlestick Point construction activities. Exposure to DPM from construction activities associated with Candlestick Point would not exceed the threshold. In addition, the HRA concluded the maximum chronic noncancer HI to be 0.007, which is below the BAAQMD's significance threshold of 1.0.

The impact of Candlestick Point construction activities without the mitigation described above would result in an estimated cancer risk at the MEI of 11 in one million, above the significance threshold of 10 in one million and, therefore, significant without mitigation. The corresponding chronic noncancer HI for the unmitigated emissions was estimated to be 0.027, which is below the BAAQMD's noncancer HI significance threshold of 1.0.

Due to the scale of the construction activities and proximity to adjacent receptors, without mitigation the impacts would be potentially above the BAAQMD's significance threshold and would, therefore, be potentially significant.

As the carcinogenic and noncarcinogenic health risks posed by DPM emissions during construction activities associated with development of Candlestick Point have been determined to be below established thresholds with mitigation, this impact is less than significant with mitigation measure MM AQ-2.1:

MM AQ-2.1 *Implement Emission Control Device Installation on Construction. To reduce DPM emissions during Project construction, the Project Applicant shall require construction equipment used for the Project to utilize emission control technology such that 50% of the fleet will meet USEPA Tier 2 standards outfitted with California ARB Level 3 VDECS (Verified Diesel Emission Control Strategies) for particulate matter control (or equivalent) during the first two years of construction activities, increasing to 75% of the fleet in 2012 and 100% of the fleet starting in 2013 and for the duration of the Project.*

Impact of Hunters Point Shipyard Phase II

Impact AQ-2b **Construction at HPS Phase II would not result in impacts to off-site populations from Project-generated emissions of DPM. (Less than Significant with Mitigation) *[Criterion H.d]***

As noted above, BAAQMD CEQA Guidelines has an established threshold of 10 in one million for carcinogenic health risks; the HRA which took into account the mitigation measures described above concluded that the cancer risk at the MEI would be 3.8 in one million. This represents the maximum level of DPM experienced by all off-site sensitive receptors during HPS-Phase II construction activities. Construction activities associated with HPS Phase II would not exceed the threshold. In addition, the HRA concluded the maximum chronic non-cancer HI to be 0.01, which is below the BAAQMD's significance threshold of 1.0. The impact of HPS Phase II construction activities without the mitigation described

above would result in an estimated cancer risk at the MEI of 8.4 in one million, which is below the significance threshold of 10 in one million and, therefore, less than significant without mitigation. The corresponding chronic noncancer HI for the unmitigated emissions was estimated to be 0.024, which is below the BAAQMD's noncancer HI significance threshold of 1.0.

Due to the scale of the construction activities and proximity to adjacent receptors, without mitigation the impacts would be potentially above the BAAQMD's significance threshold and would, therefore, be potentially significant.

As the carcinogenic and noncarcinogenic health risks posed by DPM emissions during construction activities associated with development of HPS-Phase II have been determined to be below established thresholds with and without mitigation, this impact is less than significant with implementation of mitigation measure MM AQ-2.1.

Impact of Alice Griffith Public Housing

Impact AQ-2c **Construction activities associated with the Project would not result in impacts to the existing Alice Griffith Public Housing from Project-generated emissions of DPM. (Less than Significant with Mitigation) *[Criterion H.d]***

As noted earlier, BAAQMD CEQA Guidelines has an established threshold of 10 in one million for carcinogenic health risks; the HRA which took into account the mitigation measures described above concluded that the cancer risk at the MEI inside Alice Griffith would be 4.5 in one million. This represents the maximum level of DPM experienced by all on-site sensitive receptors during Project construction activities. Exposure to DPM from construction activities associated with the Project would not exceed the threshold. In addition, the HRA concluded the maximum chronic non-cancer HI to be 0.02, which is below the BAAQMD's significance threshold of 1.0.

The impact of Candlestick Point and HPS Phase II construction activities without the mitigation described above would result in an estimated cancer risk at the on-site MEI (sensitive receptors inside Alice Griffith) of 20 in one million, above the significance threshold of 10 in one million and therefore significant without mitigation. The corresponding chronic noncancer HI for the unmitigated emissions was estimated to be 0.09, which is below the BAAQMD's noncancer HI significance threshold of 1.0.

Due to the scale of the construction activities and proximity to adjacent receptors, without mitigation the impacts would be potentially above the BAAQMD's significance threshold and would therefore be potentially significant.

As the carcinogenic and noncarcinogenic health risks posed by DPM emissions during construction activities associated with development of the Project have been determined to be below established thresholds with mitigation, this impact is less than significant with implementation of mitigation measure MM AQ-2.1 and mitigation measure MM AQ-2.2:

MM AQ-2.2 *Implement Accelerated Emission Control Device Installation on Construction Equipment Used for Alice Griffith Parcels. In addition to mitigation measure MM AQ-2.1, in order to minimize the potential impacts to residents living in Alice Griffith from the construction activities in that area, the Project Applicant will require that all construction equipment used in the Alice Griffith parcels (CP01 though*

CP06) would utilize equipment which meets the USEPA Tier 4 engine standards for particulate matter control (or equivalent) throughout the entire duration of construction activities on those parcels.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact AQ-2 Construction activities associated with the Project would not result in impacts to on-site and off-site populations from Project-generated emissions of DPM. (Less than Significant with Mitigation) *[Criterion H.d]*

As noted earlier, BAAQMD CEQA Guidelines has an established threshold of 10 in one million for carcinogenic health risks; the HRA which took into account the mitigation measures described above concluded that the inhalation cancer risk at the on-site and off-site MEI would be 4.5 in one million. This represents the maximum level of DPM experienced by all off-site and on-site (i.e., Alice Griffith) sensitive receptors during Project construction activities. Exposure to DPM from construction activities associated with the Project would not exceed the threshold. In addition, the HRA concluded the maximum chronic noncancer HI to be 0.01, which is below the BAAQMD's noncancer HI significance threshold of 1.0.

The impact of Candlestick Point and HPS Phase II construction activities without the mitigation described above would result in an estimated cancer risk at the on-site and off-site MEI of 20 in one million, above the significance threshold of 10 in one million and therefore significant without mitigation. This represents the maximum level of DPM experienced by all off-site and on-site (i.e., Alice Griffith) sensitive receptors during Project construction activities. The corresponding chronic noncancer HI for the unmitigated emissions was estimated to be 0.09, which is below the BAAQMD's noncancer HI significance threshold of 1.0.

Due to the scale of the construction activities and proximity to adjacent receptors, without mitigation the impacts would be potentially above the BAAQMD's significance threshold and would, therefore, be potentially significant.

As the carcinogenic and noncarcinogenic health risks posed by DPM emissions during construction activities associated with development of HPS Phase II have been determined to be below established thresholds with mitigation in place, this impact is less than significant with implementation of mitigation measure MM AQ-2.1 and mitigation measure MM AQ-2.2.

Impact AQ-3: TACs from Construction Activities

Within the HPS Phase II site, there are many existing structures associated with ship repair, piers, dry-docks, storage, administrative, and other former Navy uses. Most of these structures are currently vacant, but the materials historically used in association with operation of these facilities have resulted in a number of hazardous materials release sites and associated contaminated soils. The types, levels, and extent of contamination of soils and other environmental media have been identified for the HPS Phase II area through a series of comprehensive environmental investigations conducted at the direction of the Navy. The Navy is currently in the process of remediating on-site conditions but some of the remedial activities may be conducted after approval of the Project, and, therefore, the current on-site conditions are considered during the evaluation of potential health hazards as a result of development of HPS Phase II. Similar to the activities described above for Candlestick Point, demolition and soil grading activities associated with HPS Phase II could release TACs bound to soil-PM_{10} into the air and pose potential health risks to nearby receptors on and off site. As described earlier, an HRA evaluated the potential concentrations of the airborne soil-PM_{10} at

numerous receptors on site (residents at the Alice Griffith Public Housing units) and off site (adult and child residents, workers, and schoolchildren) in the Project vicinity.

In order to determine the concentration of TACs in soils during Project construction activities, a number of site investigations and HHRAs were evaluated for HPS and CP.

- HPS—The Navy directed a series of comprehensive environmental investigations and HHRAs at the former HPS. The selection of areas and chemicals for evaluation in this HHRA is based on information and analytical results presented in the Navy HHRA reports. The Navy applied a consistent investigation and risk assessment approach for each of the Parcels. Specifically, each Parcel was divided into "redevelopment blocks," corresponding to the future reuse (e.g., residential or recreational) outlined in the Hunters Point Shipyard Redevelopment Plan (San Francisco Redevelopment Agency [SFRA] 1997). The Navy HHRAs identified the proposed future use and associated soil cleanup levels (corresponding to residential, industrial, or recreational levels) for each redevelopment block. The selection of areas for evaluation in this HHRA was based on the environmental condition of the Parcels and/or redevelopment blocks within a Parcel at the time Project construction activities will commence, as provided by the Project Applicant. Specifically, if a redevelopment block (within a Parcel) is designated for residential use (including mixed use), it was assumed that the redevelopment block had been remediated to residential cleanup levels prior to construction activities, and the redevelopment block was excluded from the analysis; all remaining redevelopment blocks within a Parcel were identified for quantitative evaluation. This is a conservative approach in that it is possible that areas designated for nonresidential uses will also have been remediated prior to construction activities. However, because residual concentrations in soil in these areas may remain above residential levels, as a screening-level approach, it was conservatively assumed that nonresidential areas had not been remediated.
- CP—Analytical results for chemicals in soils within the CP area were available from two investigations conducted by Geomatrix Consultants, Inc.: *Site Investigation and Risk Evaluation Report for the Proposed San Francisco 49ers Stadium and Mall Site: North Park and Last Port Areas*[205] and *Addendum 1 to the Site Investigation and Risk Evaluation Report for the Proposed San Francisco 49ers Stadium and Mall Site: North Park and Last Port Areas*.[206]

Emissions of soil PM_{10} from construction activities were estimated assuming the mitigation measures discussed in MM HZ-15. Projected emissions without these mitigation measures were not quantified. As discussed earlier, airborne concentrations of TACs bound to soil-PM_{10} were estimated at receptor locations using the emissions estimates and the USEPA–recommended air dispersion model, AERMOD. Based on the results of the exposure evaluation and air dispersion modeling, quantitative estimates of excess lifetime cancer risks and noncancer HIs associated with potential exposure to Project-related emissions were developed. The methods used to estimate excess lifetime cancer risks and noncancer HIs are consistent with risk assessment guidance from BAAQMD, Cal/EPA, and USEPA.

[206] Geomatrix Consultants. 1998. Addendum 1 to the Site Investigation and Risk Evaluation Report for the Proposed San Francisco 49ers Stadium and Mall Site: North Park and Last Port Areas. Candlestick Point, San Francisco, California. Volume I of II.

Impact of Candlestick Point

Impact AQ-3a **Construction at Candlestick Point would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}. (Less than Significant with Mitigation) *[Criterion H.d]***

Historical operations within the Candlestick Point site have increased the concentration levels of certain metals and/or organic compounds in the on-site soils. During construction activities (demolition and soil grading) associated with development at Candlestick Point, these chemicals could be released into the air, bound to dust particles or particulate matter (PM_{10}) and pose health risks to nearby receptors on- and off site. As described earlier, an HRA evaluated the potential concentrations of the airborne soil-PM_{10} at numerous receptors on site (residents at the Alice Griffith Public Housing units) and off site (adult and child residents, workers, and schoolchildren) in the Project vicinity.

As noted above, BAAQMD CEQA Guidelines has an established threshold of 10 in 1 million for carcinogenic health risks; the inhalation cancer risk at the point of maximum impact or MEI as a result of construction activities at the Candlestick Point would be 0.04 in one million. This represents the maximum level of PM_{10} experienced by all sensitive receptors in and around the Project during construction activities. Exposure to soil-PM_{10} from construction activities associated with Candlestick Point would not exceed the threshold.

In addition, the HRA concluded the maximum non-cancer HI to be 0.01, which would be below the BAAQMD's significance threshold of 1.0.

As the carcinogenic and noncarcinogenic health risks posed by soil-PM_{10} emissions during construction activities associated with development of Candlestick Point have been determined to be below established thresholds, this impact is less than significant with mitigation measure MM HZ-15 discussed above. An analysis was not conducted to determine the impact of Project construction activities without the dust control mitigation measures described in MM HZ-15 because the dust controls described in MM HZ-15 are required by *San Francisco Health Code* Article 22B or BAAQMD regulations. Due to the scale of the construction activities and proximity to adjacent receptors, without these dust control measures, the impacts from TACs bound to soil PM_{10} would likely be above the BAAQMD's significance threshold and would, therefore, be potentially significant.

Impact of Hunters Point Shipyard Phase II

Impact AQ-3b **Construction at HPS Phase II would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}. (Less than Significant with Mitigation) *[Criterion H.d]***

Historical operations within the HPS Phase II site have increased the concentrations of certain metals and/or organic compounds in the on-site soils. During construction activities (demolition and soil grading) associated with development at HPS Phase II, these chemicals could be released into the air, bound to dust particles or particulate matter (PM_{10}) and pose health risks to nearby receptors on and off site. As described earlier, an HRA evaluated the potential concentrations of the airborne soil-PM_{10} at numerous receptors on site (residents at the Alice Griffith Public Housing units) and off site (adult and child residents, workers, and schoolchildren) in the Project vicinity.

As noted above, BAAQMD has an established threshold of 10 in 1 million for carcinogenic health risks; the inhalation cancer risk at the point of maximum impact or MEI as a result of construction activities at the HPS Phase II site would be 0.01 in one million. This represents the maximum level of PM_{10} experienced by all sensitive receptors in and around the Project during construction activities. Exposure to soil-PM_{10} from construction activities associated with Candlestick Point would not exceed the threshold.

In addition, the HRA concluded the maximum non-cancer HI to be 0.03, which would be below the BAAQMD's significance threshold of 1.0.

As the carcinogenic and noncarcinogenic health risks posed by soil-PM_{10} emissions during construction activities associated with development of HPS Phase II have been determined to be below established thresholds, this impact is less than significant with mitigation measure MM HZ-15 discussed above. An analysis was not conducted to determine the impact of Project construction activities without the dust control mitigation measures described in MM HZ-15 because the dust controls described in MM HZ-15 are required by *San Francisco Health Code* Article 22B or BAAQMD regulations. Due to the scale of the construction activities and proximity to adjacent receptors, without these dust control measure, the impacts from TACs bound to soil PM_{10} would likely be above the BAAQMD's significance threshold and would, therefore, be potentially significant.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact AQ-3 **Construction activities associated with the Project would not result in impacts to off-site and Alice Griffith populations from emissions of TACs bound to soil-PM_{10}. (Less than Significant with Mitigation) *[Criterion H.d]***

As discussed earlier, construction activities at both Candlestick Point and HPS Phase II have the potential to generate TACs associated with soil-PM_{10} and an HRA evaluated the potential concentrations of the airborne soil-PM_{10} at numerous receptors on site (residents at the Alice Griffith Public Housing units) and off site (adult and child residents, workers, and schoolchildren) in the Project vicinity.

As noted above, BAAQMD has an established threshold of 10 in 1 million for carcinogenic health risks; the inhalation cancer risk at the point of maximum impact or MEI as a result of construction activities at the Project would be 0.04 in one million. This represents the maximum level of PM_{10} experienced by all sensitive receptors in and around the Project during construction activities. Exposure to soil-PM_{10} from construction activities associated with Candlestick Point would not exceed the threshold.

In addition, the HRA concluded the maximum non-cancer HI to be 0.03, which would be below the BAAQMD's significance threshold of 1.0.

As the carcinogenic and noncarcinogenic health risks posed by soil-PM_{10} emissions during construction activities associated with development of HPS Phase II have been determined to be below established thresholds, this impact is less than significant with mitigation measure MM HZ-15 discussed above. An analysis was not conducted to determine the impact of Project construction activities without the dust control mitigation measures described in MM HZ-15 because the dust controls described in MM HZ-15 are required by *San Francisco Health Code* Article 22B or BAAQMD regulations. Due to the scale of the construction activities and proximity to adjacent receptors, without these dust control measure, the impacts

from TACs bound to soil PM_{10} would likely be above the BAAQMD's significance threshold and would, therefore, be potentially significant.

Operational Impacts

Impact AQ-4: Criteria Pollutants

Impact AQ-4 **Operation of the Project would violate BAAQMD CEQA significance thresholds for mass criteria pollutant emissions from mobile and area sources and contribute substantially to an existing or projected air quality violation at full buildout. (Significant and Unavoidable)** ***[Criteria H.a and H.c]***

The proposed Project's design incorporates a dense, compact development plan that includes a diverse mix of land uses that are well connected with regional mass transit systems. The analysis of Project emissions in the criteria pollutant emission inventory assumed certain Project features. The land use mixes and basic land plan design proposed in the Project Description are fundamental aspects of the Project and include certain features assumed in the criteria pollutant emissions inventory, including providing neighborhood-serving retail; providing automobile, public transportation and pedestrian connections between the Shipyard, Candlestick Point, and the larger BVHP neighborhood; providing for transportation and open space corridors; and integrating land use patterns with a multimodal street network that facilitates walking and cycling for internal trips and transit for trips of greater distance. Other Project features assumed in the criteria pollutant emission inventory are more conceptual, such as landscape plans and plans related to energy efficiencies in building design. Further, transportation features proposed as part of the Project that would be implemented in part by San Francisco Municipal Transportation Agency (SFMTA) are identified in Section III.D (Transportation and Circulation) as mitigation measures. With these features included, the proposed Project at full buildout is expected to generate 78,109 daily external motor vehicle trips. In contrast, the proposed Project's Transportation Study estimates that a similar development not including the above-mentioned design features (termed the "Business as Usual" or BAU scenario) would generate 137,282 daily external motor vehicle trips (about 76 percent more).

The estimates of average daily operational emissions for the proposed Project used the CARB's URBEMIS 2007 computer model initialized with land use specifications from the Project Description and daily vehicle trip and average trip length estimates taken from the Transportation Study. Table III.H-5 (Operational Criteria Pollutant Emissions [Year 2030]) presents the emission modeling with comparisons to BAAQMD thresholds and the transportation scenario without trip reduction features (referred to as the Business as Usual [BAU] scenario). The estimated daily criteria pollutant emissions associated with the proposed Project and the BAU scenario are shown in Table III.H-5 in comparison with each other and with the BAAQMD CEQA significance criteria. Although the Project would generate substantially fewer emissions than the BAU scenario (i.e., from 14 to 50 percent less than BAU depending on the pollutant), Project emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ would exceed the BAAQMD thresholds. No additional feasible mitigation measures have been identified that would further reduce the Project's operational criteria emissions below the BAAQMD thresholds. This would be a significant and unavoidable impact.

Table III.H-5 Operational Criteria Pollutant Emissions (Year 2030)

SOURCE: PBS&J, 2009. Based on URBEMIS 2007 Version 9.2.4; model input/output in included in Appendix H1.

Daily emissions of ROG and NO_X were calculated under summer conditions when ambient ozone concentrations are highest. Daily emissions of CO, PM_{10}, and $PM_{2.5}$ were calculated under winter conditions when associated ambient concentrations are highest. http://www.baaqmd.gov/Divisions/Communications-and-Outreach/Air-Quality-in-the-Bay-Area/Air-Pollutants.aspx

* Area emissions are from sources located on the Project site, such as natural gas combustion for heating/cooling, maintenance equipment, consumer product use, etc.

— BAAQMD significance threshold for CO is based on air concentration and not mass emission rates.

However, the Project design is a dense, infill mixed-use project, with a transit-oriented design, which is consistent with Senate Bill 375 as well as the San Francisco's sustainable city initiatives to reduce emissions, on a per-capita basis by its very nature. However, the BAAQMD CEQA guidelines list a total mass of criteria pollutants as its CEQA threshold. Accordingly, a large project, such as this one, regardless of its design and location will always exceed these mass-based thresholds.

Impact AQ-5: Carbon Monoxide

Impact AQ-5 **Operation of the Project would not cause local concentrations of CO to exceed State and federal ambient air quality standards due to motor vehicles trips. (Less than Significant) *[Criterion H.b]***

Project increases in traffic on streets would contribute to localized CO emissions. CALINE4 dispersion modeling to determine local CO concentrations was performed for receptors near four intersections in the adjacent Bayview residential neighborhood. These intersections were selected because they represent the locations where Project traffic would produce the greatest change in traffic level of service associated with the Project (and, therefore, the greatest increase in congestion, which would produce the greatest increase in CO emissions) and/or the highest total traffic volumes of all intersections in the Project vicinity. Table III.H-6 (Carbon Monoxide Concentrations at Selected Intersections in the BHVP Neighborhood) presents CO concentrations and shows that the Project would not cause exceedances of the state and federal standards. Other intersections affected by Project traffic and at a further distance from the Project would be expected to have CO concentration levels similar to or lower than the four analyzed intersections. Therefore, the Project effects on ambient CO standards would be less than significant. No mitigation is required.

Table III.H-6 Carbon Monoxide Concentrations at Selected Intersections in the BVHP Neighborhood

	One-Hour Average CO (ppm)[a]			*Eight-Hour Average CO (ppm)[a]*

SOURCE: PBS&J, 2008; model input/output in included in Appendix H1.

The BAAQMD recommends that the current CO background for use with CALINE4 be chosen as the second highest recorded value over the last two years at the nearest BAAQMD station (i.e., the Arkansas Street station on Potrero Hill, in this case); these background levels are shown below. The California ARB has estimated San Francisco's CO emissions through the year 2020, but not for more distant future years; such CO emissions show a steady decrease over time at least up to 2020. Consequently, the current CO background levels were also used as the 2030 background levels, a conservative approach considering that 2030 levels are likely to be lower than current levels since ambient concentrations generally follow emission trends.

CO Background:
1-hour average: 3.6 ppm
8-hour average: 2.0 ppm

Ambient CO Standards:
1-hour average—federal: 35 ppm; state 20 ppm
8-hour average—federal and state: 9 ppm

a. Calculations reflect CO levels at 25 feet from roadside.

Impact AQ-6: Toxic Air Contaminants

Impact AQ-6 **Implementation of HPS Phase II would not expose nearby receptors to an increase in local concentrations of toxic air contaminants due to the operation of Research and Development uses. (Less than Significant with Mitigation) *[Criterion H.d]***

The Project would include R&D facilities at HPS Phase II, which are situated on a peninsula extending to the East of the proposed stadium and south of the proposed residential areas. As the predominant winds are out of the West, on-site receptors will generally be upwind from these R&D areas. As such, the Project is designed to minimize potential adverse impacts between TAC sources in R&D areas and both on-site and off-site receptors.

Depending on the type of activity conducted at these planned R&D facilities, airborne TAC could be emitted. As the Project land use designations provide that a wide range of stationary sources could operate within the R&D uses, the exact type of stationary sources and quantity of TAC emissions from those sources are not known. However, for the purposes of this analysis, a conservative scenario of potential TAC emissions from each potential future source of TACs was modeled to estimate the potential health impact on nearby receptor locations. It was assumed that each allowable location for TAC emissions would emit chemicals at the maximum allowable rate, when, in fact, the TAC emissions at some of these locations within the R&D area would be below the maximum rate (for example, office building emissions for TAC would be zero or close to zero).

Using the assumptions discussed in the Analytic Method section, the HRA[207] estimated the excess lifetime cancer risk and chronic noncancer HI due to the combined TAC emissions from the R&D areas at any surrounding receptor location. All receptors were initially evaluated as residential receptors. The estimated excess lifetime cancer risks and HIs within areas designated for residential use were found not to exceed the BAAQMD's significance thresholds of an incremental residential cancer risk of 10 in one million for carcinogenic and a chronic noncancer HI of 1.0 for noncarcinogenic health risks. An analysis was not conducted to determine the impact without the assumptions discussed earlier (such as the assumptions that each lot would be 1 acre in size and have one source of TAC emissions); however, due to the potential number of R&D facilities with sources of TAC emissions capable of locating in the R&D areas and their proximity to adjacent receptors, without mitigation, the impacts would potentially be above the BAAQMD's significance threshold and therefore potentially significant.

The estimated cancer risks for long-term residential exposure would be above 10 in one million in an area designated as open space or stadium that would extend slightly south beyond the R&D boundary. The maximum estimated cancer risk for a residential receptor in this location would be 17 in one million; the noncarcinogenic health risks would have a HI of 1.6. However, as noted above, this receptor location would be in an area designated as open space or stadium use, and would not be a residential location. If cancer risks were estimated based on exposure assumptions consistent with recreational use of the open space, the risks would be reduced well below the threshold of 10 in one million. Due to the decrease in the frequency and duration of potential exposures, the chronic HI would also be reduced below the HI threshold of 1.0.

[207] ENVIRON, *Ambient Air Quality Human Health Risk Assessment: Candlestick Point–Hunters Point Shipyard Phase II Development Plan*, Attachment III, May 4, 2010. See Appendix H3.

The estimated health risks would be below BAAQMD thresholds for all residential receptor locations as a result of implementation of the Project, including implementation of the following mitigation measures. The mitigation measures would require TAC emitting facilities that are located on a lot 1 acre or larger in size to establish that their TAC emissions are below the BAAQMD thresholds. If they exceed these thresholds, or if a TAC emitting facility locates on a lot smaller than 1 acre in size, the facility would further need to analyze the effect of its emissions in combination with other TAC emitting facility emissions to establish that the combined emissions would be below the BAAQMD thresholds. Impacts would be less than significant.

MM AQ-6.1 *If a facility with sources of TAC emission wishes to locate on a plot size smaller than 1 acre, an analysis will be required to show the facility, in conjunction with all other TAC emitting facilities in the R&D areas, will not cause these thresholds of a residential cancer risk of 10 in one million and a chronic noncancer HI of 1.0 to be exceeded at the nearest residential locations.*

MM AQ-6.2 *Each facility with sources of TAC emissions on a plot of 1 acre or larger will limit their emissions such that residential cancer risk and chronic non-cancer hazard index evaluated at the facility boundary does not exceed 10 in one million or 1.0, respectively. If these thresholds are exceeded at the boundary, an analysis will be required to show the facility, in conjunction with all other TAC emitting facilities in the R&D areas, will not cause these thresholds to be exceeded at the nearest residential locations.*

Impact AQ-7: Traffic $PM_{2.5}$

Impact AQ-7 **Operation of the Project would not expose receptors to concentrations of $PM_{2.5}$ above a 0.2 μg/m³ action level for $PM_{2.5}$ and, therefore, would not substantially affect the health of nearby receptors as a result of an increase in local concentrations of vehicle emissions ($PM_{2.5}$) associated with vehicle use attributable to operation of the Project. (Less than Significant) *[Criterion H.d]***

With development of the Project, vehicle trips and thereby vehicle emissions along local roadways would increase. The exposure of residential receptors to increased vehicle emissions could affect human health. As a result, and as discussed above, potential $PM_{2.5}$ concentrations at select roadways with the addition of Project traffic were estimated compared against an identified 0.2 μg/m³ action level to determine whether sensitive receptors would be exposed to a substantial increase in $PM_{2.5}$ concentrations attributed to vehicle emissions that would be associated with the Project. Several roadway segments were chosen based on whether Project-related traffic would use these streets to access neighboring freeways and other areas of San Francisco and/or currently or would experience significant truck traffic. The roadways chosen include:

- Third Street
- Innes Avenue/Hunters Point Boulevard/Evans Avenue
- Palou Avenue
- Gilman Avenue/Paul Avenue
- Harney Way
- Jamestown Avenue
- Ingerson Avenue

With the addition of Project-related traffic, no receptors along the streets listed above would experience and increase in $PM_{2.5}$ concentrations in excess of the identified 0.2 μg/m³ action level. The details of the

HRA for $PM_{2.5}$ can be found in Appendix H3, Attachment IV. As concentrations of $PM_{2.5}$ at sensitive receptor locations would not exceed the identified 0.2 $\mu g/m^3$ action level, impacts would be less than significant. No mitigation is required.

Impact AQ-8: Odors

Impact AQ-8 **Implementation of the Project would not generate objectionable odors affecting a substantial number of people. (Less than Significant) *[Criterion H.e]***

According to the current BAAQMD CEQA Guidelines, odor impacts could result from siting a new odor source near existing sensitive receptors or siting a new sensitive receptor near an existing odor source. Examples of land uses that the BAAQMD regards with potential to generate considerable odors include: wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, oil refineries and chemical plants. The Project would be a large mixed-use development containing residential, office, retail, R&D, recreational, and entertainment uses. Although there may be some potential for small-scale, localized odor issues to emerge around Project sources such as solid waste collection, food preparation, etc., substantial odor sources and consequent effects on on-site and off-site sensitive receptors would be unlikely and would be resolved by interventions after receipt of any complaints. This would be a less-than-significant impact. No mitigation is required.

Impact AQ-9: Consistency with Regional Air Plans

Impact AQ-9 **The Project would conform to the current regional air quality plan. (Less than Significant) *[Criterion H.a]***

The most current air quality plan for the BAAQMD is the *Bay Area 2005 Ozone Strategy*. The BAAQMD is currently drafting its *2009 Clean Air Plan (CAP)*, which represents a unique approach to air planning, by including GHGs as well as criteria pollutants and TACs. For the 2005 Plan, the travel activity adjustments used in preparing the on-road mobile source inventory for the 2005 Plan are the same as were used in the Transportation Air Quality Conformity Analysis for the MTC's *Transportation 2030*. MTC's travel demand model utilizes regional demographic forecasts from ABAG's socioeconomic and population projections, in this case, *Projections 2003*. The bulk of the emissions into the air from the Project stems from the operation of mobile sources, accordingly, to evaluate consistency, a review of the mobile source emissions are needed. Both the draft CAP and the 2005 Plan emphasize the need for smart growth and a reduction of single automobile usage. The Project is consistent with these plans, in that it promotes the use of alternative transportation modes, such as transit, biking and walking. In addition, it puts housing in close proximity with jobs and retail establishments, reducing the length of trips and further reducing reliance on single-occupancy vehicles. Therefore, this project conforms to the regional air quality plan and would be a less-than-significant impact. No mitigation is required.

The purpose of the 2009 CAP, which is currently under preparation, is to comply with California *Clean Air Act*, and in particular, to: reduce ozone precursor emissions; comply with transport mitigation requirements; reduce ambient concentrations of particulate matter; reduce ambient concentrations of TACs; and, reduce GHG emissions. The current draft control strategy has 57 control measures: 19 stationary source control measures; 10 mobile source control measures; 18 transportation control measures; 6 land use and local

impacts measures; four energy and climate measures; and 14 further study measures. Of particular import to the project are the transportation control measures and land use and local impacts measures.

The transportation control measures are grouped into five categories: improve transit services; improve system efficiency; encourage sustainable travel behavior; support focused growth and implement pricing strategies. The Project supports four out of these five categories. It improves transit services by adding and expanding certain transit routes. It improves the system efficiency and encourages sustainable travel behavior by locating residences near jobs, shopping and services. It supports focused growth by locating high-density residences near transit and services.

The proposed land use and local impacts measures are intended to promote focused growth to reduce the need for motor vehicle travel, and ensure that we plan for focused growth in a way that protects people from exposure to air pollution from stationary and mobile sources of emissions. There are no significant stationary sources within 1,000 feet of the proposed residential development. The potential for exposure to mobile sources was evaluated in the air quality section and found to be less than significant. Finally, the project is an example of focused growth that reduces the need for vehicle travel.

Although the 2009 CAP is under development, and the control measures may evolve over time, the Project is consistent and supports the transportation control measures and land use and local impact measures currently considered for inclusion in the 2009 CAP.

Cumulative Impacts

Generally, the geographic context for the analysis of construction and operational air quality impacts is the SFBAAB, which is the basin considered and evaluated by the BAAQMD in its evaluation of air quality impacts. For certain issues, however, the geographic context is more limited to areas immediately surrounding the Project. This is true for construction dust and DPM emissions, $PM_{2.5}$ and CO associated with Project traffic and TACs from facilities in Project R&D areas; as opposed to regional issues such as the release of PM_{10} or ozone forming precursors (NO_X and ROG). Based on BAAQMD guidance as contained in BAAQMD CEQA Guidelines (*Assessing the Air Quality Impacts of Projects and Plans*),[208] any proposed project that would individually have a significant air quality impact would also be considered to have a significant cumulative air quality impact.

Construction

Construction emissions associated with new developments underway or at the planning stage in the area of the Project have the potential to combine with Project-related construction emissions to cause significant impacts. However, as discussed below, these impacts considered together are unlikely to cause significant impacts.

As shown in Figure III.A-1 (Proposed Developments in the Project Area), new proposed developments in the area of the Project are summarized below.

- Yosemite Slough Restoration Project: Re-vegetation, recreational and trails only; no structures
- Hunters View: 550 new homes

[208] Bay Area Air Quality Management District (BAAQMD), *BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans*, December 1999.

- India Basin Shoreline Area C: approximately 1,240 homes; 100,000 sq. ft. of retail; 1,365,000 sq. ft. of commercial space
- Hunters Point Shipyard Phase I (HPS Phase I): 1,600 homes
- Brisbane Baylands: 8,400,000 sq. ft. of development
- Executive Park: 2,800 homes; 90,000 sq. ft. of retail /restaurant
- Jamestown: - approximately 200 homes
- Visitacion Valley: 1,250 homes; 100,000 sq. ft. of retail
- Cow Palace Redevelopment: 1,700 homes; 550,000 sq. ft. of commercial/R&D

- When evaluating combined impacts, the relative location of the other proposed project to the Project is a critical factor to consider as local wind patterns affect the transport of pollutants from each location. As shown in Figure 1 of the HHRA Appendix V, the winds in the vicinity of the Project are predominantly from the west, blowing directly east. As such, only construction activities on other projects directly west of the Project are likely to combine with Project-related construction activities. As the Project is on the San Francisco Bay shoreline, there are no additional project immediately east. As shown in the map, the adjacent project with the most likely chance of causing a combined impact is the HPS Phase I development; however, infrastructure and grading is scheduled to be complete on that project by 2010 with full build-out in 2014 (depending on market conditions). Because the predominant wind direction is from the west to the east, the HPS Phase I project could impact the Project; however, the first occupancy of the HPS Phase II portion of the Project is not expected until 2016 or later, as such it is not expected that construction activities associated with HPS Phase I will cause adverse impacts on receptors in the HPS Phase II portion of the Project. The Project will not substantially impact HPS Phase I; the impacts of Project-related construction activities on HPS Phase I were explicitly evaluated in Impact AQ-2 and Impact AQ-3, as discussed above. Depending on the construction schedule for the Yosemite Slough Restoration Project, air quality impacts from construction equipment could combine with construction emissions of the Project. However, construction emissions from the Yosemite Slough Restoration Project would be predominantly blown east over the Bay and would not be anticipated to combine with construction emissions of the Project to cause a significant impact on sensitive receptors.

  The Jamestown project is located directly west of CP, however, due to its limited size and indeterminate timeline, it is not likely to combine with Project-related construction activities to cause a significant impact. Additionally, as discussed in the preceding mitigation measures, the Project applicant is committing to a number of mitigation measures to reduce impacts to a less-than-significant level, for example the stringent dust control measures outlined in mitigation measure MM AQ-1. As all other nearby projects are subject to BAAQMD requirements and most are subject to San Francisco requirements, they will also have to implement dust control measures which would keep combined construction impacts to less than significant.

  As stated under Impact AQ-1, fugitive dust associated with Project construction would not be expected to cause violations of AAQS with the inclusion of a City mandated and approved dust control plan. As stated under Impact AQ-2 and Impact AQ-3, emissions of DPM and soil-PM_{10} from construction activities associated with the Project would not exceed BAAQMD's thresholds for determining potential impacts to human health. With this plan in place, Project dust emissions would be controlled consistent with BAAQMD CEQA Guidelines and, therefore, construction fugitive dust emissions would be considered to

have a less-than-significant project impact. With Project emissions well controlled, the Project would not make a considerable contribution to a cumulative impact.

Operation

- Project operational emissions of the ozone precursors, ROG and NO_X, and of the criteria pollutants PM_{10} would exceed the BAAQMD project-specific significance thresholds. Therefore, as discussed earlier, these emissions would be considered to have a significant and unavoidable cumulative impact. However, these emissions are typically addressed though the BAAQMD Clean Air Plan so that Project emissions, in combination with all adjacent projects, will be addressed at a regional level.

  As discussed earlier, Project operational motor vehicle emissions of CO, including existing traffic volumes, would not cause violations of AAQS and the SFBAAB is expected to remain an Attainment area for CO. Additionally, as CO hotspots are a very localized impact and the CO analysis conducted includes cumulative traffic volumes, the cumulative CO impacts from the Project and any additional projects in the area will not cause a localized CO hotspot. Therefore, CO emissions would be considered to have a less-than-significant cumulative impact.

- Project stationary-source TACs, which could present human health risks to nearby receptors as a result of operation of the Project, would not exceed BAAQMD thresholds. Therefore, in accordance with BAAQMD guidelines, TAC emissions would be considered to have a less-than-significant cumulative impact.[209]

- No guidance is currently available for the assessment of $PM_{2.5}$ cumulative impacts from Project operations. $PM_{2.5}$ cumulative effects are assessed below based on the proposed BAAQMD CEQA guidelines.

Discussion of Proposed BAAQMD CEQA Guidelines

As discussed in the "Regional" section of Section III.H.3 (Regulatory Framework), as of the date of this Draft EIR the BAAQMD is in the process of revising their CEQA guidelines and expects the draft to be approved by their board of directors by the end of 2009. On October 7, 2009, the BAAQMD released a draft table of Staff-Recommended CEQA Thresholds of Significance which indicates a number of modifications to existing guidelines, including changes to the maximum daily emissions thresholds for criteria pollutants emissions from operational sources as well as requirements for the quantification of criteria pollutant and TAC emissions from construction activities and comparison to mass emission or risk thresholds, respectively. As these draft guidelines have not been adopted by the BAAQMD's Board of Directors, the Project is not subject to the draft requirements. However, the impacts of the Project with respect to the draft requirements, which differ from the current, approved requirements are described below.

Construction

Modifications from Existing Requirements

The proposed guidelines differ from the existing guidelines in two main areas:

1. Mass emission limits for ROG, NO_X, PM_{10} (exhaust) and $PM_{2.5}$ (exhaust) are proposed

[209] Bay Area Air Quality Management District (BAAQMD), *BAAQMD CEQA Guidelines: Assessing the Air Quality Impacts of Projects and Plans*, December 1999.

2. A cancer risk of 10 in one million, non-cancer HI of 1.0, and a $PM_{2.5}$ concentration threshold of 0.3 $\mu g/m^3$ have been proposed

Impact Conclusion Based on Draft Guidelines

As stated above, the Project construction-related emissions would be less than significant with mitigation in accordance with the current BAAQMD CEQA Guidelines in effect at the time of this Draft EIR, which do not require quantification of construction-related emissions. However, in anticipation of the future implementation of proposed new BAAQMD CEQA quantitative thresholds of significance for construction-related emissions, this section provides a quantitative analysis of the Project's construction emissions to determine whether they would exceed the proposed thresholds. Worst-case, construction related emissions of criteria air pollutants and precursors were modeled in accordance with BAAQMD-recommended methodologies. Emissions of criteria air pollutants and precursors were modeled based on Project specifications (e.g., amount and type of equipment) described previously and default and BAAQMD-recommended settings and parameters attributable to the activity period and site location.

Table III.H-7 (Construction Criteria Pollutant Emissions) summarizes the modeled Project-generated, construction-related emissions of each criteria air pollutant and precursor. As shown in the table, construction-related emissions of ROG and NO_X would have potentially significant and unavoidable impacts on air quality in accordance with the proposed BAAQMD thresholds of significance.

Table III.H-7 Construction Criteria Pollutant Emissions

Emission Source	*ROG (lbs/day)*	*NO_X (lbs/day)*	*Exhaust PM_{10} (lbs/day)*	*Exhaust $PM_{2.5}$ (lbs/day)***
Candlestick Point*	527 (2019)	453 (2106)	2.8 (2016)	2.6 (2016)
HPS Phase II*	639 (2016)	1,036 (2016)	8.5 (2016)	7.8 (2016)
Project*	724 (2106)	1,490 (2016)	11.2 (2016)	10.3 (2016)
Proposed BAAQMD Significance Threshold*	54	54	82	54
Project Exceeds Proposed BAAQMD Threshold?	Yes	Yes	No	No

SOURCE: ENVIRON, 2009. Based on URBEMIS 2007 Version 9.2.4.

* Values in parentheses represent year of construction when maximum daily emissions occur.

** Per URBEMIS 2007, exhaust $PM_{2.5}$ is calculated as 92% of exhaust PM_{10}.

As discussed in Impact AQ-2 and Impact AQ-3, the estimated cancer risk and noncancer HIs associated with Project-related construction activities are below the current and proposed significance thresholds. As such, Impact AQ-2 and Impact AQ-3 would be less than significant with mitigation. While a detailed evaluation has not been separately documented, the analysis conducted to evaluated risks and hazards from construction exhaust can be used to evaluate the proposed $PM_{2.5}$ standard of 0.3 $\mu g/m^3$. At no off-site location did the estimated concentration of DPM exceed this threshold; therefore, construction activity associated with the Project would be less than significant when judged against this proposed standard.

Operational

Modifications from Existing Requirements

The proposed guidelines differ from the existing guidelines in two main areas:

1. Mass emission limits for ROG, NOx, PM_{10} (exhaust) are changed and a mass emission rate is proposed for $PM_{2.5}$ (exhaust) and fugitive dust
2. A $PM_{2.5}$ concentration threshold of 0.3 $\mu g/m^3$ has been proposed

Impact Conclusion Based on Draft Guidelines

The proposed mass emission limits for ROG, NOx, PM_{10} (exhaust), and $PM_{2.5}$ (exhaust) are shown in parentheses next to the existing mass emission limits and in Table III.H-8 (Operational Criteria Pollutant Emissions [Year 2030]). As shown in the table, the criteria pollutant emissions from mobile and area sources would continue to be above the proposed significance thresholds, Impact AQ-1 would remain significant and unavoidable.

Table III.H-8 Operational Criteria Pollutant Emissions (Year 2030)

Daily emissions of ROG and NO_X were calculated under summer conditions when ambient ozone concentrations are highest. Daily emissions of CO, PM_{10}, and PM $_{2.5}$ were calculated under winter conditions when associated ambient concentrations are highest. http://www.baaqmd.gov/Divisions/Communications-and-Outreach/Air-Quality-in-the-Bay-Area/Air-Pollutants.aspx

* Area emissions are from sources located on the Project site, such as natural gas combustion for heating/cooling, maintenance equipment, consumer product use, etc.

** Represent mass daily emissions thresholds reflected in draft Staff-Recommended CEQA Thresholds of Significance table released by the BAAQMD on October 7, 2009.

— BAAQMD significance threshold for CO is based on air concentration and not mass emission rates.

As shown in the "Impact AQ-7: Traffic $PM_{2.5}$" discussion above, $PM_{2.5}$ concentrations associated with Project-related traffic at 2030, would be below the SFDPH standard of 0.2 $\mu g/m^3$. As the proposed

BAAQMD standard is 0.3 $\mu g/m^3$, the traffic-related operational emissions would meet the proposed BAAQMD standard. As such, Impact AQ-4 would be less than significant.

Cumulative

Modifications from Existing Requirements

The proposed guidelines differ from the existing guidelines in proposing to add a zone of influence analysis for any operational or construction source within 1,000-foot radius of the Project fenceline, such that the combined impacts cannot exceed any of the following:

- Cancer risk of 100 in one million
- Non-cancer HI of 1.0
- $PM_{2.5}$ concentration threshold of 0.8 $\mu g/m^3$ have been proposed

Impact Conclusion Based on Draft Guidelines

As shown in Figure III.H-1 (1,000-Foot Buffer Surrounding Project Fenceline), there are few, if any, additional large emission sources within 1,000 feet of the Project fenceline. The only potential exceptions are:

- Operational emissions associated with traffic on US-101 to the southwest of CP, which is greater than 500 feet from the Project fenceline and only within 1,000 feet of the shoreline park section of the Project
- Construction emissions from development of other project in the vicinity, as discussed above

As shown previously, Impact AQ-3, Impact AQ-4, Impact AQ-7, and Impact AQ-8 indicate that operational and construction emissions associated with the Project are less than significant. As there are no additional major sources of emissions sources within 1,000 feet of the Project fenceline, it is unlikely that the cumulative impacts would exceed the proposed standards. The impact of US-101 has not been directly evaluated; however, that section of freeway is only within 1,000 feet of the portion of the Project designated as a shoreline park where no residents would locate. As such, based on the proposed BAAQMD CEQA Guidelines, the freeway would not adversely affect residents at the Project. Therefore the cumulative impacts would likely be less than significant for the proposed thresholds.

However, the area adjacent to the Project zoned commercial where small-scale TAC or $PM_{2.5}$ emissions sources, such as automotive repair or refinishing, dry cleaning, or artist shops. As the identity of these sources is not known, if they exist at all, it is impossible to determine what cumulative impacts may be though there is the potential for these cumulative impacts to exceed the proposed BAAQMD CEQA thresholds. At workshops discussing the proposed CEQA guidelines, the BAAQMD indicated that a District-wide database of TAC/$PM_{2.5}$ sources would be released at some point in the future to support this effort. However, at this time, it is not possible to accurately predict the potential cumulative risks in the Project vicinity. Nonetheless, given the potential for these cumulative impacts to exceed the proposed BAAQMD CEQA thresholds, it is possible that the Project would contribute considerably to a cumulative impact from such sources and, therefore, may result in a significant cumulative air quality impact to sources of TAC emissions. If such an impact exists, this impact would be considered significant and unavoidable at this time, given the inability to determine the nature of such an impact accurately and, therefore, to determine whether any mitigation measures would be effective to reduce the impact to a less than significant level.

1,000-FOOT BUFFER SURROUNDING PROJECT FENCELINE

[This page is intentionally left blank.]

SECTION III.I NOISE AND VIBRATION

III.I.1 Introduction

This section of the EIR discusses existing and future sources of noise and vibration on and around the Project site and examines the potential for (1) exposure of persons to or generation of noise levels in excess of standards established in the Environmental Protection Element of the *San Francisco General Plan* or San Francisco Noise Ordinance (Article 29, *San Francisco Police Code*); (2) exposure of persons to or generation of excessive groundborne vibration levels; (3) a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project; (4) a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project; (5) exposure of persons to excessive aircraft noise levels; or (6) substantial impacts from existing noise sources. The impact analysis identifies both Project-level and cumulative environmental impacts, as well as feasible mitigation measures that could reduce or avoid the identified impacts.

Data used to prepare this analysis were obtained from the *San Francisco General Plan* (General Plan) *Environmental Protection Element*; the *Bayview DEIR San Francisco 49ers Stadium Operational Noise Study*, prepared by Wilson, Ihrig & Associates (included as Appendix I1); the Federal Transit Administration's *Transit Noise and Vibration and Impact Assessment* methodology; and by measuring and modeling existing and future noise levels within the Project site and at surrounding land uses. Traffic information contained in the *Traffic Impact Analysis*, prepared by the LCW Consulting, Fehr & Peers Associates, and CHS Consulting Group, was used to prepare the noise modeling for vehicular sources. All construction activity estimates were based on the September 2009 and March 2010 MACTEC Engineering Construction Phasing Plan.

Acoustic Terminology and Definitions

Sound is created when vibrating objects produce pressure variations that move rapidly outward into the surrounding air. The main characteristics of these air pressure waves are amplitude, which we experience as a sound's loudness, and frequency, which we experience as a sound's pitch. The standard unit of sound amplitude is the decibel (dB); it is a measure of the physical magnitude of the pressure variations relative to the human threshold of perception. The human ear's sensitivity to sound amplitude is frequency-dependent; it is more sensitive to sounds in the mid-frequency range than to sounds with much lower or higher frequencies.

Most "real world" sounds (e.g., a dog barking, a car passing, etc.) are complex mixtures of many different frequency components each having different amplitudes. When the average amplitude of such sounds is measured with a sound level meter, it is common for the instrument to apply adjustment factors to each of the measured sound's frequency components. These factors account for the differences in perceived loudness of each of the sound's frequency components relative to those to which the human ear is most sensitive. Because the human ear is not equally sensitive to a given sound level at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) provides this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. The unit of A-weighted sound amplitude is also the decibel. In reporting measurements to which A-weighting has been applied, an "A" is appended to dB (dBA) to

make this clear. In some cases, however, it is useful to know the actual average sound amplitude without application of the A-weighting factors; this type of averaging is called C-weighting and its result is reported in C-weighted decibels (dBC). Finally, since environmental sound levels usually vary greatly over time, it is often useful to know the degree of variability at a particular location over any measurement period. This variability is specified in terms of statistical sound levels (L_n), where n is the percentage of time these levels are exceeded during the measurement period. For example, L_{10}, L_{50}, and L_{90} are descriptors that represent the sound level exceeded 10 percent of the time, 50 percent of the time, and 90 percent of the time, respectively, during a measurement, while L_{min} and L_{max} represent the minimum and maximum sound levels during the measurement period.

Noise is the term generally given to the intrusive, "unwanted" aspects of sound. Many factors influence how a sound is perceived and whether it is considered harmful or disruptive to an individual or a community. These factors include the primary physical characteristics of a sound (e.g., amplitude, frequency, duration, etc.), but also secondary acoustic and non-acoustic factors (that can influence judgment regarding the degree to which it is intrusive and disruptive. Table III.I-1 (Representative Environmental Noise Levels) lists representative noise levels for the environment.

All quantitative descriptors used to measure environmental noise exposure recognize the strong correlation between the high acoustical energy content of a sound (i.e., its loudness and duration) and the disruptive effect it is likely to have as noise. Because environmental noise fluctuates over time, most such descriptors average the sound level over the time of exposure, and some add "penalties" during the times of day when intrusive sounds would be more disruptive to listeners. The rating scales of L_{eq}, L_{min}, and L_{max} are measures of ambient noise, while the L_{dn} and Community Noise Equivalent Level (CNEL) are measures of community noise. L_{eq} is the average A-weighted sound level measured over a given time interval. L_{eq} can be measured over any time period, but is typically measured for 1-minute, 15-minute, 1-hour, or 24-hour periods. L_{dn} is another average A-weighted sound level measured over a 24-hour time period. However, this noise scale is adjusted to account for some individuals' increased sensitivity to noise levels during the evening and nighttime hours. L_{eq}, L_{min}, and L_{max}, as well as L_{dn} and CNEL are all applicable to this analysis and defined as follows:

The most commonly used noise descriptors for environmental exposures are:

- **L_{eq}**, the equivalent-energy noise level, is the average acoustic energy[210] content of noise over any chosen exposure time. The L_{eq} is the constant noise level that would deliver the same acoustic energy to the ear as the actual time-varying noise over the same exposure time. L_{eq} does not depend on the time of day during which the noise occurs.
- **L_{dn}**, the day-night average noise level, is a 24-hour average L_{eq} with a 10 dBA "penalty" added to noise during the hours of 10:00 P.M. to 7:00 A.M. to account for increased nighttime noise sensitivity. Because of this penalty, the L_{dn} would always be higher than its corresponding 24-hour L_{eq} (e.g., a constant 60 dBA noise over 24 hours would have a 60 dB L_{eq}, but a 66.4 dBA L_{dn}).

[210] Averaging sound levels in decibels is not done by standard arithmetic averaging, but according to the following rule:
$L_{eq} = 10 \times \log((1/n) \times (10^{L1/10} + 10^{L2/10} + \ldots + 10^{Ln/10})$; where L_1, L_2, L_n are n individual sound levels.
For example, the L_{eq} of the sound levels $L_1 = 60$ dBA and $L_2 = 70$ dBA is 67.4 dBA, not 65 dBA as it would if standard arithmetic averaging were used. The larger individual sound levels contribute much more substantially to the L_{eq} than they would to an average done in the standard way.

Table III.I-1 Representative Environmental Noise Levels

SOURCE: California Department of Transportation 1998

- **CNEL**, the Community Noise Equivalent Level, is a 24-hour average L_{eq} with a 5 dBA "weighting" during the hours of 7:00 P.M. to 10:00 P.M. and a 10 dBA "weighting" added to noise during the hours of 10:00 P.M. to 7:00 A.M. to account for noise sensitivity in the evening and nighttime, respectively. The logarithmic effect of these additions is that a 60 dBA-24 hour L_{eq} would result in a measurement of 66.7 dBA CNEL.
- **SEL**, the sound exposure level (also known as the single noise event level), is the constant noise level that would deliver the same acoustic energy to the ear of a listener during a one-second exposure as the actual time-varying noise would deliver over its entire time of occurrence.[211] SEL is typically used to characterize the effects of short-duration noise events (e.g., aircraft fly-overs or train pass-bys)

[211] For a sound lasting longer than one second, its SEL would be higher than that of the largest of the shorter-duration component sounds that make up the total. For example, if a sound with a ten-second-long duration made up of 10 one-second-long component sounds, each of 60 dBA amplitude, its SEL would be 70 dBA.

Noise levels from a particular source decline as distance to the receptor increases. Other factors, such as the weather and other reflecting or shielding factors, also help intensify or reduce the noise level at any given location. A commonly used rule of thumb for roadway noise is that for every doubling of distance from the source, the noise level is reduced by about 3 dBA at acoustically "hard" locations (i.e., where the area between the noise source and the receptor is nearly complete asphalt, concrete, hard-packed soil, or other solid materials) and 4.5 dBA at acoustically "soft" locations (i.e., where the area between the source and receptor is unpacked earth or has vegetation, including grass). Noise from stationary or point sources (such as commercial heating and ventilation units [HVAC] or construction equipment) is reduced by about 6 to 7.5 dBA for every doubling of distance at acoustically hard and soft locations, respectively. Generally, if a noise source is completely enclosed or completely shielded with a solid barrier located close to the source, an 8 dBA noise reduction can be expected; if the enclosure and/or barrier it is interrupted, noise would be reduced by only 5 dBA. The exterior-to-interior reduction of newer residential units and office buildings is generally 30 dBA or more.

Fundamentals of Environmental Ground-borne Vibration

Vibrating objects in contact with the ground radiate energy through the ground. If the object is massive enough and/or close enough to an observer, the ground vibrations are perceptible. Vibration magnitude is measured in vibration decibels (VdB) relative to a 1 micro-inch-per-second reference level. Background vibration levels in most inhabited areas are usually 50 VdB or lower, well below the threshold of perception (i.e., typically about 65 VdB). In most cases, when vibration is perceptible to people in their homes or workplaces, the source is within the same building (i.e., operation of HVAC equipment, movement of other occupants, slamming of doors, etc.). The outdoor sources most commonly responsible for producing perceptible vibration are heavy construction equipment, steel-wheeled trains, and motor vehicle traffic on rough roads (if the roadway is smooth, the vibration from traffic is rarely perceptible). At about 100 VdB, vibration levels are strong enough to begin to cause structural damage in fragile buildings.

Health and Welfare Effects of Environmental Noise

World Health Organization Noise Exposure Recommendations

The World Health Organization (WHO) is perhaps the best source of current knowledge regarding health impacts of noise. According to WHO, sleep disturbance can occur when continuous indoor noise levels exceed 30 dBA or when intermittent interior noise levels reach 45 dBA, particularly if background noise is low. With a bedroom window slightly open (a reduction from outside to inside of 15 dB), the WHO criteria would suggest exterior continuous (ambient) nighttime noise levels should be 45 dBA or below, and short-term events should not generate noise in excess of 60 dBA. WHO also notes that maintaining noise levels within the recommended levels during the first part of the night is believed to be effective for the ability to fall asleep.[212]

Other potential health effects of noise identified by WHO include decreased performance on complex cognitive tasks, such as reading, attention, problem solving, and memorization; physiological effects such as hypertension and heart disease (after many years of constant exposure, often by workers, to high noise

[212] World Health Organization, *Guidelines for Community Noise.* Geneva, 1999. http://www.who.int/docstore/peh/noise/guidelines2.html.

levels); and hearing impairment (again, generally after long-term occupational exposure, although shorter-term exposure to very high noise levels, for example, exposure several times a year to concert noise at 100 dBA). Noise can also disrupt speech intelligibility at relatively low levels; for example, in a classroom setting, a noise level as low as 35 dBA can disrupt clear understanding. Finally, noise can cause annoyance, and can trigger emotional reactions like anger, depression, and anxiety. WHO reports that, during daytime hours, few people are seriously annoyed by activities with noise levels below 55 dBA, or moderately annoyed with noise levels below 50 dBA.

According to WHO, an adverse effect of noise is defined as:

> … a change in the morphology and physiology of an organism that results in impairment of functional capacity, or an impairment of capacity to compensate for additional stress, or increases the susceptibility of an organism to the harmful effects of other environmental influences … [including] any temporary or long-term lowering of the physical, psychological or social functioning of humans or human organs.

WHO exposure recommendations to avoid the adverse effects described below is summarized in Table III.I-2 (WHO Guideline Values for Community Noise in Specific Environments).

Table III.I-2 WHO Guideline Values for Community Noise in Specific Environments

Specific Environment	*Critical Health Effect(s)*	L_{eq} *(dBA)*	*Exposure Time (hours)*	L_{max} *(dB)*
Outdoor residential area	Serious annoyance, daytime and evening	55	16	—
	Moderate annoyance, daytime and evening	50	16	—
Dwelling, indoors	Speech intelligibility & moderate annoyance, daytime and evening	35	16	
Inside bedrooms	Sleep disturbance, nighttime	30	8	45

SOURCE: WHO Guidelines for Community Noise - A complete, authoritative guide on the effects of noise pollution on health, Table 4.1.

a. Existing quiet outdoor areas should be preserved, and the ratio of intruding noise to natural background sound should be kept low.

The San Francisco Noise Ordinance (Section 2900) makes the following declaration with regard to community noise levels and the WHO Guidelines (additional provisions of the San Francisco Noise Ordinance that pertain to the Project are given below in Regulatory Framework):

> It shall be the policy of San Francisco to maintain noise levels in areas with existing healthful and acceptable levels of noise and to reduce noise levels, through all practicable means, in those areas of San Francisco where noise levels are above acceptable levels as defined by the World Health Organization's Guidelines on Community Noise.

III.I.2 Setting

Existing Noise Levels and Noise-Sensitive Uses in the Project Vicinity

The Project site consists of two distinct geographic areas: Candlestick Point, which primarily contains the existing San Francisco 49ers stadium, the Candlestick Point State Recreation Area (CPSRA), a recreational vehicle park, and the Alice Griffith Public Housing; and HPS Phase II, which contains many structures associated with ship repair, storage, and former Navy uses, most of which are vacant, as well as 300 artists located in studios on Parcels A and B.

The Project site is located in the southeastern area of San Francisco and extends east to San Francisco Bay (refer to Figure II-1 [Project Location]). This promontory is bounded on the south and west by the Bayview Hunters Point neighborhood and on the north and east by San Francisco Bay. The ground surface across the entire Project site is relatively flat with elevations ranging from approximately 0 feet to +20 feet (San Francisco City Datum [SFCD]).[213] Maximum ground surface elevation near the Project site is on Bayview Hill (west of Candlestick Point), which reaches an elevation of approximately 400 feet SFCD. To the north of HPS Phase II, there is a bluff that forms the end of a ridge (Hunters Point Hill) extending to the northwest almost to Third Street. The bluff is currently being developed with residential uses by Lennar Urban (HPS Phase I). The ridge serves to shield a portion of an existing residential neighborhood further north from any existing or future noise sources on HPS Phase II. To the northwest of HPS Phase II, the land is generally flat and largely residential, while west of Candlestick Point, an existing residential neighborhood is elevated above that site's flat terrain.

There are also existing light industry and warehouse land uses to the west and northwest of the Project site (in the vicinity of and north of Carroll Avenue), but these uses are not generally considered to be noise sensitive.

Noise-Sensitive Uses

The City and County of San Francisco has defined noise-sensitive uses as land uses and/or receptors of residences of all types, schools, hospitals, convalescent facilities, rest homes, hotels, motels, and places of worship. Sensitive uses from a noise perspective include places where there is a reasonable expectation that individuals could be sleeping, learning, worshipping, or recuperating. Existing noise-sensitive uses in the vicinity of the Project site include residential areas of Bayview Hunters Point, and Hunters Point Phase I residential uses. Schools in the vicinity of the Project site include Bret Harte Elementary School, Bret Harte Nursery and School-Age Children's Center, Kipp Bayview Academy, S.R. Martin College Preparatory School, Muhammad University of Islam, Malcom X Academy Elementary School, and Dr. George Washington Carver Elementary School. Additionally, residential uses developed within the Project site that would be occupied during subsequent construction phases would be considered noise-sensitive uses for the purposes of this EIR.

[213] San Francisco City Datum (SFCD) is a local vertical geodetic reference system specific to the City and County of San Francisco and formally established in 1964 as 8.616 feet above the National Geodetic Vertical Datum of 1929 (NGVD29), making it about 8.13 feet above mean sea level. The North American Vertical Datum (NAVD88) generally has replaced NGVD29 as a standard reference. Elevations expressed in NGVD29 may be converted to NAVD88 by adding 2.69 feet.

Community Ambient Noise Levels

Long-term 24-hour ambient noise measurements were taken at six locations in the residential neighborhoods north and west of the Project site for a total of six days in 2009. The long-term ambient noise measurements were conducted over the course of three days in January 2009 first by recording A-weighted community noise levels. In July 2009, the C-weighted community noise levels were measured at the same locations over the course of three days. Both the A-weighted and C-weighted measurements were for three consecutive 24-hour periods at each location during the respective measurement times and were recorded using Larson Davis digital sound level meters that satisfy the American National Standards Institute (ANSI) for general environmental noise measurement instrumentation. The Saturday-Sunday-Monday period was chosen for the three-day measurements because those are the days when a football game would most likely to be played at the proposed Stadium and concerts are also most likely to occur there during a weekend. To obtain the measurements, the microphone was positioned at a height of 12 ft feet above the ground. The locations of these measurements are indicated as N1 through N6 on the aerial photo in Figure III.I-1 (Long-Term Ambient Noise Measurement Locations).

Table III.I-3 (Existing Day-Night Noise Levels [L_{dn}]) contains a summary of the L_{dn} measurements by location for each 24-hour period of the survey. Hourly data were recorded for L_{eq} and Ln descriptors (the latter being the levels exceeded n% of the time, where n=90, 50, 10, and 1). The existing ambient noise measurement data indicate variable conditions, with some areas quieter than others. From Table III.I-3 it can be seen that the measured L_{dn} ranges from 58 dBA to 67 dBA, with the highest level measured at N1 (likely due to a higher level of truck traffic there than at the other locations). Weekend noise levels were lower (by 1 to 4 dBA) on Sunday than on Saturday, while Monday noise levels were generally similar to those on Saturday. With most L_{dn} values (i.e., except those at N3 and N6) near or greater than 65 dBA L_{dn}, the ambient noise levels in the study area are generally higher than in San Francisco's western residential neighborhoods (i.e., Richmond or Sunset Districts), but lower than those in Downtown or South of Market Areas.[214] It was observed that N3 and N6 had less traffic than the other locations measured, which would explain why these locations are quieter than the others.

Table III.I-4 (Existing A-Weighted Background Noise Levels [L_{90}]) contains a summary of the range of existing A-weighted ambient background (L_{90}) levels, at times when a football game would usually occur (i.e., weekend afternoons, 3:00 P.M. to 6:00 P.M., and Monday evenings, 6:00 P.M. to 9:00 P.M.).

Table III.I-5 (Existing C-Weighted Background Noise Levels [L_{90}] at Night) contains a similar summary of the C-weighted background levels at night, the time a concert at the proposed stadium would likely occur (7:00 P.M. to midnight).

Traffic Noise Levels along Major Project Site Access Routes

Short-term traffic noise measurements (i.e., 15 minutes each) were taken at five near-curbside locations along the main Project site access routes during the weekday PM peak commute period, as shown in Table III.I-6 (Existing Peak-Hour Traffic Noise Measurements). The locations of these measurements are indicated as T1 through T5 on the aerial photo in Figure III.I-2 (Short-Term Ambient Noise Measurement Locations).

Table III.I-6 Existing Peak-Hour Traffic Noise Measurements (L_{eq})

Noise Receptor	*Land Use Description*	*Noise Level* L_{eq}	L_{min}	L_{max}	*Primary Noise Source*
T1	Candlestick Condos	66.8	60.5	87.3	Traffic along Candlestick, and US-101
T2	Residences along Hunters Point Boulevard	67.8	47.1	86.3	Traffic along Hunters Point Boulevard
T3	Residences along Palou Avenue between Jennings and Ingalls	65.8	51.6	86.4	Traffic along Palou Avenue

SOURCE: PBS&J, 2009.
Noise measurements taken on May 20, 2009, between the hours of 3:00 P.M. and 6:00 P.M. for 15 minutes each.
Noise measurement data sheets are available in Appendix I2 (Short-Term Noise Measurements).

In addition to short-term measurements, traffic noise L_{eq} (peak hour) and L_{dn} at the setbacks of the residential uses adjacent to the major access routes (and other streets likely to carry substantial Project traffic volumes) were calculated using the Federal Highway Administration (FHWA) Traffic Noise Model (TNM). The model calculates the average noise level at specific locations based on traffic volumes, average speeds, roadway geometry, truck mix, distance from roadway to receptor and site environmental conditions. The average vehicle noise rates (energy rates) utilized in TNM replicate the latest measurements of average vehicle noise rates for all vehicle classes. Traffic volumes utilized as data inputs in the noise prediction model were provided through the traffic analysis prepared for this EIR.[215] The *San Francisco General Plan* regards noise levels less than or equal to 60 dBA L_{dn} as "satisfactory, with no special noise insulation requirements" for residential uses (refer to Section III.I.3 [Regulatory Framework]). The average daily noise levels along these roadway segments are presented in Table III.I-7. As shown, all roadways modeled were below the 60 dBA L_{dn} noise level, except for 3rd Street and Bayshore Boulevard.

Existing Aircraft Noise Levels on the Project Site

San Francisco International Airport (SFO) is located approximately 10 miles to the south of the Project site. Commercial aircraft associated with SFO operations regularly fly-over the Project site. However, as shown in Figure III.I-3 (SFO Noise Contour Map), the Project site is well outside SFO's 65 dBA CNEL noise contour (and is even outside the 55 dBA CNEL contour). Additionally, SFO issues monthly July 2009 *Airport Director's Reports*, which document the frequency of aircraft noise standard violations and the number/locations of noise complaints received. A review of *Airport Director's Reports* from the past 6 months indicates that no complaints were received from BVHP neighborhood residents regarding aircraft noise.[216]

Football Game Noise Levels Measured Near the Existing 49er Stadium

Noise measurements were taken near the existing Candlestick Park stadium (outside the Jamestown Condominiums on the west side of Jamestown Avenue) during a football game (49ers vs. Tampa Bay, Sunday December 23, 2007). As shown in Figure III.I-4 (Monster Park Sound Levels [49ers vs. Tampa Bay on December 23, 2007] at Jamestown Condominiums), the noise level in the vicinity of a stadium with a football game in progress is highly variable. Most of the peak noise events were associated with game activities (e.g., pre-game ceremonies, crowd cheering, music, and announcements on the public address system, etc.). The highest game-related peak noise (L_{max}) was in the upper 60s to mid 70s dBA, but more often lower; audible game-related noise events were fairly frequent but of short duration. The average noise level (L_{eq}) during the portion of the game monitored was in the mid 60s dBA, while the background level (L_{90}) was in the upper 50s dBA. Also, game activity was not the only source of peak noise events. Candlestick Park is under major approach/departure routes to/from SFO. Aircraft overflights happened a few times during the monitoring period and though their L_{max} were not as large as that of the highest game noise events, their audible duration was longer, pushing their SEL level into the low to mid 70s dBA.

III.I.3 Regulatory Framework

Federal

US Environmental Protection Agency

The federal *Noise Control Act of 1972* addressed the issue of noise as a threat to human health and welfare, particularly in urban areas. In response to the Act, the US Environmental Protection Agency (USEPA) published *Information of Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety* (USEPA Levels). Table III.I-8 (Summary of Noise Levels Identified as Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety) summarizes EPA recommendations for noise-sensitive areas. Ideally, the yearly average L_{eq} should not exceed 70 dBA to prevent measurable hearing loss over a lifetime, and the L_{dn} should not exceed 55 dBA outdoors and 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas. In addition to the identified noise levels to protect public health, the USEPA Levels identifies an increase of 5 dBA as an adequate margin of safety relative to a baseline noise exposure level of 55 dBA L_{dn} before a noticeable increase in adverse community reaction would be expected.

Table III.I-8 Summary of Noise Levels Identified as Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety

Effect	*Level*	*Area*
Hearing Loss	L_{eq}(24 hr) < 70 dBA[a]	All areas.
Outdoor activity interference and annoyance	L_{dn} < 55 dBA	Outdoors in residential areas and farms and other outdoor areas where people spend widely varying amounts of time and other places in which quiet is a basis for use.
Outdoor activity interference and annoyance	L_{eq}(24 hr) < 55 dBA	Outdoor areas where people spend limited amounts of time, such as school yards, playgrounds, etc.
Indoor activity interference and annoyance	L_{dn} < 45 dBA	Indoor residential areas.
Indoor activity interference and annoyance	L_{eq}(24 hr) < 45 dBA	Other indoor areas with human activities such as schools, etc.

SOURCE: US Environmental Protection Agency, *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety*, March 1974.

a. Yearly average equivalent sound levels in decibels; the exposure period that results in hearing loss at the identified level is a period of forty years.

The EPA does not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as advisory exposure levels below which there would be no reason to suspect that there would be risk from any of the identified health or welfare effects of noise.

Federal Transit Administration

The Federal Transit Administration (FTA) developed a methodology and significance criteria to evaluate noise impacts from surface transportation modes (i.e., passenger cars, trucks, buses, and rail) in *Transit Noise Impact and Vibration Assessment* (FTA Guidelines) (May 2006). The incremental noise impact criteria included the FTA Guidelines, as presented in Table III.I-9 (Federal Transit Administration Impact Criteria

for Noise-Sensitive Uses), are based on USEPA Levels and subsequent studies of annoyance in communities affected by transportation noise and contained in the FTA Guidelines. The scientific rationale for the choice of these criteria is also explained in the FTA Guidelines. Starting from the EPA's definition of minimal noise impact as a 5 dBA change from an established protective ambient level, the FTA extended the EPA's incremental impact criteria to higher baseline ambient levels. As baseline ambient levels increase, smaller and smaller increments are allowed to limit increases in community annoyance (e. g., in residential areas with a baseline ambient noise level of 50 dBA L_{dn}, a 5 dBA increase in noise levels would be acceptable, while at 70 dBA L_{dn}, only a 1 dBA increase would be allowed).

Table III.I-9 Federal Transit Administration Impact Criteria for Noise-Sensitive Uses

Residences and Buildings Where People Normally Sleep[a]		*Institutional Land Uses with Primarily Daytime and Evening Uses*[b]	
Existing L_{dn} (dBA)	*Allowable Noise Increment (dBA)*	*Existing Peak Hour L_{eq} (dBA)*	*Allowable Noise Increment (dBA)*
45	8	45	12
50	5	50	9
55	3	55	6
60	2	60	5
65	1	65	3
70	1	70	3
75	0	75	1
80	0	80	0

SOURCE: Federal Transit Administration, Transit Noise Impact and Vibration Assessment, May 2006.

a. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.

b. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material.

The FTA has also developed criteria for judging the significance of vibration produced by transportation sources and construction activity, as shown in Table III.I-10 (Groundborne Vibration Impact Criteria for General Assessment).

Under Federal Highway Administration (FHWA) regulations, noise abatement must be considered for new highway construction and highway reconstruction projects when the noise levels approach or exceed the noise-abatement criteria. For residential, school and other noise sensitive sites, these criteria indicate that the equivalent noise level (L_{eq}) during the noisiest 1-hour period of the day should not exceed 67 A-weighted decibels (dBA) at the exterior or 52 dBA within the interior. For commercial purposes, the exterior L_{eq} should not exceed 72 dBA.

Table III.I-10 Groundborne Vibration Impact Criteria for General Assessment

Land Use Category	*Impact Levels (VdB; relative to 1 micro-inch/second)*		
	Frequent Events[a]	*Occasional Events*[b]	*Infrequent Events*[c]
Category 1: Buildings where vibration would interfere with interior operations	65[d]	65[d]	65[d]
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83

SOURCE: Federal Transit Administration, Transit Noise Impact and Vibration Assessment, May 2006.

a. "Frequent Events" is defined as more than 70 vibration events of the same source per day.

b. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.

c. "Infrequent Events" is defined as fewer than 30 vibration events of the same source per day.

d. This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research would require detailed evaluation to define the acceptable vibration levels.

Federal Aviation Administration

Federal Aviation Administration (FAA) regulations (i.e., Part 150, Airport Noise Compatibility Planning) prescribe the methodology governing the development, submission, and review of airport noise exposure maps and noise compatibility programs. The noise exposure maps use average annual L_{dn} or CNEL contours around the airport as the primary noise descriptor. To the FAA, all land uses are considered compatible when aircraft noise effects are less than 65 dB L_{dn} or CNEL. At higher noise exposures, increasing restrictions are applied to development within the aircraft noise contours depending upon the noise-sensitivity of the land use and the degree of noise attenuation required in the structures' interior spaces. As shown in Figure III.I-3, the Project site is well outside SFO's 65 dBA CNEL noise contour.

State

Governor's Office of Planning and Research

The Governor's Office of Planning and Research (OPR) *General Plan Guidelines 2003* (GP Guidelines) promotes use of L_{dn} or CNEL for evaluating the compatibility of various land uses with respect to their noise exposure. The designation of a level of noise exposure as "normally acceptable" for a given land use category implies that the interior noise levels would be acceptable to the occupants without the need for any special structural acoustic treatment. The GP Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels. The GP Guidelines provide each local community some flexibility in setting local noise standards that allow for the variability in community preferences. Findings presented in the USEPA Levels influenced the recommendations of the GP Guidelines, most importantly in the choice of noise exposure metrics (i.e., L_{dn} or CNEL) and in the upper limits for the "normally acceptable" outdoor exposure of noise-sensitive uses (i.e., no higher than 60 dBA L_{dn}/CNEL for residential, which is obtained when the EPA's 5 dBA margin of safety is added to the baseline noise exposure level of 55 dBA level that the USEPA believes is completely adequate to protect public health and welfare).

Title 25 (California Noise Insulation Standards)

The California Noise Insulation Standards (*California Code of Regulations*, Title 25, Section 1092) establishes uniform minimum noise insulation performance standards for new hotels, motels, dormitories, apartment houses, and dwellings other than detached single-family dwellings. Specifically, Title 25 states that interior noise levels attributable to exterior sources shall not exceed 45 dBA L_{dn} or CNEL (the same levels that the EPA recommends for residential interiors) in any habitable room of new dwellings. Acoustical studies must be prepared for proposed multiple unit residential and hotel/motel structures where outdoor L_{dn} or CNEL is 60 dBA or greater. The studies must demonstrate that the design of the building would reduce interior noise to 45 dBA L_{dn} or CNEL, or lower. Dwellings are to be designed so that interior noise levels would meet this standard for at least ten years from the time of building permit application. Interior noise levels can be reduced through the use of noise insulating windows, and by using sound isolation materials when constructing walls and ceilings. The primary means to achieve this standard is through the use of noise insulating windows, and/or sound isolation materials when constructing walls and ceilings.

Local

San Francisco General Plan

The *San Francisco General Plan* provides long-term guidance and policies for maintaining and improving the quality of life and the man-made and natural resources of the community. The Environmental Protection Element of the *San Francisco General Plan* is concerned primarily with avoiding or mitigating the adverse effects of transportation noise. However, many of the Objectives and related Policies of the *Transportation Noise* section could be applicable to noise from other sources (including noise from crowds, public address systems, and concert noise from a stadium):

Objective 10 Minimize the impact of noise on affected areas.

Policy 10.1 Promote site planning, building orientation and design, and interior layout that will lessen noise intrusion.

Policy 10.2 Promote the incorporation of noise insulation materials in new construction.

Objective 11 Promote land uses that are compatible with various transportation noise levels.

Policy 11.1 Discourage new uses in areas in which the noise level exceeds the noise compatibility guidelines for that use.

The "Land Use Compatibility Chart for Community Noise" included in Policy 11.1 specifies the compatibility of different land use types within a range of ambient noise levels.

For residential uses:

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 60 dBA or less.
- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 60 dBA and 70 dBA.

- "New construction or development should generally be discouraged" where L_{dn} is over 65 dBA.

For other noise-sensitive uses (i.e., schools, libraries, churches, hospitals, nursing homes):

- Noise exposure is considered "satisfactory, with no special noise insulation requirements" where the L_{dn} is 65 dBA or less.
- "New construction or development should be undertaken only after a detailed analysis of noise reduction requirements is made and needed noise insulation features included in the design" where the L_{dn} is between 62 dBA and 70 dBA.
- "New construction or development should generally not be undertaken" where L_{dn} is over 65 dBA.

Policy 11.3 Locate new noise-generating development so that the noise impact is reduced.

San Francisco Noise Ordinance (Article 29, San Francisco Police Code)

The Noise Ordinance specifically recognizes that adverse effects on a community can arise from noise sources such as transportation, construction, mechanical equipment, entertainment, and human and animal behavior. The San Francisco Noise Ordinance (Article 29, *San Francisco Police Code*, Section 2900) makes the following declaration:

> It shall be the policy of San Francisco to maintain noise levels in areas with existing healthful and acceptable levels of noise and to reduce noise levels, through all practicable means, in those areas of San Francisco where noise levels are above acceptable levels as defined by the World Health Organization's Guidelines on Community Noise.

The following policies are included to address and limit disruptive noise intrusions from these sources.

Waste Disposal Services (Section 2904)

The Noise Ordinance limits noise from waste disposal services mechanical or hydraulic device to 75 dBA when measured from 50 feet. This maximum noise level does not apply to the noise associated with crushing, impacting, dropping, or moving garbage on the truck, but only to the truck's mechanical processing system.

Construction (Sections 2907 and 2908)

The Noise Ordinance limits noise from powered construction equipment to a level of 80 dBA at a distance of 100 feet (or an equivalent level at some other distance).[217] This does not apply to impact tools (provided they are equipped with appropriate noise control features recommended by the manufacturers and approved by the Director of Public Works or the Director of Building Inspection) nor to construction

[217] By definition, Noise Ordinance Section 2901j states "Powered construction equipment" means any tools, machinery, or equipment used in connection with construction operations which can be driven by energy in any form other than manpower, including all types of motor vehicles when used in the construction process of any construction site, regardless of whether such construction site be located on-highway or off-highway, and further including all helicopters or other aircraft when used in the construction process except as may be preempted for regulation by state or federal law.

equipment used in connection with emergency work. Also, construction activities are generally prohibited between the hours of 8:00 P.M. and 7:00 A.M. if the noise created would be in excess of the ambient noise level by 5 dBA at the nearest property line (although exceptions to these limits can be made in certain cases by the Director of Public Works or the Director of Building Inspection).

Noise Limits (Section 2909)

The Noise Ordinance limits noise from sources defined as "any machine or device, music or entertainment or any combination of same" located on residential or commercial/industrial property to 5 dBA or 8 dBA, respectively, above the local "ambient"[218] at any point outside of the property plane of a residential, commercial/industrial or public land use, respectively, containing the noise source. An additional low-frequency criterion applies to noise generated from a licensed Place of Entertainment, specifically that no associated noise or music shall exceed the low-frequency ambient noise level by more than 8 dBC.

The Noise Ordinance limits noise from a fixed "source"[219] from causing the noise level measured inside any sleeping or living room in any dwelling unit located on residential property to 45 dBA between the hours of 10:00 P.M. to 7:00 A.M. or 55 dBA between the hours of 7:00 A.M. to 10:00 P.M. with windows open except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

Variances (Section 2910)

The Noise Ordinance gives the Directors of Public Health, Public Works, Building Inspection, or the Entertainment Commission, or the Chief of Police authority to grant variances to noise regulations over which they have jurisdiction. The Department of Public Health has jurisdiction over sources specified in Noise Limits (Section 2909), the Departments of Building Inspection and Public Works over sources specified in Construction (Sections 2907 and 2908), and the Director of the Entertainment Commission may enforce noise standards associated with licensed Places of Entertainment.

III.I.4 Impacts

Significance Criteria

The City and Agency have not formally adopted significance standards for impacts related to noise, but generally consider that implementation of the Project would have significant impacts if it were to:

I.a Result in exposure of persons to or generation of noise levels in excess of standards established in the Environmental Protection Element of the *San Francisco General Plan* or San Francisco Noise Ordinance (Article 29, *San Francisco Police Code*)

[218] By definition, Noise Ordinance Section 2901a states "ambient" means the lowest sound level repeating itself during a minimum ten-minute period as measured with a type 1, precision sound level meter, set on slow response and A-weighting … in no case shall the ambient be considered or determined to be (1) less than 35 dBA for interior residential noise, and (2) 45 dBA in all other locations."

[219] By definition, Noise Ordinance (Section 2901e) states "fixed source" means a machine or device capable of creating a noise level at the property upon which it is regularly located, including but not limited to: industrial and commercial process machinery and equipment, pumps, fans, air-conditioning apparatus or refrigeration machines.

I.b Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels

I.c Result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project

I.d Result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project

I.e For a project located within an airport land use plan area, or, where such a plan has not been adopted, in an area within two miles of a public airport or public use airport, would the Project expose people residing or working in the area to excessive noise levels

I.f For a project located in the vicinity of a private airstrip, would the Project expose people residing or working in the project area to excessive noise levels

I.g Be substantially affected by existing noise levels

Based on the following quantitative significance thresholds specifically included in the City of San Francisco *General Plan* or Noise Ordinance, the Project would cause or be subject to a significant noise or vibration impact if it would:

- **During Construction**
  - > Generate construction noise between the hours of 8:00 P.M. and 7:00 A.M. that exceeds the ambient noise level by 5 dBA at the nearest property line (unless a special permit has been granted by the Director of Public Works or the Director of Building Inspection); or produce noise by any construction equipment (except impact tools) that would exceed 80 dBA at 100 feet. (Criteria I.a and I.d)
- **During Operation**
  - > Cause an increase in noise (i.e., as produced by "any machine or device, music or entertainment or any combination of same") greater than 5 dBA or 8 dBA above the local ambient (i.e., defined as the "lowest sound level repeating itself during a minimum 10-minute period as measured with a sound level meter, using slow response and A-weighting")[220] at any point outside the property plane of a residential, commercial/industrial or public land use, respectively, containing the noise source. (Criteria I.a, I.c, or I.d)
  - > In the case of noise or music generated from a "licensed Place of Entertainment," cause an increase in low frequency ambient noise (i.e., defined as the "lowest sound level repeating itself during a 10-minute period as measured with a sound level meter, using slow response and C-weighting") by more than 8 dBC. (Criteria I.a, I.c, or I.d)

In the following cases where quantitative significance thresholds may not be included in the City of San Francisco *General Plan* or Noise Ordinance, the Project would cause or be subject to a significant noise or vibration impact if it would:

[220] Although not explicitly stated in the San Francisco Noise Ordinance (Section 2901), the "ambient" level would most likely correspond to the L_{90} descriptor (i.e., the sound level exceeded 90% of the time) because of the operative words *"lowest sound level repeating itself"* in the Ordinance definition; there is a 10% chance that sound levels at or lower than L90 would repeat during a 10-minute period, whereas the L_{min} would likely occur only once.

- For football game or concert noise from the proposed Stadium:[221]
  - > Cause L_{dn} on a typical football day to increase by 1 dBA or more in a residential area where existing ambient L_{dn} already exceeds 65 dBA or would exceed 65 dBA with the game/concert noise added[222] (Criteria I.a, I.c, or I.d)
  - > Result in L_{max} levels in the residential area that exceed 75 dBA.[223] (Criteria I.a, I.c, or I.d)
  - > Expose persons to or generate groundborne vibrations from construction activities that exceed the FTA vibration impact thresholds for residential and other vibration-sensitive land uses as specified in Table III.I-10. (Criterion I.b)
- Cause outdoor traffic noise levels at existing or proposed residential and other noise-sensitive uses to increase by more than the FTA criteria specified in Table III.I-9, which vary depending on the baseline ambient noise levels. (Criterion I.c)
- Cause excessive annoyance, activity disruption, or sleep disturbance due to noise from SFO-related aircraft operations at the proposed residential uses to be located on the Project site according to FAA criteria (i.e., aircraft noise level of 65 dBA L_{dn} or greater). (Criteria I.e, I.f, and I.g)

Analytic Method

As noted above, long-term 24-hour ambient noise measurements were taken at six locations in the residential neighborhoods north and west of the Project site for a total of six days in 2009. The long-term ambient noise measurements were conducted over the course of three days in January 2009, and again in July 2009. Both the A-weighted and C-weighted measurements were for 24-hour periods during the respective measurement times and were recorded using Larson Davis digital sound level meters. Table III.I-3 through Table III.I-5 show the results of the long-term L_{eq} and the A-and C-weighted results respectively, while Figure III.I-1 shows the locations of these measurements.

The analysis of the existing and future noise environments is based on noise-level monitoring, noise-prediction computer modeling, and empirical observations of receptor noise exposure characteristics. Existing short-term noise levels were monitored at selected locations in and around the Project site using a Larson-Davis Model 820 sound level meters. These short-term noise measurements were taken on May 20, 2009, between the hours of 3:00 P.M. and 6:00 P.M. for 15 minutes each. The results of these noise measurements are shown in Table III.I-6, while Figure III.I-2 shows the location of these measurements.

---

[221] Although there is an existing football stadium on the Candlestick Point site, construction of the proposed Stadium at a different location on the Hunters Point Shipyard site has the potential to expose other noise-sensitive uses near the new location to substantial additional football game and concert noise. Also, the public address system in the proposed Stadium is likely to be different than the one at the existing facility and this difference is included in the noise model used for this analysis. The football game/concert noise impact analysis focuses only on potential adverse noise impacts from the proposed Stadium with respect to the significance criteria presented above.

[222] The General Plan *Land Use Compatibility Chart for Community Noise* sets 65 dBA L_{dn} as the lowest level at which "*new [residential] construction or development should generally be discouraged.*" This level is taken as the point at which noise from the proposed stadium would begin to substantially interfere with the residential character of the existing neighborhood.

[223] Interior L_{max} noise levels that exceed 60 dBA would generally be considered to cause interference with normal speech indoors or with activities that involve speech comprehension (e.g., watching television), whereas L_{max} noise levels that are less than 55 dBA would generally not interfere. Since residential structures typically provide 15 to 20 dBA of exterior-to-interior noise level reduction with windows closed, as long as exterior L_{max} noise levels did not exceed 75 dBA substantial interference with normal speech or speech comprehension would not occur indoors.

Traffic noise modeling procedures involved the calculation of existing and future vehicular noise levels at selected noise-sensitive uses in the vicinity of the Project site using the FHWA Traffic Noise Model (TNM). The model calculates the average noise level at specific locations based on traffic volumes, average speeds, roadway geometry, truck mix, distance from roadway to receptor, and site environmental conditions. The average vehicle noise rates (energy rates) utilized in TNM reflects the latest measurements of average vehicle noise rates for all vehicle classes. Traffic volumes utilized as data inputs in the noise prediction model were provided through the traffic analysis prepared for this EIR. For purposes of analysis, the average peak-hour traffic volumes were extrapolated from the Project traffic study and input into the model to estimate existing and future traffic noise levels on roadway segments in the Project vicinity where existing or reasonably foreseeable sensitive receptors are located.

The proposed stadium would primarily be used for football games, but may also be used occasionally for popular music concerts. The proposed stadium design, measured game and concert noise data gathered from similar existing facilities, the influence of surrounding topography and meteorology, and the location of noise-sensitive receptors (primarily residential) in the area were developed as input parameters to the community noise prediction computer model SoundPLAN®. The sound emission characteristics of both the stadium's "house" sound system (the permanent sound system that would be utilized during football games) and that of a portable system characteristic of concerts were used in the SoundPLAN® model to (1) project noise levels in the community for both games and concerts; (2) to evaluate whether noise impacts would potentially occur; and (3) determine the possible need for mitigation and the details of such mitigation.

Aircraft noise levels on the Project site were estimated using available data from SFO. The noise analysis considered the existing CNEL and SEL noise data as likely exposure for the proposed residential uses on site.

Construction noise and vibration levels were quantified using equipment noise reference levels and modeling techniques developed by the FTA.[224]

Construction Impacts

Impact NO-1: Exposure of Persons to Excessive Noise Levels

Impact of Candlestick Point

Impact NO-1a **Construction at Candlestick Point would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would occur primarily in noise-sensitive areas adjacent or near to active construction sites (which would vary in location and duration over the entire period the proposed Project would be under construction), they would not occur during recognized sleep hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 & 2908 of the *Municipal Code*. (Less than Significant with Mitigation) *[Criterion I.a]***

[224] It is the City's standard that noise impact findings be based on the City's General Plan and Noise Ordinance significance criteria. However, for the purposes of this EIR analysis, the traffic noise and vibration analysis are based on the FTA (2006) criterion. The methodology and impact conclusions would be the same using either criterion.

- It is anticipated that the Project would be constructed beginning in 2011 with full build-out by 2031 and full occupancy in 2032, which represents an approximately 20-year construction period. Figure II-16 (Proposed Site Preparation Schedule) illustrates the site preparation sequence that precedes building construction. Figure II-17 (Proposed Building and Parks Construction Schedule) illustrates the building construction sequence.

  Construction activities would include demolition, site preparation, grading, placement of infrastructure, placement of foundations for structures, and fabrication of structures. Demolition and construction activities would require the use of heavy trucks, excavating and grading equipment, concrete breakers, concrete mixers, and other types of mobile and stationary construction equipment. The Project's construction would require heavy-duty equipment such as excavators, a drill rig, concrete mixers, and pump trucks would be used during the demolition of existing buildings, grading and foundation work. Excavation and grading in the Jamestown and Alice Griffith districts would be likely to encounter hard bedrock, requiring the use of heavy construction equipment. Heavy construction equipment rock removal methods include ripping (such as a Caterpillar D9 tractor with ripper attachment) and mechanical rock-breaking utilizing hammers, splitters or cutters. The mid and high-rise residential towers to be developed at CP North and CP South, as well as the shoreline improvements and development of the Yosemite Slough bridge would require the use of pile-driving equipment.

  Construction activities would also involve the use of smaller power tools, generators, and other equipment that generate noise. Haul trucks using the local roadways would generate noise as they move along the road. Each stage of construction would involve a different mix of operating equipment, and noise levels would vary based on the amount and types of equipment in operation and the location of the activity. Table III.I-11 (Construction Equipment Noise Emission Levels) provides average noise levels for standard construction equipment. Figure III.I-5 (Existing and Future Noise-Sensitive Land Uses in Project Site and Vicinity) illustrates the location of existing and future noise-sensitive land uses within and in the vicinity of the Project site.

Construction Impacts at Off-Site Noise-Sensitive Receptors

Average noise levels at sensitive receptors off site would vary by construction phase and depend on the equipment used, the duration of the construction phase, and the proximity of construction activity to the noise-sensitive receptors. The Project would improve existing roadways to serve Candlestick Point and HPS Phase II and surrounding Bayview and Hunters Point neighborhoods. Improvements would be within the Project boundaries, and off site as shown in Figure II-12 (Proposed Roadway Improvements) in Chapter II (Project Description). These improvements would include widening, re-striping, and/or reconfiguration of roadway segments and intersections. Construction activities associated with roadway improvements would be located within 25 feet of existing residential uses in the BVHP neighborhood along Gilman Avenue, Carroll Avenue, and Ingalls Street. Additionally, construction activities that would occur within Candlestick Point, including the demolition and redevelopment of the Alice Griffith Public Housing and within the Jamestown district would be located within 25 feet of existing residential uses along Gilman Avenue and Jamestown Avenue, respectively.

FIGURE III.I-5 ~~Candlestick~~ ~~Point~~ - ~~Hunters~~ ~~Point~~ ~~Shipyard~~ ~~Phase~~ II ~~EIR~~
EXSITING AND FUTURE NOISE SENSITIVE LAND USES IN PROJECT SITE AND VICINITY

Due to different densities of the underlying bedrock at Candlestick Point, controlled rock fragmentation may be utilized during general excavation and grading of the residential uses in the Jamestown and Alice Griffith districts. Controlled rock fragmentation technologies include pulse plasma rock fragmentation (PPRF), controlled foam or hydraulic injection, and controlled blasting (CB). In some scenarios it may be necessary to utilize a combination of these techniques. Controlled blasting can typically be performed at noise levels below typical building demolition levels (80-100 dBA) at the same distance. Table III.I-12 (Noise Levels for Controlled Rock Fragmentation Technologies) provides average noise levels for both PPRF and controlled blasting.

Table III.I-12 Noise Levels for Controlled Rock Fragmentation Technologies

Distance (Meters)	*PPRF (dBA)*	*CB (dBA)*
20	67.6	82.2
30	65.8	78.9
40	65.3	73.3

SOURCE: MACTEC Engineering and Consulting, Inc.

Off-site roadway improvements would utilize a pavement crusher (similar in noise levels to a grader), loaders and graders, as well as water and haul trucks. Based on the noise levels presented in Table III.I-11, the approximate noise levels experienced by adjacent noise-sensitive uses due to construction activities occurring during off-site roadway improvements, which are conservatively assumed to be 25 feet from the proposed improvement activity, would be approximately 92 dBA during the loudest off-site activities (noise from a grader).

Noise levels from excavation and grading activities associated with development at the Jamestown and Alice Griffith districts are estimated to be approximately 92 dBA due to the use of heavy construction equipment, such as D-9 Caterpillar Bulldozers. Controlled rock fragmentation activities (whether PPRF or CB) would also result in noise levels of approximately 67.6 to 82.2 dBA at distances of approximately 60 feet.

Construction Impacts at Future On-Site Noise-Sensitive Receptors

Residential uses that would be developed as part of the Project in Candlestick Point would be occupied starting in 2019, as shown in Table II-15 (Building Construction Completion Dates) in Chapter II (Project Description). These residential uses would be located in the Alice Griffith district. Subsequent residential uses in Candlestick Point are scheduled for occupancy in 2023, 2027, and 2032 in the CP North, CP South, CP Center, and Jamestown districts as shown in Figure II-16 (Proposed Site Preparation Schedule) and Figure II-17 (Proposed Building and Parks Construction Schedule). As shown in Table II-15, the commercial, neighborhood and regional retail, hotel and performance venue associated with Candlestick Point would be completed by 2023.

The Project would include redevelopment of Alice Griffith Public Housing to provide one-for-one replacement units. Eligible Alice Griffith Public Housing residents would have the opportunity to move to the new units directly from their existing Alice Griffith Public Housing units without having to relocate to any other area. Therefore, while construction would occur at one parcel, residents would continue to

reside at the remaining parcels. As such, these residents have been identified as on-site receptors during Project construction. Construction activities associated with grading and excavation, including controlled rock fragmentation activities in the Alice Griffith district, are estimated to be approximately 92 dBA at the residential uses of Alice Griffith due to the use of heavy construction equipment, such as D-9 Caterpillar Bulldozers. Controlled rock fragmentation activities (whether PPRF or CB) would also result in noise levels of approximately 67.6 to 82.2 dBA at distances of approximately 60 feet.

Construction of the residential and commercial uses in the remainder of Candlestick Point would include the development of high-rise mixed-use residential towers. Based on Table III.L-7 (Geotechnical Treatments for Candlestick Point Geotechnical Subparcels) in Section III.L (Geology and Soils), these high-rise towers would require the construction of deep foundations. The recommended construction method for these deep foundations would be to utilize pile drivers. As shown in Table III.I-11, pile drivers produce noise levels of approximately 101 dBA. As shown in Figure II-4 (Proposed Land Use Plan), the high-rise towers that would be closest to existing noise-sensitive uses would be located in the southwestern portion of the CP North district, approximately 150 feet from the redeveloped Alice Griffith district. Therefore, it is estimated that the greatest construction noise levels (during pile driving activities) associated with construction of Candlestick Point would be approximately 91 dBA at the residential uses in the Alice Griffith district.

Pile driving would also be required in the CP Center and CP South districts after residential uses have been occupied in these districts; therefore, pile-driving activities would also be located within 50 feet of occupied residential structures, and these uses would experience noise levels of approximately 101 dBA.

Pile driving activities would also be required for implementation of the shoreline improvements within Candlestick Point; however, as shown in Figure III.I-5, no noise-sensitive uses are located within approximately 500 feet of the shoreline improvement areas. It is, therefore, anticipated that pile-driving activities associated with the shoreline improvements would result noise levels for noise-sensitive receptors that are below the level of significance.

Construction activities that would not require pile driving would also generate noise levels in excess of 80 dBA in the occupied Alice Griffith district. Specifically, construction of the medium- and low-density residential uses in the CP North district would be located within approximately 50 feet of the residential uses in the Alice Griffith district. Based on the noise levels presented in Table III.I-11, and the diminishment of noise levels at a rate of 6 dBA per doubling of distance, the approximate noise levels from construction in the CP North district would result in noise levels of up to 88 dBA at the property line of the Alice Griffith residential uses from activities associated with excavation, paving, and external finishing.

Construction of Candlestick Point must comply with the San Francisco Noise Ordinance, which prohibits construction 8:00 P.M. and 7:00 A.M. Further, the Noise Ordinance would limit noise from any individual piece of construction equipment (except impact tools) to 80 dBA at 100 feet unless the construction activity occurred during allowable hours.

As shown above, both on- and off-site noise-sensitive receptors in the Project vicinity could experience noise levels up to 91 dBA L_{eq} as a result of construction activities. *San Francisco Municipal Code* Sections 2907 & 2908 require that (1) noise levels from individual pieces of construction equipment, other than impact tools, not exceed 80 dBA at a distance of 100 feet from the source (the equipment generating the noise); (2) impact tools, such as jackhammers, must have both the intake and exhaust muffled to the satisfaction

of the Director of Department of Public Works (DPW); and (3) if the noise from construction would exceed the ambient noise levels at the property line of the site by 5 dBA, the work must not be conducted between 8:00 P.M. and 7:00 A.M., unless the Director of DPW authorizes a special permit for conducting the work during that period.[225]

To reduce the noise levels resulting from construction of the Project to the extent feasible for both on-site and off-site noise-sensitive receptors, the following mitigation measures shall be implemented:

MM NO-1a.1 *Construction Document Mitigation to Reduce Noise Levels During Construction. The Project Applicant shall incorporate the following practices into the construction documents to be implemented by the Project contractor:*

- *Provide enclosures and mufflers for stationary equipment, shrouding or shielding for impact tools, and barriers around particularly noisy operations on the site*
- *Use construction equipment with lower noise emission ratings whenever possible, particularly air compressors*
- *Provide sound-control devices on equipment no less effective than those provided by the manufacturer*
- *Locate stationary equipment, material stockpiles, and vehicle staging areas as far as practicable from sensitive receptors*
- *Prohibit unnecessary idling of internal combustion engines*
- *Require applicable construction-related vehicles and equipment to use designated truck routes to access the Project site*
- *Implement noise attenuation measures to the extent feasible, which may include, but are not limited to, noise barriers or noise blankets. The placement of such attenuation measures will be reviewed and approved by the Director of Public Works prior to issuance of development permit for construction activities.*
- *Designate a Noise Disturbance Coordinator who shall be responsible for responding to complaints about noise during construction. The telephone number of the Noise Disturbance Coordinator shall be conspicuously posted at the construction site and shall be provided to the City. Copies of the construction schedule shall also be posted at nearby noise-sensitive areas.*

MM NO-1a.2 *Noise-reducing Pile Driving Techniques and Muffling Devices. The Project Applicant shall require its construction contractor to use noise-reducing pile driving techniques if nearby structures are subject to pile driving noise and vibration. These techniques include pre-drilling pile holes (if feasible, based on soils) to the maximum feasible depth, installing intake and exhaust mufflers on pile driving equipment, vibrating piles into place when feasible, and installing shrouds around the pile driving hammer where feasible.*

Contractors shall be required to use construction equipment with state-of-the-art noise shielding and muffling devices. In addition, at least 48 hours prior to pile-driving activities, the Project Applicant shall notify building owners and occupants within 500 feet of the Project site of the dates, hours, and expected duration of such activities.

Under mitigation measure MM NO-1a.1, the implementation of noise attenuation measures may include the use of noise barriers (e.g., sound walls) or noise blankets. As a general rule of thumb, if a noise source

[225] Warren, Elaine, email communication with Deputy City Attorney, City and County of San Francisco, October 2, 2009.

is completely enclosed or completely shielded with a solid barrier located close to the source, an 8 dBA noise reduction can be expected; if the enclosure and/or barrier is interrupted, noise would be reduced by only 5 dBA. [226] In addition, mitigation measure MM NO-1a.1, which requires that construction staging areas and earthmoving equipment be located as far away from noise and vibration-sensitive land uses as possible, would also reduce construction-related noise levels. Mitigation measure MM NO-1a.1 also would require that heavily loaded trucks traverse along pre-approved routes only, which would serve to reduce noise impacts from construction related truck trips. Mitigation measure MM NO-1a.2 would require that noise impacts from pile driving activities be reduced to the extent practicable by requiring pre-drilled holes and utilizing vibratory pile driving techniques as soil conditions would allow. MM NO-1a.2 would also require that the contractor utilize noise shrouds around the pile driving, which would serve to reduce noise levels by approximately 5 to 10 dBA.

- While the construction activities would occur over an approximately 20-year timeline, the activities that impact individual receptors would be temporary. The conditions under which noise levels would be considered excessive during construction activities, such as excavation or pile driving, would only occur for the duration of the specified activity and would only impact receptors located within 150 feet or closer of the noise producing activity. Once that particular construction activity was completed, the associated noise would no longer be experienced by the affected receptor.

The City allows for construction noise levels to exceed the standards established if the project complies with the Noise Ordinance as required by law, as well as include other construction noise attenuating features, such as those identified in mitigation measures MM NO-1a.1 and MM NO-1a.2, project-related construction noise impact would be considered to be less than significant. Construction noise would be reduced by mitigation measures MM NO-1a.1 and MM NO-1a.2. Further, as construction activities would only occur under the hours allowed under Sections 2907 and 2908, this impact would be less than significant.

Impact of Hunters Point Shipyard Phase II

Impact NO-1b **Construction at HPS Phase II would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would be temporary, they would also not occur during recognized sleep hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 and 2908 of the *Municipal Code*. (Less than Significant with Mitigation) *[Criterion I.a]***

Construction Impacts at Off-Site Noise-Sensitive Receptors

Off-site roadway improvements to Innes Avenue would result in construction activities occurring within 25 feet of residential uses along Innes Avenue. As described under Impact NO-1, noise levels associated with these off-site roadway improvements would be approximately 85 dBA at 50 feet; at 25 feet, which is a halving of distance, noise levels would increase by 6 dBA, which would result in a noise level 91 dBA due to grading activities.

[226] US Department of Transportation, Federal Highway Administration, *FHWA Roadway Construction Noise Model, Version 1.0 User's Guide*, Appendix A: Best Practices for Calculating Estimated Shielding for Use in the RCNM, January 2006.

Construction of the proposed football stadium would be located in HPS Phase II and would require pile-driving activities. As shown in Table III.I-11, pile drivers produce noise levels of approximately 101 dBA within 50 feet of the source. The closest off-site noise-sensitive receptor to the proposed football stadium would be the residential uses located in HPS Phase I. These residential uses are located approximately 600 feet from the proposed stadium; therefore, as stationary noise levels diminish by 6 dBA per doubling of distance, it is estimated that the greatest construction noise levels (during pile driving activities) associated with construction of the stadium would be approximately 77 dBA to 83 dBA, depending on the exact distance. It should be noted that the residential uses located at HPS Phase I are located along a ridge that serves to shield the residential uses from the stadium site, which would serve to further reduce construction related noise levels.

All off-site construction activities associated with HPS Phase II would be required to comply with Sections 2907 and 2908 of the Noise Ordinance and implement mitigation measures MM NO-1a.1 and MM NO-1a.2. Compliance with the Noise Ordinance and the identified mitigation measures would reduce the impact of construction noise to off-site receptors from construction related noise associated with HPS Phase II.

Construction Impacts at Future On-Site Noise-Sensitive Receptors

At HPS Phase II, new development would begin with the construction of the 49ers stadium, scheduled for completion during the 2014–2017 time period. HPS North district residential development would begin during 2011–2015 and is planned for completion by 2019. Build-out of the R&D district is planned by 2027. The mixed-use, neighborhood retail, and residential development at the HPS Village Center district would be completed in 2023. Based on the construction schedule, construction activities associated with the stadium, HPS North district, and R&D district would not impact on-site noise-sensitive uses. Construction of the HPS Village Center district would occur while the HPS North district residential uses are occupied and, therefore, could potentially impact the HPS North district residential uses.

Construction of the residential and commercial uses in the HPS Village Center district would include the development of high-rise mixed-use residential towers. Based on Table III.L-8 (Geotechnical Treatments for HPS Phase II Geotechnical Subparcels) in Section III.L, these high-rise towers would require the construction of deep foundations. The recommended construction method for these deep foundations would be to utilize pile drivers. The HPS Village Center district would be located within 50 feet of the HPS North district residential uses, as shown in Figure II-4. As shown in Table III.I-11, noise levels from pile driving activities could be as high as 107 dBA for the residential uses within the HPS North district (assuming a distance of 25 feet). Other construction activities such as grading, excavation, paving, and structural finishes would be anticipated to produce noise levels of up to 89 dBA.

Pile driving activities would also be required for implementation of the shoreline improvements within HPS Phase II; however, as shown in Figure III.I-5, no noise-sensitive uses are located within approximately 500 feet of the shoreline improvement areas. It is, therefore, anticipated that pile-driving activities associated with the shoreline improvements would not result in excessive noise levels for noise-sensitive receptors.

As stated under Impact NO-1a, the conditions under which noise levels would be considered excessive during construction activities, such as excavation or pile driving, would only occur for the duration of the specified activity and would only impact receptors located within 150 feet or closer of the noise producing activity. Once that particular construction activity was completed, the associated noise would no longer be experienced by the affected receptor.

Construction of HPS Phase II must comply with the San Francisco Noise Ordinance, which prohibits construction between 8:00 P.M. and 7:00 A.M. Further, the Noise Ordinance would limit noise from any individual piece of construction equipment (except impact tools) to 80 dBA at 100 feet unless the construction activity occurred during allowable hours. Additionally, mitigation measures MM NO-1a.1 and MM NO-1a.2 would be implemented during construction of HPS Phase II. Construction noise would be reduced as required by mitigation measures MM NO-1a.1 and MM NO-1a.2. Further, as construction activities would only occur under the hours allowed under Sections 2907 and 2908 of the Noise Ordinance, noise from project construction would not violate any City Codes or other requirements placed on construction activity by the City or Agency and, therefore, this impact would be less than significant.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact NO-1 **Construction activities associated with the Project would generate increased noise levels for both off-site and on-site sensitive receptors; however, the Project's construction noise impacts would occur primarily in noise-sensitive areas adjacent or near to active construction sites (which would vary in location and duration over the entire period the proposed Project would be under construction); they would also not occur during recognized sleep hours, and would be consistent with the requirements for construction noise that exist in Sections 2907 and 2908 of the *Municipal Code*. (Less than Significant with Mitigation) *[Criterion I.a]***

Construction activities for the Project would create a substantial temporary increase in ambient noise levels on the site and in existing residential neighborhoods adjacent to the site. While construction activities would occur over a 20-year timeline, the conditions under which noise levels would be considered excessive during construction activities, such as excavation or pile driving, would only occur for the duration of the specified activity and would only impact receptors located within 150 feet or closer of the noise producing activity. Construction activities must comply with the San Francisco Noise Ordinance, which prohibits construction between 8:00 P.M. and 7:00 A.M. and limits noise from any individual piece of construction equipment (except impact tools) to 80 dBA at 100 feet. Implementation of mitigation measures MM NO-1a.1 and MM NO-1a.2, which would require implementation of construction best management practices to reduce construction noise and the use of noise-reducing pile driving techniques, would reduce any potentially significant impacts to less-than-significant levels.

Impact NO-2: Exposure of Persons to Excessive Vibration Levels

Impact of Candlestick Point

Impact NO-2a **Construction at Candlestick Point would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would still be significant. (Significant and Unavoidable with Mitigation) *Criterion I.b]***

Although construction-related vibration associated with the Project would be temporary there are two potential impacts that could occur. First, vibration at high enough levels can result in human annoyance. Second, groundborne vibration can potentially damage the foundations and exteriors of fragile structures close enough to the construction activity. Damage potential is typically limited to vibration generated by impact equipment, especially pile drivers.

Most construction activities would only have the potential to generate low levels of groundborne vibration. Table III.I-13 (Vibration Source Levels for Construction Equipment) identifies various vibration velocity levels for the types of construction equipment that would operate on the Project site during construction.

Table III.I-13 Vibration Source Levels for Construction Equipment

	Approximate VdB			
Equipment	***25 Feet***	***50 Feet***	***75 Feet***	***100 Feet***
Large Bulldozer	87	78	69	60
Loaded Trucks	86	77	68	52
Jackhammer	79	70	61	52
Small Bulldozer	58	49	40	31
Pile Driver (Impact)	112	103	94	85
Pile Driver (Sonic)	105	96	87	78

SOURCE: Federal Transit Administration, 2006.

Construction Impacts as to Vibration at Off-Site Vibration-Sensitive Receptors

Roadway improvements would occur off site near Candlestick Point, and as stated under Impact NO-1a, the construction activity associated with these improvements would occur within 25 feet of residential uses long Gilman Avenue, Carroll Avenue, and Ingalls Street. Off-site roadway improvements would utilize pavement crushers, loaders and graders, as well as water and haul trucks. Based on the vibration levels presented in Table III.I-13, and the diminishment of vibration levels at a rate of 9 VdB per doubling of distance, the approximate groundborne vibration levels experienced by adjacent sensitive uses due to construction activities occurring during off-site roadway improvements would be approximately 86 VdB during the off-site construction activities (vibration from loaded trucks), which exceeds the 80 VdB threshold and would be significant.

Construction activities at off-site vibration-sensitive receptors would be significant and unavoidable. Implementation of mitigation measure MM NO-1a.1 would reduce this impact by requiring that vibration-producing equipment be located as far away from sensitive receptors as practicable. Additionally, construction activities would only occur during the hours of 7:00 A.M. to 8:00 P.M. and construction activity would be intermittent and temporary in nature. Implementation of MM NO-1a.1 would reduce vibration impacts, but not to a less-than-significant level; therefore, this impact would remain significant and unavoidable.

Construction Impacts as to Vibration at Future On-Site Vibration-Sensitive Receptors

The construction of residential towers in Candlestick Point would be developed after the redeveloped residential uses in the Alice Griffith district are occupied. Construction of these residential towers would likely require pile-driving activities. The closest residential towers that would be constructed when the

housing within the Alice Griffith district is occupied would be located in the southwestern portion of the CP North district, approximately 150 feet from the residential uses. As groundborne vibration levels attenuate at a rate of approximately 9 VdB per doubling of distance, it is estimated that vibration levels at the Alice Griffith Public Housing residential uses would be approximately 76 VdB. This would be below the 80 VdB threshold for human annoyance for infrequent events established in Table III.I-10. Pile driving would also be required in the CP Center and CP South districts; however, these areas would be located farther than 150 feet from the Alice Griffith Public Housing residential uses. It is, therefore, anticipated that vibration levels would be lower than 76 VdB identified for the CP North district.

Additionally, activities that would not require pile driving but would be located closer to the Alice Griffith Public Housing residential uses would not result in vibration levels that would exceed the 80 VdB threshold established for this EIR. While construction of the low and medium density residential uses within the CP North district would be located within 50 feet of the Alice Griffith Public Housing residential uses, these activities would not result in groundborne vibration above 80 VdB. Based on the data presented in Table III.I-13, vibration from large bulldozers that may be utilized during excavation activities would be approximately 78 VdB, which would be below the 80 VdB threshold.

Pile driving would also be required in the CP Center and CP South districts after residential uses have been occupied in these districts; therefore, pile driving activities would also be located within 50 feet of occupied residential structures. As shown in Table III.I-10, pile driving activities would potentially result in groundborne vibration levels of approximately 103 VdB at the residential uses located in the CP Center and CP South. This impact would be considered potentially significant.

Pile driving activities would also be required for implementation of the shoreline improvements within Candlestick Point; however, as shown in Figure III.I-5, no vibration-sensitive uses are located within approximately 500 feet of the shoreline improvement areas. It is, therefore, anticipated that pile-driving activities associated with the shoreline improvements would not result in excessive vibration levels for vibration-sensitive receptors.

No other construction activities associated with Candlestick Point would result in vibration levels that would exceed the threshold for on-site residential uses that would be located in Candlestick Point or Alice Griffith district during construction. This impact is less than significant.

In order to reduce potential impacts from pile driving activities, the following mitigation measure has been identified.

MM NO-2a *Pre-construction Assessment to Minimize Pile Driving Impacts. The Project Applicant shall require its geotechnical engineering contractor to conduct a pre-construction assessment of existing subsurface conditions and the structural integrity of nearby buildings subject to pile driving impacts prior to receiving a building permit. If recommended by the geotechnical engineer, for structures or facilities within 50 feet of pile driving, the Project Applicant shall require groundborne vibration monitoring of nearby structures. Such methods and technologies shall be based on the specific conditions at the construction site such as, but not limited to, the following:*

- *Pre-pile driving surveying of potentially affected structures*
- *Underpinning of foundations of potentially affected structures, as necessary*

- *The construction plan shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of an excavation. Monitoring results shall be submitted to DBI. In the event of unacceptable ground movement, as determined by DBI inspections, all pile driving work shall cease and corrective measures shall be implemented. The pile driving program and ground stabilization measures shall be reevaluated and approved by DBI.*

In summary, construction activities at off-site vibration-sensitive receptors would be significant and unavoidable. Implementation of mitigation measure MM NO-1a.1 would reduce this impact by requiring that vibration-producing equipment be located as far away from sensitive receptors as practicable. Mitigation measure MM NO-1a.2 would also be implemented, which would also serve to reduce potentially significant vibration impacts by requiring pre-drilled holes and alternate methods for driving piles, such as a vibratory/sonic pile driver in order to reduce noise and vibration levels. However, these methods would not reduce impacts from pile driving activities to less-than-significant levels. As shown in Table III.I-13, vibration levels from vibratory pile driving methods would be approximately 96 VdB at distances of 50 feet. Implementation of mitigation measure MM NO-2a would require that buildings within 50 feet of pile driving activities be monitored to ensure that groundborne vibration does not result in damage to structures.

Similar to construction noise levels, the conditions under which vibration levels would be considered excessive during construction activities, such as excavation or pile driving, would only occur for the duration of the specified activity and would only impact receptors located within 100 feet or closer of the vibration producing activity. Once the vibration producing activities were completed, the affected receptors would no longer be impacted. Additionally, construction activities would only occur during the hours of 7:00 A.M. to 8:00 P.M. as required by Sections 2907 and 2908 of the Noise Ordinance. Implementation of MM NO-1a.1, MM NO-1a.2, and MM NO-2a would reduce vibration impacts, but not to a less-than-significant level; therefore, this impact would remain significant and unavoidable.

Impact of Candlestick Point in the Alice Griffith and Jamestown Districts

Impact NO-2b **Rock removal activities in the Alice Griffith and Jamestown districts would result in vibration levels that exceed the FTA threshold of 80 VdB or could cause damage to structures from vibration caused by the fracturing of bedrock for excavation. (Significant and Unavoidable with Mitigation) *[Criterion I.b]***

Construction activities that would occur within Candlestick Point, including the demolition and redevelopment of Alice Griffith Public Housing and within the Jamestown district would be located within 25 feet of existing residential uses along Gilman Avenue and Jamestown Avenue, respectively. Hard bedrock encountered at both sites during general excavation and grading would be removed utilizing heavy construction equipment. Heavy construction equipment rock removal methods include ripping (such as a Caterpillar D9 tractor with ripper attachment) and mechanical rock-breaking utilizing hammers, splitters or cutters. Harder areas of bedrock may require alternative techniques for removal such as controlled rock fragmentation. Controlled rock fragmentation technologies include pulse plasma rock fragmentation (PPRF), controlled foam or hydraulic injection and controlled blasting.

As detailed further in Section III.L, vibration impacts from either PPRF or CB may result in damage to adjacent structures due to these activities fracturing adjacent rock bed and causing settlement or shifting

of the structures above. In order to ensure that this vibration-related impact is reduced to a less-than-significant level, mitigation measure MM GE-3a would be implemented and adjacent properties would be monitored during controlled rock fragmentation activities. With implementation of MM GE-3a, vibration from controlled rock fragmentation in the area would not cause damage to adjacent or nearby properties. Consequently, vibration impacts to buildings and structures related to controlled rock fragmentation would be reduced to less-than-significant levels.

While PPRF and CB would not result in vibration-related impacts, the use of heavy construction equipment, such as a D-9 tractor, would potentially result in vibration levels that would exceed 80 VdB. As stated under Impact NO-1a.1, the demolition and redevelopment of the Alice Griffith Public Housing and the Jamestown district would be located within 25 feet of existing residential uses along Gilman Avenue and Jamestown Avenue, respectively. As shown in Table III.I-13, vibration levels from a large bulldozer (equivalent to a D-9 tractor) would be approximately 87 VdB at distances of 25 feet. While mitigation measure MM NO-1a.1 would reduce this impact by requiring that construction equipment be staged and operated as far from noise and vibration-sensitive uses as practicable, the excavation activity would occur within 25 feet of vibration-sensitive uses. Therefore, this impact would be significant and unavoidable.

Impact of Hunters Point Shipyard Phase II

Impact NO-2c **Construction at HPS Phase II would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would be significant. (Significant and Unavoidable with Mitigation) *[Criterion I.b]***

Construction Impacts as to Vibration at Off-Site Vibration-Sensitive Receptors

Off-site roadway improvements to Innes Avenue would result in construction activities occurring within 25 feet of existing residential uses along Innes Avenue. As described under Impact NO-2a, the approximate groundborne vibration levels experienced by adjacent sensitive uses due to construction activities occurring during off-site roadway improvements would be approximately 86 VdB during the off-site construction activities (vibration from loaded trucks).

Construction of the proposed football stadium would require pile-driving activities. The closest off-site vibration-sensitive receptor to the proposed football stadium would be the residential uses located in HPS Phase I. These residential uses are located approximately 600 feet from the proposed stadium; therefore, as stationary vibration levels diminish by 9 dBA per doubling of distance, it is estimated that the greatest construction vibration levels (during pile driving activities) associated with construction of the stadium would be approximately 62.5 VdB, which is below the level of significance. Additionally, the elevated location of HPS Phase I would further reduce vibration levels from HPS Phase II construction activities.

Construction Impacts as to Vibration at Future On-Site Vibration-Sensitive Receptors

Construction of the residential and commercial uses in the HPS Village Center would include the HPS Phase II Geotechnical Subparcels) in Section III.L, these high-rise towers would require the construction of deep foundations. The recommended construction method for these deep foundations would be to utilize pile drivers. The HPS Village Center would be located within 50 feet of the HPS North district residential uses, as shown in Figure II-4. As shown in Table III.I-13, vibration levels from pile driving activities could be as high as 103 VdB for the residential uses within the HPS North district. This is a potentially significant impact.

Groundborne vibration levels associated with off-site roadway improvements along Innes Avenue would be approximately 86 VdB due to the vibration from loaded trucks and bulldozers for grading. This would exceed the FTA's 80 VdB threshold for residential uses for infrequent events. Additionally, construction activities associated with development of the HPS Village Center district would result in vibration levels of approximately 103 VdB at the newly developed HPS North district residential uses.

Implementation of mitigation measure MM NO-1a.1 would help to reduce this impact by requiring that vibration-producing equipment be located as far away from sensitive receptors as practicable. Mitigation measure MM NO-1a.2 would also be implemented, which would also serve to reduce potentially significant vibration impacts by requiring pre-drilled holes and alternate methods for driving piles, such as a vibratory/sonic pile driver in order to reduce vibration levels. However, these methods would not reduce impacts from pile driving activities to less-than-significant levels. Implementation of mitigation measure MM NO-2a would require that buildings within 50 feet of pile driving activities be monitored to ensure that groundborne vibration does not result in damage to structures.

Similar to construction noise levels, the conditions under which vibration levels would be considered excessive during construction activities, such as excavation or pile driving, would only occur for the duration of the specified activity and would only impact receptors located within 100 feet of the vibration producing activity. Once the vibration producing activities were completed, the affected receptors would no longer be impacted. Additionally, construction activities would only occur during the hours of 7:00 A.M. to 8:00 P.M. as required by Sections 2907 and 2908 of the Noise Ordinance. Implementation of mitigation measures MM NO-1a.1, MM NO-1a.2, and MM NO-2a would reduce vibration impacts, but not to a less-than-significant level; therefore, this impact would remain significant and unavoidable.

Combined Impact of Candlestick Point and Hunters Point Shipyard Phase II

Impact NO-2 **Construction activities associated with the Project would create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the Project site and at proposed on-site residential uses should the latter be occupied before Project construction activity on adjacent parcels is complete. Although the Project's construction vibration impacts would be temporary, would not occur during recognized sleep hours, and would be consistent with the requirements for construction activities that exist in Sections 2907 & 2908 of the *Municipal Code*, vibration levels would still be significant. (Significant and Unavoidable with Mitigation) *[Criterion I.b]***

Construction activities could also create excessive groundborne vibration levels in existing residential neighborhoods adjacent to the site and at proposed on-site residential uses, should the latter be occupied before construction activity on adjacent parcels is complete. Implementation of mitigation measures MM NO-1a.1, MM NO-1a.2, and MM NO-2a would require implementation of construction best management practices, noise-reducing pile driving techniques as feasible, and monitoring of buildings within 50 feet of pile driving activities. Implementation of these measures would reduce vibration impacts, but not to a less-than-significant level as vibration levels from pile driving activities could be as high as 103 VdB for the residential uses within the HPS North District and the CP Center and South Districts when occupied. Additionally, excavation activities at the Alice Griffith area would result in vibration levels of approximately 87 VdB, due to the use of heavy construction equipment; therefore, this impact would remain significant and unavoidable, even with implementation of the identified mitigation measures.

Impact NO-3: Increases in Ambient Noise Levels

Impact NO-3 **Construction activities associated with the Project would result in a substantial temporary or periodic increase in ambient noise levels. (Significant and Unavoidable with Mitigation) *[Criterion I.d]***

Construction activities occurring within the Project site and in the Project vicinity for roadway and infrastructure improvements would involve demolition, grading, and excavation activities, followed by construction and external finishing of the proposed facilities and associated parking areas, as well as roadway and landscaping improvements. These activities would involve the use of heavy equipment. Pile driving activities would be required for development of the residential towers in the CP South district and the HPS North district, with noise levels of up to 107 dBA at a distance of 50 feet. Further, based on the noise levels presented in Table III.I-11, the approximate noise levels experienced by adjacent noise-sensitive uses due to construction activities occurring during off-site roadway improvements, which are conservatively assumed to be 50 feet from the proposed improvement activity, would be approximately 85 dBA during the loudest off-site activities (noise from a grader). Excavation activities at the Jamestown and Alice Griffith districts are estimated to be approximately 92 dBA for existing off-site receptors, due to the use of heavy construction equipment, such as D-9 Caterpillar Bulldozers.

Construction activities would also involve the use of smaller power tools, generators, and other equipment that generate noise. Each stage of construction would use a different mix of equipment, and noise levels would vary based on the amount and types of equipment in operation and the location of the activity related to potential receptors.

Mitigation measures MM NO-1a.1, MM NO-1a.2 and MM NO-2a have been identified to minimize or reduce construction related noise levels to the extent feasible. Implementation of mitigation measure MM NO-1a.1 would reduce this impact by requiring that noise-producing equipment be located as far away from sensitive receptors as practicable; however, construction activities would still occur within 25 feet of existing and future residential uses. Mitigation measure MM NO-1a.2 would also be implemented, which would also serve to reduce potentially significant vibration impacts by requiring pre-drilled holes and alternate methods for driving piles, such as a vibratory/sonic pile driver in order to reduce noise and vibration levels. However, these methods would not reduce impacts from pile driving activities to less-than-significant levels. As shown in Table III.I-11, noise levels during pile driving activities could reach up to 107 dBA at the existing

residential use in the Project vicinity, or in the new residential uses developed during earlier phases of the Project. The construction contractor would be required to implement noise attenuation measures during pile driving activities, including but not limited to the utilization of noise blankets, which would reduce noise levels up to 10 dBA. However, pile-driving and excavation activities would last throughout the 20-year construction phasing, and, therefore, this temporary increase in ambient noise levels would be noticeable and would likely be cause for human annoyance. Implementation of the above-mentioned mitigation measures would reduce the noise levels associated with impact the loudest construction activities identified above, but not to a less-than-significant level. Therefore, construction related temporary increases in ambient noise levels would be considered significant and unavoidable.

Operational Impacts

Impact NO-4: Exposure of Persons to Excessive Noise Levels

Impact NO-4 **Implementation of the Project, including the use of mechanical equipment or the delivery of goods, would not expose noise-sensitive land uses on or off site to noise levels that exceed the standards established by the City. (Less than Significant) *[Criterion I.c]***

Both Candlestick Point and HPS Phase II would include development of new commercial, retail, and residential uses. Daily operations of these uses would require mechanical cooling systems, deliveries of retail and commercial products and activities such as trash collection. These operational activities and systems would occur on a daily basis throughout the Project site once operational. Noise levels from these activities and systems would be similar throughout the entire Project site on a daily basis. It is anticipated upon build-out that the entire Project site would have a daily noise environment of a typical urban area with average noise levels ranging between 60 and 70 dBA.

Large-scale HVAC systems would be installed for the new residential, retail, and commercial buildings located on the Project site. Large HVAC systems associated with the residential, retail and commercial buildings can result in noise levels that average between 50 and 65 dBA L_{eq} at 50 feet from the equipment. As a project design feature, these HVAC units would be mounted within HVAC wells on the rooftops of the proposed buildings and would be screened with sufficient noise insulation by the walls and other building features, and, therefore, noise levels would not impact sensitive receptors on or off the Project site. Additionally, as additional project design features, noise from mechanical equipment associated with operation of the Project would be required to comply with Title 24 of the *California Building Code* requirements pertaining to noise attenuation, which requires that all multi-family residential units achieve an interior noise level of 45 dBA. Therefore, HVAC equipment would not be anticipated to produce noise levels that would be 5 dBA above the ambient noise level, which is the threshold under *Municipal Code* Section 2909(a).

Operation of the Project would also involve the delivery of goods and food stuffs to the commercial and retail operations associated with the Project, as well as refuse pick up for both the commercial and residential components. Two noise sources would be identified with delivery operations: the noise of the diesel engines of the semi-trailer trucks and the backup beeper alarm that sounds when a truck is put in reverse, as is required and regulated by Cal-OSHA. The noise generated by idling diesel engines typically ranges between 64 and 66 dBA L_{eq} at 75 feet. This noise would be temporary in nature, typically lasting no

more than five minutes. Backup beepers are required by Cal-OSHA to be at least 5 dBA above ambient noise levels. These devices are highly directional in nature, and when in reverse the trucks and the beeper alarm would be directed towards the loading area and adjacent commercial structures. Backup beepers are, of course, intended to warn persons who are behind the vehicle when it is backing up. Further, the loading docks associated with the Project would be screened from sensitive receptors both on site and off site by intervening structures and design of the loading spaces. In addition, noise generated by authorized City refuse collectors would be limited to 75 dBA per Section 2904 of the *Municipal Code*.

Daily operation of the Project such as loading dock activity, regional retail and other commercial activities would generate noise levels that are comparable to a typical urban environment. As such, mechanical systems, daily deliveries, and trash collection would not result in increases of 5 dBA over the anticipated ambient noise level. Therefore, the daily operational activity would not exceed the noise standards established by the *Municipal Code* and this impact would be considered less than significant. No mitigation is required.

Impact NO-5: Exposure of Persons to Excessive Vibration Levels

Impact NO-5 **Implementation of the Project would not generate or expose persons on or off site to excessive groundborne vibration. (Less than Significant) *[Criterion I.b]***

Typical background vibration levels in inhabited areas are about 50 VdB.[227] Such vibration background levels would be expected generally on the project site after the completion of all project-related construction activities. This is substantially less than the FTA's vibration impact threshold of 80 VdB for human annoyance. Groundborne vibration resulting from operation of the Project would primarily be generated by trucks making periodic deliveries to the Project site (including, but not limited to, garbage trucks, freight trucks and moving trucks). However, these types of deliveries would be consistent with deliveries that are currently made along roadways in the Project vicinity to nearby commercial uses, and on site as a result of ongoing commercial and R&D operations, and would not increase groundborne vibration above existing levels. No substantial sources of groundborne vibration would be built as part of the Project; therefore, operation of the Project would not expose sensitive receptors on site or off site to excessive groundborne vibration or groundborne noise levels, and this impact would be less than significant. No mitigation is required.

Impact NO-6: Exposure of Persons to Excessive Noise Levels

Impact NO-6 **Operation of the Project would generate increased local traffic volumes that could cause a substantial permanent increase in ambient noise levels in existing residential areas along the major Project site access routes. (Significant and Unavoidable) *[Criterion I.c]***

The increase in traffic resulting from implementation of the Project and ambient growth over the next 20 years would increase the ambient noise levels at noise-sensitive locations along the major vehicular access routes to the Project site. Table III.I-14 (Modeled Noise Levels along Major Project Site Access Roads) identifies the changes in future noise levels along the study area roadway segments that have residential uses (and, therefore, are sensitive receptors). The noise levels identified in Table III.I-14 are presented in

[227] Federal Transit Administration, *Transit Noise and Vibration Impact Assessment* (May 2006), Figure 7-3.

dBA L_{dn}. All future roadway analysis assumed completion of capital improvements as well as roadway improvement measures required as part of the Project's traffic mitigation measures as detailed in Section III.D (Transportation and Circulation).

Table III.I-14 Modeled Traffic Noise Levels along Major Project Site Access Roads

Roadway	*Land Use*	*Existing Noise Level*	*2030 Without Project*	*2030 With Project*	*Project-Related Increase*	*Allowable Increase*	*Significant Impact?*

SOURCE: PBS&J 2009

Noise model data sheets are available in Appendix I3 (Traffic Noise Model Output)

a. The land uses along Carroll Avenue are almost all commercial/industrial uses; the only exception is Alice Griffith Public Housing which is proposed for demolition and reconstruction and would be subject to Title 25 Noise Insulation Standards.

As stated in thresholds of significance, increases in ambient noise due to increases in Project-related traffic are based upon the FTA criteria specified in Table III.I-9. As baseline ambient levels increase, smaller and smaller increments are allowed to limit increases in community annoyance (e. g., in residential areas with a baseline ambient noise level of 50 dBA L_{dn}, a 5 dBA increase in noise levels would be acceptable, while at 70 dBA L_{dn}, only a 1 dBA increase would be allowed). Further, in order to demonstrate the Project's contribution to future noise levels, the baseline for traffic noise levels is the year 2030 without the Project compared to the year 2030 with the Project.

The greatest Project-related traffic noise increase (5.7 dBA L_{dn}) would occur along Jamestown Avenue, north of Harney Way. Additionally, two other roadway segments would experience substantial Project-related traffic noise level increases: Carroll Avenue, east of 3rd Street (4.3 dBA L_{dn}) and Gilman Avenue, east of 3rd Street (4.0 dBA L_{dn}). As shown in Table III.I-14, these increments are large enough to exceed the adopted threshold for a "substantial permanent increase" in traffic noise in residential areas. Figure III.I-6 (Project-Related Roadway Noise Level Increases) illustrates the roadways where noise levels would exceed the adopted threshold for a permanent increase in traffic noise.

Measures available to address significant traffic noise increases in these residential areas are limited. For example, the construction of continuous noise barriers at curbside along the entire length of the identified roadways would not be feasible because it would preclude residents' main vehicular access route to their homes and would conflict with the aesthetic character of the BVHP neighborhood by placing 6- to 8-foot-

~~Candlestick Point - Hunters Point Shipyard Phase II EIR~~

PROJECT-RELATED ROADWAY NOISE LEVEL INCREASES

high cinder block walls in front of residential front yards. While exterior noise levels would exceed the thresholds established in this EIR, in order to reduce human annoyance at existing residential uses from permanent increases in ambient noise levels, acoustical testing and retrofitting the interior of such uses could potentially be performed to ensure that interior noise levels would not exceed 45 dBA. Investigation into the need for such acoustical upgrades would only be necessary for the residences along Gilman and Jamestown Avenues. The land uses along Carroll Avenue are almost all commercial/industrial uses (and, therefore, much less noise sensitive); the only exception is the existing Alice Griffith Public Housing at the west end of Carroll Avenue. But this residential use is proposed for demolition and reconstruction as part of the Project. As a multi-family residential use, the reconstructed Alice Griffith Public Housing residential uses would be required under California Noise Insulation Standards (Title 25) to ensure acceptable interior noise levels appropriate to its expected future noise exposure.

However, the ultimate feasibility and implementation of the noise insulation measures that would be required to reduce interior noise levels to 45 dBA would be dependent on factors that would be beyond the control of the City as the lead agency or the Project Applicant to guarantee. In order to implement an acoustical analysis and retrofitting program, the Project Applicant would have to gain to access to all potentially affected private residential units along the identified sections of Gilman and Jamestown Avenues, perform noise measurements and other tests within these private residential units, and install structural noise attenuation features and verify their effectiveness. Further, it is unknown whether the proper attenuation would be achievable at every impacted property. While double and triple paned windows would serve to reduce interior noise levels, due to the age of several structures, this may not be sufficient to reduce noise levels. Additionally, it is unlikely that many of these structures have air conditioning or other internal cooling mechanisms, and as such, open windows provide the main source of ventilation and cooling for these structures. Therefore, the residents would be required to choose between open windows for ventilation or closed windows for sound attenuation. In some cases, the structure may have to be entirely rebuilt in order to achieve the proper attenuation level.

Additionally, as shown in Table III.I-14, the change from current noise levels to 2030 without the Project is greater than 3 dBA for all roadway segments except for Carroll west of 3rd Street. In fact, along Innes north of Carroll Avenue the "without project" increase is 7.6 dBA, while the "with project" increase is 0.0 dBA. As such, it would be difficult to determine the ultimate contribution of the Project to the increase in ambient noise levels in a manner that would not unfairly burden this Project with reducing interior noise levels in existing residential uses. Therefore, as measures to reduce this impact would be considered infeasible, this impact would be considered significant and unavoidable. It should also be noted that the project future increase with the project would not result in a 24-hour community noise level above an estimated 68.6 dBA $L_{dn.}$ As shown in Table III.I-1, this would be within the range typical of a urban environment.

Further, while an acoustical and retrofitting program could reduce interior noise levels in some affected residential structures, if feasible, the exterior noise level increase would still exceed the threshold of significance established in this EIR, even with implementation of an acoustical and retrofitting program.

Impact NO-7: Exposure of Persons to Excessive Noise Levels

Impact NO-7 **Noise during football games and concerts at the proposed stadium would result in temporary increases in ambient noise levels that could adversely affect surrounding residents for the duration of a game or concert. (Significant and Unavoidable with Mitigation) *[Criterion I.d]***

Although the current stadium exists at Candlestick Point, this analysis recognizes that the proposed location on HPS Phase II could result in noise impacts on different and new receptors. This impact analysis is based upon the findings presented in the *Bayview DEIR San Francisco 49ers Stadium Operational Noise Study*, prepared by Wilson, Ihrig & Associates.

There are two general sources of noise during football games/concerts in the stadium that could produce noise that affects the surrounding community:

- The game spectators/concert audience
- Amplified speech and music broadcast over the stadium/concert sound system

There would also be event day changes to the traffic flows, with consequent changes in traffic noise levels and patterns, in the community. However, the traffic noise levels in the community during a game or concert day were not modeled for the following reasons:

- The percentage of game/concert attendees using local transit service and the site's improved connectivity to regional transit service are expected to increase from 19 percent under existing conditions to 25 percent.
- Levels of background traffic (i.e., motor vehicle use by local residents and others non-game attendees) using local streets would be suppressed due to avoidance of the area during a game/concert day.
- Since game/concert traffic would be temporally concentrated during the few hours before and after such events, such congestion would reduce the average traffic speeds with consequent lowering of traffic noise emissions.

Thus, the traffic noise levels presented above in Table III.I-14 for a non-event weekday could be considered upper bounds for the location and degree of traffic noise impacts on an event day and the potential significance of their cumulative impacts will be considered further below.

Unlike noise in the existing residential neighborhoods surrounding the stadium site, which is typically dominated by transportation sources that have a predictable pattern day-to-day and year-to-year, game/concert noise would occur on only a few days per year and would last only a few hours on those days, although it would be much louder than the current background noise in the immediate vicinity of the stadium than on non-game and non-concert days. For the purposes of this EIR, and as stated under the Significance Criteria for this section, an increase in community noise levels exceeding 65 L_{dn} at a noise-sensitive receptor, or an L_{max} increase above 75 dBA at a noise-sensitive receptor would be considered a significant impact.

Noise intensity during games/concerts, its variation over time, and the duration of games/concerts are important with regard to determining noise impacts. A 3-D computer noise model was developed using SoundPLAN® to estimate game/concert noise levels in the surrounding community. As shown in Figure III.I-1, the model receivers (i.e., R1 through R6) were located at representative locations in the potentially

affected existing residential areas near the project site, which are the same locations as the long-term noise monitoring sites (i.e., N1 through N6). The following new receivers were added to the noise model:

- R7 on Coleman Street at the proposed Project's new residential development closest to the stadium (mixed use at the HPS Village Center district)
- R8 at the closest point to the proposed Project's HPS Phase II Residential Density III area (HPS North district)
- R9 on Palou Avenue and Lane Street in the BVHP neighborhood
- R10 on Bayview Circle near Newhall Street in the BVHP neighborhood

Wind effects can increase noise levels downwind of a noise source, while reducing noise levels upwind. The prevailing winds for the Project study area originate from the west, northwest, or west-northwest directions, which would be acoustically favorable for neighborhood receivers and could reduce noise levels from the stadium as they would "carry" the noise over the San Francisco Bay. However, "no wind" conditions were chosen for modeling purposes to produce worst-case noise levels in the surrounding neighborhood.

A temperature inversion is a reversal of the normal atmospheric temperature gradient (i.e., lower temperature with increasing height above the ground). This can cause increased noise levels at distant receivers. Temperature inversion effects are difficult to model accurately and were not included in SoundPLAN® for this study.

Modeling of Crowd and Public Address System Noise Levels

Potential noise impacts associated with noise from the crowd and the proposed stadium's sound system were evaluated for a typical full-capacity football game. Projections assume a typical game is on the order of three hours with crowd and/or public address system (PA) noise sustained at typical maximum levels for an aggregate 45 minutes over the 3-hour period.

For each noise source, estimates were made for typical maximum noise levels (L_{max}) and the day night level (L_{dn}) for a typical game day. The game day L_{dn} calculations are based on a noise energy summation of the existing ambient hourly L_{eq} noise levels at each location (i.e., as measured or extrapolated from measured data) and the projected game noise levels at that location. The L_{dn} calculations assume typical games would be during evening hours and would not continue past 10:00 P.M., which could substantially affect the L_{dn}, as this noise scale is adjusted to account for some individuals' increased sensitivity to noise levels during the evening and nighttime hours. Thus, game delays or other reasons for game operations continuing past 10:00 P.M. would increase the potential for noise impacts.

Table III.I-15 (Predicted Crowd and PA Combined Noise Levels [No Wind Condition]) present the modeling results for combined crowd noise and PA system noise. The combined noise levels are slightly higher than the larger of the crowd or PA noise level components, but present a more conservative estimate, which would vary at each receiver location. The location of the model receiver locations is illustrated by Figure III.I-7 (3-D Computer Noise Model).

Table III.I-15 Predicted Crowd and PA Combined Noise Levels (No Wind Condition)

Model Receiver	*Distance from proposed Stadium (miles)*[a]	*L_{max} (dBA)*[b]	*Game Day L_{dn}*[c]	*L_{dn} Increase over Existing*[d]	*Proposed Criteria Exceeded*
R1	1.0	61	63 to 67	<1 dBA	None
R2	1.0	64	63 to 65	<1 dBA	None
R3	0.3	**76**	**62 to 65**	**3 to 4 dBA**	**65 L_{dn}, 75 dBA L_{max}**
R4	0.7	66	65 to 66	<1 dBA	None
R5	0.9	62	62 to 65	<1 dBA	None
R6	1.4	58	59 to 60	<1 dBA	None
R7	0.2	**83**	**69**	**7 to 9 dBA**	**65 L_{dn}, 75 dBA L_{max}**
R8	0.3	**78**	**64 to 66**	**4 to 6 dBA**	**65 L_{dn}, 75 dBA L_{max}**
R9	1.3	55	63 to 65	<1 dBA	None
R10	1.6	57	65 to 66	<1 dBA	None

SOURCE: Wilson, Irhig & Associates, 2009.

a. Approximate distance to center of stadium.

b. L_{max} was estimated by SoundPLAN® and represents anticipated typical maximum noise levels expected during football games.

c. Based on noise energy summation of measured or assumed ambient plus SoundPLAN® predicted game noise levels.

d. Relative to representative ambient data.

The modeled noise impacts would occur at:

- R3, which is representative of the existing Hunters Point Hill residential neighborhood closest to the stadium. Here combined noise sources would increase the existing L_{dn} by 3 to 4 dBA, to a resultant L_{dn} as high as 65 dBA, while game-day maximum noise levels could be as high as 75 dBA. Thus, there is the potential to equal the L_{dn} impact criterion of 65 dBA and exceed the L_{max} criterion of 75 dBA at this location.
- R7, which is representative of the new residential development located in Hunters Point Phase I closest to the stadium (but not part of the Project). Here combined noise sources would increase the existing L_{dn} by 7 to 9 dBA, to a resultant L_{dn} as high as 69 dBA, while game-day maximum noise levels could be as high as 83 dBA. Thus, there is the potential to exceed both the L_{dn} and L_{max} criteria at this location.
- R8, which is representative of new Project residential use in the HPS North district, closest to the stadium. Here combined noise sources, would increase the existing L_{dn} by 4 to 6 dBA, to a resultant L_{dn} as high as 66 dBA, while game-day maximum noise levels could be as high as 78 dBA. Thus, there is the potential to exceed both the L_{dn} and L_{max} criteria at this location.

In general, potential football game noise impacts would be limited to areas near the stadium (i.e., within about 3,300 ft. from the stadium). In more distant areas, it is not likely that game operational levels would exceed the 65 dBA L_{dn} or the 75 dBA L_{max} noise impact criteria. However, for the existing residential uses closest to the proposed stadium (as characterized by Receiver R3) and possibly for the new residential uses closest to the proposed stadium (as characterized by Receivers R7 and R8) there would be significant noise impacts during football game days.

FIGURE III.I-7

Candlestick Point — Hunters Point Shipyard Phase II EIR

3-D COMPUTER NOISE MODEL

Although game noise would not exceed the above-mentioned significance criteria outside a 3,300-foot radius from the stadium, there would be a potential for audibility at greater distances from noise generated during football games when background ambient noise in the neighborhoods is low (i.e., whenever the A-weighted game noise level is equal or greater than the A-weighted community background noise level, L_{90}). However, audibility alone is not sufficient for a finding of significance in this EIR. Candlestick Park is currently used for football games. Noise from 49er home games are audible over a wide area that would largely overlap with the area of audibility of football games played at the proposed stadium. Consequently, football game noise is already part of the existing ambient condition in the residential neighborhoods north and west of the Project site.

Nevertheless, the potential for football game noise to be easily detectable both outdoors and indoors was modeled and the results shown in Table III.I-16 (Audibility of Game Noise at Model Receivers). Crowd noise that is less than the background L_{90} would be masked at least 90% of the time, while crowd noise that exceeds the L_{10} would be easily detectable at least 90 percent of the time. Crowd noise would be easily detectable outdoors at times at distances up to about 1.6 miles from the stadium. Also, game L_{max} would exceed ambient background levels (i.e., L_{90}) at all modeled receivers by 8 dBA or more at all modeled receivers; this would equal or exceed the 8 dBA noise limit set by the San Francisco Noise Ordinance (Section 2909b). As for interior effects, assuming a 15 dBA nominal exterior-to-interior noise reduction provided by the building shell, which is typical for single family homes without special acoustical mitigation, maximum game noise levels would be audible indoors at times at Receivers R1, R2, R4, and R5. The location of the model receiver locations is illustrated by Figure III.I-7.

Table III.I-16 Audibility of Game Noise at Model Receivers

Model Receiver	*Distance from proposed Stadium (miles)*	*Exterior Ambient L_{10} (dBA)*	*Exterior Ambient L_{50} (dBA)*	*Exterior Ambient L_{90} (dBA)*	*Exterior Game L_{max}*	*Detectable Outdoors?*	*Interior Game L_{max} (dBA)*	*Detectable Indoors?*
R1	1.0	52 to 55	44 to 48	42 to 45	61	At least 22.5% of the time	46	**Yes**
R2	1.0	60 to 64	48 to 53	45 to 47	64	At least 12.5% of the time	49	**Yes**
R4	0.7	60 to 63	48 to 52	44 to 46	66	At least 12.5% of the time	51	**Yes**
R5	0.9	61 to 63	47 to 50	43 to 44	62	At least 12.5% of the time	47	**Yes**
R6	1.4	58 to 62	49 to 50	45 to 46	58	At least 12.5% of the time	43	No
R9	1.3	60 to 64	48 to 53	45 to 47	55	At least 2.5% of the time	40	No
R10	1.6	60 to 63	48 to 52	44 to 46	57	At least 2.5% of the time	42	No

SOURCE: Wilson, Irhig & Associates, 2009.

a. Ranges of "Exterior Ambient" for L_{10}, L_{50} and L_{90} are representative of afternoon or evening hours when games are most likely to occur.

b. Judgment of "Detectability" is based on comparisons of game L_{max} with an assumed indoor ambient background noise level of 45 dBA.

Modeling of Concert Noise Levels

The proposed stadium may be used occasionally as a venue for popular music concerts performed in front of a large audience. The sound system used for such a concert would not be the one permanently installed at the proposed stadium, but one specifically designed for and temporarily installed by each touring band.

The typical stage configuration during concerts would likely have the stage in the end zone for large events or at the 50-yard line for smaller shows. The noise impacts associated with large events were analyzed since this represents a worst-case condition for concert noise levels. Although the stage could be located at either end of the field (north or south), it was assumed the stage would be at the northern end of the field pointing south. In this way, most of the sound would be projected towards the Bay and away from residences.

Noise levels from a music concert would fluctuate greatly depending on the type of music being performed (e.g., rock, pop, hip-hop, etc.) and on the performers' preferred style of loudness. The latter affects the sound power settings used for the event. The loudness is also related to the size of the venue and to some degree the size of the audience. To address the variable range of music genre possible, recorded music samples were used to obtain sound spectra for rock and hip-hop music as two different styles of music that might use the Stadium as a concert venue. Other styles of music would generally be less percussive and, therefore, presumably have less of an impact on the surrounding community.

Table III.I-17 (Predicted Concert Sound System Noise Levels) present the modeling results for concert noise. Unless mitigations were implemented for the existing residential uses closest to the proposed stadium (as characterized by Receiver R3) and possibly for the new residential uses closest to the proposed stadium (as characterized by Receivers R7 and R8), there would be a potential for significant Project-induced concert noise impacts.

Table III.I-17 Predicted Concert Sound System Noise Levels

Model Receiver	*Distance (miles)*	*L_{max} (dBA)*	*L_{max} (dBC)*	*Concert L_{dn} (dBA)*	*L_{dn} Increase over existing (dBA)*	*Proposed Criteria Exceeded*

R10	1.6	58	78	65 to 66	< 1 dBA	None

SOURCE: Wilson, Irhig & Associates, 2009.

As with football game noise, there would also be a potential for outdoor audibility of concert noise at all receivers modeled, and for indoor audibility at distances up to 1.0 mile from the proposed Stadium. Also, game L_{max} would exceed both A-weighted and C-weighted ambient background levels at all modeled receivers by at least 8 dBA or 8 dBC, respectively; this would equal or exceed the noise limits set by the San Francisco Noise Ordinance (Section 2909b).

MM NO-7.1 *Mitigation to Minimize Game/Concert-related Temporary Increases in Ambient Noise Levels at Nearby Residences. To ensure that stadium game-and event-induced interior L_{max} noise levels do not*

exceed an interior noise level of 60 dBA and interfere with speech and other indoor activities in the existing Hunters Point Hill residential community closest to and north of the proposed Stadium (i.e., as identified by the R3 stadium noise model receiver), the Stadium Operator shall:

- *After Stadium Operator enters into lease agreement with Agency, send notification of the establishment of a stadium noise mitigation program (SNMP) to the residential property owners in the identified neighborhood potentially affected by noise from the proposed Stadium*
- *Allow property owners an appropriate time after the date of notification about the SNMP to apply for the program, with a reminder sent to the owners before the end of the application period*
- *Determine if responding property owners meet qualifications*
- *Compile for property-owners reference and send to them a summary of standard types of structural acoustical mitigations*
- *Choose a qualified acoustical consultant to survey the potentially affected residential units and recommend sound reduction measures appropriate to offset the modeled stadium noise impacts, which may include:*
  - *Acoustical upgrades to windows and doors*
  - *Acoustical stripping around doors and other openings*
  - *Ventilation improvements*
- *Estimates cost of recommended sound reduction measures, which shall include labor and materials, permit fees, and City inspections; material costs will, as much as possible, be based on "like-for-like", that is, for replacement of existing materials similar in quality or appearance*
- *Pay each qualifying property owner the amount of this estimate after obtaining a release from future claims for stadium event noise impacts at each property with each property owner responsible for implementing the sound reduction improvements*
- *Establish an ad hoc community working group of neighbors to develop a mediation process should any future disputes arise over the effectiveness of the SNMP in eliminating stadium noise intrusions*

MM NO-7.2 *Residential Use Plan Review by Qualified Acoustical Consultant. To ensure that stadium game-and event-induced interior L_{max} noise levels do not exceed an interior noise level of 60 dBA and interfere with speech and other indoor activities in the proposed on-site residential uses closest to the proposed Stadium, the Project Applicant shall choose a qualified acoustical consultant to review plans for the new residential uses planned for areas closest to the proposed Stadium and follow their recommendations to provide acoustic insulation or other equivalent measures to ensure that interior peak noise events would not exceed 60 dBA L_{max}.*

Unless mitigations were implemented for the residential uses that would be impacted as represented by modeling location R3, there would be a potential for significant stadium induced noise impacts during football games and concerts at this location. Implementation of mitigation measure MM NO-7.1 would ensure that these residential uses do not experience game/concert-related transient increases in ambient noise levels within their homes that would exceed 60 dBA L_{max}. Mitigation measure MM NO-7.2 would be implemented for new residential uses associated with the HPS Phase II site located in proximity of the proposed Stadium. Implementation of mitigation measure MM NO-7.2 would ensure that new residential uses at the HPS Phase II site would not experience noise levels associated with the Stadium uses that would interfere with regular interior activities, including speech and sleep.

However, the ultimate feasibility and implementation of the noise insulation measures recommended under mitigation measure MM NO-7.1 would depend on factors that would be beyond the control of the City as the lead agency, or the Project Applicant to guarantee. Implementation of mitigation measure MM NO-7.1, would require access all potentially affected residential units at the identified location outside of the Project site, performance of noise measurements and other tests within these private residential units, installation of structural noise attenuation features and verification of the effectiveness of the installed noise attenuation features during football games and concerts at the proposed Stadium. Further, installation of such noise attenuation features may not be practicable or possible at all locations due to the age and integrity of the residential structures as noted under Impact NO-6. Therefore, as the ultimate feasibility and practicality of mitigation measure MM NO-7.1 cannot be guaranteed at this time, noise impacts from football games and concerts this impact would be considered as significant and unavoidable.

Impact NO-8: Exposure of Persons to Excessive Noise Levels

Impact NO-8 **Implementation of the Project would not expose residents and visitors to excessive noise levels from flights from San Francisco International Airport such that the noise would be disruptive or cause annoyance. (Less than Significant) *[Criteria I.e, I.f]***

The Project would not expose people living or working on site to excessive noise from commercial aircraft overflights associated with SFO operations. As shown on Figure III.I-3, the Project site is well outside SFO's existing 65 dBA CNEL contour and is expected to remain outside this contour for the foreseeable future, which the FAA regards as an impact threshold for noise-sensitive land uses (i.e., residential). Although the Project site is under some of the main aircraft approach and departure tracks, these flights all pass over the site at considerable altitude. The typical SEL associated with such overflights (as observed during the football game noise measurements conducted at Candlestick Park) would be in the low 70s dBA. Given the 20 to 30 dBA of acoustic insulation that would be typical for the new residential uses that would be built as part of the Project, the expected daily/nightly sleep disturbance probability in the residential interiors would be very low even with the relatively large number of daily flight operations typical for SFO. Additionally, a review of *Airport Director's Reports* from the past 6 months indicates that no complaints were received from BVHP neighborhood residents regarding aircraft noise. Therefore, this impact would be considered less than significant. No mitigation is required.

Cumulative Impacts

The geographic context for an analysis of cumulative impacts with regard to noise and vibration is limited to the immediate vicinity of the Project. This is due to the dissipation of noise and vibration with the increase of distance between receptors and noise sources. Noise impacts from cumulative development in the Project area can be largely attributed to an increase in vehicular traffic that is generated by the development both within and in the immediate vicinity of the Project, as well as noise generated from the use of the proposed stadium as included in the Project. The past and present development in the City is described in the Setting section of this chapter, representing the baseline conditions for evaluation of cumulative impacts. The noise assessment relies on the future transportation projections, which reflect the traffic Project and reasonably foreseeable background growth and development within the study area as

well as modeled noise from stadium activities. Therefore, the analysis as conducted in Section III.I covers both Project-specific and cumulative impacts.

Construction activities include pile driving, which can reach levels up to 107 dBA L_{eq} at existing residential uses in the Project vicinity, and because these activities would be periodic throughout the 20-year construction phasing, thereby noticeably increasing ambient noise levels likely resulting in human annoyance, construction-related temporary increases in ambient noise levels would be considered significant and unavoidable. As discussed in Section III.I, construction activities would implement noise attenuation measures including, but not limited to, limiting the hours when pile driving can occur to the daytime (i.e., 7:00 A.M. to 8:00 P.M.) and the utilization of noise blankets, which could reduce noise levels up to 10 dBA. Although the implementation of mitigation measures would reduce the noise levels associated with pile-driving activities and limit the time of day that the noise could occur, it would not be reduced to a less-than-significant level. Therefore, because pile-driving activities would be periodic over a 20-year period, and may overlap with other nearby construction activities during Project development, construction-related temporary increases in ambient noise levels would be considered cumulatively significant and unavoidable.

After construction is complete, Project operation would create a substantial, permanent increase in traffic noise levels that would affect existing and future residential uses along all Project site access roads. These noise increases, as modeled on ten of the major site access roads, are expected to raise ambient noise levels by between 3.5 dBA L_{dn} to 9.8 dBA L_{dn} above the existing ambient levels, as shown in Table III.I-18 (Modeled Cumulative Traffic Noise Levels along Major Project Site Access Roads).

Table III.I-18 Modeled Cumulative Traffic Noise Levels along Major Project Site Access Roads

SOURCE: PBS&J, 2009.

In addition, the operation of the stadium for both football games and concerts are anticipated to result in increases of ambient noise levels during these events that would be up to 9 dBA L_{dn} above the existing ambient levels at locations near the proposed Stadium, and at lesser but audible levels at distances at least within 2 miles of this facility.

Conducting the acoustic studies and implementing their recommendations as proposed above could not guarantee that either traffic and stadium event noise impacts would be reduced to an individually less-than-significant level. Further, at many noise-sensitive locations in the project site vicinity, traffic noise, stadium event noise and noise from other sources identified above would be additive. Thus, project operational noise from each identified sources category would be cumulatively considerable and their collective impacts would be cumulatively significant and unavoidable.

As with their noise impacts, the pile-driving activities during construction have the potential to cause vibration effects that would be considered significant. Due to the construction phasing, it is possible that pile driving and other heavy construction equipment would operate on multiple sites and collectively result in vibration impacts in excess of 85 VdB at nearby sensitive receptors Implementation of Best Management Practices could reduce the severity of potential impact, but could not guarantee a less-than-significant level. Therefore, impacts for vibration from the 20-year construction schedule would remain cumulatively significant and unavoidable.

Vibration sources anticipated with the operation of the Project could occur from trucks, buses, and light-rail vehicles entering the Project site. These vehicles would not be expected to exceed 85 VdB FTA threshold individually nor collectively act to produce an exceedance of this threshold. Also, there are no substantial fixed sources of groundborne vibration included as part of Project development; therefore, impacts from operational groundborne vibrations are anticipated to be cumulatively less than significant.

SECTION III.J CULTURAL RESOURCES AND PALEONTOLOGICAL RESOURCES

III.J.1 Introduction

This section examines the potential impacts of the Project on cultural and paleontological resources. Cultural resources consist of prehistoric and historical archaeological resources, and buildings and structures of historic value. Paleontological resources are the fossilized remains or impressions of prehistoric plants and animals used to document the existence of extinct life forms and to reconstruct the environments in which they lived. This section identifies both Project-level and cumulative environmental impacts, as well as feasible mitigation measures that could reduce or avoid the identified impacts.

- The cultural resources section is based on the following technical studies: *Historical Context for the Archaeology of the Bayview Waterfront Project*,[228] San Francisco, California, November 2008;[229] *Archaeological Research Design and Treatment Plan for the Bayview Waterfront Project*, San Francisco, California, November 2009, and Addendum, March 2010;[230] *Historic Context for the Bayview Waterfront Plan*, July 2009;[231] the *Bayview Waterfront Plan Historic Resources Evaluation, Volume II: Historic Resources Survey and Technical Report*, October 2009;[232] *Historic Resource Evaluation for Candlestick Park Sports Stadium, San Francisco*, April 2010;[233] and *Memorandum on Comparative Rarity of World-War-II Era Buildings at Hunters Point Shipyard*, April 2010.[234]229b The technical studies incorporate archival research, site reconnaissance, and interviews with public agency staff and other informed contacts. The paleontological setting is based on databases searches of the University of California Museum of Paleontology; the American Museum of Natural History, Division of Paleontology; the North American Mammalian Paleofaunal Database in July 2009; and a review by PBSJ of published studies by the US Geological Survey and other agencies and organizations to identify previously reported fossil finds in the vicinity of the Project site or in the same geologic units that occur at the Project site.[235] Ground surface reconnaissance and ground-disturbing activities to identify paleontological resources were deemed inappropriate at this stage of the investigation.

---

[228] The prior name of the Project was the Bayview Waterfront Project. Some of the technical studies completed for the Project use the former name if they were prepared prior to August 2009; however, regardless of name, the reports address conditions at the Project site.

III.J.2 Setting

Prehistoric Context

Until the late 1980s, the greatest concentration of documented prehistoric sites in San Francisco was in the Hunters Point-Bayview-Candlestick Point area. Dominant assumptions during this time were that San Francisco had a low prehistoric site density and that this was the result of either sparse prehistoric occupation or of modern destruction of prehistoric deposits. It was also assumed that prehistoric sites in San Francisco were virtually restricted to the Bay littoral with a few temporary food procurement camps along the coast. In the last twenty years, prehistoric sites have been discovered in San Francisco with unexpected frequency and with locations, depths, age, range of types, and an abundance that was not foreseen. New research tools (such as geoarcheology and Geographic Information Systems) have been employed in the study of these recent sites that have resulted in better predictability of vertical and horizontal site locations and new comparative interpretations of shell middens have resulted in a greater understanding of the complexity of construction and site-interrelationships of San Francisco Bay Area shell midden sites. Very little is known of the prehistoric sites in southeast San Francisco as they have been subject to almost no field investigation since Nels Nelsen first surveyed them in the early 1900s. Because of their poor documentation, prehistoric sites of the Hunters Point-Bayview-Candlestick Point area have an unclear relationship to the better-researched, more recently known concentration of San Francisco prehistoric sites in the South of Market Area of San Francisco.
