Under Scenario 2, a voluntary agreement would be implemented as an alternative to the adopted Bay-Delta Plan Amendment. The March 1, 2019, proposed voluntary agreement submitted to the state water board has yet to be accepted, and the shortages that would occur with its implementation are not known. The voluntary agreement proposal contains a combination of flow and non-flow measures that are designed to benefit fisheries at a lower water cost, particularly during multiple dry years, than would occur under the Bay-Delta Plan Amendment. The resulting regional water system supply shortfalls during dry years would be less than those under the Bay-Delta Plan Amendment and would require rationing of a lesser degree and closer in alignment to the SFPUC's adopted level of service goal for the regional water system of rationing of no more than 20 percent system-wide during dry years. The SFPUC Resolution No. 19-0057, which authorized the SFPUC staff to participate in

voluntary agreement negotiations, stated its intention that any final voluntary agreement allow the SFPUC to maintain both the water supply and sustainability level of service goals and objectives adopted by the SFPUC when it approved the WSIP. Accordingly, it is reasonable to conclude that if the SFPUC enters into a voluntary agreement, the supply shortfall under such an agreement would be of a similar magnitude to those that would occur under Scenario 1. In any event, the supply shortfall of water supplies would be of a similar magnitude to those that would occur under Scenario 1. Rationing under Scenario 2, with implementation of the Voluntary Agreement, would be to a lesser degree than that under Scenario 3, with implementation of the Bay-Delta Plan Amendment.

Scenario 3 – Bay-Delta Plan Amendment

Under Scenario 3, the 2018 Bay-Delta Plan Amendment would be implemented as it was adopted by the state water board without modification. As discussed above, there is considerable uncertainty whether, when, and in what form the plan amendment will be implemented. However, because implementation of the plan amendment cannot be ruled out at this time, an analysis of the cumulative impact of projected growth on water supply resources under this scenario is included in this document to provide a worst-case impact analysis.

Under this scenario, which is assumed to be implemented after 2022, water supplies would be available to meet projected demands through 2040 in wet and normal years with no shortfalls. However, under Scenario 3 the entire regional water system—including both the wholesale and retail service areas—would experience significant shortfalls in single dry and multiple dry years, which over the past 97 years occur on average just over once every 10 years. Significant dry-year shortfalls would occur in San Francisco, regardless of whether the proposed project or its variant is approved. Except for the currently anticipated shortfall to retail customers of about 6.1 mgd (6.8 percent) that is expected to occur under Scenario 1 during years seven and eight of the 8.5-year design drought based on 2040 demand levels, these shortfalls to retail customers would exclusively result from supply reductions resulting from implementation of the Bay-Delta Plan Amendment. The retail supply shortfalls under Scenario 3 would not be attributed to the incremental demand associated with the proposed project or its variant, because this demand is incorporated already in the growth and water demand/supply projections contained in the 2015 Urban Water Management Plan.

Under the Bay-Delta Plan Amendment, existing and planned dry-year supplies would be insufficient for the SFPUC to satisfy its regional water system supply level of service goal of no more than 20 percent rationing system-wide. The Water Shortage Allocation Plan does not specify allocations to retail supply during system-wide shortages above 20 percent. However, the plan indicates that if a system-wide shortage greater than 20 percent were to occur, regional water system supply would be allocated between retail and wholesale customers per the rules corresponding to a 16 to 20 percent system-wide reduction, subject to consultation and negotiation between the SFPUC and its wholesale customers to modify the allocation rules. These allocation rules result in shortfalls of 15.6 to 49.8 percent across the retail service area as a whole under Scenario 3. Total shortfalls under Scenario 3 would range from 12.3 mgd (15.6 percent) in a single dry year to 36.1 mgd (45.7 percent) in years seven and eight of the 8.5-year design drought based on 2025 demand levels and from 21 mgd (23.4 percent) in

a single dry year to 44.8 mgd (49.8 percent) in years seven and eight of the 8.5-year design drought based on 2040 demand.¹⁹

Water Supply Impact Analysis

As described above, the supply capacity of the Hetch Hetchy regional water system that provides the majority of the city's drinking water far exceeds the potential demand of any single development project in San Francisco. No single development project alone in San Francisco would require the development of new or expanded water supply facilities or require the SFPUC to take other actions, such as imposing a higher level of rationing across the city in the event of a supply shortage in dry years. Therefore, a separate project-only analysis is not provided for this topic. The following analysis instead considers whether the proposed project or its variant, in combination with both existing development and other projected growth through 2040 would require new or expanded water supply facilities, the construction or relocation of which could have significant cumulative impacts on the environment. It also considers whether a high level of rationing would be required that could have significant cumulative impacts. It is only under this cumulative context that development in San Francisco could have the potential to require new or expanded water supply facilities or require the SFPUC to take other actions, which in turn could result in significant physical environmental impacts related to water supply. If significant cumulative impacts could result, then the analysis considers whether the project would make a considerable contribution to the cumulative impact.

Impacts Related to New or Expanded Water Supply Facilities

The SFPUC's adopted water supply level of service goal for the regional water system is to meet customer water needs in non-drought and drought periods. The system performance objective for drought periods is to meet dry-year delivery needs while limiting rationing to a maximum of 20 percent system-wide reduction in regional water service during extended droughts. As the SFPUC has designed its system to meet this goal, it is reasonable to assume that to the extent the SFPUC can achieve its service goals, sufficient supplies would be available to serve existing development and planned growth accounted for in the 2015 Urban Water Management Plan (which includes the proposed project or its variant) and that new or expanded water supply facilities are not needed to meet system-wide demand. While the focus of this analysis is on the SFPUC's retail service area and not the regional water system as a whole, this cumulative analysis considers the SFPUC's regional water supply level of service goal of rationing of not more than 20 percent in evaluating whether new or expanded water supply facilities would be required to meet the demands of existing development and projected growth in the retail area through 2040. If a shortfall would require rationing more than 20 percent to meet system-wide dry-year demand, the analysis evaluates whether as a result, the SFPUC would develop new or expanded water supply facilities that result in significant physical environmental impacts. It also considers whether such a shortfall would result in a level of rationing that could cause significant physical environmental impacts. If the analysis determines that there would be a significant cumulative impact, then per CEQA Guidelines section 15130, the analysis considers whether the project's incremental contribution to any such effect is "cumulatively considerable."

¹⁹ Technical Memorandum from Steven Ritchie, SFPUC Water Enterprise to Lisa Gibson, San Francisco Planning Department, May 31, 2019, Table 3, p. 10.

With the implementation of the proposed project or its variant, existing and planned dry-year supplies would meet projected retail demands through 2040 under Scenario 1 within the SFPUC's regional water system adopted water supply reliability level of service goal. Therefore, the SFPUC could meet the water supply needs for the proposed project or its variant, in combination with existing development and other projected growth in San Francisco through 2040 from the SFPUC's existing system. The SFPUC would not be expected to develop new or expanded water supply facilities for retail customers under Scenario 1 and there would be no significant cumulative environmental impact.

The effect of Scenario 2 cannot be quantified at this time, but as explained previously, if it can be designed to achieve the SFPUC's level of service goals and is adopted, it would be expected to have effects similar to Scenario 1. Given the SFPUC's stated goal of maintaining its level of service goals under Scenario 2, it is expected that Scenario 2 effects would be more similar to Scenario 1 than to Scenario 3. In any event, any shortfall effects under Scenario 2 that exceed the SFPUC's service goals would be expected to be less than those under Scenario 3. Therefore, the analysis of Scenario 3 would encompass any effects that would occur under Scenario 2 if it were to trigger the need for increased water supply or rationing in excess of the SFPUC's regional water system level of service goals.

Under Scenario 3, the SFPUC's existing and anticipated water supplies would be sufficient to meet the demands of existing development and projected growth in San Francisco, including the proposed project or its variant, through 2040 in wet and normal years, which have historically occurred in approximately nine out of 10 years on average. During dry and multiple dry years, retail supply shortfalls of 15.6 to 49.8 percent could occur.

As a result of the adoption of the Bay-Delta Plan Amendment and the resulting potential limitations on supply to the regional water system during dry years, the SFPUC is increasing and accelerating its efforts to develop additional water supplies and explore other projects that would increase overall water supply resilience. The SFPUC is beginning to study water supply options, but it has not determined the feasibility of the possible projects, has not made any decision to pursue any particular supply projects, and has determined that the identified potential projects would take anywhere from 10 to 30 years or more to implement. One or more of these projects may require additional environmental review.

There is also a substantial degree of uncertainty associated with the implementation of the Bay-Delta Plan Amendment and its ultimate outcome; and therefore, there is substantial uncertainty in the amount of additional water supply that may be needed, if any. Moreover, there is uncertainty and lack of knowledge as to the feasibility and parameters of the possible water supply projects the SFPUC is beginning to explore. Consequently, the physical environmental impacts that could result from future supply projects is quite speculative at this time and would not be expected to be reasonably determined for a period of time ranging from 10 to 30 years. Although it is not possible at this time to identify the specific environmental impacts that could result, this analysis assumes that if new or expanded water supply facilities, such as those listed above under "Additional Water Supplies," were developed, the construction and/or operation of such facilities could result in significant adverse environmental impacts, and that this would be a significant cumulative impact.

As discussed above, the project variant would represent 0.09 percent of total retail demand in San Francisco in 2040, whereas implementation of the Bay Delta Plan Amendment would result in a retail supply shortfall of up to 49.8 percent.

Thus, new or expanded dry-year water supplies would be needed under Scenario 3 regardless of whether the proposed project or its variant is approved or constructed, and regardless to

6. DEIR Revisions

which the frequency of dry years may increase due to climate change. As such, any physical environmental impacts related to the construction and/or operation of new or expanded water supplies would occur with or without the proposed project or its variant. Therefore, neither the proposed project, nor the project variant, would have a considerable contribution to any significant cumulative impacts that could result from the construction or operation of new or expanded water supply facilities developed in response to the Bay-Delta Plan Amendment.

Impacts Related to Rationing

Given the long lead times associated with developing additional water supplies, in the event the Bay-Delta Plan Amendment were to take effect sometime after 2022 and result in a dry-year shortfall, the expected action of the SFPUC for the next 10 to 30 years (or more) would be limited to requiring increased rationing. The remaining analysis therefore focuses on whether rationing at the levels that might be required under the Bay-Delta Plan Amendment could result in any cumulative impacts, and if so, whether the proposed project or its variant would make a considerable contribution to these impacts.

The SFPUC has established a process through its Retail Water Shortage Allocation Plan for actions it would take under circumstances requiring rationing. Rationing at the level that might be required under the Bay-Delta Plan Amendment would require changes to how businesses operate, changes to water use behaviors (e.g., shorter and/or less-frequent showers), and restrictions on irrigation and other outdoor water uses (e.g., car washing), all of which could lead to undesirable socioeconomic effects. Any such effects would not constitute physical environmental impacts under CEQA.

High levels of rationing could however lead to adverse physical environmental effects, such as the loss of vegetation cover resulting from prolonged restrictions on irrigation. Prolonged high levels of rationing within the city could also make San Francisco a less desirable location for residential and commercial development compared to other areas of the state not subject to such substantial levels of rationing, which, depending on location, could lead in turn to increased urban sprawl. Sprawl development is associated with numerous environmental impacts, including, for example, increased greenhouse gas emissions and air pollution from longer commutes and lower density development, higher energy use, loss of farmland, and increased water use from less water-efficient suburban development.²⁰ In contrast, as discussed in the transportation section of the EIR, the project site is located in an area where VMT per capita is well below the regional average; development projects in San Francisco are required to comply with numerous regulations that would reduce greenhouse gas emissions, as discussed in the greenhouse gas section of this initial study, and San Francisco's per capita water use is among the lowest in the state. Thus, the higher levels of rationing on a citywide basis that could be required under the Bay-Delta Plan Amendment could lead directly or indirectly to significant cumulative impacts. The question, then, is whether the proposed project or its variant would make a considerable contribution to impacts that may be expected to occur in the event of high levels of rationing.

While the levels of rationing described above apply to the retail service area as a whole (i.e., 5.0 to 6.8 percent under Scenario 1, 15.6 to 49.8 percent under Scenario 3), the SFPUC may allocate different levels of rationing to individual retail customers based on customer type (e.g., dedicated irrigation, single-family residential, multi-family residential, commercial,

²⁰ Pursuant to the SFPUC 2015 Urban Water Management Plan, San Francisco's per capita water use is among the lowest in the state.

etc.) to achieve the required level of retail (citywide) rationing. Allocation methods and processes that have been considered in the past and may be used in future droughts are described in the SFPUC's current Retail Water Shortage Allocation Plan.²¹ However, additional allocation methods that reflect existing drought-related rules and regulations adopted by the SFPUC during the recent drought are more pertinent to current and foreseeable development and water use in San Francisco and may be included in the SFPUC's update to its Retail Water Shortage Allocation Plan.²² The Retail Water Shortage Allocation Plan will be updated as part of the 2020 Urban Water Management Plan update in 2021. The SFPUC anticipates that the updated Retail Water Shortage Allocation Plan would include a tiered allocation approach that imposes lower levels of rationing on customers who use less water than other customers in the same customer class and would require higher levels of rationing by customers who use more water. This approach aligns with the state water board's statewide emergency conservation mandate imposed during the recent drought, in which urban water suppliers who used less water were subject to lower reductions than those who used more water. Imposing lower rationing requirements on customers who already conserve more water is also consistent with the implementation of prior rationing programs based on past water use in which more efficient customers were allocated more water.

The SFPUC anticipates that, as a worst-case scenario under Scenario 3, the multi-family mixed-use residential, commercial, and office land uses that would be developed under the proposed project or its variant could be subject to up to 38 percent rationing during a severe drought.²³ In accordance with the Retail Water Shortage Allocation Plan, the level of rationing that would be imposed on individual development projects/customers would be determined at the time of a drought or other water shortage and cannot be established with certainty prior to the shortage event. However, newly-constructed buildings, such as those that would be constructed as part of the proposed project or its variant, have water-efficient fixtures and non-potable water systems that comply with the latest regulations. Thus, if the proposed project or its variant demonstrates below-average water use, either of them would likely be subject to a lower level of rationing than other retail customers that meet or exceed the average water use for the same customer class.

While any substantial reduction in water use in a new, water efficient building likely would require behavioral changes by building occupants that are inconvenient, temporary rationing during a drought is expected to be achievable through actions that would not cause or contribute to significant environmental effects. The effect of such temporary rationing would likely cause occupants to change behaviors but would not cause the substantial loss of vegetation because vegetation on this urban infill site would be limited to ornamental landscaping, and non-potable water supplies would remain available for landscape irrigation

²² SFPUC, *2015-2016 Drought Program*, adopted by Resolution 15-0119, May 26, 2015.

²³ This worst-case rationing level for San Francisco multi-family residential was estimated for the purpose of preparing comments on the Draft Substitute Environmental Document in Support of Potential Changes to the Bay-Delta Plan (SED), dated March 16, 2017. See comment letter Attachment 1, Appendix 3, Page 5, Table 3. The comment letter and attachments are available at https://www.waterboards.ca.gov/public_notices/comments/2016_baydelta_plan_amendment/docs/dennis_herrera.pdf, accessed August 20, 2019.

6. DEIR Revisions

in dry years. The proposed project or its variant would primarily consist of multi-family residential uses along with some institutional, commercial, and office use, and it is not anticipated to include uses that would be forced to relocate because of temporary water restrictions, such as a business that relies on significant volumes of water for its operations. While high levels of rationing that would occur under Scenario 3 could result in future development locating elsewhere, existing residents, office workers, and businesses within the project site would be expected to tolerate rationing for the temporary duration of a drought.

As discussed above, implementation of the Bay-Delta Plan Amendment would result in substantial system-wide water supply shortfalls in dry years. These shortfalls would occur with or without implementation of the proposed project or its variant. The proposed project's or its variant's incremental increase in potable water demand (0.09 percent of total retail demand) would have a negligible effect on the levels of rationing that would be required throughout San Francisco under Scenario 3 in dry years.

As such, temporary rationing that could be imposed on the proposed project or its variant would not cause or contribute to significant environmental effects associated with the high levels of rationing that may be required on a city-wide basis under Scenario 3, even if that rationing is more frequent due the effects of climate change. Thus, the proposed project or its variant would not make a considerable contribution to any significant cumulative impacts that may result from increased rationing that may be required with implementation of the Bay-Delta Plan Amendment, were it to occur.

Conclusion

As stated above, there is considerable uncertainty as to whether the Bay-Delta Plan Amendment will be implemented. If the plan amendment is implemented, the SFPUC will need to impose higher levels of rationing than its regional water system level of service goal of no more than 20 percent rationing during drought years by 2025 and for the next several decades. Implementation of the plan amendment would result in a shortfall beginning in years two and three of multiple dry-years in 2025 of 33.2 percent, and dry year shortfalls by 2040 ranging from 23.4 percent in a single dry year and year one of multiple dry years to up to 49.8 percent in years seven and eight of the 8.5-year design drought. While the SFPUC may seek new or expanded water supply facilities, it has not made any definitive decision to pursue particular actions and there is too much uncertainty associated with this potential future decision to identify environmental effects that would result. One or more of these projects may require additional environmental review. Such effects are therefore speculative at this time. In any case, the need to develop new or expanded water supplies in response to the Bay Delta Plan Amendment and any related environmental impacts would occur irrespective of the water demand associated with the proposed project or its variant. Given the long lead times associated with developing additional supplies, the SFPUC's expected response to implementation of the Bay-Delta Plan Amendment would be to ration in accordance with procedures in its Retail Water Shortage Allocation Plan.

Both direct and indirect environmental impacts could result from high levels of rationing. However, the proposed project and its variant would be expected to tolerate the levels of rationing imposed on them for the duration of the drought, and thus would not contribute to sprawl development caused by rationing under the Bay-Delta Plan Amendment.

The proposed project or its variant would be subject to the requirements of the Non-potable Water Ordinance. Thus, the proposed project or its variant would not be expected to

contribute to a loss of vegetation because project-generated non-potable supplies would remain available for irrigation in dry years.

The small increase in potable water demand attributable to the proposed project or its variant compared to citywide demand would not substantially affect the levels of dry-year rationing that would otherwise be required throughout the city. Thus, the proposed project or its variant would not make a considerable contribution to a cumulative environmental impact caused by implementation of the Bay-Delta Plan Amendment. Therefore, for the reasons described above, under all three scenarios, this impact would be considered less than significant. No mitigation is required.

Biological Resources

To further clarify that under the proposed project or project variant, removal and replacement of street trees and significant trees would be consistent with the standards in the Urban Forestry Ordinance and would be addressed as part of the major encroachment permit recommended by public works and adopted by the board of supervisors by ordinance, the following text has been added to the end of EIR Section 4.F, Initial Study Supplement, to supplement the initial study project- and cumulative-level impact analysis with respect to conflicts with local policies or ordinances protecting biological resources (because all is new text, it is not shown in double underlining for readability) .

BIOLOGICAL RESOURCES

The Urban Forestry Ordinance

As discussed in the initial study, pp. 202-204, the proposed project or project variant removal and replacement of street and significant trees would be consistent with the standards in the Urban Forestry Ordinance and would be part of the major encroachment permit recommended by public works after a noticed public hearing with opportunity for public comment, and adopted by the board of supervisors by ordinance. Substantive standards and requirements for tree removal and replacement, including payment of in lieu fees if necessary, would remain the same as set forth in the Urban Forestry Ordinance. As a result, the proposed project or project variant would be consistent with ordinance requirements with Urban Forestry Ordinance requirements regarding protection of biological resources, replacement, and payment of any in-lieu fees. The proposed project would be consistent with all applicable city policies and ordinances regarding protected trees regarding protection of biological resources, replacement, and payment of any in-lieu fees.

F. REVISIONS TO CHAPTER 6, ALTERNATIVES

The last paragraph on EIR p. 6.78 incorrectly identifies a two-story vertical addition. This paragraph has been corrected as follows (new text is double-underlined and deletions are shown in ~~strikethrough~~):

Rehabilitation Standard 1 states that the “property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.” As described above, the glass curtain wall system would be replaced with a system compatible with the historic resource. Other changes to the building’s historic

6. DEIR Revisions

features would be minimal, i.e., ~~two~~ one-story, stepped vertical addition and removal of the northerly extension of the east wing.

SAN FRANCISCO PLANNING COMMISSION:

Commissioner Rich Hillis, President

Commissioner Myrna Melgar, Vice President

Commissioner Rodney Fong

Commissioner Milicent Johnson

Commissioner Joel Koppel

Commissioner Kathrin Moore

Commissioner Dennis Richards

Jonas Ionin, Commission Secretary

1 P R O C E E D I N G S

2 SECRETARY IONIN: Very good, Commissioners.

3 That will place us on Item 11 for Case No.

4 2015-014028ENV, 3333 California Street. This is a Draft
5 Environmental Impact Report.6 MS. GIBSON: President Hillis, Commissioners,
7 Lisa Gibson, Environmental Review Officer. I'd like to
8 introduce to you the planner who's going to be
9 presenting on this item. This is Kei Zushi. He's a
10 senior planner in our Environmental Planning Division.11 Kei has over 10 years of land use and
12 environmental planning experience, having worked as a
13 city planner in Oregon, Washington, and California.
14 Notably, Kei worked as an environmental planner at the
15 planning department for two years back in 2012 through
16 '14, and after that he went off to law school at UC
17 Hastings.18 During law school, Kei interned at the city
19 attorney's office with our land use team, and he
20 worked on CEQA litigation, and he also clerked for
21 administrative law judges at the California Public
22 Utilities Commission.23 And, most recently, Kei worked as a
24 law clerk at the Thomas Law Group. He worked on some
25 challenging CEQA cases, including the Golden State

1 Warriors Arena in San Francisco -- you might have heard
2 of that project -- the Newhall Ranch project in Santa
3 Clarita Valley, and also the City Place project in Santa
4 Clara.

5 Luckily, for us, CEQA and land use planning
6 continue to be Kei's main career focus. We're very
7 fortunate to have him working for us again at the
8 planning department where he rejoined us in September.
9 Thank you very much, Kei.

10 MR. ZUSHI: Thank you, Lisa. I have slides to
11 show.

12 PRESIDENT HILLIS: Okay. There you go.

13 MR. ZUSHI: Good afternoon, President Hillis
14 and members of the commission, Kei Zushi. As Lisa
15 mentioned, planning staff and environmental review
16 coordinator for the 3333 California Street mixed-use
17 project. The purpose of the hearing today is to receive
18 comments on the Draft Environmental Impact Report, or EIR,
19 for the 3333 California Street mixed-use project.

20 Joining me today are my colleagues, Debra Dwyer,
21 principal environmental planner, Justin Greving, senior
22 preservation planner, and Nick Foster, senior current
23 planner. Leigh Lutenski of the Mayor's Office of Senior
24 Economic and Workforce Development is also here, and Dan
25 Safier, Prado Group and SKS Partners and other

1 members of the project sponsor team are present.

2 The commission secretary is providing you with
3 a handout of my presentation and letter from the
4 historic preservation. Copies of these are available
5 for members of the public on the table to my left.

6 I would like to note that we have a
7 stenographer present to create a transcript of today's
8 proceedings, so I would encourage all speakers to speak
9 slowly and clearly in order to assist the process.

10 So the 10 -- sorry about that. So the 10.25
11 acre site is located on the south side of California
12 Street between Laurel Street and Presidio Avenue, and
13 is currently occupied by the University of California
14 San Francisco Laurel Heights Campus.

15 In order to facilitate the receipt of comments
16 and inform the Commission and members of the public, Leigh
17 Lutenski of the Mayor's Office of Economic Workforce
18 Development and the project sponsor will provide a brief
19 overview of the project.

20 MS. LUTENSKI: Hello, Commissioners, my name is
21 Leigh Lutenski, with the Office of Economic and
22 Workforce Development. I have a few brief remarks
23 today. The proposed project would create 558 or 744
24 units of housing under the base project and variant,
25 respectively, in addition to child care and new public

1 open space and neighborhood retail, all while adaptively
2 reusing portions of the existing building.

3 OEWD is working with the project sponsor to
4 negotiate a development agreement for this project which
5 would include commitments to specified community
6 benefits. The DA will be limited to a set of benefits
7 that are contextual with the neighborhood and in scale
8 with the project, particularly focusing on open space
9 and affordable housing.

10 Mayor Breed has named housing, and particularly
11 affordable housing, a top priority of her
12 administration. The Mayor has continued the work of
13 late Mayor Lee, and has initiated new policies aimed at
14 more quickly entitling projects and increasing the pace
15 at which housing is built. This project would be an
16 important contribution to these initiatives, as well as
17 the effort to create new housing in all parts of the
18 city.

19 I thank you for your attention to this project.

20 MR. SAFIER: Can I use this over here?

21 SECRETARY IONIN: Sure.

22 PRESIDENT HILLIS: Yeah, either one.

23 MR. SAFIER: Okay. Happy holidays, President
24 Hillis, Commissioners, Director Rahaim and staff. I'm
25 Dan Safier, project sponsor with --

1 PRESIDENT HILLIS: Just pull that up closer to
2 you.

3 MR. SAFIER: How's that?

4 PRESIDENT HILLIS: That's good.

5 MR. SAFIER: Okay. We've been working on this
6 project for close to four years, and today we have a
7 brief overview of the project as context for the Draft
8 EIR. We anticipate returning in the Spring of this year
9 to provide additional project detail, including specific
10 plans for the architecture and design.

11 This is the site today.

12 PRESIDENT HILLIS: Can we go to the computer,
13 please? There you go.

14 MR. SAFIER: There we go. The 10-plus acre site
15 is bounded by California Street to the north, Presidio
16 to the east, Euclid to the south, and Laurel to the
17 west. Our project began with a question: How do you
18 evolve a 10.3 acre suburban park-centric office campus
19 into a place for people that is connected with the
20 neighborhoods around it?

21 The site has a significant grade change of
22 almost 65 feet from one end of the site to the next, so
23 about six-and-a-half stories from the corner of
24 California and Presidio to the high point at Euclid and
25 Laurel.

1 The proposed project includes 558 residential
2 units, approximately 50,000 square feet of office space,
3 54,000 square feet of small scale retail on California
4 Street, and on-site child care. This plan is consistent
5 with the existing RM-1 zoning, which the planning code
6 defines as residential mixed district at low density.
7 And in the upper right corner, you'll see the Walnut
8 Building which contains office in the base project.

9 Planning also requested, as was mentioned, that
10 we develop a variant at the PUD density. This allows
11 the site to go up to the RM-2 zoning minus one unit for
12 residential mixed district at moderate density, which
13 equates to 744 residential units.

14 To achieve this density, the Walnut Building
15 has two additional stories, which is the same height as
16 the Jewish Community Center across the street, and the
17 50,000 square feet of office space is eliminated and
18 replaced with 186 residential units. Apart from the
19 Walnut Building change, the rest of the site is the same
20 as the base project.

21 In order to create design diversity across this
22 large site, our project team includes three building
23 design architects and two landscape architects. The
24 team was selected for their award-winning track records,
25 design-forward thinking, community orientation, and

1 commitment to quality architecture and planning. With
2 over five acres of usable open space, our team
3 prioritized design of the pedestrian experience and open
4 space with the idea of creating buildings within a park.

5 Over the past four years, we've also had over
6 140 meetings with the community, including large
7 community meetings, neighborhood associations and
8 individual neighbor meetings, and we're continuing that
9 outreach today.

10 At a high level, here are some of the key design
11 elements of the project. The city and the project
12 sponsor team established a goal to weave this site back
13 into the city's urban fabric through the creation of
14 north/south and east/west pedestrian connectors. As you
15 can see, the existing site is not pedestrian or public
16 friendly. The main access is through these driveway
17 entrances, which are gated and walled.

18 The current site is physically disconnected
19 from the surrounding neighborhood context both through
20 the brick walls on the perimeter and the topography
21 which steeply berms up along Masonic Avenue. With the
22 walls, berms and surface parking lots, the site does
23 not currently invite pedestrians through the site. You
24 can see that the existing condition is also somewhat
25 like an island, isolated and walled off from the

1 existing neighborhoods.

2 The project design reconnects the site to the
3 existing neighborhood grid through the north/south and
4 east/west connector, effectively turning the site into
5 four well-scaled blocks. We are also retaining and
6 adaptively reusing the main portion of the existing
7 building while also cutting a 40-foot wide pedestrian
8 connection through the existing building, aligned with
9 the Walnut Street to the north to create a north/south
10 access.

11 Our Draft EIR acknowledges the presence of a
12 historic resource, and our plan includes converting the
13 retained building from its grandfathered office use to
14 residential.

15 Our plan also increases the pedestrian access
16 points around the perimeter of the site. They make the
17 project more porous, encouraging walkability and
18 accessibility. The proposed project and north/south and
19 east/west connectors will be designed to be ADA
20 accessible, which is an important feature, given the
21 steep grade change of the site.

22 This is a view of the Mayfair walk connector
23 looking east, the overlook, which is actually where
24 there's an existing portion of the building right now
25 that hangs over this area that would be removed, but

1 this would provide the public with scenic views of the
2 city and then ADA access and stairs to Presidio Avenue
3 below.

4 To help reconnect, activate, and integrate the
5 site into the existing neighborhood fabric, we're
6 proposing small scale ground floor retail along
7 California Street, connecting with the Laurel Village
8 shopping center to the west and extending to the Fire
9 Credit Building and Ellas restaurant to the east. You
10 can see on this image the pink shaded element includes
11 Laurel Village shopping center, and then the small scale
12 retail proposed on our project.

13 We believe that providing mixed use will make
14 for a more convenient and whole neighborhood, promote
15 walkability, eyes on the street, and safety.
16 Importantly, it will provide us with the opportunity to
17 curate uses that are currently missing from the
18 neighborhood for existing and future residents.

19 Our approach has always been to complement
20 Laurel Village shopping center. We've met with the
21 Laurel Village and Sacramento Street merchants many
22 times, and will continue to work with the community and
23 the merchants to identify future retailers to complement
24 and not compete with the existing retail.

25 The proposed project is also proposing over

1 five acres of generous open space, over half of which
2 will be publicly accessible space. The project aims
3 to create a wide variety of landscaped open spaces that
4 are inspired by the California landscapes.

5 The existing open space is primarily asphalt,
6 designed for cars, and includes over 3.2 acres of
7 surface parking. This is in addition to the lawn at
8 Euclid and Laurel, and the space on Presidio. By
9 contrast, our project proposes to put all the parking
10 underground, freeing up the ground plane for the network
11 of usable and welcoming open spaces.

12 Additionally, the project is on a transit
13 corridor and is actually between two of the main transit
14 corridors in the city, the Geary line and the California
15 line, and it's extremely well served by Muni with
16 a number of buses adjacent to the site.

17 The primary project open spaces include Cypress
18 Square, which is accessed off a grand staircase and ADA
19 access on California Street. It will be a beautiful
20 south-facing plaza centered around the mature cypress
21 trees. We'll also be enhancing Euclid Green at the
22 corner of Laurel and Euclid, and retaining the view
23 corridor to downtown.

24 We're proposing to increase the number of
25 street trees around the site to 613 percent of the

1 current count, and the number of on-site trees will be
2 146 percent of their current count, all to improve the
3 urban canopy.

4 As part of the landscape plan, we worked with our
5 arborist and landscape architect to identify key trees
6 to be preserved and celebrated. Some of our open spaces,
7 including Cypress Square, Oak Meadow, and Pine Street
8 steps are designed around these trees and enhanced with
9 additional trees.

10 The proposed project and the variant also
11 include on-site child care of approximately 14,600 square
12 feet with capacity for about 175 children. We
13 understand that this is a major priority for the city,
14 and we believe that this amenity will encourage young
15 families to join and stay in the neighborhood. To
16 complement this family-friendly approach, approximately
17 60 percent of the total residences proposed are
18 two, three, and four-bedroom units.

19 Finally, this project has been designed with
20 the city's important housing policies and objectives in
21 mind. It will bring new homes to San Francisco's west
22 side and District 2, where very little new housing has
23 been built over the past 40 years.

24 It will provide affordable housing units that
25 will help preserve the diversity of our city and the

1 equity of our neighborhoods. It will also provide
2 millions of dollars in new annual tax revenue due to
3 conversion from a public tax exempt use to residential
4 mixed use, in addition to contributing substantial
5 community benefit fees toward open space, jobs, housing,
6 schools, transportation, and child care.

7 In short, this project is a significant housing
8 and mixed use opportunity for District 2 and for the
9 future of our city.

10 Thank you very much. And our team will also be
11 available to answer any questions you might have, and
12 also Gregg Miller is here from Coblentz.

13 PRESIDENT HILLIS: All right. Thank you.

14 MR. ZUSHI: Thank you. Again, the purpose of
15 today's hearing is to take public comments on the draft
16 EIR on the accuracy, adequacy and completeness of the
17 Draft EIR for this project pursuant to the California
18 Environmental Quality Act, or CEQA, and San Francisco's
19 local procedures for implementing CEQA. This is not a
20 hearing to consider approval or disapproval of the
21 project. That hearing will follow the Final EIR
22 certification.

23 In addition, there will be future opportunities
24 to comment on the merits of the proposed project or
25 project variant.

1 I'd like to make a few comments to further
2 facilitate the receipt of comments today. I'll briefly
3 summarize the significant impacts of the project.

4 PRESIDENT HILLIS: Yeah, can we go to the
5 computer, please? There you go.

6 MR. ZUSHI: The Draft EIR finds that the
7 project or project variant, even with mitigation, would
8 result in significant and unavoidable impacts with
9 respect to historic resources for the 3333 California
10 Street property, transit capacity on the 43 Masonic
11 route, and construction noise.

12 The Draft EIR also finds that other significant
13 impacts to transportation, construction vibration and
14 operational noise, archaeological resources, human
15 remains, and tribal cultural resources, biological
16 resources, and paleontological resources can be mitigated
17 to a less than significant level.

18 The Draft EIR analyzes six alternatives to the
19 project to address significant and unavoidable impacts.
20 In addition to the no project alternative required by
21 CEQA, the EIR includes two full preservation
22 alternatives, two partial preservation alternatives, and
23 a code conforming alternative. The details regarding
24 the alternatives are provided in Chapter 6 of the EIR.
25 I will also note that the preservation alternatives were

1 informed by input from the architectural review
2 committee of the Historic Preservation Commission.

3 With respect to the significant and unavoidable
4 impacts of the proposed project or project's variant, the
5 full preservation alternatives would result in less
6 than significant impacts on historical architectural
7 resources and reduce but not avoid the transit
8 capacity and construction noise impacts. The partial
9 preservation alternatives would reduce the significant
10 impacts on historic architectural resources, but not to
11 a less than significant level and would still have
12 significant impacts to transit capacity and construction
13 noise.

14 A code conforming alternative would result in
15 significant and unavoidable historic resource and
16 construction noise impacts similar to those of the
17 project and project variant, and it would also result in a
18 significant transit capacity impact, but it would be
19 reduced compared to the project or project variant.

20 A public hearing before the Historic
21 Preservation Commission was held on December 5th, 2018
22 in order for the commissioners to provide comments to
23 the planning commission and the department on the Draft
24 EIR. Subsequent to the hearing, the HPC issued a
25 comment letter on the Draft EIR which the commission

1 secretary has provided to you.

2 HPC found that the analysis of historic
3 resources in the Draft EIR was adequate and accurate and
4 agreed that the Draft EIR analyzed a reasonable and
5 appropriate range of preservation alternatives. The HPC
6 also suggested refinements to some of the preservation
7 alternatives and expressed interest in understanding more
8 about the neighborhood alternative that was discussed by
9 the public at the hearing.

10 As I mentioned, there's a stenographer present
11 to create a transcript of today's proceedings, so I
12 would encourage all speakers to speak slowly and
13 clearly.

14 While we would appreciate if members of the
15 public would state their name for the record, members of
16 the public are not required to provide personal
17 identifying information when they communicate with the
18 commission or the department. In this case, the
19 information from the hearing today will be made
20 available to the public on the website as part of the
21 proposed project's record of proceedings.

22 Staff is not here to answer comments today.
23 Again, the purpose of the hearing is to receive comments
24 on the information and analysis in the Draft EIR. There
25 will be future opportunity to comment on the project

1 itself. The comments made will be transcribed and
2 then responded to in writing in the Responses To Comments
3 document, or RTC. The RTC will respond to all verbal
4 and written comments received and make revisions to the
5 Draft EIR, as appropriate.

6 Before I conclude, I would like to remind
7 members of the public that the Draft EIR was published
8 on November 7th, 2018. The public comment period for
9 this project began on November 8th, 2018 and closes at
10 5:00 p.m. December 24th, 2018. Comments on the draft
11 EIR must be submitted orally at today's hearing or in
12 writing to the project email shown here or planning
13 department by 5:00 p.m. on December 24th for them to be
14 responded to in the Final EIR.

15 There have been several requests to extend the
16 public comment period to January 8th, 2019. The
17 environmental review officer has opined that an
18 extension is not warranted in this case. After hearing
19 comments from the members of the public, we'll receive
20 comments on the Draft EIR by the planning commission.

21 This ends my presentation. City staff and
22 members of the project sponsor team are available to
23 answer any questions you may have. Unless the
24 commission members have questions, I would respectfully
25 request that the public hearing be opened. Thank you.

1 PRESIDENT HILLIS: Okay. Great. Thank you
2 very much. So we'll open this up for public comment.
3 Again, I want to reiterate this is comments on the draft
4 EIR and its adequacy. We'll have the project before us,
5 I imagine, sometime next year. We won't answer
6 necessarily the comments made today. We may make some
7 of our own on the EIR, but it's a tool to help us
8 analyze the project in view in the future.

9 So I'll call names. Roger Miles, Eileen Boken,
10 Adam McDonough, Judy Doane, Bill Cutler, Ms. Desby,
11 Richard Frisbie. So if I've called your name, you can
12 speak in any order. Line up on the screen side of the
13 room.

14 Go ahead if you want to start, sir. Sir, go
15 ahead. Go ahead. You can speak in any order. If I've
16 called your name, you are welcome to come up and speak
17 and tell us about the EIR. No?

18 All right, next speaker, if you want to come
19 up. There's no order, necessarily. So if your name's
20 been called, line up on the screen side of the room and
21 you can approach in any order. Now's the time.
22 Welcome.

23 MR. MILES: Good afternoon. My name is Roger
24 Miles. And, firstly, I would like to urge you to increase
25 a 15-day extension to the DEIR. It seems the holidays

I-Miles1

1
(GC-3)

1 might be better used for friends and family than dealing
2 with this. 1 (GC-3)
cont'd

3 I live in the neighborhood, have for a long
4 time, right across the street. And I understand why
5 it's considered historic, and it would be a shame to
6 destroy it. It was designed a bit like a college
7 campus, even though it was a business. And it was
8 designed so that the people in the building could enjoy
9 the dramatic outside that was created by some wonderful
10 planners, and it just melds in and doesn't stand out and
11 wave at you and say, "I don't belong here," even though
12 it was commercial establishment. 2 (CR-2)

13 The developer's proposal would destroy this.
14 The existing buildings and grounds fit so well in
15 the neighborhood now, it just nestles right in. And we 3 (ME-1)
16 don't need anymore commercial. It would just provide a
17 lot of extra traffic, parking issues, and also wouldn't
18 necessarily be very good for extra competition for the
19 existing small stores up and down Sacramento and right
20 adjacent. The Laurel Village Association sort of agrees
21 with that.

22 So I would urge you to look -- support the 4 (AL-2)
23 neighborhood full preservation measure. That will
24 leave everything basically as it is. It currently
25 provides access all over the place, unlike what they're V

1 telling you; there is no north/south access. But there
2 isn't hardly any place you can't walk up and enjoy the
3 campus. And even though they have separations, it's
4 always been open to the public and family. And dogs,
5 pets, everybody uses it all the time, and has for years,
6 and it's always been welcomed. And if they get away with
7 this mess, you'll have no more housing in comparison to
8 what you can get with the existing premises.

9 And, therefore, that's what I urge you do to.
10 It will give you 100 percent of the characteristics, and
11 the historic site would remain the same. It provides up
12 to 744 units of housing. It doesn't provide any
13 commercial. It builds them in three years instead of
14 seven to fifteen --

15 SECRETARY IONIN: Thank you, sir. Your time is
16 up.

17 MR. MILES: Thank you.

18 PRESIDENT HILLIS: Thank you. Next speaker,
19 please.

20 SECRETARY IONIN: And I will remind members of
21 the public that we are accepting comment on the adequacy
22 and accuracy of the Environmental Impact Report, not the
23 project itself.

24 MR. MCDONOUGH: Hello, members of the -- sorry,
25 commissioners.

4
(AL-1)
cont'd

1 PRESIDENT HILLIS: Overhead, please. Go ahead.

2 MR. MCDONOUGH: Thank you. My name is Adam I-McDonough1
3 McDonough. I'm a resident of Laurel Heights. First thing 1
4 I want to ask is that you strongly consider the granting (GC-3)
5 of the 15-day extension, the due date. It's a very
6 lengthy and complex document. It came out right before
7 the holidays. We're being asked to respond by Christmas
8 Eve. A few more weeks won't kill the project.

9 Secondly, I just wanted to show you some
10 pictures. You've seen some of these already. Not much
11 really needs to be said about them. These pictures and
12 the listing on the California Register of Historical
13 Resources, after the unanimous support of the State
14 Historic Resources Commission at their May hearing,
15 speak for themselves. San Francisco Historic
16 Preservation Commissioner further reinforced these
17 comments at their recent December 5th hearing.

18 Again, not much needs to be said. The
19 commissioners in Palo Alto spoke more eloquently and
20 with considerably more authority than I can about the
21 master status of the three principals associated with
22 3333 California Street. The developer proposes the
23 virtual total destruction of this historically listed
24 site.

25 The black areas indicate the extent to which 50 ↓

1 percent of the historic main building will be
2 demolished. The red indicates the bulldozing and total
3 destruction of more than 80 percent of the historically
4 listed landscaping. It is unimaginable that anyone
5 responsible for San Francisco's future could countenance
6 such a mindless destruction of such an iconic and
7 important part of San Francisco's past.

8 So what will be the future of 3333? Will we
9 preserve it or destroy it? A great deal of this
10 decision lies in your hands. I will not restate the
11 first five items in red.

12 Please take note that the community alternative
13 builds the same number of housing units as the
14 developers propose, but we do so in three years, not
15 in seven to 15 years, as proposed by the developer. It
16 took less than five years to build the Salesforce Tower,
17 after all.

18 Clearly, the developers and planning don't
19 appreciate the fact that San Francisco has a housing
20 crisis and needs housing now, not in 2030 or beyond.
21 Housing activists, NIMBYs and others should pay
22 careful attention to this glaring discrepancy.

23 Finally, anyone concerned about eliminating
24 climate change should pay special attention to the
25 greenhouse gases that will be released by the two

2
(CR-2)
cont'd

3
(AL-2)

4
(GHG-3)

1 solutions. The developer's plan generates three times
2 that of the community alternative. Thank you.

4
(GHG-3)
cont'd

3 PRESIDENT HILLIS: Thank you. Next speaker,
4 please.

5 MS. BOKEN: I'll be using the overhead.

6 PRESIDENT HILLIS: Okay.

I-Boken

7 MS. BOKEN: I'm Eileen Boken, San Francisco
8 Coalition for Neighborhoods, here on my own behalf. I
9 strongly urge the commission to grant a 15-day extension
10 to the due date for comments for this DEIR. It is a
11 lengthy and complex document.

1
(GC-3)

12 On the overhead is a coalition resolution
13 urging the historic designation of the site. I am here
14 in support of Laurel Heights Improvement Association, as
15 they have a proven track record of working with project
16 sponsors to achieve successful outcomes such as the CPMC
17 California Street site and the Lucky Penny site.

2
(CR-1)

3
(ME-1)

18 That being said, it is my understanding that
19 this project sponsor has been challenging. It is my
20 understanding that, because of ongoing challenges, that
21 the neighborhood decided to develop the community
22 alternative. Besides maintaining the historical and
23 architectural integrity of this site, the community
24 option alternative achieves the following: Meets the
25 city's housing goals, does not contain retail component

4
(AL-2)

1 which would compete with existing neighborhood serving
2 businesses, maintains a portion of the office space
3 which is consistent with the original purpose of the
4 buildings.

5 I would urge the department and the
6 commission to seriously consider the community
7 alternative.

8 PRESIDENT HILLIS: All right. Thank you. Next
9 speaker, please.

10 MR. CUTLER: Good afternoon. My name is Bill
11 Cutler. My wife and I have lived in Laurel Heights on
12 California Street, one block from the site of the
13 proposed real estate development, for over 45 years.

14 Over the decades, we've seen many big changes to our
15 neighborhood, some positive and some negative. But this
16 proposal which violates the zoning laws and the
17 character of the district is, by far, the most
18 disturbing to date.

19 Everyone recognizes the need for affordable
20 housing in San Francisco, and we support construction of
21 housing on this site. But the current proposal which
22 Prado wants seven to 15 years to complete includes
23 unnecessary retail space, creates major traffic
24 problems, and includes a plan to mar the beauty of
25 Laurel Hill by destroying the majority of 185 old growth

4
(AL-2)
cont'd

I-Cutler1

1
(GC-3)

2
(ME-1)

1 trees that we cannot afford to lose in an era of toxic
2 air and climate change.

2
(ME-1)
cont'd

3 The high density of the proposed project
4 will increase traffic flow and congestion, increase
5 noise and pollution and contribute to the loss of
6 parking in a neighborhood where it's already almost
7 impossible to find adequate street parking, even
8 for those of us who have G stickers as residents.

9 Fortunately, there's a much better way to
10 address the need for a development at Laurel Hill that
11 both meets the housing demands and still protects the
12 historic building as well as the beautiful landscaping
13 that surrounds it. It's called the neighborhood full
14 preservation alternative. It provides the same number
15 of residential housing units as the Prado project, 558
16 with a 744 variant, protects the majority of the 185
17 mature trees, and does not include major retail that
18 would only negatively compete with Laurel Village
19 shopping center which borders the site and already has
20 two supermarkets, Starbucks and Pete's Coffee, Ace
21 Hardware, three restaurants, three banks, several
22 boutiques, a Gap store, and a variety of other shops --
23 not to mention Sacramento Street, where there are many
24 others.

3
(AL-2)

25 We don't need new retail in Laurel Heights. We

1 need affordable housing, built without changing the
2 existing zoning laws, without 10-story buildings, and
3 using the available space primarily for housing which
4 allows for some units big enough for middle class
5 families. The neighborhood alternative does all that and
6 can be built in about three years, not seven-and-a-half
7 to 15.

3
(AL-2)
cont'd

8 Please consider supporting our plan, and please
9 grant a 15-day extension of the due date for comments on
10 the Draft EIR. Thank you.

4
(GC-3)

11 PRESIDENT HILLIS: Thank you. Next speaker,
12 please.

O-LHIA5

13 MR. FRISBIE: Can I have the overhead, please?
14 Hi. I'm Richard Frisbie. I live in the neighborhood.
15 December 24th, what does this mean to you? It should
16 mean Christmas Eve. But, no, it doesn't. As it was
17 pointed out very, very boldly, 5:00 p.m. December 24th is
18 the due date of the DEIR, no exceptions.

1
(GC-3)

19 I brought a book I'm going to leave. You can
20 give it to Toys for Tots. Was this an accident? Did no
21 one in planning actually notice this date? It begs
22 the question as to why management, why didn't the
23 director of planning, who I noticed has left, do
24 something? Why didn't he step in and say, "No, this
25 isn't right; this isn't proper; this isn't what we do to

↓

1 the citizens of San Francisco who pay our salaries."

2 It gives a new meaning to the word "public
3 servant." Anyone who stands by silently, that is just an
4 unconscionable act for Christmas Eve. I'm personally
5 offended. And I think I speak for everyone in the room?
6 Raise your hand. I hope I speak for each of you,
7 actually.

8 So, what's so special about Christmas Eve?
9 It's many things to many people, all the way from deeply
10 spiritual to totally secular, across a wide spectrum of
11 society. The week leading up to Christmas, however, you
12 celebrate it, is a time for peace, for family, for
13 reflection. It's a time when family and friends travel
14 across California, across the country, across the globe
15 to be with loved ones. It's a time for grandmothers to
16 teach granddaughters how to bake Christmas cookies and
17 prepare a meal for Santa and his reindeer. It's a time
18 for grandfathers to teach grandsons how to hang up
19 outside Christmas lights without getting electrocuted.

20 It's not a time when the community should be forced
21 by some arbitrary day, totally arbitrary day, to give up
22 their involvement in this special season.

23 On December 24th, 1968 -- this year is the 50th
24 anniversary of that date -- James Lovell, Bill Anders, and
25 Frank Borman circled the moon, the first humans ever to

1
(GC-3)
cont'd

1 adventure to another planetary body. And they
2 shared these photos and a message of joy, peace, and
3 humanity with all the people of Planet Earth. This is
4 what Christmas Eve is all about. So my question is,
5 where do you stand? We request an extension.

1
(GC-1)
cont'd

6 PRESIDENT HILLIS: All right. Thank you. Next
7 speaker, please.

I-Doane

8 MS. DOANE: Good afternoon. My name is Judy
9 Doane. I have lived near the 3333 California Project
10 site since early in the 1970s. I strongly urge the
11 planning commission to grant a 15-day extension of the
12 due date for comments on this Draft EIR because it is a
13 long, complex document.

1
(GC-3)

14 I support building more housing in our
15 neighborhood, and specifically at the 3333 California
16 Street site, but it needs to be the right development
17 plan.

2
(ME-1)

18 After examining available plans, including the
19 plan proposed by the developer, Prado, and an
20 alternative the neighbors themselves have produced, I am
21 supporting the neighborhood full preservation

3
(AL-2)

22 alternative for the following reasons: One, we do not
23 need more retail in this area. We have plenty of shops
24 serving the neighborhood now. Adding more will make
25 3333 California not just a residence, but also a retail
destination, guaranteeing an unacceptable amount of

4
(TR-11)

1 extra traffic and exacerbating an already stressed
2 on-street parking problem.

4
(TR-11)
cont'd

3 In addition, increasing the traffic will make
4 it more hazardous for a large number of seniors using
5 walkers, as well as endanger mothers with baby carriages
6 trying to cross these already very busy intersections.

5
(TR-8)

7 Two, the neighborhood full preservation
8 alternative will retain the same number of units, 558 or
9 the variant of 744, as the Prado plan.

6
(AL-2)

10 Three, a neighborhood plan will also keep the
11 unique features of the original historically significant
12 building and landscaping. That means some of the old
13 growth trees on the lot can be retained, protecting the
14 important ecological aspects of this space for our
15 beautiful, green city.

16 Four, the three to five years of construction of
17 the neighborhood plan will be much more tolerable than
18 Prado's proposed seven to 15 years.

19 Please consider the neighborhood full
20 preservation plan. Thank you.

21 PRESIDENT HILLIS: Thank you. Next speaker,
22 please.

I-Desby

23 MS. DESBY: Hi. My name is Krisanthly Desby. I
24 live in Presidio Heights, two and-a-half, three blocks
25 from the proposed project. First of all, I do request

1
(GC-3)

1 that the planning commission grants a 15-day extension
2 for comments on the DEIR. I personally come from a very
3 large extended family. I don't have time to read it.
4 An extra two weeks would really be helpful.

1
(GC-3)
cont'd

5 I also support the community full preservation
6 residential alternative for 3333. I feel that the Prado
7 Group proposal is akin to building a mini city three
8 blocks from my house. There will be many, many years,
9 no matter which way you slice it, at least seven,
10 possibly ten, maybe with extensions more, of noise
11 pollution, traffic, congestion, all the things that we
12 deal with downtown. And then it's going to be
13 permanent. It will just turn our neighborhood into
14 another Civic Center.

2
(AL-2)
3
(ME-1)

15 The project is completely out of scale for the
16 surrounding neighborhoods. There are four neighborhoods
17 immediately surrounding, and I feel that it's a mini
18 city that's just going to be plunked down in the middle
19 of us.

20 I -- among other things, removing the trees,
21 almost 200 trees, and saying that they're going to plant
22 more, those trees that are there now have been there for
23 decades, and it will take many decades for new trees to
24 grow. And we don't know if they'll grow. Who's studied
25 what trees fit there? What if they tear up the

4
(BR-1)

1 sidewalk? And when will they be placed there? After
2 the project is finished? During? Who knows? So we're
3 going to be losing that resource which helps clear the
4 air.

4
(BR-1)
cont'd

5 Anyway, I ask that you reject the Prado
6 proposal and accept the community full preservation
7 residential alternative in its place. Thank you very
8 much.

5
(AL-2)

9 PRESIDENT HILLIS: All right. Thank you. Next
10 speaker, please.

11 MR. GOLDBRENNER: Hi. My name is David
12 Goldbrenner. I live about six blocks from the site. My
13 family and I find ourselves at this intersection all the
14 time. I have a young daughter. We use the JCC
15 regularly.

I-Goldbrenner1

16 I found out about this relatively recently. I
17 don't know much about real estate development, but my
18 gut instincts is that this is going to be an incredibly
19 huge imposition on the neighborhood, the idea of seven to
20 15 years of construction at this intersection that we rely
21 on constantly to get where we're going. We rely on the
22 1 Bus on the 43 Bus, driving past there, and the
23 thoughts of construction, dumpsters, and board walls and
24 backhoes backing up, and trucks beeping for seven to
25 15 years is just really kind of soul-crushing.

1
(ME-1)

2
(TR-6)

1 And so from what I've heard, I would really
2 support the proposed neighborhood alternative, which
3 apparently provides the same housing, but with a much
4 shorter period and with much less impact on the
5 neighborhood both during the construction and
6 afterwards.

T³
(AL-2)

7 I'd also like to request, respectfully, the
8 15-day extension. It seems like a reasonable thing to
9 do, given that this came out just before the
10 Thanksgiving and the Christmas and Hanukkah holidays. So
11 I'd like to ask for that extension, as well. Thank you.

T⁴
(GC-3)

12 PRESIDENT HILLIS: Thank you. Next speaker,
13 please.

I-McMichael

14 MR. McMICHAEL: Hi, folks. My name is Adam
15 McMichael. I'm here out of work today as a concerned
16 citizen of San Francisco to urge you to support the
17 proposed project at 3333 California Street. This
18 project's a critical step forward in addressing San
19 Francisco's housing crisis by providing much needed
20 housing for families in a transit-friendly neighborhood.

T¹
(ME-1)

21 As a long-time resident of this neighborhood,
22 I've seen neighbors and friends move out of the city due
23 to the housing shortage and housing affordability
24 challenges. The combined effects of job creation and
25 slow housing production have created difficult

↓

1 situations for families like mine.

1
(ME-1)
cont'd

2 The west side of San Francisco needs more
3 housing. The residents in this area have benefited from
4 the city's job creation, property values have soared,
5 but these same residents have skated by and deepened the
6 housing crisis by maintaining current local zoning. This
7 is much change for the long-term sustainability of the
8 city for families like mine.

9 This underused parcel is an awesome opportunity
10 to build more housing in the city, and this project is
11 exactly what the city needs. The proposed project
12 creates a family-friendly community in a city that has
13 seen rapid flight of young families like mine.

14 San Francisco is an innovative city that values
15 inclusion, diversity and community, and in this moment
16 of crisis, we hope that you will support this project
17 and ensure the residents of San Francisco have access to
18 more housing.

19 In addition to this letter that my wife and I
20 wrote, I would just like to say that if I had to make a
21 few changes to the project, I would triple the size of
22 it, in coordination with a lot of the buildings that
23 surround the area, and do as much as we can to add more
24 housing to the city in general. Thank you for your
25 time.

O-YIMBY1

$$\frac{1}{(\text{ME}-1)}$$

2
(GC-3)

2
(GC-3)

1 not just Christians, and so it's much broader.

2 We just had hearings all through the Hanukkah
3 holiday, and I actually didn't see anybody demanding any
4 delays based on the celebration, a much longer event, of
5 Hanukkah. I didn't see anybody demanding delays. I
6 think that these delay tactics are silly. These people
7 have a lot of time on their hands. We see that they are
8 spending hours at these hearings, reading the EIRs, and
9 we can, in fact, move quickly. Thank you.

10 PRESIDENT HILLIS: Thank you. Next speaker,
11 please. And I'll call a couple more names. Zarin
12 Randeria, Perviz Randeria, Kathy Devincenzi, Holly
13 Galbrecht, Joe Scaroni, Rose Hillson, Susan McConkey.

14 MR. YUEN: Good afternoon. My name is Alex
15 Yuen. Personally, I'm a nearby resident who grew up not
16 far from this site, and I've passed the site countless
17 times in my life. Professionally, I'm an architect and
18 urban designer. In this role I've always wondered what
19 was going on in this existing building and how this site's
20 position within the city has never been fully taken
21 advantage of, due to its silent nature.

22 I believe that the proposed plan on the site
23 serves two main purposes: Primarily it provides
24 housing for a city in desperate need for it, but that is
25 clear.

2
(GC-3)
cont'd

I-Yuen

1
(ME-1)

1 Secondly, I believe that the proposal creates
2 the opportunity for an urban node that attracts users
3 from adjacent neighborhoods and has the ability to draw
4 residents from one neighborhood to another in a way that
5 it currently does not.

6 All cities need housing, but healthy, usable
7 open space like the team is suggesting separate the best
8 cities from the rest. If anything, I encourage the
9 development team to maximize the potential of this site
10 as an urban amenity in an environmentally beneficial
11 manner that includes preserving existing trees and
12 offsetting impacts of parking.

13 In conclusion, I would like to echo other
14 speakers' requests to extend the window for public
15 comment.

16 However, I also believe that the Draft EIR
17 sufficiently studies the potential environmental impacts
18 to the neighborhood while providing housing for a city
19 sorely lacking it, while also providing an urban amenity
20 that would be of use for the adjacent neighborhoods and
21 the city at large. Thank you.

22 PRESIDENT HILLIS: Thank you. Next speaker,
23 please.

24 MS. RYAN: Good afternoon. I had the pleasure
25 of being here last year for the Lucky Penny, and that
 project went through. And I think it went through, in a

1
(ME-1)
cont'd

2
(GC-3)

3
(GC-1)

1 way, because of neighborhood consensus. I'm a neighbor.
2 I've lived in the area for over 30 years. I was born in
3 the city. And we're looking forward to the 95 units
4 that Lucky Penny is building. [We're also looking
5 forward to the housing that this project brings.

I-RyanC

1
(ME-1)

6 What we request, though, is an extension for this
7 Draft EIR. To put it out Thanksgiving and then ask for
8 something by the end of the year, it's a busy time for a
9 lot of people. So two weeks, we're respectfully hoping,
10 is reasonable.

2
(GC-3)

11 My name is Colleen Ryan, and I appreciate
12 this opportunity to be heard. I hope that you'll hear
13 our concerns and that they'll resonate with you, with
14 this commission.

15 We support the housing, as I've said. [We
16 welcome the change. We're concerned, though, the amount
17 of retail, the developer making the profits. [And also I
18 know, having been here last year, that I think there are
19 people at this event to speak who are being paid, who
20 are not part of the neighborhood, and whose only skin in
21 the game is to create certain -- I don't even know the
22 word.

3
(ME-1)

23 As mentioned today during Agenda Item 9,
24 one of the goals of the city staff was to keep
25 what makes a neighborhood special. And,

4
(ME-1)

1 frankly, our neighborhood is special. We feel that this 4
2 site is very iconic. I walk my dog there. My kids have (ME-1)
3 played on the lawn. My mom runs around there and loves cont'd
4 the views, and just walking around and greeting her
5 neighbors. So we really hope that that sense of
6 community and neighborhood specialness can be kept.

7 We appreciate your time and look forward to 5
8 hopefully the community preservation idea going through (AL-2)
9 since it keeps the housing, drops the retail, and
10 lessens the impacts of seven to 15 years of
11 construction. Thank you for your time.

12 PRESIDENT HILLIS: Thank you. Next speaker,
13 please.

14 SECRETARY IONIN: I would like to take this
15 opportunity to remind members of the public that this is
16 the Draft Environmental Impact Report and we are here to
17 review the -- accept comments on the adequacy and accuracy
18 of that document, not the project itself. O-LHIA6

19 MS. RANDERIA: I am Perviz Randeria and I also 1
20 want to strongly urge that you, as a commission, to (GC-3)
21 grant the 15-day extension for the Draft Environmental
22 Report because it is quite complex and it's a lengthy
23 document.

24 I also fully support the community full 2
25 preservation residential alternative for 3333 California (AL-2)

1 because it takes into consideration the need for housing
2 more than anything related to retail space, and also
3 that it preserves the historic significance and
4 characteristics of the neighborhood. Thank you.

2
(AL-2)
cont'd

5 PRESIDENT HILLIS: Thank you. Next speaker,
6 please.

I-McConkey

7 SPEAKER: Hello. Thank you for giving us the
8 opportunity to talk to you. I also live in the
9 neighborhood, like a lot of the people here, and I support
10 increasing housing in San Francisco very much.

1
(ME-1)

11 The only thing that I do not want is more
12 retail, because we have a lot of it on Sacramento,
13 Masonic, Geary. People can just walk to that. Right now
14 as I was coming to city hall there was already
15 congestion on Euclid with ten cars trying to get through
16 to Laurel and Euclid intersection. And this was at
17 noon. Can you imagine what it's going to be like when
18 you increase retail and more apartments there?

19 I strongly urge the planning commission to
20 grant us a 15-day extension due to the complexity of the
21 document, and hopefully we will grant that. Thank you
22 very much.

2
(GC-3)

23 PRESIDENT HILLIS: Thank you. Next speaker,
24 please.

25 SPEAKER: Thank you, commissioners. Good

1 afternoon. I really appreciate your time and listening
2 to us on 3333 California Street. I have four points
3 I'll make in just quick succession here.

I-Scaroni

4 I am a 40-year resident of Laurel Heights, very
5 near the project. I also want to strongly encourage the
6 commission to grant a 15-day extension for this DEIR
7 review. It is a lengthy and complex document, and
8 ending it right in the middle of the holidays is
9 difficult for everyone.

1
(GC-3)

10 Number two, I fully support the community full
11 preservation residential alternative for this site,
12 unlike the speaker three or four before me who is
13 constantly here at these hearings, suggesting that we're
14 all NIMBYs; that is just not the case.

2
(AL-2)3
(ME-1)

15 Like one of my neighbors, I was involved in the
16 Lucky Penny project a year ago, and it was really due to
17 that developer listening to the neighbors that we got
18 that through. And 95 units are now going up. I'm happy
19 to report, as I walked by the site just a day or so ago,
20 that construction has begun a year later for that.

21 And what disturbs me, and it was said again by
22 the developer earlier this afternoon, that they've had
23 some 140 meetings from some kind of count they keep with
24 the neighborhood. That has just not been our experience,
25 for many people.

4
(CEQA-1)

1 In fact, it's just the opposite. I don't
2 believe the developers have engaged with the
3 neighborhood in a meaningful way to come to agreement
4 and not delay this housing we so desperately need.

4
(CEQA-1)
cont'd

5 We are in support of the same amount of 550 --
6 552, is it -- 558 units or the 744 alternatives. We
7 want that to happen. And it can happen in the three years
8 instead of perhaps a lengthy delay of seven to 10 years
9 to get this done. So I appreciate your time and
10 consideration.

5
(AL-2)

11 PRESIDENT HILLIS: Thank you. Next speaker,
12 please.

I-JohnsonCh

13 MS. JOHNSON: Hi, my name is Chris Johnson.
14 And I'd first like to say I support what my neighbor
15 just said entirely. And I won't take the time to repeat
16 what he just said, but I would like to ask for the
17 commission to grant an extension for the comments on the
18 DEIR. I'm a homeowner, along with my husband, in Jordan
19 Park, and it is a humongous project with lots of legs and
20 things to study and I would appreciate additional time.
21 Thank you.

1
(ME-1)

2
(GC-3)

22 PRESIDENT HILLIS: Thank you.

23 MS. THOMSON: Hi, and thank you. I'm Joanna I-Thomson
24 Thomson. I'm also a resident of the neighborhood that
25 will be, hopefully, positively impacted by the addition

1
(ME-1)

1 of housing. My family and I live within blocks, and
2 I've lived in the neighborhood for almost 20 years.

1
(ME-1)
cont'd

3 I would really appreciate an extension. Having
4 book-ended the time period between Thanksgiving and the
5 Christmas holiday, it is a very complicated, complex
6 document, and we have tried to read it and need more time
7 to make comments. We hope that you will grant that.
8 Notwithstanding anybody's personal preference about
9 holidays, it's a busy time of year, and it would be great
10 to have more time.

2
(GC-3)

11 I also want to echo what a couple of other
12 speakers have indicated, which is that, as a proud
13 homeowner in this neighborhood, we are desperate for
14 more housing, for all different income housing. We would
15 love for friends and people from across the city to join
16 us in this neighborhood; we just would like to see it
17 done in a way that benefits the neighborhood.

3
(ME-1)

18 We listened closely today to the Mission,
19 outer Mission and Excelsior conversations about how
20 important it is to be able to maintain some character
21 that draws and keeps people there. And at the moment,
22 we are concerned about the small business owners that
23 will absolutely get pushed out.

24 After a multi-decade career in sales
25 marketing and business development, myself, I

1 want to applaud the Prado Group for their
2 excellent presentation, but I don't think that
3 augmenting what the small business owners are doing is
4 actually an accurate depiction.

5 We do hope that you will give us a couple of
6 more weeks, and we really look forward to coming to
7 closure and bringing more housing in. Thank you.

4
(GC-3)

8 PRESIDENT HILLIS: Thank you, Ms. Thompson.
9 Next speaker, please.

10 MS. DEVINCENZI: Please.

11 PRESIDENT HILLIS: Overhead, please. All
12 right. There it is.

O-LHIA3

13 MS. DEVINCENZI: President Hillis
14 and commissioners, I'm Kathy Devincenzi, President of
15 the Laurel Heights Improvement Association. This
16 commission, as the decision-maker that's responsible for
17 preparing and certifying the EIR, is authorized to grant
18 a 60-day comment period to January 7th, but the
19 department has only given a 45-day period. And you
20 don't need special circumstances for a 60-day. 45 is the
21 minimum required because this had to go to the state
22 clearinghouse as an area-wide significance project with
23 over 500 housing units. So they only gave us the
24 minimum.

1
(GC-3)

25 And it's not fair to the public to release a

2
(ME-1)

1 Draft EIR on a 10-acre project with a seven to 15-year
2 construction period during this time of the year,
3 especially in view of the community opposition to the
4 developer's concept. Over 800 residents have signed a
5 petition against his concept but supporting the housing
6 component.

2
(ME-1)
cont'd

7 So we've worked successfully with the Lucky
8 Penny and the CPMC, and we had a role there. But
9 despite all the meetings with this developer, when we
10 asked him in the supervisor's office what the project
11 was before he went public with it, he said, "This is not
12 a negotiation." And the community is supposed to have a
13 role in planning when there is a major rezoning asked
14 for.

3
(CEQA-1)

15 Now, the EIR admits that the project would have
16 a significant impact on the historical resource by
17 destroying most of the landscaping, half of the building,
18 and cutting a hole in it. It would also have a
19 significant construction noise impact that's unmitigable
20 and significant traffic impact which they say they'd
21 mitigate by cutting the retail parking. We think that
22 is bogus.

4
(CR-2)

5
(NO-1)

6
(TR-4)

23 I attended all of the public meetings, and
24 UC and the developer concealed the historic significance
25 of the site from the public. Our association nominated

7
(CR-1)

1 it as soon as we learned, and it's now listed on the
2 California Register. Last week the San Francisco
3 Historic Commission expressed strong support for the
4 resource, and also wanted to know more about our
5 alternative.

6 The Fireman's Fund corporate headquarters and
7 landscaping and building are an integrated composition
8 that was designed to complement each other and promote
9 the seamless integration between indoor and outdoor
10 spaces. No employee was to be more than 40 feet from a
11 window.

12 Our community preservation alternative is
13 better because it would have the same number of housing
14 units and it would preserve the landscaping, the
15 115-foot cypress tree that's a holdover from the
16 cemetery. And we ask that it be evaluated in the same
17 degree of detail as the other alternatives in the EIR.
18 Alternative C, their preservation alternative, has 26
19 less housing units and it's unreasonably configured to
20 have less.

21 So we hope for the extension. And I have a
22 handout.

23 PRESIDENT HILLIS: All right. Thank you very
24 much. Next speaker, please.

25 MS. GALBRECHT: My name is Holly Galbrecht. I ↓¹ (GC-3)

7
(CR-1)
cont'd

8
(AL-2)

9
(AL-3)

10
(GC-3)

I-Galbrecht1

1 live one block from 3333 California, on Presidio Avenue. ¹(GC-3)
2 I would like to request a 15-day extension. And I fully ²(AL-2)
3 support the community full preservation alternative, and
4 I support everything the last speaker, that Kathy said.
5 Thank you.

6 PRESIDENT HILLIS: Thank you. Next speaker,
7 please. Ms. Hillson. And I'll call some more names. MJ
8 Thomas, Sonya Dolan, Tina Kwok, Abe Lee, Kelly
9 Roberson, Debra Seglund, and Anne Harvey.

10 MS. HILLSON: Hi. I'm just waiting for a reset.

11 PRESIDENT HILLIS: Go ahead. You'll get extra
12 time. Keep going.

13 MS. HILLSON: Good afternoon, commissioners. In
14 regards to the adequacy, completeness and accuracy of
15 the DEIR, getting back to the subject of the matter ¹(GC-3)
16 -- however, I do have to throw this line in: I urge that
17 the 12-24 DEIR deadline be extended 15 days.

18 I would like the overhead, please. As you can
19 see from -- thank you so much to the planning department
20 for providing this picture. It is the site of the
21 existing property. Over four decades ago, the Chronicle
22 described the site as having "pleasant green lawns
23 and plantings that enhance the handsome low lines of the
24 simple building designed by Edward B. Paige," unquote.

25 The DEIR does not mention that the cultural ²(GHG-1)

1 resource of remnant large mature trees from Laurel Hill
2 Cemetery that were incorporated into the Fireman's Fund
3 building site as historic character-defining features
4 are work horses in mitigating greenhouse gas emissions.
5 Planting small trees over a span of 15 years, as if that
6 would provide equivalent or reduced greenhouse gases
7 from thousands of vehicle miles traveled associated with
8 the new retail uses to negatively impact everyone's
9 health is very concerning.

2
(GHG-1)
cont'd

10 As you can see from this diagram, you'll see
11 Masonic Avenue here and Pine Street from downtown.
12 Three lanes one way will be heading pretty quickly up
13 that hill towards Euclid Avenue. There's already a lot
14 of vehicles that go through there, and I don't think
15 this has been adequately studied along what I just said.

3
(TR-3)

16 Historically, the site was designed to have
17 commercial on California only. I have some records from
18 Chronicle. The Jordan Park Improvement Association
19 Board opposes the retail on the Euclid side. I would
20 submit this less than 150-word summary according to
21 Sunshine 67.16 for the minutes. Thank you so much.

4
(ME-1)

22 PRESIDENT HILLIS: Thank you. Next speaker,
23 please.

I-Roberson1

24 MS. ROBERSON: Hello. I'm Kelly Roberson and I
25 strongly urge the commission to grant a 15-day extension

1
(GC-3)

1 of the due date for comments on the DEIR. It's a
2 lengthy document, and we need some time to process it.

1
(GC-3)
cont'd

3 I specifically wanted to speak to the point of
4 construction duration. Fifteen years, seven years, seems
5 crazy to me. So I did a few things. I just looked up a
6 few other buildings that had similar unit counts.
7 This is the NEMA Building. It's at 10th and Market. It
8 has 754 units. Construction started in November 2011
9 and completed in March 2014. So that's less than three
10 years.

2
(PD-1)

11 The two towers at Rincon near the Embarcadero
12 were 709 units, started in July 2012, finished August
13 2014. Less than three years.

14 The Paramount Building, Mission and 3rd, 495
15 units, started in 2002 -- sorry, started in 2000,
16 completed in 2002. That's less than three years. All
17 of these projects, soup to nuts, done. Obviously, we have
18 very competent construction companies in San Francisco;
19 I'm sure they can manage it.

20 Okay. So, in addition, most people in our
21 neighborhood would very much like to maintain the height
22 limits in the existing zoning. There's a 40-foot
23 height limit, and in the neighborhood full preservation
24 alternative, these height limits would be maintained.
25 That avoids significant shadowing at sunrise and sunset

3
(AL-2)

4
(WS-2)

1 on the east and the west sides of the site because
2 the existing residences, apartments, neighborhoods,
3 houses, will be affected by shadowing at the extreme ends
4 and beginning of the day.

4
(WS-2)
cont'd

5 The Victorian character of our neighborhood
6 should be maintained. And we prize it small scale
7 residential qualities, but, you know, we can embrace new
8 housing too. I think we can all work together.

5
(ME-1)

9 If the proposed retail component is added,
10 we're subjected to many additional car trips resulting
11 in additional traffic congestion on already narrow
12 streets. This is kind of problematic. And our
13 neighborhood already has one large residential --
14 or one retail shopping center at Geary and Masonic.
15 And the Target store, I think, really has our big-box
16 needs, retail needs, covered.

17 So thank you for your time. I appreciate it. I
18 hope you have a good afternoon.

19 PRESIDENT HILLIS: All right. Thank you, Ms.
20 Roberson. Next speaker, please.

21 MS. THOMAS: Good afternoon. My name is M.J.
22 Thomas. I have lived in San Francisco all my life,
23 except for ten years. I have lived within half a mile
24 to a mile and-a-half the entire time during that period.
25 Right now it's closer to less than half a mile.

O-LHIA7

1 I strongly urge the planning commission to 1 (GC-3)
2 grant a 15-day extension for the DEIR. I am in favor of 2 (PP-1)
3 retaining zoning as residential only. That was the
4 intention originally by the gentleman who developed
5 Laurel Heights as well as Antivista Heights. He was
6 going to develop this area; unfortunately, he died
7 before that happened.

8 I am not in favor of seven to 15 years of 3 (PD-1)
9 ongoing construction, 50,000 square feet of commercial 4 (ME-1)
10 space, 50,000 square feet of retail, and carving under
11 much of the hill for a three to four-story garage with 5 (TR-7)
12 exits onto Presidio and California, which is already a
13 3-ring circus, or out towards -- on Laurel, which is
14 opposite one of two exits of the Laurel Village parking
15 lot.

16 I am against chopping the building in half. 6 (CR-1)
17 And this building is part of the California historic
18 site. And I am -- the plan was to raise the sections,
19 the other two sections, by two or three stories, so I do
20 not concur with that.

21 The present plans are ludicrous and, to my mind,
22 will be San Francisco's great urban real estate tragedy
23 of the 21st century. Please consider the same 7 (AL-2)
24 alternative plan.

25 Also, to point out, we're going to have a lot 8 (CU-1)

1 of action in that particular neighborhood because two
2 blocks away in 2019 Children's Hospital will be torn
3 down and there will be 307 units developed there. So
4 that's something to consider, that we are not without
5 new housing. Thank you.

8
(CU-1)
cont'd

6 PRESIDENT HILLIS: Thank you, Ms. Thomas. Next
7 speaker, please.

I-Dolan

8 MS. DOLAN: Hello. My name is Sonya Dolan, and
9 I strongly urge the planning commission to grant a
10 15-day extension to the due date for the comments on
11 this DEIR.

1
(GC-3)

12 In addition, I'd like to say that the community
13 full preservation alternative will protect the retail in
14 Laurel Village and on Sacramento Street where I live.
15 More retail is unneeded, unwanted, and will compete
16 directly with the small businesses already in place.

2
(AL-2)

3
(ME-1)

17 The addition of a large retail area will add an
18 immense amount of traffic and congestion. Both
19 California and Pine and Masonic Streets are used to get
20 across the city. The proposed project would put a huge
21 snarl into these thoroughfares. That's not to mention
22 noise, light, and air pollution it will add to the very
23 lengthy construction period and after.

4
(TR-3)

5
(NO-1)

6
(AQ-1)

24 If you have not visited the area, it is truly a
25 neighborhood in the traditional sense, and the proposed

7
(AL-2)

1 construction would destroy that aspect. My husband and
2 I have lived across from the proposed site -- we can see
3 it from our window -- for eight years, and we fully
4 support the community full preservation residential
5 alternative for 3333 California. Thank you.

7
(AL-2)
cont'd

6 PRESIDENT HILLIS: Thank you. Next speaker,
7 please.

I-Kwok2

8 MS. KWOK: Good afternoon, my name is Tina
9 Kwok. I live in Laurel Heights, and I strongly urge
10 the planning commission to please grant the 15-day
11 extension for the due date of the comments of the DEIR.
12 It is a lengthy, complex document and we're in full
13 force into the holidays. Thank you.

1
(GC-3)

14 I support additional housing and the Laurel
15 Heights community alternative plan for the development
16 of 3333 California Street, a 10-acre site. It projects
17 a three-year plan build-out rather than the seven to 15
18 year planned construction time. One can imagine the
19 noise, traffic, congestion, dirt, pollution in the air and
20 on the ground that this would make the neighborhood go
21 through.

2
(ME-1)

3
(AL-2)

22 Millions of tons of dirt to be excavated. The
23 construction takes almost half of a generation, assuming
24 the 15-year build-out proposal. If you have a toddler
25 in your household, similar to the gentleman earlier here

4
(GC-1)

5
(PD-1)

1 who was supporting the site, this toddler will be in
2 college by the end of this project.

5
(PD-1)
cont'd

3 And San Francisco needs housing right now, not
4 to wait for 15 years. San Francisco has a need for
5 housing now. Please consider that. I'm sure that
6 people don't want to wait that long.

7 The construction period also brings congestion
8 and chaos to the major commute route which is
9 California Street, Pine Street, Bush, Euclid, to and
10 from the Richmond area, not just for the Laurel Heights,
11 Jordan Park, Presidio Heights area.

6
(TR-6)

12 The segment of Euclid Avenue on this site that
13 is planned for retail is hilly and windy, and, you know,
14 I'm sure you've driven past it. People with dogs have
15 walked past it. And in my personal opinion, it's not
16 conducive to a leisurely casual, strolling shopping
17 afternoon.

7
(ME-1)

18 I support the preservation of this site for
19 significant historical architectural reasons as well as
20 preservation of the 180-plus rare species of trees.

21 My husband and I call the houses on this 500
22 block of Laurel Street across from the site "The
23 mid-century ladies," fondly, just as others fondly refer
24 to "The painted ladies" on Alamo -- across from Alamo
25 Park.

1 I urge the commission to, again, please
2 consider the time extension. Thank you very much. 8
(GC-3)

3 PRESIDENT HILLIS: Thank you. Next speaker,
4 please.

5 MS. GLICK: Good afternoon, Commissioners. My
6 name is Linda Glick. I'm a resident --

7 PRESIDENT HILLIS: Just pull the mic over to
8 you so we can hear.

9 MS. GLICK: I'm a resident of San Francisco for
10 49 years and a resident of Laurel Heights for the past I-Glick1
11 15 years. Before I begin, I, too, urge you to consider a 1
12 15-day extension of the due date for comments of this (GC-3)
13 DEIR due to its length and complexity.

14 Today I'd like to explain the history of the 2
15 restrictions placed on the site by the planning (PP-1)
16 commission and the community use of green space as a
17 park. The same developer who built Laurel Heights
18 residential tract in Antivista, was going to build a
19 residential tract on this site, but he died. The school
20 district acquired the property for a possible site for
21 Laurel High School, but decided to locate that elsewhere
22 and sell the site. The district could get 50 percent
23 more money from the sale of it if it could rezone it
24 from first residential to commercial.

25 The district went through its first attempt at ↓

1 rezoning due to community opposition, as can be seen
2 here. Finally, a deal was struck with the community
3 that resulted in restrictions stated in Resolution 4109
4 that include 100-foot landscape setbacks along Laurel
5 and Euclid Streets and a ban on retail uses of this site.

6 Under Planning Code Section 174, such
7 stipulations as to character of improvements become
8 provisions of the planning code and can only be changed

9 by the board of supervisors. The EIR identifies the
10 concrete pergola atop a terrace planting feature facing
11 Laurel Street as a character-defining resource --
12 defining feature of the resource. The EIR explains that
13 it's characteristic of mid-century modern design. The
14 use of patios, pergolas, and interior courtyards created
15 a welcoming transition area where the inside and outside
16 merged.

17 Through the years, the community has used the
18 green landscape spaces for recreational purposes, and a
19 lawyer has stated that the public has acquired permanent
20 recreational rights on the green spaces.

21 There's a lot of talk about preserving
22 neighborhood character. Laurel Hill has always been a
23 place where neighbors gather, children learn sports from
24 their parents, and a community is formed. These community
25 bonds will not be formed along meandering concrete

2
(PP-1)
cont'd

3
(CR-1)

4
(PD-5)

5
(PD-3)

1 pathways.

5
(PD-3)
cont'd

2 I and the entire community strongly support our
3 full preservation alternative that protects these
4 cherished historic features of this important and iconic
5 site. Thank you.

6
(AL-2)

6 PRESIDENT HILLIS: Thank you. Next speaker,
7 please.

8 MS. SEGLUND: Hi. My name is Debra Seglund.

9 I'm a -- I live about one block from the new proposed I-Seglund
10 site. And I, like everyone else, would strongly urge
11 the planning commission to grant a 15-day extension of
12 the due date for comments on the Draft EIR. It is a
13 lengthy and complex document.

1
(GC-3)

14 My concern environmentally has been regarding
15 traffic. I would like to ask that retail and the office
16 sections of the plan be eliminated. The traffic
17 estimates by our neighborhood group has said that there
18 will be 12 to 15,000 visits in our neighborhood to use
19 those services a day. And, to me, 12 to 15,000 sounds
20 enormous.

2
(TR-3)

21 And living already in that area, we already have
22 a lot of traffic problems and parking problems, and I
23 just can't envision more retail and office use. So -- and
24 in regard to retail, we have the Laurel Village. We have
25 so much. There's not a service that we don't have.

3
(ME-1)

1 There's not a restaurant or anything of that type that
2 we need. It's all in our neighborhood. So I can't -- I
3 think we'll have open areas. Already Mayor Breed is
4 trying to help in our city people finding ways to use
5 brick and mortar places because they're not being
6 utilized, so would we add more square footage to that
7 problem?

3
(ME-1)
cont'd

8 So, anyway, I do support our neighborhood
9 alternative plan, and I hope you will consider removing
10 the retail and office areas. Thank you.

4
(AL-2)

11 PRESIDENT HILLIS: Thank you. Next speaker,
12 please. And I'll call a couple more names. Arielle
13 Mouller, Michael Coholan, Adam McMichael, Joe Catalano.
14 Go ahead.

15 MS. HARVEY: Good afternoon. My name is Ann
16 Harvey. My senior citizen husband and I have lived in San
17 Francisco since 1976 both as renters and homeowners. Our
18 two sons were born here, raised here, grade school,
19 primary school, high school, on to college and grad
20 school. They're both young professionals. They both want
21 to live in the city and have their homes here. We've
22 had -- our home's multi-generational too, was taking care
23 of my parents, and we also take in students.

I-Harvey2

24 We were very excited to hear that this property
25 was going to be developed. I know intimately I don't

1
(ME-1)

1 live right near there; I live down the way in Cow Hollow
2 right now. But we've lived in the Western addition;
3 we've lived on Lake Street. I'm totally familiar with
4 this area, and I think there's real opportunity here where
5 we can plan something nice and wonderful for the city.
6 What I'm seeing proposed is, frankly, awful.

1
(ME-1)
cont'd

7 One son's a physician, one's an economist.
8 They want to raise their families here. They want --
9 they're upset about prices in the city and they want
10 a place where they can raise their family. We always
11 thought about moving out of the city for a while, but we
12 stayed here. We raised our family here. They went to
13 nursery school. They could walk home, and they were safe.

14 And when I'm seeing what's being proposed here,
15 I'm sick. And I listened to what Mr. Safier said about
16 not being walkable. I walk that area all the time. I'm
17 70 years old and I walk up that hill and down the hill.
18 I walk home.

2
(ME-1)

19 What was I going to say? I support the
20 extension to, if you want, written comments. It's worth
21 the time to be able to digest the draft -- Draft EIR,
22 whatever it is. Anyways, people talk about architecture.
23 Well, this is not just buildings, it's landscape, one ball
24 of what's together.

3
(GC-3)

4
(ME-1)

25 And I thought -- I don't know who designed this

1 thing, but they should -- I was here when the preservation
2 commission was considering this project and what about
3 the history and the landscape, and I thought Mr. Pearlman
4 really listened closely to what was going on. And they
5 need real help and designs, what really works. And take
6 into consideration some of this stuff about walkability.
7 Maybe they should consult with him. Thank you very
8 much.

4
(ME-1)
cont'd

9 PRESIDENT HILLIS: All right, thank you, Ms.
10 Harvey. Next speaker, please. And I've called all the
11 names I have with cards, so if others would like to
12 speak, please line up on the screen side of the room.
13 Welcome.

I-Mouller

14 MS. MOULLER: Hi. I'm Arielle Mouller. I live
15 On Euclid, and I'm really much in support of more housing
16 as much and fast as possible. So I'm here in support of
17 the Prado Project.

1
(ME-1)

18 That said, I had never heard of the community
19 project before. I don't know if it's in the
20 documentation, and I'm sorry if I missed it in the EIR.

2
(AL-2)

21 If that's the fastest way to build, sure, I
22 would be very much in support of the community program.
23 I don't know if they have secured a developer yet, and
24 I know it's really hard to secure one without retail
25 attached to the project, but if that's the case, that

↓

1 might be a faster way. Otherwise, if that's not
2 possible, the fastest way may be to accept retail on
3 site.

2
(AL-2)
cont'd

4 PRESIDENT HILLIS: Thank you. Next speaker,
5 please.

6 MR. CATALANO: Could we possibly get that
7 activated?

8 PRESIDENT HILLIS: Yeah, it will come up. Go
9 ahead. Just start speaking.

10 MR. CATALANO: Hi. My name is Joe Catalano. I
11 live at 3320 California Street, directly across the O-CSHG2
12 street from the project's proposed retail. My wife and
13 I represent a group of 40 homeowners and residents who
14 live on that block between Laurel and Walnut, on
15 California Street.

1
(GC-1)

16 The Draft EIR fails completely to recognize the
17 impact of this project on our group. The developer has
18 been attentive to our interests. We have met with him
19 on several occasions. They have listened to us. Now is
20 the time for the developer, the commission, the
21 department, and the city to recognize the specific and
22 unaddressed impacts that this project, in its current
23 form, will have on our neighborhood.

24 We are 40 residents. In addition, there are 11
25 other neighborhood occupants whose garages enter by

2
(TR-7)

1 backing into California Street between Laurel and
2 Walnut. Right now, that's a hazardous proposition with
3 the construction proposed, with the development
4 proposed. It will be become basically untenable. The
5 Draft EIR does not address this. It obviously, then,
6 can't mitigate something it hasn't addressed.

2
(TR-7)
cont'd

7 The proposed intrusion of a lane for
8 construction purposes on California between Laurel and
9 Walnut will constitute a taking of available parking
10 currently, which would last for years. The proposed
11 imposition of a commercial loading zone on the street
12 side of California Street, rather than putting
13 construction staging and construction loading and
14 commercial loading within the confines of the project
15 is unacceptable, an intrusion, and taking of existing
16 property interests.

3
(TR-6)

4
(TR-10)

17 The Draft EIR does not address, nor does it
18 adequately mitigate because it doesn't address, the
19 effect of taking the streetscape away and taking the
20 view you see in the overhead and putting it behind the
21 project's walls. The requested zoning between California

5
(CEQA-2)

22 and Laurel to 45 feet instead of the currently permitted
23 40 feet is an unacceptable denial of light and air and
24 will create shading on the residents who share our
25 perspective.

6
(WS-2)

1 So I want to join those who have asked to get
2 an additional 15 days, not just for the reasons stated,
3 but also to continue the dialogue that has existed with
4 supervisor Stefani and with the developers.

7
(GC-3)

5 PRESIDENT HILLIS: Thank you very much. Next
6 speaker, please.

7 MR. MUNNICH: I'm just using your handout. Thank
8 you.

9 My name is Ed Munnich. I don't live in the
10 neighborhood. I live in the Richmond at 568 Balboa.
11 And we very much wanted to live in this neighborhood.
12 My wife was working at Mt. Zion Hospital -- or Mt. Zion
13 campus of UCSF at the time. I work at USF. We don't
14 own a car. We walk and use transit. And this was an
15 area, as many of the neighbors have pointed out, where
16 there were a lot of -- all the stores we needed were
17 within walking distance. There was transit available.
18 And what was really frustrating was that, even with a
19 physician and a professor's salary, we weren't able to
20 afford to live in that area.

O-YIMBY2

21 What I understand of the EIR, I think it's a
22 very thorough process. There's been much public comment
23 on the EIR, and I would just like to say we really need
24 this housing. We live in the Richmond because we
25 couldn't afford this area. And I hear the neighbors

1
(GC-1)
2
(ME-1)
↓

1 talking about how much they love their community. But,
2 honestly, when I look at this picture, this campus
3 doesn't look anything like the community around it.
4 When I walk by there, there's a street grid everywhere
5 around it except here.

6 This was a mid-century architectural
7 development in the same way that -- the mid-century they
8 were planning to put freeways through Golden Gate Park.
9 Thankfully, our city didn't take that direction.

10 And I really hope that you consider the overall
11 effects on the city. And I would just assure the
12 neighbors from the neighborhood -- you're probably pissed
13 off at me for saying what I'm saying; I don't live in
14 your neighborhood. But when it's time to build in the
15 Richmond, especially on the Geary, Balboa and Fulton
16 corridors, I'll be here speaking for those projects as
17 well.

18 And I understand the environmental impacts of
19 the noise, and we're all going to have to do that,
20 because I'm committed to the people of San Francisco.
21 I'm committed to the people who made this city what it
22 is, the creative people, the people who are being
23 displaced from their housing. And the environmental
24 impact that this is not having -- it's not displacing
25 anyone. There's no housing being lost to build this.

2
(ME-1)
cont'd

3
(NO-1)

4
(PH-1)

1 There's no rent controlled or affordable housing being
2 taken out to build this, unlike many projects around the
3 city.

4
(PH-1)
cont'd

4 So I would just urge you, please, to move forward
5 on this. If you do give extra time for comment, I'd
6 like to hear specific concerns with the EIR. I haven't
7 heard that many today, except that we're all going to
8 have to deal with some construction noise if we want the
9 city to be the vibrant city that it is. Thank you.

5
(ME-1)
6
(GC-3)

10 PRESIDENT HILLIS: Thank you. Next speaker,
11 please.

12 MS. MASSENBERG: Good afternoon, commissioners
13 and staff. I'm Maryann Massenberg. And I have lived a
14 hundred feet from the proposed site for -- since 1972.
15 We've lived in one of the small houses that was on the
16 outskirts of the city cemetery when this was the cemetery
17 site. And the row of houses on Laurel were actually
18 built for low-income cemetery workers, just to give
19 you a little historical perspective.

I-Massenburg

20 I'm going to address the EIR in a moment, but I
21 also want to remind us that we absolutely need more
22 housing; we're in support of more housing. But we need
23 and need to stress affordable housing. We don't need
24 more housing for rich people. So we very much are
25 looking forward to hearing from the development group

1
(ME-1)

1 about affordable housing.

2 Turning now to the EIR, I share the concerns
3 about the construction noise, the air pollution and the
4 duration of the construction of the currently proposed
5 project. [I have concerns, too, about the open space] but

6 mostly I want to address parking and the parking deficit
7 and traffic congestion we already have in the
8 neighborhood.

9 Having lived in the neighborhood for 46 years,
10 we've seen increasing congestion, even those of us with
11 residential parking permits. Many of these homes were
12 built before any parking requirements were made by the
13 city, so many of them don't have garages or garages
14 large enough, so most of us are looking for parking all
15 the time on the street. And it requires -- over all
16 these years, it requires many trips around many blocks.
17 And often times we end up parking, even at night, three
18 or four blocks away and then walking home from there.

19 If you go through the neighborhood, you see many
20 people and homeowners and renters illegally parking
21 across the sidewalk, for which we often are ticketed, and
22 that's simply because we can't find parking. So we
23 already have a significant parking problem.

24 And the EIR has a section which talks about a
25 study in New York and New Jersey that proposes the

1
(ME-1)
cont'd

2
(GC-1)

3
(PD-1)

4 (PD-3)

5
(TR-11)

1 premise that if you have fewer parking spaces and fewer
2 garages, than people will have fewer cars and drive
3 less. In the development of the neighborhood, the
4 neighborhood has been built out over the last several
5 years. There used to be lots of vacant lots.

6 There's been significant additional buildings
7 on California Street across from the proposed site.
8 That did not, in my experience, reduce the number of cars;
9 it's only increased the congestion.

10 So I would ask you to consider, in the EIR, looking
11 more closely at the number of parking spaces proposed. If
12 there are that many housing units, we need more parking.
13 I don't think it really bears out that there have been
14 fewer cars, because we have fewer garages. And, you know,
15 with all due respect, we choose to live in San Francisco,
16 not in New York City. Thank you.

17 PRESIDENT HILLIS: Thank you. Next speaker,
18 please.

19 MR. SMITH: Good afternoon, commissioners.
20 Cory Smith, on behalf of the San Francisco Housing
21 Action Coalition. We have not formally reviewed this
22 project yet, so we do not have a position. I do look
23 forward to diving into the details when we have that
24 opportunity ahead of the next hearing.

O-SFHAC

25 So speaking more generally, there are a couple

5
(TR-11)
cont'd

↓¹
(ME-1)

1 of alternatives there. We will encourage to you, we
2 will encourage the project team as well, to maximize the
3 amount of housing on this. We're talking about 744
4 total new homes for San Francisco families, for San
5 Francisco young folks, people like me. And I think
6 that's a really exciting opportunity.

1
(ME-1)
cont'd

7 This is kind of nestled between Sacramento and
8 California, but we're also a couple blocks away from Geary
9 Boulevard. For people like me who are going to
10 continuously advocate for a Muni expansion, either below
11 ground -- I'm a big fan of the 15 feet above ground. It's
12 a much easier and less expensive way to do light rail
13 service across San Francisco. I realize we're not there
14 yet, and it's really tough for a lot of people to kind of
15 envision what that would look like.

2
(TR-9)

16 I plan on riding that subway, that
17 Muni line at some point in my life right now on Geary
18 Boulevard. And this will literally be about a block
19 and-a-half away, and folks will be able to get downtown,
20 and it's all kind of part of the longer vision of
21 everything that we're going for.

22 A comment, I guess, on retail use. I live down
23 on Masonic towards the other end, towards the Haight
24 Ashbury, so I'm actually at this corner all the time.
25 For those of us that drive up north on Masonic and then

1 you're right down Bush, that is the quickest way to get
2 downtown.

3 Everything happening around the area is really,
4 really cool. The Lucky Penny has been mentioned a number (ME-1)
5 of times. So this is -- yeah it's going to be a new
6 neighborhood. It's going to be a new community. And for
7 all of the shops and businesses along that area, there's
8 also going to be customers. So all the small business
9 owners are really going to benefit from the increased
10 amount of traffic, foot traffic that's going to be
11 coming up and down in the area and, again, spending money
12 at these small businesses.

13 From the EIR itself and the environmental
14 impact, it can't be stated enough that the number one (GHG-3)
15 threat to our planet right now is global warming, from a
16 30,000 foot big picture perspective. And if we don't
17 build these 744 homes here, they are going to be built out
18 in Modesto and Merced and Fresno, and those people are
19 going to be commuting into the San Francisco Bay Area
20 because this is a fantastic place to be, and that will
21 end up putting more CO2 into the air. It will slowly,
22 slowly, slowly continue to kill our planet, and that's
23 what we're all trying to avoid.

24 We love the fact that all the neighbors are
25 advocating for the streamline construction process. I (PD-1)

1 hope that that can also apply to the permitting and
2 approval process. So I echo all of them, and make this go
3 faster. Let's build this faster. I think that's
4 commendable, because everybody does understand that we do
5 need more homes for people to live in.

5
(PD-1)
cont'd

6 And, of course, to close, in reference to the
7 Draft EIR itself, I ask you to look at it through the
8 lens of the quality of the EIR and not the project
9 itself, which we will have a hearing on in the future.
10 Thank you.

11 PRESIDENT HILLIS: Thank you. Next speaker,
12 please. And if there is anybody else that would like to
13 speak, now is your time. Please line up on the screen
14 side of the room.

I-Varrone

15 MS. VARRONE: Yeah, hi. My name is Joan Varrone
16 and I live directly across the street from the project at
17 3320 California Street, between Laurel and Walnut. And we
18 are actually a residential neighborhood. I think no one
19 has really acknowledged that, particularly when I
20 read the Draft EIR and I look at what is being proposed.

1
(PD-2)

21 We are 40 different residential units. We have
22 over 100 people living directly across the street,
23 including probably 30 children or more, and elderly. And
24 if you are elderly, you will die before this project is
25 finished. You "may" die. Sorry. Not you "will" die.

1 The proposed time frame of seven to 15 years,
2 not only will have a negative impact on our
3 neighborhood, the neighborhood with the 100 residents.
4 Let's not forget about those people that are directly
5 across the street. But everyone here has mentioned how
6 unconscionable it is that this neighborhood will be held
7 hostage to a seven to 15-year construction period when,
8 in fact, many people have recognized here -- because
9 I've been here during the whole time -- that this does
10 not have to take that long, and that the residential
11 alternative which we support could be done in far fewer
12 years. In fact, people have talked about three years.

13 When we -- We've had many discussions with the
14 developers, and we really appreciate that they have had
15 those discussions. However, in those discussions when we
16 asked how long will the development take, we were told two
17 to three years, many times. So when I looked at the draft
18 EIR, I almost dropped my teeth. Seven to 15 years,
19 that is so unconscionable.

20 The other two things that are unique to our
21 concerns that were not addressed in the EIR is the fact
22 that the developers are proposing a commercial loading
23 zone directly across the street from where these hundred
24 people live and, all along, again, in discussions with
25 the developer, they asserted that all commercial loading

2
(PD-1)

3
(TR-10)

1 would be underground. Again, when we read the draft
2 EIR, we were shocked to find that. And that loading
3 zone would be there after the project is over. So this
4 is not a temporary thing.

5 There was a mitigation suggested in the EIR
6 which we think is not viable. They suggested, because of
7 the traffic impact of commercial loading, that the
8 loading happen before 7:00 a.m. and after 7:00 p.m.
9 Well, if you're one of the hundred people that live
10 across the street, that makes absolutely no sense. And
11 I think what was ignored were the hundred-plus people
12 across the street when you're considering a commercial
13 loading zone.

14 PRESIDENT HILLIS: Thank you very much. Thank
15 you. Next speaker, please.

16 MS. ALSCHUELER: Hi. Good afternoon. My name
17 is Donna Alschueler and I also live in the neighborhood.
18 I just missed this entire hearing up 'til now. I am
19 very, very concerned that when the building is taken
20 down, when the UC is cleared -- I'm extremely concerned
21 about asbestos contamination. I do not know how that
22 is going to be handled, but I just wanted to let you know.
23 Thank you.

24 PRESIDENT HILLIS: All right. Thank you. Any
25 additional public comment on this item? No? Okay.

3
(TR-10)
cont'd

I-Alschueler

1
(HZ-1)

1 Seeing none, we'll close public comment.

2 I just wanted to ask a clarifying question. On
3 the 15 days, do we -- I mean, I would support extending
4 this 15 days, but I don't think we have the authority to
5 do it; I think only -- only you do. But we can encourage
6 you to do it. Is that right, Ms. Gibson?

7 MS. GIBSON: President Hillis, I can answer
8 that question. In fact, you do have the authority. The
9 Chapter 31 of the Administrative Code allows for
10 extension of the Draft EIR comment review period by
11 either the environmental review officer or by the
12 commission. And, you know, we've asked that that be by
13 a vote for clarity.

14 And, if I may, I'd like to note that I
15 did respond to a prior request for extension of
16 this comment period for this Draft EIR, and I can
17 explain the basis for my decision that, in fact, it
18 wouldn't be warranted here. That's, again, my --

19 PRESIDENT HILLIS: Right. I agree. It doesn't
20 seem like the most complex EIR. We've certainly seen
21 projects that are a lot more complex in a lot more
22 truncated time period. I think the holidays caused some
23 concern. This project is going to take a while to
24 get through the process. I don't think 15 days
25 is going to -- is going to be a factor. So I would

1 support the extension, but I get your rationale and agree
2 with it.

3 And then there was discussion of the community
4 alternative. I think it was flashed quickly by Ms.
5 Devincenzi, but I haven't seen anything. Do we have
6 this alternative?

7 MS. GIBSON: According to staff who have been
8 reviewing the comments that have come in, we don't
9 recall receiving that yet. Of course, the comment
10 period hasn't yet closed, so we hope that we will
11 receive some more information about that.

12 PRESIDENT HILLIS: Okay. And, Ms. Devincenzi,
13 do you have that? Do you want to submit that to us at
14 this point? I mean, it would be great. It seems like a
15 lot of people have seen it and have commented on it. It
16 would be great to have it.

17 MS. DEVINCENZI: So we have a draft of it and
18 we're going to submit it. We had asked that this be
19 postponed to put our alternatives --

20 PRESIDENT HILLIS: I get it.

21 MS. DEVINCENZI: -- EIR and it wasn't done.

22 PRESIDENT HILLIS: Right. But if you have it --

23 MS. DEVINCENZI: -- submit it as comments.

24 PRESIDENT HILLIS: Okay. But it would be good
25 to get it. It seems like a lot of people have seen it

1 and we haven't, staff hasn't, the developer hasn't --

2 MS. DEVINCENZI: I just put it out last night
3 and I have to do a little more checking and there are
4 legends that go with it.

5 PRESIDENT HILLIS: Okay.

6 MS. DEVINCENZI: We just have the drawing.
7 There are legends how many housing units and things, so
8 it's not finished yet. But we will get in there and --

9 PRESIDENT HILLIS: But there's a lot of
10 support for it, so it seems like people are supporting
11 it, but if nobody's seen it, I don't know how they're
12 quite supporting it. But I get you.

13 MS. DEVINCENZI: We just got the drawings last
14 night, sir. We're working as fast as we can.

15 PRESIDENT HILLIS: Okay. Thank you very much.
16 So we'll open it up to comments on the DEIR.
17 Commissioner Moore.

A-CPC-Moore

18 COMMISSIONER MOORE: The document as constructed
19 is accurate and well set up. It follows pretty much of
20 what the department has done. I think it is thorough,
21 except where it comes to process. And I will repeat
22 what I have said in different circumstances. I think
23 projects of this size have been recommended to be
24 introduced to the public and to the commission in public
25 hearings with soft presentations and introductions of

1
(GC-1)

2
(CEQA-4)

1 the project which, in this particular case, again, has not
2 occurred.

3 I'd like to remind the commission and the
4 public how smoothly 1 Oak, the Goodwill site, India
5 Basin, Shipyard 2, Schlage Lock, Lucky Penny and CPMC
6 ultimately were in these huge EIRs because they were
7 properly introduced to this commission and to the public
8 who were interested in a manner that let public
9 dialogue, commissioners' feedback of questions shape
10 alternatives in a manner that they are not as clashing
11 sitting here as today's comments indicate.

12 While many of the comments are not necessarily
13 in response to the customary questions that DEIR hearings
14 require, it was quite obvious that the community has
15 comments and concerns that should have been flushed out
16 in meetings where the commission themselves would have
17 participated in hearing them.

18 So, that said, thank you, President Hillis. I
19 would definitely ask for a 15-day and support a 15-day
20 extension, because it is only through today's
21 presentation by the developer that more clarity was
22 brought to what's intended than what the document, even
23 after very careful and painful reading, allowed me to
24 gather.

25 And I'm a pretty good reader and quite versed

2
(CEQA-4)
cont'd

3
(GC-3)

4
V (PD-3)

1 in reading EIRs, and I'm quite versed in reading
2 drawings, many of which were missing in this document.
3 There were more elevations and sections than a proper
4 description about the project and its planning diagrams
5 and urban design intentions.

4
(PD-3)
cont'd

6 Moving on -- sounds like a negative comment --
7 I'd like to speak about process and encourage people in
8 the future with large projects to bring these projects as
9 they develop, because this is the most futile ground to
10 get what you ultimately need to go through the EIR and
11 the environmental process, which is complicated. This
12 department knows how to do that, except they can not fully
13 respond to the community's feelings that you so very much
14 brought to the table today.

5
(CEQA-4)

15 Onward. I made a couple of notes here. When I
16 hear the concerns about the length of suggested
17 construction, project implementation, I would agree 17
18 years or whatever the accurate time frame is -- I heard a
19 different number, but all of them are excessively long.

6
(PD-1)

20 The first thing I would ask is what is actually the
21 phasing of this project? I think it's one of the most
22 important projects -- most important questions, because
23 the cumulative impact over extended periods of time in
24 construction is more accentuated when it occurs over this
25 length of time, and a healthy phasing diagram would

↓

1 clearly allow people to understand what the actual impacts
2 are, relative to their own location near the project.

6
(PD-1)
cont'd

3 By the same token, I would be interested in
4 seeing the EIR address cumulative impact on construction
5 phasing and construction realization in the corridor,
6 with the public mentioning that the large Children's
7 Hospital's complex is being taken down in 2019.
8 The demolition of that site and construction of a very
9 large project on that particular site definitely has
10 interactive cumulative effects together with what's
11 intended here on the 3333 California Street site.

7
(CU-1)

12 I would be interested in a further examination
13 how below-grade parking which, from an environmental
14 visual point of view, is desirable, increases
15 proportionately the cost of construction. And I would
16 like to see that mirrored against the expressed need
17 that was affordability on this site.

8
(PD-3)

18 The site already has particular issues which
19 makes construction more complicated because it has
20 significant topography which adds to construction costs.
21 Adding completely below-grade parking will further
22 accentuate that. I'd like the issue of affordability
23 further examined.

24 I support President Hillis' comment on
25 a community preservation alternative. I would like that

9
(AL-2)

1 to be visually added to the alternatives. I would like
2 -- if at all possible, like to see that further
3 evaluated. The seamless factor of the alternatives, as
4 they're proposed, is a little bit disturbing to me
5 because it is only about adding and subtracting pieces.
6 There are not really any new ideas in the alternatives
7 here, and this particular alternative may indeed add a
8 completely different view on how the site is used and how
9 the site lays itself out as a change in land use yet
10 reflects adjoining community concerns -- for example, the
11 location of retail, continued presence of office on the
12 site, where retail is, et cetera, et cetera.

9
(AL-2)
cont'd

13 I believe that single-sided retail on, for
14 example, the Euclid Street side -- on the Euclid Avenue
15 side, is very questionable. The site itself is more or
16 less a freeway. I'm sorry to use that word, but that's
17 just what it is. And single-sided retail on very busy
18 commercial corridors have a very small survival factor.

10
(GC-2)

19 I see Commissioner Fong nod. And I like to use
20 that empirical experience of where retail is strategically
21 placed. That goes all around the site with a decline in
22 retail corridors. Putting that much retail on all street
23 frontages in this block is a question to me that I
24 think creates a risk, a front end risk of retail of not
25 succeeding.

↓

1 So there should be a backup strategy, where we
2 really want to support retail. Do we like to support
3 retail intensification in Laurel shopping center, which is
4 in front of this commission frequently? And do we expect
5 more successful retail to be in the Sacramento and
6 Presidio Avenue corridor? I'm just raising it as
7 questions. I've spent quite a bit of time there.
8 But the way at this moment the site is bordered in
9 areas where it doesn't work, I would like the EIR
10 to take a closer look at the realities of how we
11 look at retail.

12 I spoke about cumulative construction
13 effects for Children's Hospital. I spoke about
14 support for the 15-day extension, adding the
15 community preservation alternative, looking more closely
16 at affordability relative to below-grade parking and
17 affordability not being properly yet or clearly addressed
18 in the document that's in front of us, and generally about
19 process. But that is not as much a specific DEIR comment,
20 but is an invitation for you to invite that as we move
21 into the future and hear other EIRs. Thank you.

22 PRESIDENT HILLIS: All right. Commissioner
23 Melgar.

A-CPC-Melgar

24 COMMISSIONER MELGAR: Thank you. So to start
25 off, I would also support the extension of the review

10
(GC-2)
cont'd

11
(CU-1)

12
(GC-3)

13
(AL-2)

14
(PD-3)

15
(CEQA-4)

1
(GC-3)

1 period. | But I am wondering if that gives you enough ²
2 time, 15 days, to incorporate perhaps another (AL-2)
3 alternative which we haven't even seen. So I'm
4 actually interested in that alternative. I mean, I
5 remember you guys worked pretty fast when we had another
6 alternative for that Christian Scientist, you know, Church
7 project. | So I -- I haven't heard anyone in the comments
8 talk about the existing building's architectural
9 aesthetics, but I actually really like that building.
10 I've always really liked that building.

11 My dad was an engineer and he, you know, was
12 partial to modern and house architecture, and it just
13 reminds me of something that my dad would have worked
14 on. So, I like the way the -- you know, it builds into
15 the hill and the topography. And | so I would be really ³
16 interested to see what a preservation alternative looks (AL-2)
17 like, if it actually works.

18 And just from an environmental point of view,
19 reusing something is always more environmentally conscious
20 than knocking it down and building it new. So I'd be
21 interested in seeing that.

22 So does 15 days give you enough time to do that
23 with people's holidays and stuff?

24 VOICE: Probably not.

25 MS. GIBSON: The extension of the public

1 comment period for the Draft EIR allows more time for
2 the public to comment. Following the close of that review
3 period, then the planning department will prepare a
4 Responses To Comments document, and the schedule for
5 that will depend, in part, on the nature and complexity
6 of the comments that we receive.

7 COMMISSIONER MELGAR: Okay.

8 MS. GIBSON: So we'll take whatever time we
9 need to adequately respond to the comments that the
10 public provides.

11 COMMISSIONER MELGAR: Awesome. Thank you.
12 There are some things about the proposed project that I
13 do like, you know. I know that we're commenting now on
14 the accuracy of the EIR and the adequacy. I do think
15 it's adequate and it's thorough.

16 For what it's worth, you know, you brought up a
17 point that I really hadn't thought about, Commissioner
18 Moore, which is where the retail is and, you know,
19 in terms of the traffic going in, too. So I will think
20 about that more.

21 I actually like having the retail. I
22 particularly like the child care component. I think
23 there is a very large shortage of child care in this
24 neighborhood. I spend a lot of time there because I
25 spend a lot of time at a JCC, and, you know, I can tell

4
(GC-1)

5
(ME-1)

1 you, those slots are very, very sought after.

2 So I think it's a good addition to the
3 neighborhood. I would like to see some more flexibility
4 about what type of retail goes in there. But I'm looking
5 forward to having comments and having an extra period for
6 those comments that come in.

7 PRESIDENT HILLIS: Commissioner Koppel. A-CPC Koppel

8 COMMISSIONER KOPPEL: Yeah, thank you. We
9 don't often see housing projects on or near the west
10 side; we don't see a lot of housing projects in
11 District 2. So it's just good that we're actually
12 spreading out the housing, not just on the eastern side
13 of the town.

14 I definitely think this is an opportunity site.
15 I visited the site recently. Ten and a quarter acres is
16 a pretty large chunk that we don't see very often.
17 I've frequented the neighborhood often and I've
18 always looked at this site as a dead zone. You just
19 don't go in there. I mean, anywhere that's that large
20 that's surrounded by a brick wall, I mean, halfway around
21 the perimeter, I'm just -- I'm not a big fan of right
22 there. That says to me, "Stay out; you're not welcome."

23 The site to me is cold, uninviting, inactive,
24 it has no retail, and it's way too car-oriented.

25 This definitely has "opportunity site" written all over

5
(ME-1)
cont'd

6
(GC-3)

1
(ME-1)

1 it. I want to see as much done with this as possible.
2 I do think the EIR, the Draft EIR, is fully adequate and
3 accurate, and as far as I'm concerned, I want to make
4 the most out of this site as possible. Thank you.

1
(ME-1)
cont'd

5 PRESIDENT HILLIS: Commissioner Richards.

A-CPC Richards

6 COMMISSIONER RICHARDS: So I guess on the
7 process, scoping document goes out, shows what the project
8 sponsor's programming needs or programming desires are for
9 the site, it has the layout and the map proposed.

1
(CEQA-1)

10 That's what we have here. And then the community should
11 take a look at that and internalize that and say,
12 "Here's our alternative plan," and maybe you would,
13 at the time you did all this work, put that as, say a G
14 or an H, or you change one of these alternatives. That's
15 what the scoping process and scoping document is.

2
(AL-1)

16 That all being said, it's a complex project,
17 and I do support, as with Commissioner Moore and
18 Commissioner Melgar, if there is a real viable
19 alternative, I'd like to see it evaluated against the
20 other alternatives.

21 The other thing is I think there is an
22 inadequate alternative to the full preservation
23 alternative. So I'd love to see, regardless of what it
24 looks like, the project sponsor's programming needs in
25 the full preservation alternative model. So would we

3
(AL-2)

1 have to go eight stories? How do we get all this stuff
2 squeezed into that site with the full preservation
3 alternative? We always say a full preservation, we have
4 office, then residential.

3
(AL-2)
cont'd

5 But what if we combined the two,
6 B and C? What would that look like? Because we've
7 got all these other alternatives that are different
8 heights -- there's a lot of different variables, and
9 it's hard to actually kind of compare them because you
10 don't get the full programming one or the other; you get a
11 partial, partial programming of that.

4
(AL-1)

12 That all being said, since the landscape is an
13 integral part of the I guess the historic nature of the
14 site, as soon as you start putting anything on the
15 landscaping, you've already degraded or defaced it, so
16 there is no real full preservation alternative. I think
17 the real full preservation alternative is no project
18 alternative, right, because we just leave it like it
19 is. So I'm struggling with that.

5
(GC-3)

20 I do support the 15-day extension. I do
21 -- I do understand from a circulation point of view where
22 the department was going with reimagining the street grid
23 as it is. We've had several projects that have come
24 before us that actually we kind of put the street grid
25 back, the power plant, Pier 70, there's projects in Selma, ✓

6
(ME-1)

1 and several in the Mission where you have that
2 mid-block alleyway that actually connects the
3 street grid. And I think that's a very desirable thing,
4 but it does actually have a negative effect on the
5 building.

6
(ME-1)
cont'd

6 You know, one of the other things for me is where
7 else do we have these kind of office parks out there? So
8 I used to work at HP on Deer Creek Road in Palo Alto --

7
(CR-1)

9 PRESIDENT HILLIS: Walnut Creek.

10 COMMISSIONER RICHARDS: Walnut Creek, Palo
11 Alto. So I'm kind of going -- I have to start weighing
12 off. We do overriding considerations. What is
13 -- are we destroying the last of its kind or are we
14 actually really helping the city out and trying to keep
15 some sense of what it used to be? I wouldn't call this
16 facadism; it's a different kind of partial
17 preservation or what this project has. But those are
18 really my comments, mostly process-oriented.

19 PRESIDENT HILLIS: All right, thanks. Just on
20 the -- I mean, one, on the EIR, I hope folks know the EIR
21 is a tool for us and you to help evaluate this project. I
22 think this EIR is one of the better ones we've seen. Any
23 issue anybody brought up here is addressed in an
24 alternative of the EIR. From no preservation to
25 historic preservation, to partial historic preservation,

A-CPC-Hillis

1
(GC-1)

1 it really gives us the flexibility to do almost anything
2 as a result of this. And it analyzes the impacts, and
3 it's meant as a tool to tell us and you what these
4 impacts are going to be. So I wouldn't get too hung up
5 on the EIR. I know Ms. Devincenzi's an expert on it
6 and she can guide you, but the EIR works. I mean, the EIR
7 is complete.

8 I would say there's two areas, you know,
9 I don't think we've quite looked at or analyzed.
10 One is the level of kind of historic importance
11 that this building is. You know, when we declare
12 something historic, any building now becomes the
13 painted ladies or the most important building down-
14 town.

15 And although I agree with Commissioner
16 Melgar, I think this building is interesting. It's
17 a D-plus as far as historic goes. I mean, it is
18 not -- it's kind of a -- I'm sorry to tell you. Go take
19 a look at it. Go take a look at it.

20 Hey, you know, what, I didn't comment when
21 you all spoke, Mr. Frisbie. I didn't comment when
22 you spoke, right?

23 MR. FRISBIE: That's true.

24 PRESIDENT HILLIS: Yeah. I didn't comment when
25 you spoke.

1
(GC-1)
cont'd

2
(CR-1)

1 So it's actually a historic example of bad
2 planning. It's like the Sears building on Geary and
3 Masonic. It's like some of the redevelopment projects
4 in the Safeway down the street on Geary. It's actually
5 -- it's actually an example of bad planning in the
6 suburbanization of San Francisco that happened in the 50s
7 and 60s. It's not something I would necessarily salute or
8 celebrate as an example of a great urban development.
9 It's exactly the opposite.

10 The person who spoke about this being like
11 the freeways, it is like that. It's part of
12 our history we should almost forget. And we need
13 housing. So it would be good to analyze kind of how
14 this fits on that spectrum of historic.

15 I, for one, do not think it's an enormously
16 significant historic resource. I think it's
17 interesting, like the cemetery was that was there, but
18 I'm not saying we should bring back that cemetery. If
19 somebody came in today with a project that proposed this
20 on Laurel Heights, it wouldn't get through the front
21 door of the planning department. So, I encourage us to
22 look at this.

23 There's also a no higher density alternative, and
24 I actually think this site could take more density than
25 what's being proposed. I get, judging by the response

3
(CR-1)

4
(AL-1)

1 today from neighbors, people aren't going to be too
2 excited about higher density, but I think we're remiss,
3 actually, in not looking at this site in a state density
4 alternative. As the developer said, this site slopes
5 down significantly and could take a state density bonus
6 or more density. I think we're remiss not to look at a
7 higher density alternative.

8 Just a couple of notes. So those are my comments
9 on the project itself -- I mean on the EIR. On the
10 project itself, I didn't encourage people to look at
11 retail. This is not meant to mimic what's at Laurel
12 Village, which tends to be more chain in bigger, fuller
13 retail.

14 It's actually you've got this big disconnect
15 from Laurel Village to California and Presidio where there
16 is additional retail and it's spotty. I think this retail
17 would be great and help connect that corridor to the
18 higher transportation corridors of California and
19 Presidios that are there. So I think I'm not quite
20 getting the disconnect on the retail, but I heard it.
21 I would encourage people to look at it.

22 Time frame wise, I'm sure the developer and the
23 community are aligned. Nobody wants to sit around and
24 wait for this project to happen. They invest a lot.
25 The community wants it to happen. I think that the time

4

(AL-1)
cont'd

5

(ME-1)

1 frame laid out in the EIR is kind of the longest level if
2 we see, you know, a recession hit or something like that,
3 but people want to see this happen.

4 And I'd say give concrete comments. I didn't
5 hear many of them today on the project itself. We see
6 tons of projects here much bigger than this. This is
7 not an enormously dense project. I'd just say keep an
8 open mind as you look at this project.

9 We desperately need this housing. As
10 Commissioner Koppel said, there's almost no better site
11 in the city for housing than this site. I get that this
12 project in these areas around it, they act kind of as
13 some open space to the neighborhood, but it's really
14 limited to that Laurel and Euclid corner, which they are
15 proposing open space. You walk around this site in the
16 other areas, it's dominated by parking and private open
17 space. It's not a welcome area. This project will knit
18 this together.

19 I get there's nervousness about what this will
20 do and the impacts, and it seems like a major
21 construction project, but trust me, it's not. And we've
22 seen this happen around the city. Not much here. I know
23 the folks who live here haven't experienced it because
24 we don't see it happen around this corridor too much,
25 but it's a fairly modest project that meets the zoning.

6
(ME-1)

7
(ME-1)

8
(PD-1)

9
(ME-1)

A-CPC-Hillis

1 It doesn't try to go too far. So give productive
2 comments to that, because I think this is a great site
3 for housing. Commissioner Richards.

9
(ME-1)
cont'd

A-CPC-Richards

4 COMMISSIONER RICHARDS: I just have one point
5 of clarification. I support the PUD minus one density.
6 I do not support the state density bonus one because we
7 don't get anything for it. So the PUD one, you get your
8 affordable units on all the units, which I think is a
9 better community benefit. So I'm sure the developer
10 would consider that.

8
(ME-1)

11 PRESIDENT HILLIS: Okay, so you -- you want --
12 is everybody supportive of an extra 15 days on this?
13 Okay. Is there any objection to it?

14 SECRETARY IONIN: Take a vote?

15 PRESIDENT HILLIS: Do you want a motion for it?

16 SECRETARY IONIN: It's cleaner if you make
17 a motion.

18 PRESIDENT HILLIS: All right.

19 COMMISSIONER MELGAR: I'd like to make a motion
20 that we extend the period for comments for this EIR by
21 15 more days.

22 COMMISSIONER RICHARDS: Second.

23 SECRETARY IONIN: Thank you, commissioners. If
24 there's nothing further, there's a motion that has been
25 seconded to extend the Draft EIR comment period by 15

1 days.

2 On that motion, Commissioner Fong?

3 MR. FONG: Aye.

4 SECRETARY IONIN: Commissioner Johnson. I'm
5 sorry. Commissioner Koppel.

6 COMMISSIONER KOPPEL: No.

7 SECRETARY IONIN: Commissioner Moore.

8 COMMISSIONER MOORE: Aye.

9 SECRETARY IONIN: Commissioner Richards.

10 COMMISSIONER RICHARDS: Aye.

11 SECRETARY IONIN: Commissioner Melgar.

12 COMMISSIONER MELGAR: Aye.

13 SECRETARY IONIN: President Hillis.

14 PRESIDENT HILLIS: Aye.

15 SECRETARY IONIN: So moved, commissioners. That
16 motion passes 5 to 1 with Commissioner Koppel voting
17 against.

18 PRESIDENT HILLIS: All right. Commissioner
19 Moore, do you have additional comments?

20 COMMISSIONER MOORE: Would you please give the
21 date and the hour, including stating that the address
22 remains the same?

23 SECRETARY IONIN: What does 15 days put us on?
24 January 7th at 5:00 p.m.?

25 PRESIDENT HILLIS: Ms. Gibson?

1 MS. GIBSON: That would be January 8th.

2 PRESIDENT HILLIS: All right, January 8th,
3 5:00 p.m. You can submit them, written comments by then.
4 All right. Thank you very much.

5 (End of item.)

SAN FRANCISCO PLANNING DEPARTMENT

Received at CPC Hearing 12/13/18
K. Zushi: A-HPC

December 11, 2018

Ms. Lisa Gibson
Environmental Review Officer
San Francisco Planning Department
1650 Mission Street, 4th Floor
San Francisco, CA 94103

1650 Mission St.
Suite 400
San Francisco,
CA 94103-2479

Reception:
415.558.6378

Fax:
415.558.6409

Planning
Information:
415.558.6377

Dear Ms. Gibson,

On December 5, 2018, the Historic Preservation Commission (HPC) held a public hearing in order for the commissioners to provide comments to the San Francisco Planning Department on the Draft Environmental Impact Report (DEIR) for the proposed 3333 California Street Project (2015-014028ENV). As noted at the hearing, public comment provided at the December 6, 2018 hearing, will not be responded to in the Responses to Comments document. After discussion, the HPC arrived at the comments below:

- The HPC found the analysis of historic resources in DEIR to be adequate and accurate. The HPC concurs with the finding that the proposed project would result in a significant, unavoidable impact to the identified historic resource. 1
(CR-2)
- The HPC expressed the importance of the historic resource as an integrated landscape and building. 2
(CR-1)
- The HPC agreed that the DEIR analyzed a reasonable and appropriate range of preservation alternatives to address historic resource impacts. 3
(AL-1)
- The HPC expressed interest in understanding more about a "neighborhood alternative" that was discussed by the public during public comment at the hearing. 4
(AL-2)
- The HPC also supported combining some elements of the different alternatives in order to increase the amount of housing in the Full Preservation Alternative C. Commissioner Hyland specifically requested that Alternative C incorporate some elements from alternatives B and D such as increased building heights along California Street (up to 65 feet), the conversion of some areas of office or retail to residential use, and the incorporation of duplexes along Laurel Street. 5
(AL-3)

The HPC appreciates the opportunity to participate in review of this environmental document.

Sincerely,

A handwritten signature in black ink, appearing to read "Andrew Wolfram", with a long horizontal flourish extending to the right.

Re: SCH# 2017092053, 3333 California Street Mixed-Use Project, City of San Francisco; San Francisco County, California

Dear Mr. Zushi:

The Native American Heritage Commission (NAHC) has reviewed the Draft Environmental Impact Report (DEIR) prepared for the project referenced above. The review included the Executive Summary; the Introduction and Project Description; the Environmental Setting and Impacts; and Appendix B (Initial Study) prepared by Environmental Science Associates for the San Francisco Planning Department. We have the following concerns:

1. While Tribal Cultural Resources are listed as a subsection under Cultural Resources, the subsection does not adequately address the questions of significance stipulated in the California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," <http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf> A separate section addressing these questions, and consultation outreach and responses, is preferred.
2. There is no documentation in the Initial Study or the DEIR of **government-to-government consultation by the lead agency** under AB-52 with Native American tribes traditionally and culturally affiliated to the project area as required by statute, or that mitigation measures were developed in consultation with the tribes.

The NAHC recommends lead agencies consult with all California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources.

A brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments is also attached.

Please contact me at gayle.totton@nahc.ca.gov or call (916) 373-3714 if you have any questions.

Sincerely,

Gayle Totton

ADDITIONAL INFORMATION:

The California Environmental Quality Act (CEQA)¹, specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.² If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared.³ In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended in 2014 by Assembly Bill 52. (AB 52).⁴ **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** AB 52 created a separate category for “tribal cultural resources”⁵, that now includes “a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment.”⁶ Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.⁷ Your project may also be subject to **Senate Bill 18 (SB 18)** (Burton, Chapter 905, Statutes of 2004), Government Code 65352.3, if it also involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space. **Both SB 18 and AB 52 have tribal consultation requirements.** Additionally, if your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966⁸ may also apply.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

Agencies should be aware that AB 52 does not preclude agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52. For that reason, we urge you to continue to request Native American Tribal Consultation Lists and Sacred Lands File searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>. Additional information regarding AB 52 can be found online at http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf, entitled “Tribal Consultation Under AB 52: Requirements and Best Practices”.

Pertinent Statutory Information:**Under AB 52:**

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice.

A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project.⁹ and **prior to the release of a negative declaration, mitigated negative declaration or environmental impact report.** For purposes of AB 52, “consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18).¹⁰

The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- a. Alternatives to the project.
- b. Recommended mitigation measures.
- c. Significant effects.¹¹

1. The following topics are discretionary topics of consultation:

- a. Type of environmental review necessary.
- b. Significance of the tribal cultural resources.
- c. Significance of the project’s impacts on tribal cultural resources.

If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency.¹²

With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process **shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10.** Any information submitted by a California Native

¹ Pub. Resources Code § 21000 et seq.

² Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b); CEQA Guidelines Section 15064.5 (b)

³ Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd.(a)(1); CEQA Guidelines § 15064 (a)(1)

⁴ Government Code 65352.3

⁵ Pub. Resources Code § 21074

⁶ Pub. Resources Code § 21084.2

⁷ Pub. Resources Code § 21084.3 (a)

⁸ 154 U.S.C. 300101, 36 C.F.R. § 800 et seq.

⁹ Pub. Resources Code § 21080.3.1, subds. (d) and (e)

¹⁰ Pub. Resources Code § 21080.3.1 (b)

¹¹ Pub. Resources Code § 21080.3.2 (a)

¹² Pub. Resources Code § 21080.3.2 (a)

American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.¹³

If a project may have a significant impact on a tribal cultural resource, **the lead agency's environmental document shall discuss** both of the following:

- a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
- b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource.¹⁴

Consultation with a tribe shall be considered concluded when either of the following occurs:

- a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
- b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.¹⁵

Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 **shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program**, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable.¹⁶

If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, **the lead agency shall consider feasible mitigation** pursuant to Public Resources Code section 21084.3 (b).¹⁷

An environmental impact report **may not be certified**, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

- a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
- b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
- c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days.¹⁸

This process should be documented in the Tribal Cultural Resources section of your environmental document.

Under SB 18:

Government Code § 65352.3 (a) (1) requires consultation with Native Americans on general plan proposals for the purposes of "preserving or mitigating impacts to places, features, and objects described § 5097.9 and § 5091.993 of the Public Resources Code that are located within the city or county's jurisdiction. Government Code § 65560 (a), (b), and (c) provides for consultation with Native American tribes on the open-space element of a county or city general plan for the purposes of protecting places, features, and objects described in Sections 5097.9 and 5097.993 of the Public Resources Code.

- SB 18 applies to **local governments** and requires them to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf
- **Tribal Consultation:** If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.**¹⁹
- **There is no Statutory Time Limit on Tribal Consultation under the law.**
- **Confidentiality:** Consistent with the guidelines developed and adopted by the Office of Planning and Research,²⁰ the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction.²¹
- **Conclusion Tribal Consultation:** Consultation should be concluded at the point in which:
 - The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or

¹³ Pub. Resources Code § 21082.3 (c)(1)

¹⁴ Pub. Resources Code § 21082.3 (b)

¹⁵ Pub. Resources Code § 21080.3.2 (b)

¹⁶ Pub. Resources Code § 21082.3 (a)

¹⁷ Pub. Resources Code § 21082.3 (e)

¹⁸ Pub. Resources Code § 21082.3 (d)

¹⁹ (Gov. Code § 65352.3 (a)(2)).

²⁰ pursuant to Gov. Code section 65040.2,

²¹ (Gov. Code § 65352.3 (b)).

- Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation.²²

NAHC Recommendations for Cultural Resources Assessments:

- Contact the NAHC for:
 - A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - A Native American Tribal Contact List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.
 - The request form can be found at <http://nahc.ca.gov/resources/forms/>.
- Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - If part or the entire APE has been previously surveyed for cultural resources.
 - If any known cultural resources have been already been recorded on or adjacent to the APE.
 - If the probability is low, moderate, or high that cultural resources are located in the APE.
 - If a survey is required to determine whether previously unrecorded cultural resources are present.
- If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
 - The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

Examples of Mitigation Measures That May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

- Avoidance and preservation of the resources in place, including, but not limited to:
 - Planning and construction to avoid the resources and protect the cultural and natural context.
 - Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
- Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - Protecting the cultural character and integrity of the resource.
 - Protecting the traditional use of the resource.
 - Protecting the confidentiality of the resource.
- Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
- Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed.²³
- Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated.²⁴

The lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

- Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources.²⁵ In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
- Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
- Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be

²² (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

²³ (Civ. Code § 815.3 (c)).

²⁴ (Pub. Resources Code § 5097.991).

²⁵ per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)).

followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Subject: 3333 California Street Mixed-Use Project
SCH#: 2017092053

Dear Kei Zushi:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on December 24, 2018, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

1
(CEQA-5)

Please note that Section 21104(c) of the California Public Resources Code states that:

"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan

SCH# 2017092053
Project Title 3333 California Street Mixed-Use Project
Lead Agency San Francisco, City and County of

Type EIR Draft EIR
Description Note: Review Per Lead

Overall, the proposed project would include 558 dwelling units within 824,691 gsf of residential floor area; 49,999 gsf of office floor area; 54,117 gsf of retail floor area; a 14,690 gsf child care center, and 236,000 sf of open areas. Parking would be provided in four below-grade parking garages and six individual, two-car, parking garages serving 12 of the 14 units in the Laurel Duplexes. New public pedestrian walkways are proposed through the site in a north-south direction between California Street and the intersection of Masonic and Euclid avenues approx along the line of Walnut St and in an east-west direction between Mayfair Dr and Presidio Ave. A variant that would replace the office space in the Walnut Building with 186 additional residential units, for a total of 744 dwelling units and no office space on the project site, is also being considered. The Walnut Building would be taller under this variant (from 45 ft under the proposed project to 67 ft).

Re: SCH# 2017092053, 3333 California Street Mixed-Use Project, City of San Francisco; San Francisco County, California

Dear Mr. Zushi:

The Native American Heritage Commission (NAHC) has reviewed the Draft Environmental Impact Report (DEIR) prepared for the project referenced above. The review included the Executive Summary; the Introduction and Project Description; the Environmental Setting and Impacts; and Appendix B (Initial Study) prepared by Environmental Science Associates for the San Francisco Planning Department. We have the following concerns:

2
 (CR-3)

1. While Tribal Cultural Resources are listed as a subsection under Cultural Resources, the subsection does not adequately address the questions of significance stipulated in the California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," <http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf> A separate section addressing these questions, and consultation outreach and responses, is preferred.
2. There is no documentation in the Initial Study or the DEIR of **government-to-government consultation by the lead agency** under AB-52 with Native American tribes traditionally and culturally affiliated to the project area as required by statute, or that mitigation measures were developed in consultation with the tribes.

The NAHC recommends lead agencies consult with all California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources.

A brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments is also attached.

Please contact me at gayle.totton@nahc.ca.gov or call (916) 373-3714 if you have any questions.

Sincerely,

Gayle Totton

ADDITIONAL INFORMATION:

The California Environmental Quality Act (CEQA)¹, specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.² If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared.³ In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended in 2014 by Assembly Bill 52. (AB 52).⁴ **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** AB 52 created a separate category for "tribal cultural resources"⁵, that now includes "a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment."⁶ Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource.⁷ Your project may also be subject to **Senate Bill 18 (SB 18)** (Burton, Chapter 905, Statutes of 2004), Government Code 65352.3, if it also involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space. **Both SB 18 and AB 52 have tribal consultation requirements.** Additionally, if your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966⁸ may also apply.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

Agencies should be aware that AB 52 does not preclude agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52. For that reason, we urge you to continue to request Native American Tribal Consultation Lists and Sacred Lands File searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>. Additional information regarding AB 52 can be found online at http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf, entitled "Tribal Consultation Under AB 52: Requirements and Best Practices".

Pertinent Statutory Information:**Under AB 52:**

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice.

A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project.⁹ and **prior to the release of a negative declaration, mitigated negative declaration or environmental impact report.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18)."¹⁰

The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- a. Alternatives to the project.
- b. Recommended mitigation measures.
- c. Significant effects.¹¹

1. The following topics are discretionary topics of consultation:

- a. Type of environmental review necessary.
- b. Significance of the tribal cultural resources.
- c. Significance of the project's impacts on tribal cultural resources.

If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency.¹²

With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process **shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10.** Any information submitted by a California Native

¹ Pub. Resources Code § 21000 et seq.

³ Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd.(a)(1); CEQA Guidelines § 15064 (a)(1)

⁴ Government Code 65352.3

⁵ Pub. Resources Code § 21074

⁶ Pub. Resources Code § 21084.2

⁷ Pub. Resources Code § 21084.3 (a)

⁸ 154 U.S.C. 300101, 36 C.F.R. § 800 et seq.

⁹ Pub. Resources Code § 21080.3.1, subds. (d) and (e)

¹⁰ Pub. Resources Code § 21080.3.1 (b)

¹¹ Pub. Resources Code § 21080.3.2 (a)

¹² Pub. Resources Code § 21080.3.2 (a)

American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.¹³

If a project may have a significant impact on a tribal cultural resource, **the lead agency's environmental document shall discuss both of the following:**

- a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
- b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource.¹⁴

Consultation with a tribe shall be considered concluded when either of the following occurs:

- a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
- b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.¹⁵

Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 **shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program**, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable.¹⁶

If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, **the lead agency shall consider feasible mitigation** pursuant to Public Resources Code section 21084.3 (b).¹⁷

An environmental impact report **may not be certified**, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

- a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
- b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
- c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days.¹⁸

This process should be documented in the Tribal Cultural Resources section of your environmental document.

Under SB 18:

Government Code § 65352.3 (a) (1) requires consultation with Native Americans on general plan proposals for the purposes of "preserving or mitigating impacts to places, features, and objects described § 5097.9 and § 5091.993 of the Public Resources Code that are located within the city or county's jurisdiction. Government Code § 65560 (a), (b), and (c) provides for consultation with Native American tribes on the open-space element of a county or city general plan for the purposes of protecting places, features, and objects described in Sections 5097.9 and 5097.993 of the Public Resources Code.

- SB 18 applies to **local governments** and requires them to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf
- **Tribal Consultation:** If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.**¹⁹
- **There is no Statutory Time Limit on Tribal Consultation under the law.**
- **Confidentiality:** Consistent with the guidelines developed and adopted by the Office of Planning and Research,²⁰ the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction.²¹
- **Conclusion Tribal Consultation:** Consultation should be concluded at the point in which:
 - The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or

¹³ Pub. Resources Code § 21082.3 (c)(1)

¹⁴ Pub. Resources Code § 21082.3 (b)

¹⁵ Pub. Resources Code § 21080.3.2 (b)

¹⁶ Pub. Resources Code § 21082.3 (a)

¹⁷ Pub. Resources Code § 21082.3 (e)

¹⁸ Pub. Resources Code § 21082.3 (d)

¹⁹ (Gov. Code § 65352.3 (a)(2)).

²⁰ pursuant to Gov. Code section 65040.2,

²¹ (Gov. Code § 65352.3 (b)).

- Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation.²²

NAHC Recommendations for Cultural Resources Assessments:

- Contact the NAHC for:
 - A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - A Native American Tribal Contact List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.
 - The request form can be found at <http://nahc.ca.gov/resources/forms/>.
- Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - If part or the entire APE has been previously surveyed for cultural resources.
 - If any known cultural resources have been already been recorded on or adjacent to the APE.
 - If the probability is low, moderate, or high that cultural resources are located in the APE.
 - If a survey is required to determine whether previously unrecorded cultural resources are present.
- If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
 - The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

Examples of Mitigation Measures That May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

- Avoidance and preservation of the resources in place, including, but not limited to:
 - Planning and construction to avoid the resources and protect the cultural and natural context.
 - Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
- Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - Protecting the cultural character and integrity of the resource.
 - Protecting the traditional use of the resource.
 - Protecting the confidentiality of the resource.
- Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
- Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed.²³
- Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated.²⁴

The lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

- Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources.²⁵ In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
- Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
- Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be

²² (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

²³ (Civ. Code § 815.3 (c)).

²⁴ (Pub. Resources Code § 5097.991).

²⁵ per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)).

followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Re: Case No. 2015-014028ENV

Dear Mr. Zushi;

Please accept these comments from the California Street Homeowners Group to the Draft EIR for the 3333 California Street project proposed by Laurel Village Partners. We speak for the interests of our neighborhood, which is the block of California Street between Laurel and Walnut.

Background

For context, it is important to note that our constituency lives directly across the street from the Project's proposed retail uses. Our street has no retail or commercial use. It is entirely residential except for the UCSF facility. Our neighborhood houses 40 families with more than 100 residents, including many children (30-40) and many elderly residents.

California Street, between Laurel and Walnut, is 4 lanes plus parallel parking lanes, or two lanes with opposing bus stops (at Laurel). Along with the garages of our 40 families, the garages for an additional 11 families open to this block of California Street, and require (sometimes blind) backing onto the already congested street for exit.

1
(TR-7)

While we agree with some of the comments provided by others, the most severe, proximate and prolonged adverse environmental impact from this Project falls uniquely and disproportionately on our neighborhood, and the EIR fails to address or provide adequate mitigation for them.

2
(GC-1)

This gives rise to our comments. We trust you will give them your most careful consideration with our unique situation in mind.

DURATION OF CONSTRUCTION

3
(PD-1)

Based on the construction plan reported in the Draft EIR, our neighborhood will bear an overwhelmingly disproportionate burden from the construction of this Project. We are concerned by the potential duration of the construction and the planned location of construction staging.

As described in the EIR, construction will continue for between seven (7) and fifteen (15) years. The elderly residents of our neighborhood could look forward to facing construction across their street for the remainder of their life expectancies.

For years, during this construction, the Developer seeks closure of an eastbound/parking lane of the street for its benefit. The loss of parking is a taking from our community. It means that there will a drastic reduction in available parking places for families, caregivers, etc., which will radically affect our chosen neighborhood.

4
(TR-6)

Further, the readily foreseeable traffic snarls will deprive us of access to, and quiet enjoyment of our residences. This plan (and the staging plan described below) will diminish our ability to enjoy our homes and could adversely impact any residential sale process for an unnecessarily long time.

5
(TR-3)
6
(PD-1)

The Developer appears to be acting in its own self-interest. It seeks to prolong entitlements for use or sale to other developers; to time the market; and, to change product mix over time if more profit would result. It is attempting this by seeking permission for this extraordinarily prolonged construction period. If permitted, the Developer's construction timetable will unjustly prolong the disproportionate environmental impact that the families in our neighborhood will endure.

As the immediate "neighbors" of this Project, this unfairly imposes the construction noise, dirt, disruption, personal risk and displacement on us for as many extra years. In fact, on numerous occasions, the Developer indicated they could build the complete project in three (3) years.

7
(GC-1)
8
(PD-1)

The most obvious way to mitigate this impact would be to require the Developer to complete construction within three years of commencement.

CONSTRUCTION STAGING

The Developer plans to stage three of the four phases of the entire Project directly across the street from our neighborhood, near the already challenged corner of California and Laurel. This is an unfair and incredible burden on our neighborhood.

This current plan would mean that even when direct construction is not happening in front of our homes, we would still uniquely bear the brunt of the construction noise by being exposed to the sound of construction trucks and machinery (back up beeping), and the non-residential aspect of having a truck parking lot at your front door for years.

This staging plan is the least impactful to the developer, but the most intrusive to us. The most obvious way to mitigate this impact would be to require the Developer to move its construction staging throughout the project during the construction and have no one adjacent neighborhood to the 10.5 acre site unduly carry the burden. This is only reasonable and fair.

RETAIL

Our neighborhood will be the only neighborhood (existing or new) facing the Project's proposed retail. In addition to patrons, retail will add traffic to our already congested street, and add turbulence from passenger pick up and drop off. While the Draft EIR acknowledges this, it assesses the impact through a much wider lens than ours; and it does not address the unique and specific localized impact we will experience.

So, even though the Draft EIR acknowledges additional traffic; and the loading and unloading of passengers and freight, it does not recognize the added unspecified activity retail will create across the street from us. Nor does it assess the environmental impact of changing our streetscape from a walkway in front of open space to a 45-foot high wall the Developer seeks to build through a zoning change. The Developer's plan has an unmitigated and severe environmental impact on our neighborhood. Our residential neighborhood zoning should not be changed to permit retail.

CALIFORNIA STREET COMMERCIAL LOADING ZONE

There is no more enduring or objectionable environmental impact from this Project than the creation of a commercial loading zone outside our doors.

The City (or the Developer) has proposed a 100-foot commercial loading zone instead of passenger loading or car parking on most of the parking lane on the eastbound side of our block.

8
(PD-1)
cont'd

9
(TR-3)

10
(GC-1)

11
(ME-1)

12
(TR-10)

In every meeting with the Developer over the past several years, the Developer asserted that the Project would require that all commercial loading would be underground, and advised that subterranean facilities for these purposes would be part of their Project. That assurance from the Developer relieved our concerns about the potential for commercial loading in front of our homes, so we were frankly shocked when the proposed Project description provided for commercial loading directly across the street from us.

12
(TR-10)
cont'd

There was originally no need to find measures to mitigate the significant and adverse environmental impact of commercial loading in front of our homes. The Developer has already proposed that all commercial loading would be underground. If the City has some rationale for a commercial loading zone on California Street, it should at least mitigate its impact by creating it across from the existing commercial uses between Walnut and Presidio, away from existing residences and the already problematic intersection of Laurel and California.

INCREASED TRAFFIC HAZARDS

13
(TR-7)

Garages for more than 50 residences exit in reverse onto this block of California Street. Currently this is challenging and sometimes hazardous. When it is manageable, it is so because the Walnut Street traffic coming on to California St when the California light is red is very light. Increased traffic coming from both directions on Walnut may make it impossible at times for the California Street neighbors to exit our buildings.

The Project's inevitable additional congestion from long term construction; followed by retail traffic, perhaps with commercial loading, will significantly and adversely impact this already difficult circumstance.

The Draft EIR is fundamentally deficient in its failure to address this unique and significant environmental impact on our neighborhood, and of course, it necessarily fails to identify or require any mitigation of it by the Developer or the City's traffic authorities.

LOSS OF OPEN SPACE AND OBSTRUCTION OF HORIZON

14
(CEQA-3)

Our neighborhood will also lose the existing open space in front of our homes and the entire view of the horizon that many in our neighborhood enjoy. The Developer takes this open space from us and sequesters it inside the Project's walls.

The open space we now enjoy is framed by 100 year old cypress trees, and our horizon extends more than a mile away. (See view below taken from 3320 California St.)

As the State Legislature noted in enacting the California Environmental Quality Act, it is the Policy of the state to: "...take all action necessary to provide the people of this state with clean

15
(GC-1)

air and water, enjoyment of aesthetic, natural, scenic, and historic environmental qualities, and freedom from excessive noise..." CEQA Section 21001.

15
(GC-1)
cont'd

Each of the above environmental impacts directly across from our front doors violates state policy, and any one of them would compel us to challenge the Draft EIR. Together, they threaten a significant loss of the peaceful enjoyment of our homes.

We have not included all our concerns, and we reserve the right to supplement our comments and responses.

We look forward to working with you and the Developer to eliminate, or significantly mitigate these impacts.

Thank you,

California Street Homeowners

RE: Comments on Draft EIR ("DEIR) for 3333 California Street Project ("Project");
Case No. 2015-014028ENV

Dear Sirs:

The Jewish Community Center of San Francisco (JCCSF), located at 3200 California Street, has been working closely with the developer of 3333 California (Developer) and the City on the Project. Our comments below, in response to the DEIR, supplement those set forth in our attached 10/20/17 letter responding to the Project NOP and 6/8/18 letter responding to the Project Initial Study.

1. **Traffic/Pedestrian Safety Concerns.** Pages 4.C. 68-71. As previously noted in our other letters, we have 4500 daily users ranging from newborns in strollers to school children to frail older adults. Our only access point for pedestrians and cars is from California Street (except for preschool pick-up and drop-off which enters off Walnut Street but exits onto California Street.) Many of our users and employees routinely cross the California/Presidio and California/Walnut intersections to enter or exit our building. We do not believe that the DEIR has fully described the existing traffic patterns around the JCCSF and, therefore, has not adequately analyzed the potential negative impact of the 7-15 years of Project construction traffic in the vicinity of our building on traffic and pedestrian safety in the vicinity of the JCCSF building. In particular, the DEIR's description of the existing traffic patterns around the JCCSF should acknowledge the existing traffic issues and (resulting impact on pedestrian safety) in the vicinity of the JCCSF caused by afternoon westbound traffic (much higher than morning westbound traffic) intermingling with: (a) cars picking up and dropping JCCSF users in the JCCSF California Street white zone; (b) cars entering the JCCSF garage snaking back in a waiting

1
(TR-8)

pattern along California; (c) cars leaving the JCCSF garage weaving into westbound traffic on California Street; and (d) cars leaving the preschool drive-through weaving into westbound traffic on California Street. All these factors are also affected by the slowdown in westbound traffic that occurs due to the dramatic decrease in visibility experienced by late afternoon westbound drivers as the sun hits their windshields causing glare. Additionally, the DEIR needs to account for the morning traffic patterns as preschool cars drop off children at the Walnut Street entrance with the line of waiting cars snaking back onto California Street in front of the JCCSF garage. We already have implemented many measures ourselves to address these issues including: (i) assignment of additional staff during peak times to manage loading zone backups; (ii) increased signage for parents re loading/ unloading; (iiiiv); provision of a white zone on Walnut (east-side close to California) to allow the line of cars waiting to go through the drive-through to have a place to queue without blocking traffic; (iv) during camp season (which is a peak period of usage), staggering programs to shift pick up and drop off and adding cones to direct traffic; and (v) working with MTA to move the bus stop on Presidio back 20 feet from the California/Presidio intersection to improve visibility of pedestrians for other southbound vehicles. Nonetheless, we are very concerned that current situation could be made much worse by 7-15 years of construction traffic. As a result, while acknowledging that we are not traffic experts, we would request that the DEIR analyze potential mitigations such as: limiting construction traffic entering into the Walnut Street entrance to the Project site; installing longer lights for pedestrian crossings at California/Walnut and/or California/Presidio; constructing sidewalk bulb outs in the vicinity of the JCCSF; installing flashing pedestrian crossing signals, etc.; directing blue book regulations to be applied in a manner that limits the exacerbation of these problems. Even if the City believes that the construction traffic will not cause significant impacts pursuant to the DEIR standards of significance, we believe that it is in everyone's best interests to implement every advance preventative action possible to enhance the safety of the thousands of young children and older adults who use this community center on a daily basis.

2. **Sensitive Receptor.** Page 4.D.12. We appreciate the fact that the DEIR identifies the JCCSF site as a sensitive receptor (in fact,

2
(NO-1)

the JCCSF is identified as the closest sensitive receptor to the Project site). As a result of this designation, we believe it imperative that the City, through DEIR mitigations and application of blue book regulations, implement all feasible measures to decrease construction noise and dust on our users. In light of the potentially negative effect on our preschool and other programs of the 7-15 year construction period (e.g. page 4.D. 40 indicates a maximum increase of 9dBA over existing 67dBA for 82 months), we would hope that the City would design a mitigation measure that creates a collaborative process enabling the City, Developer and JCCSF to monitor the impact of the construction noise, dust and traffic on the JCCSF with the City retaining the ability to impose enhanced mitigation measures throughout the construction period, if warranted, depending on the actual on-the-ground experience of the JCCSF, as a sensitive receptor.

2
(NO-1)

3. **Construction Vibration.** Pages 4.D.54-56. The DEIR concludes that the JCCSF is located too far from the Project construction site to experience construction vibration impacts to the JCCSF structure. We acknowledge that the San Francisco Fire Credit Union building is closer and is more at risk from vibrations from construction activities; however, we continue to be extremely worried about this issue especially given the presence of the underground garage and pool at the JCCSF. As a result, we request that the City amend the last sentence of the fourth bullet of Mitigation M-NO-2 to add the JCCSF to the list of entities which is alerted when vibration levels exceed the allowable threshold at the San Francisco Fire Credit Union building. In other words, if the San Francisco Fire Credit Union is the canary in the coal mine, then the JCCSF will want to know when something happens to the canary. Additionally, if damage is observed at the JCCSF, then similarly to the San Francisco Credit Union Building, we believe that excavation should cease and vibration control measures should be implemented. Thus, we would request that the phrase in the fifth bullet of Mitigation M-No-2 be amended to add the bolded language: i.e. "if damage to the SF Fire Credit Union building or the JCCSF building is observed..."

3
(NO-2)

4. **Dewatering/Subsidence.** Page 2.99. When the JCCSF building was constructed, it was necessary to pump a significant amount of water to draw down the water table to perform construction. We assume

4
(GEO-1)

that the Project will face similar water tables issues. In fact, Page 2.99 indicates that groundwater or perched water could be encountered; however, the DEIR does not include any mitigation measures in the event of dewatering. We believe that the DEIR needs to include appropriate mitigation measures addressing potential subsidence in the event of dewatering.

4
(GEO-1)
cont'd

We look forward to continuing to work collaboratively with the City and the Project developer, and remain excited about the increased housing density and the activation of the streetscape created by the Project. Thank you for taking these items into consideration.

 Department, Attn: Julie Moore
 1650 Mission Street, Suite 400
 San Francisco, CA 94103

RE: Response to Initial Study ("IS") for 3333 California Street Project ("Project")

Dear Ms. Moore:

The Jewish Community Center of San Francisco (JCCSF), located at 3200 California Street, has been working closely with the developer of 3333 California and the City on this project. Our comments below, in response to the project Initial Study (IS), supplement those set forth in our attached 10/20/17 letter responding to the Project NOP. We believe that the EIR should contain specific construction mitigations designed to consider the following construction-related concerns, which we have developed in conjunction with Cahill Contractors, the contractor which built the JCCSF building:

1. Construction Traffic, Staging and Safety – We have 4500 daily users ranging from newborns in strollers to school children to frail older adults. Our only access point for pedestrians and cars is from California Street (except for preschool pick-up and drop-off which enters off Walnut Street but exits onto California Street.) Many of our users and employees routinely cross the California/Presidio and California/Walnut intersections to enter or exit our building. As a result, we are concerned about disruption to our facility caused by construction traffic on California Street and by California Street southside parking lane closures (IS pg.77) during the construction period. We request that the EIR study these considerations in an effort to minimize these impacts.
2. Construction Dust and Hazardous Materials – We are concerned about safety to our users and employees from exposure to dust and potentially hazardous materials during the construction process, especially given that many of them are sensitive receptors – e.g. young children and older adults (pgs. 144-145, Impacts AQ-2 and AQ-3). It is important that Best Management Practices are employed to minimize these potential hazards (especially given that winds pick up in the afternoon with fog).

1
(TR-6)

2
(AQ-1)

3. Construction Vibration and Noise – The IS notes (pg. 142, Impact NO-3) that vibration is a potential issue for the SF Fire Credit Union. We are similarly concerned by construction related activity and request that the EIR consider potential impact to the JCCSF building – including our underground pool, parking and overall structure. [Additionally, in light of the fact that we have approximately 170 preschoolers who use our outdoor play yard every day from 8:00 am – 3:00pm, we would like to make sure that the Impact NO-2 analysis considers construction noise impacts on these sensitive receptors.]
4. Dewatering/Subsidence - When we built the JCCSF, we pumped a significant amount of water to draw down the water table to perform construction. Please study this issue to confirm if this issue will apply to this project and if so please study the impact on the JCCSF including potential settlement.

3
(NO-2)

4
(NO-1)

5
(GEO-1)

Additionally, please note that we continue to strongly support the inclusion of 60 on-site public parking spaces on the Project site given that the Project is causing not only the loss of current public parking on the site but also the loss of significant neighborhood street parking (*i.e.* conversion of 15 on-street parking spaces to loading zones and the loss of 36 on street parking spaces.)

6
(TR-11)

We look forward to continuing to work collaboratively with the City and the Project developer, and remain excited about the increased housing density and the activation of the streetscape created by the Project. Thank you for taking these additional items into consideration.

San Francisco, CA 94103
Case # 2015-014028ENV

RE: Response to Notice of Preparation (“NOP”) for 3333 California Street Project (“Project”)

Dear Ms. Moore,

I am writing on behalf of the Jewish Community Center of San Francisco (JCCSF) located at 3200 California Street in response to the Project NOP. As you consider the EIR scope, we request that you address the environmental issues described below that are of concern to the JCCSF. We have met on multiple occasions with Project representatives and found them to be very forthcoming in their desire to work with the JCCSF to address our concerns and find mitigation solutions. We are submitting these comments so that the Project can be the best it can be and because there are certain unique aspects of the JCCSF of which we want the city to be aware. We look forward to continued productive discussions with the city and the developer.

The JCCSF is a 501c3 organization which has been in existence for almost 140 years, providing social, cultural and physical programs that are open and welcoming to all, including, by way of example, after school programs, holiday programs, youth sports, arts enrichment and older adults exercise and music programs. Our rebuilt facility reopened in 2004 and serves approximately 4500 users every day who range in age from newborns in strollers to frail older adults. As a result, our primary concerns relate to safety – *e.g.*, traffic, air quality, construction and noise – and our continued ability to use our outdoor areas (roof and courtyards) for programming. Your scope likely already includes these general issues, so this letter explains the specifics as they pertain to the JCCSF.

1
(GC-1)

A. **Traffic/Safety**: The TIS should evaluate:

1. Impacts of Project traffic on: the white zone in front of 3200 California; the Muni bus stops on Presidio and California Streets; traffic flow on California Street; and the ability of JCCSF users to safely cross California Street, as detailed in the attached 6/3/16 letter to you. All the issues in that letter continue to be relevant, except that we are pleased to note that the developer has eliminated the midblock entrance on California Street directly across from the JCCSF. We request that the TIS address the other issues in the attached letter.
2. Conflicts between the Walnut Street entrance to the Project (location of its passenger loading and retail parking entrances) and the JCCSF Walnut Street drive-through for preschool pick-up/drop-off and the Jackson Muni line, detailed in the attached letter.

2
(TR-7)

3. Project traffic impacts on the JCCSF accounting for the fact that many of the core JCCSF users are families with small children who require safety restraints in their cars, and consequently require extra timing loading and unloading children from cars in the JCCSF loading zone and in the preschool pick-up and drop-off zone. It is the JCCSF's observation that families with young children have been slow to adapt to ride share or public transit. 3
(TR-10)
4. Impacts on California Street and Walnut Street traffic from the Project's proposed: commercial loading spaces; residential move-in and move-out use of on street parking spaces; two bus stops on California; Walnut street bulb-out. 4
(TR-11)
5. JCCSF desire for continued availability of publicly available spaces at the Project, especially given the Project's elimination of 33 on-street parking spaces 4
(TR-11)
6. Our traffic consultant, Fehr and Peers, raised the following specific traffic-related concerns:
 - a. Passenger Loading - The TIS should evaluate passenger loading needs on California Street to minimize potential effects on JCCSF passenger loading and Muni service. The site plan includes mixed use office, retail, and childcare facilities along California Street east of Walnut Street. These uses are likely to generate demand for passenger loading and commercial loading activities. However, the NOP states that the Project will include three passenger loading zones (Masonic Avenue, Euclid Avenue, and Laurel Street) and two commercial zones (both near the Laurel/California intersection) but does not include (or mention) any spaces on California Street near the JCCSF. The TIS should quantify passenger loading (including Transportation Network Companies) and commercial loading demand, and identify an appropriate amount of curb space on California Street to ensure minimization of spillover that could affect JCCSF operations. 5
(TR-10)
 - b. Traffic Circulation and Pedestrian Safety 6
(TR-8)
 - i. California Street: The TIS should evaluate sidewalk capacity on both sides of California Street with respect to Project-related pedestrian trips, particularly at bus shelter pinch points.
 - ii. California/Walnut Intersection: The TIS should evaluate left turn restrictions as a means of mitigating the pedestrian safety effects of unprotected left turns across California Street by Project-related traffic.
 - iii. California/Presidio Avenue intersection: The TIS should assess the removal of the right-turn (slip) lane on California Street as a means of mitigating the pedestrian safety effects of free right turns by Project-related traffic.
 - c. Transit - The TIS should consider the need for bus bulbs to handle Project-related transit ridership. 7
(TR-9)
 - d. Cumulative - The TIS should consider the cumulative effects of the Project in relation to other nearby projects that are currently in the planning stages. 8
(TR-12)
- B. **Shadow, Wind and Noise** – The EIR should examine Project shadow, wind and noise impacts on outdoor program use of the JCCSF roof and courtyard spaces. 9
(GC-1)

We understand that a project of this scale and magnitude has a longer than typical construction period and, therefore, we anticipate that you will be examining the impacts of the seven-year construction period on such issues as air quality, toxic waste removal, ingress and egress, staging, traffic and noise.

9
(GC-1)
cont'd

Among other aspects we are excited about the increased housing density and the activation of the streetscape this project creates. We look forward to continuing to work collaboratively with the city and the developer. Thank you for taking these items into consideration in the EIR.

Sarah Jones, Director of Environmental Planning
Daniel A. Sider, AICP, Senior Advisor for Special Projects,
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-6378

Dear Ms. Jones and Mr. Sider,

I am writing on behalf of the Jewish Community Center of San Francisco (JCCSF) located at 3200 California Street with respect to the proposed Prado/SKS 3333 California Street and TMG CPMC projects. We understand that the former has submitted its PPA and EEA applications but that the latter has not yet done so. As you review those applications and consider the scope of their traffic/circulation studies, we thought it important to share our perspective on some of the safety-related traffic/circulation issues in the neighborhood, so that you have that background in mind as you consider the appropriate analysis for these two proposed projects. We have met on multiple occasions with the developers of both projects and find them to be very forthcoming in their desire to work with the JCCSF to address our concerns and find mitigation solutions for the issues identified below. We look forward to productive discussions with both developers to find solutions to these issues.

The JCCSF is a 501c3 organization which has been in existence in San Francisco for almost 140 years, providing social, cultural and physical programs that are open and welcoming to everyone. Our rebuilt facility located at 3200 California Street opened in January 2004 and serves users of all ages ranging from newborns in strollers to the frail elderly. Because we serve so many children and older adults, we are very focused on safety concerns around traffic/circulation. In the 12 years since it has opened, the JCCSF has observed an increasing number of traffic/circulation problems in the vicinity of 3200 California, primarily attributable to conflicts with MUNI and increasing amounts of westbound and eastbound traffic on California. Given that the surrounding neighborhood is currently in the beginning phases of a number of significant development projects which would likely increase traffic in the neighborhood, the JCCSF would like to make sure that the following background conditions and safety issues are taken into account in the city's analysis of the proposed projects and in the development of mitigations to address the issues.

We understand that the City Planning Department has recently shifted from a focus on intersection analysis to vehicle miles traveled from potential projects, but that, in conjunction with the SFMTA, it will still consider the projects' impacts to the adjacent transportation

1
(TR-14)

2
(TR-1)

network, including existing safety and circulation issues (identified in 1-3 below). We look forward to coordinating with the Department, the SFMTA and the developers to create a safer neighborhood for all users.

2
(TR-1)
cont'd

1. The white zone in front of 3200 California.

This zone extends the full length of the building on California. This space is used as a drop off/pick up point for participants, including parents, transportation services and school buses dropping off and picking up children. It is also the holding zone where cars wait to enter the garage when it is full. Unfortunately, the increase in westward flow traffic along California since the JCCSF opened 12 years ago contributes to a bottlenecking of vehicles entering/leaving our garage/white zone/drive through areas, particularly in the afternoons and evenings, creating congestion and safety concerns. We hope that the city's traffic analysis for the proposed new projects addresses mitigations for any increase in this bottlenecking linked to any potential increase in westbound traffic from the proposed projects. We are particularly concerned about the impact of cars headed westbound on California that may queue as they wait to turn south onto Walnut into the primary entrance to the 3333 project. We look forward to conversations with the developers and SFMTA about potential management, parking and intersection design solutions to mitigate this concern that could be implemented by some combination of the developers, the JCCSF and SFMTA.

3
(TR-7)

2. Walnut Street Drive-Through Conflict with the Jackson MUNI line

The JCCSF has a parent drive-through area that enters the JCCSF property on Walnut Street and exits onto California Street (just west of the JCCSF garage entrance). This drive-through is used by parents to drop off their preschoolers in the morning and pick them up in the afternoon. At peak times (i.e., weekday mornings and late afternoons) the line of cars waiting to enter this area will back up and wrap around onto California Street, blocking the drive-through exit. Space is at a premium at this Walnut/California intersection, given that MUNI's Jackson line heads west on California and then turns north onto Walnut (the buses have little room to manoeuvre around the cars, as they run on overhead electric lines, and the lines of cars and buses then interfere with each other). Recently, we contacted SFMTA to start to find solutions to this problem. We would like to make sure that the traffic studies for the proposed projects take this concern into account and closely examine the space premium issues at the Walnut/California intersection in order to devise appropriate mitigations in light of the likely increase in traffic at this intersection from cars entering and exiting the 3333 project on Walnut Street.

4
(TR-9)

3. MUNI bus stops on Presidio Street and California Street.

MUNI buses staging on Presidio directly adjacent to the east side of the JCCSF block the views of cars heading south on Presidio and turning west on California. Importantly, pedestrians in the California/Presidio intersection crosswalks can be obscured by the waiting MUNI buses. We are already in conversation with SFMTA about the impact of this conflict on the safety of pedestrians in these crosswalks (particularly older adults who walk more slowly and young children who can be hard to see). We want to make sure that the potential increase in California Street traffic (whether east- or westbound) does not further exacerbate the safety

5
(TR-8)

issues at this intersection. We are hopeful that your analysis might look at different intersection design configurations at California/Presidio that would reduce these safety impacts.

5
(TR-8)

4. UCSF Parking

We understand that the developers of the 3333 project are proposing around 60 public spaces as part of their facility. We are very supportive of the proposal for additional public parking, given that a number of JCCSF employees and users have been using the UCSF lot for many years during peak parking periods at the JCCSF.

6
(TR-11)

5. Midblock passageway

We understand that the initial conceptual design for the 3333 project shows a north/south midblock passageway with a California Street entrance to this passageway across from the JCCSF entrance on California. We are very concerned that this location will encourage jaywalking across the middle of California. We think it advisable that the developers of the 3333 project use design measures to discourage that kind of unsafe behavior and would ask that consideration be given to moving the location of that opening so that it does not encourage jaywalking.

7
(ME-1)

Thank you for your consideration of these issues in the analysis for the proposed projects. We would be very happy to meet with you at your convenience to discuss these concerns in more detail.

Regards,

Craig Salgado

San Francisco Planning Commission
 1650 Mission Street, Suite 400
 San Francisco, CA 94102-4689

Dear President Hillis and Commissioners:

Re: 3333 California Street, Draft Environmental Impact Report
 SF Planning Department Case No: 2015-014028ENV
 Hearing Date: December 13, 2018

December 13, 2018
 Planning Commission

RECEIVED

DEC 05 2018

CITY & COUNTY OF S.F.
 PLANNING DEPARTMENT

INTRODUCTION AND REQUEST FOR EXTENSION OF COMMENT PERIOD

The Draft EIR states that the proposed project would have ***SIGNIFICANT AND UNAVOIDABLE IMPACTS ON HISTORICAL RESOURCES AND NOISE FROM CONSTRUCTION.***

The Draft EIR states that the "proposed project or project variant would cause substantial additional Vehicles Miles Traveled and/or substantially induce automobile travel" but claims that reducing the retail parking would mitigate the impact to less than significant. DEIR pp. 4.C.68 and 80. We will submit comments on these and other matters. 74

We request a 15-day extension of the 45-day comment period on the Draft EIR from December 24, 2018 to January 8, 2018 since the project construction would last for 7-15 years and there is substantial community opposition to the developer's concept. We presented to the Supervisor of District 2 approximately 800 signatures of residents opposing the developer's concept and requested rezonings.

There are two new Full Preservation Alternatives which are feasible.

This Commission should support the Community Full Preservation Alternative because such an alternative is feasible and would avoid substantial adverse changes in character-defining

RECEPTION DESK

1
(TR-5)

2
(GC-3)

3
(AL-2)

San Francisco Planning Commission
 December 5, 2018
 Page 2

features of the historically significant resource. This Alternative would include the same number of housing units as the proposed project (558 units) and the project variant (744 units). This Commission should request that the Draft EIR (DEIR) be revised to substitute the Community Full Preservation Alternative for DEIR Alternative C, because Alternative C would have 24 less housing units than the proposed project and substantial new retail uses, which are not permitted under the current site zoning. Retail was banned when the site was rezoned from First Residential to limited commercial in order to prevent adverse effects on the Laurel Village Shopping Center and Sacramento Street merchants.

Public Resources Code section 21002 confirms that it is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects. The DEIR admits that the developer's proposed concept "would cause a substantial adverse change in the significance of a historical resource." DEIR p. B.41.

1. COMMUNITY FULL PRESERVATION ALTERNATIVE

The Community Full Preservation Alternative would have the same number of housing units as the project (558 units) or project variant (744 units) and would build new residential buildings where the parking lots are located along California Street. Also, a residential Mayfair building would be built on a small portion of the landscaping. Other than that, the historically significant landscaping including the beautiful Terrace designed by the renowned landscape architects Eckbo, Royston & Williams and the majority of the 185 mature trees would be retained and would continue to absorb greenhouse gases. Under this Alternative, the existing 1,183 asf café and 11,500 gsf childcare center would remain in the main building. Approximately 10,000 gsf of office uses in the existing main building could be retained, at the developer's option.

The site would not be rezoned for approximately 54,117 gsf of retail uses or a 49,999 gsf new office building. By using all the newly constructed buildings for housing, some units large enough to be attractive to middle-income families would be provided along with other affordable

3
 (AL-2)
 cont'd

San Francisco Planning Commission

December 5, 2018

Page 3

3 (AL-2) cont'd

housing. Retail uses were banned as a commercial use on the site by Planning Commission Resolution 4109, which still applies, when the site zoning was changed from First Residential to commercial with limitations, in order to prevent adverse effects on the adjacent retail uses in Laurel Village Shopping Center and along the Sacramento Street neighborhood commercial area. See Attachment G, Resolution 4109. This resolution was recorded in the chain of title as a Stipulation as to Character of Improvements and can only be changed by the Board of Supervisors.

4
(PP-1)

The Community Alternative would retain all of the existing office building's character-defining features and the bulk of the character-defining features of the site and landscape. Also, this Alternative would be built in approximately 3 years, as opposed to the 15 years which the developer is requesting in the development agreement so that if "conditions do not exist to build out the entire project, we can phase construction in order to align with market conditions and financing availability." Attachment A, October 12, 2017 email from Dan Safier. An architect is drawing up a graphic of the Community Alternative, which we will submit as comment on the Draft EIR.

5
(AL-2)

2. ALTERNATIVE C: FULL PRESERVATION RESIDENTIAL ALTERNATIVE

6
(AL-3)

There is also a new alternative in the Draft EIR (DEIR) which was not presented to the Architectural Review Committee of the San Francisco Historic Preservation Commission on March 21, 2018.

DEIR Alternative C: Full Preservation Residential Alternative would have 534 residential units plus 44,306 gsf of retail uses. DEIR p. 6.13. Please note that some of the proposed retail uses under this Alternative can be converted to residential uses to add 24 more residential units in order to match the 558 residential units in the proposed project. The DEIR unreasonably configured this alternative to have 24 less residential units than the project, in order to provide a false pretext for its rejection.

Alternative C would not divide the existing office building with a 40-foot-wide pathway, demolish the south wing of the building or destroy the Eckbo Terrace and majority of the

San Francisco Planning Commission
December 5, 2018
Page 4

historically-significant landscaping. (See Attachment B hereto - Alternative C Site Plan from DEIR p. 6.67) This alternative would also have 14,650 gsf of daycare uses. *Ibid.*

According to the DEIR, Alternative C would retain most of the existing office building's character-defining features and many of the character-defining features of the site and landscape. DEIR p. 6.78. It is unclear what the DEIR means by stating that "the glass curtain wall system would be replaced with a system compatible with the historic resource," as the DEIR only states that the replacement would be "a residential system that would be compatible with the historic character of the resource; e.g. operable windows with small panes divided by a mullion and muntins." DEIR pp. 6.77-6.78. Illustrations do not appear to have been provided. It is also unclear what the DEIR means by stating that the proposed one-story vertical addition (12-feet tall) "would appear visually subordinate to the historic portion of the building" and that "the new rooftop addition would distinguish it from the original building yet be compatible with Midcentury Modern design principles." DEIR pp. 6.77-6.79. Illustrations do not appear to have been provided. The Final EIR should explain exactly what is meant by these two items so that their impact on the character-defining features of the resource can be determined.

6
(AL-3)
cont'd

3. THERE IS AN EXISTING PATHWAY THROUGH THE BUILDING TO MASONIC.

Opening at the front of the main building, there is a pathway through the building that opens into the Eckbo Terrace and continues to Masonic. See Attachment C, photos of pathway.

7
(PD-4)

4. PHOTOGRAPHS OF THE SITE ARE PROVIDED IN ATTACHMENT D.

Photographs of the property that were provided to the State Historic Resources Commission are attached hereto because the DEIR does not appear to contain photographs of the character-defining features, other than the aerial view on the cover. See Attachment D.

8
(CR-1)

5. THE DEVELOPERS AND USCF CONCEALED THE HISTORIC SIGNIFICANCE OF THE PROPERTY.

↓

San Francisco Planning Commission
 December 5, 2018
 Page 5

During the meetings UCSF held with community members prior to granting the developer a 99-year lease for the property in 2015, UCSF concealed the historic significance of the property from the community members. The developers also concealed the historic significance of the site from community members during the time they met with community members to discuss their development concepts. The City of San Francisco disclosed the historic significance of the site in the Notice of Preparation of Environmental Impact Report and Notice of Public Scoping Meeting dated September 20, 2017. However, UCSF knew at least six years earlier that the site was a historically significant resource eligible for listing in the National Register and California Register, as shown in the *UCSF HISTORIC RESOURCES SURVEY* prepared on February 8, 2011 by Carey & Co, Inc. See Attachment E, excerpts from Carey & Co, Inc., *UCSF HISTORIC RESOURCES SURVEY*.

8
 (CR-1)
 cont'd

6. The Public Has Acquired Rights of Recreational Use on Open Space on the Property.

As explained in the letter from attorney Fitzgerald, the public has acquired recreational rights to the open space on the property as a result of the public's use of the used open space on the property as a park. See Attachment F.

9
 (PD-5)

CONCLUSION

The Commission should support the Community Full Preservation Alternative which would construct the new residential uses in approximately three years, rather than 7-15 years, under the developer's proposal. This Commission should also request that the Community Full Preservation Alternative be substituted for Alternative C in the DEIR.

In the alternative, this Commission should propose that Alternative C be modified so that no portion of the exterior of the existing office building be removed or expanded and that 24 additional residential units be constructed in the space allocated for 44,306 gsf of retail uses in Alternative C so that the total number of residential uses in Alternative C would match the 558 units in the proposed project

10
 (AL-2)

11
 (AL-3)

San Francisco Planning Commission
December 5, 2018
Page 6

and 744 units in the project variant. Under this Alternative, as well as the Community Full Preservation Alternative, the existing passageway which extends from the north of the building, through the building, into the Eckbo Terrace, and onto an open-air pathway that directly connects to Masonic Avenue can be used as a pathway open to the public. No division of the main building would be needed to produce a pathway. There is also an existing open-air passageway from the north gate through the property that connects with Laurel Street.

12
(PD-4)

The confirmation of listing on the California Register of Historical Resources is attached.

Dear John, Kathy, Catherine, M.J., and Dick:

First of all John, thank you for the meeting last week at your home. As we agreed in the meeting, we are responding to your recent questions regarding the project. We have re-arranged your questions slightly to group them according to subject. If we haven't answered any of your questions, please let us know. We very much appreciate your willingness to promptly write back to us with your five outstanding issues on the project that are currently preventing us from obtaining LHIA support for the project. We appreciate your doing this so we can set a follow up meeting to find a mutually workable solution.

LHIA Questions:

Q: You also stated that Prado wants to have a development agreement to lock in entitlements for longer periods of time than would normally be allowed?

A: Yes, we are looking to enter into a development agreement (DA) with the City for a term of approximately 15 years. For large projects with multiple buildings like 3333 California Street, the City generally requires a DA. The DA vests the entitlements, protecting the entitlements from changes in the law in exchange for certain community benefits. This would include the community benefit of certainty of the entitlements during that period. If we did not build the project during the term of the DA, then the DA would expire and we would lose the protections of the DA.

Q: What portion of the project would be built first?

A: At this time, we have assumed that the Masonic and Euclid buildings would be built first. In general, we anticipate construction beginning with a staging and site preparation phase, which will include some demolition, then excavation for underground parking, followed by construction of the buildings. With the exception of work on the sidewalks, addition of landscaping, paving, and connecting to the City's various systems and utilities, our general contractor, Webcor Builders, is anticipating that construction will occur within the site. We will be preparing a detailed construction management plan, and the EIR will include mitigation measures around construction emissions, air quality, etc. with which we will have to comply.

Q: What would you expect to be built in each successive phase of the project?

A: At this time, we anticipate the following in each phase – Phase 1: Masonic and Euclid buildings; Phase 2: Center Buildings A and B; Phase 3: Plaza A, Plaza B and Walnut buildings; and Phase 4: Mayfair Building and Laurel Duplexes.

Q: What do you anticipate the total period of time will be during each phase of construction?

A: Our current planning assumes that each phase would overlap, e.g., Phase 2 begins approximately 20 months after Phase 1. Specifically, we think Phase 1 could take 30 months, Phase 2 could take 24 months, Phase 3 could take 36 months, and Phase 4 could take 20 months. Assuming an overlap of phases, from start to finish it could take approximately six to seven years to complete all phases of the construction. This construction phasing and related

durations are consistent with and defined in the phasing schedule under review in our environmental application. While the phasing could be accelerated, we have assumed a relatively conservative approach to the construction phasing.

Q: What is the period of time that you anticipate that construction will occur?

A: We anticipate that construction will occur in the spring of 2020.

Q: What is the reason for constructing the project in phases?

A: By allowing for potential phased construction, we would have the ability to complete and occupy portions of the project as each phase is completed. If conditions do not exist to build out the entire project, we can phase construction in order to align with market conditions and financing availability.

Q: How many extensions do you anticipate requesting for the entitlements?

A: None. Any extension of the DA's term would be a material amendment that would require Board of Supervisor's approval.

Q: During those extended periods, would it be possible for Prado to request changes in the project as related specifically to increased height, increased bulk, increased numbers of residential units, increased amounts of retail or office space? What about the possibility of design changes or other changes? Could Prado apply to change any part of the construction to provide the opportunity to have high rise construction?

A: Once the EIR is certified and the project is approved, any material changes to the project would be subject to new environmental review, would require Planning Commission and Board of Supervisor approvals and also an amendment to the DA. Any increase in height over what is entitled in our project would require a revision to the Planning Code and Zoning Maps that would entail Planning Commission and Board of Supervisors approval.

Q: There are genuine concerns about reducing open spaces and reduced on-site parking places.

A: Open space will be part of the entitlements and will likely be considered by the City as one of the public benefits supporting the DA -- for that reason alone, reducing the amount of it would be very difficult if not impossible. The open space requirements will be carefully described in the project's approvals and will also be recorded against the property. So, as with any material changes to the approved project, any material change to the open space would be very difficult and would involve a public process and City approval. As to parking spaces, as you know, the City would like to see the number of spaces reduced. We plan to continue advocating for the proposed number of project parking spaces in our application.

Q: During the phased construction could Prado transfer shares in the project to provide for new or additional investors?

A: We have no plan to transfer any shares in the project and construction lenders generally prohibit any changes of ownership by the project developer during construction and stabilization of a project. PSKS, along with our equity partners and lenders, intend to provide all of the capital necessary to construct, own and operate the project. We plan to

retain day-to-day control of the project during development, construction, stabilization and ongoing operations. We design and build our projects to hold for the long-term owner. O-LHIA1

We look forward to reconnecting and thank you again for making the time to meet with us.

Sincerely, Dan

The next slides show the horizontality of the composition as the building steps down the hillside. As the nomination explains, the horizontality of the architecture both in its long, low wings, and in the specific design features of the wings—the division of floors by continuous thin edges of concrete and the walls of the floors consisting of long repetitions of similar window units—helped to balance the massing of the Office Building with the surrounding landscape.

These photos of the windows show the modern aluminum materials and the long repetitions of similar window units and the modernist design of the vertical and horizontal dividers in the windows evoking modern art forms. Also, the exterior glass walls provided views into the landscape of the outdoor spaces and at certain times of day reflected landscape features (trees, lawn, walls, patterned pavement, etc.), adding yet another level of integration between interior and exterior spaces. P. 21. This reflection can be seen on these slides.

In 1984, the glass of the windows was tinted, the aluminum frames of the units of the windows were painted brown and the bottom panels of ceramic coated glass were changed from blue to brown. As the nomination explains, this change did not alter the essential features of the building or its “design as a glass box open to its immediate landscape and to distant views.”

Next, we see the exquisite outdoor Terrace— which was set on the east side of the building, framed by the Office and Cafeteria Wings, where it was “protected from the prevailing west wind” and on a portion of the site that had been graded to provide “a good view of a large part of San Francisco.” Here a biomorphic-shaped lawn was framed by a patio, whose exposed aggregate pavement was divided by rows of brick that aligned with the window frames of the building.

Benches attached to the niches of the zig-zag of the seat wall, which enclosed the eastern side of the Terrace, provided places for employees “to relax in the sun during lunch or coffee breaks.” P. 21

Here we see the views of the Transamerica Pyramid and other notable buildings from the Terrace.

In these photos we see the brick aligned with the window frames of the building.

It created a boundary wall along some sides of the property and was transformed into low retaining walls that defined a series of planting beds along the some sides of the property.

EXHIBIT E

UCSF HISTORIC RESOURCES SURVEY

San Francisco, California

February 8, 2011

Prepared for

University of California, San Francisco

Prepared by

HAPEY & CO. INC.
P. 100. 111

The materials Rockrise used for the student housing, their scale, their immediate access to the outdoors – particularly the sliding glass door and wide balconies – and their siting and landscaping, which landscape architect Lawrence Halprin designed, all conform to the principles of the Second Bay Region Tradition. In terms of integrity Aldea 10 retains a high degree of integrity of location, design, setting, workmanship, feeling and association. Some materials have been replaced, such as wood railings or siding, but these alterations are visually compatible. Therefore, Aldea 10 appears to be eligible for listing NRHP/CRHR under Criterion C/3 as an intact example of Second Bay Region Tradition.

745 Parnassus Avenue/Faculty Alumni House

Built in 1915, this two-story building occupies a heavily wooded lot at the southeast corner of 5th Avenue and Judah Street. The L-shaped building faces northwest and wraps around a small enclosed courtyard covered with brick pavers. Textured stucco clads the structure. The primary window type is wood sash, casement. The clay tile-clad, cross-gable roof features exposed rafter tails. The main entrance, which faces the courtyard at the northwest corner of the building, consists of a round projection with a conical roof clad with clay tiles; its door is framed by a deep shaped opening. Three wood, glazed double doors are located at the first story on other side of the main entrance. At the second story, each façade contains four sets of paired casement windows with shutters featuring prominent rivets. The second floor of the west-facing façade overhangs the first and is supported by machicolations. Each gable end features a paired double door at the second story that opens to a small balcony supported by decorative brackets.

The Faculty Alumni House is not known to be associated with persons of significance and therefore does not appear to be eligible for the NRHP/CRHR under Criterion B/2. It does, however, appear to be eligible for the NRHP/CRHR under Criteria A/1 and C/3, for its association with significant developments in the history of UCSF and as an excellent example of Spanish Eclectic architecture with high artistic value. Built for dental students in 1915, the building marks the first attempt to address student needs outside of the classroom. Recreational facilities also coordinated by the dental students followed within a few years. Thus the building expresses early attempts to foster student life at UCSF, rendering it eligible under Criterion A/1. With its stucco cladding, clay tile roof, heavy brackets, rounded entrance and carved archway, the Faculty Alumni House also stands as a fine example of Spanish Eclectic architecture, which was entering its peak of popularity in 1915. The building has not been moved or undergone significant alterations and stands in a residential neighborhood that has changed little since 1915. It thus retains its integrity of location, setting, design, materials, workmanship, feeling, and association.

3333 California Street/Laurel Heights Building

Built in 1957, this four-story building has an irregular plan and occupies the approximate center of an irregular-shaped city block. The intervening spaces are filled with extensive landscaping or parking lots. The concrete slab floors extend beyond the wall surface to form projecting cornices at each floor, and between these projections, an aluminum-sash window wall with dark, slightly mirrored glass forms the exterior walls. Brick veneer covers the walls in certain locations, and the roof is flat. The main entry opens on the north side of the building and features a covered entry with the roof supported on large square brick piers, a small ground-level fountain, and sliding aluminum doors.

The Laurel Heights building appears to be eligible for listing in the NRHP/CRHR under Criteria A/1 and C/3. It stands as the most prominent postwar commercial development in the Laurel Heights neighborhood and dramatically transformed the former cemetery site, rendering it eligible for the NRHP/CRHR under Criterion A/1. No persons of significance are known to be associated with the building; thus it does not appear to be eligible under Criterion B/2. While Edward B. Page was not the most prominent architect in San Francisco during the postwar period, his resume does accord him master

architect status. More importantly, this main building at the Laurel Heights campus is an excellent example of mid-century Modernism and the International Style. Its horizontality makes it a particularly good regional example of the architectural style. For these reasons the building appears to be eligible for the NRHP/CRHR under Criterion C/3.

The Firemen's Fund Insurance Company Building at Laurel Heights retains excellent integrity. It has not been moved and its surroundings have not undergone many alterations. Thus the building retains its integrity in all seven categories – location, setting, design, materials, workmanship, feeling, and association.

513 Parnassus Avenue/Medical Sciences Building

Built in 1954, this L-shaped building rises 17 stories on a steel structural frame and forms the east boundary and part of the north boundary of the Parnassus Heights campus' Saunders Courtyard. The north elevation faces Parnassus Avenue and features ten structural bays. Masonry panels clad the first and tenth bays. In the remaining bays, masonry spandrels with horizontal ribbing separate horizontal bands of aluminum windows. Four exhaust shafts enclosed in masonry panels project from the wall surface and rise from the second story to above the roof line. The ground floor features floor-to-ceiling aluminum windows separated by dark masonry panels at the structural columns. Monumental stairs rise approximately four feet above the sidewalk level to the main entry, where three columns support a flat entry roof. On the south and west elevations facing Saunders Courtyard, masonry panels cover the wall surfaces and separate horizontal bands of aluminum windows. Projecting metal brackets used to support exposed mechanical pipes and ducts attach to the wall surface in line with the structural columns.

The Medical Sciences Building was constructed at a time when UCSF was undergoing its most significant metamorphosis since the Affiliated Colleges were founded in the 1890s. Enrollment skyrocketed during the postwar years and the institution received unprecedented levels of government funding for research and curriculum development. New buildings were added rapidly to meet the demand and reflect the growing prestige. Within this context, MSB appears eligible for listing in the NRHP/CRHR under Criterion A/1, for its association with events or historic themes of significance in UCSF's history. It also stands as a good example of mid-century hospital architecture and the shift from Palladian Style campuses to International Style, highrise buildings. Blanchard and Maher, while not the most prominent architects in the San Francisco Bay Area, also rise to the level of master architects and this building stands as one of the firm's most prominent buildings in San Francisco. Thus, MSB appears to be eligible for the NRHP/CRHR under Criterion C/3. The building is not known to be associated with persons significant to history and therefore does not appear to be eligible for the NRHP/CRHR under Criterion B/2.

MSB has undergone some alterations but appears to retain a good degree of integrity to convey its historical significance. It has not been moved and continues to stand between Moffitt Hospital and the Clinical Sciences building, down the road from LPPI, and among hospital and medical school facilities. Thus it retains its integrity of location, setting, association, and feeling. The building has undergone some alterations, most notably a new exit to Saunders Court and a glass shaft containing a stairwell and vents on the west elevation. As these alterations occur on secondary elevations and are not notable on the primary, Parnassus Avenue façade, they do not significantly detract from the building's overall design, materials, and workmanship. Thus the building retains a good degree of integrity in these areas.

707 Parnassus Avenue/School of Dentistry

Built in 1979, this L-shaped building rises four stories and steps back to form terraces. The lot contains a parking lot to the south and a partially wooded green space at the north. This reinforced concrete

Ms. Mary Woods
Planner - North West Quadrant
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2414

RE: 3333 California St. Development

Dear Ms. Woods:

I am writing regarding the development of the 3333 California Street development, currently the UCSF Laurel Heights Campus (the "Site"). It is my understanding that the San Francisco Planning Department is working with the developer of the Site regarding the initial project plans for the proposed development. The owner of the fee interest and the developer of the Site are limited in their joint ability to develop the Site because the owner of the Site does not have free and clear title; rather the general public holds a permanent recreational interest in all of the open space at the Site. Therefore, any development plans at the Site may not impinge upon this open space.

The general public holds a **permanent** right of recreational use on all of the open space at 3333 California and such rights were obtained by implied dedication. Dedication is a common law principle that enables a private landowner to donate his land for public use. Implied dedication is also a common law principle and is established when the public uses private land for a long period of time, which period of time is five (5) years in California. In 1972, the California legislature enacted Civil Code Section 1009 to modify the common law doctrine of implied dedication and to limit the ability of the public to secure **permanent** adverse rights in private property. Here, however, the existing open space at the Site was well established and well used as a park by the general public long before the completion of the construction of the full footprint of the improvements at the Site in 1966. Therefore, the general public has permanent recreational rights to the open space at the Site; the rights were obtained by implied dedication prior to the enactment of Cal. Civil Code Sec. 1009 in 1972.

Even if the general public had not secured permanent rights to recreational use through implied dedication prior to 1972, the public and countless individuals have acquired a prescriptive easement over the recreational open space. The recreational use has been continuous, uninterrupted for decades, open and notorious and hostile (in this context, hostile means without permission). Every day, individuals and their dogs use the green space along Laurel, Euclid and along the back of the Site at Presidio. Individuals ignore the brick wall along Laurel and regularly use the green space behind the wall as a park for people and for their dogs. The use of the Site has not been permissive. For example, the owner of the Site has not posted permission to pass signs in accordance with Cal. Civil Code Sec. 1008. If such signs ever were posted, they have not been reposted at least once per year. Although it is counterintuitive, an owner typically posts such signs to protect against the public securing adverse rights. One might assume the owner of the Site has not posted such signs, as the owner is aware of the pre-existing and permanent recreational rights the general public has secured to the open space. Because the

13
(PD-5)

public's rights to the open space were secured decades ago through implied dedication, it is not necessary for the general public to rely upon its prescriptive easement rights outlined in this paragraph; rather it is another means to the same end.

It is important that the Planning Department understand these legal issues as any project plan (or any future project description in an Environmental Impact Report ("EIR") for the Site) cannot include development of the open land over which the public has a secured permanent rights of recreational use. It would not be a concession by the owner/developer to leave the open space undeveloped and allow public recreational use as the general public holds permanent recreational rights to this space. It is important to note that even the open space behind the walls that has been used as park space is also included in this dedication to the public. According to well-established case law, a wall or fence is not effective in preventing the development of adverse property rights if individuals go around the wall, as is the case here.

In sum, the open space at the Site cannot be developed as the public secured such rights through implied dedication prior to 1972 (or, alternatively, by prescriptive easement). In reviewing the development plans for the Site, the City cannot decide to allow development of any of the open space as the recreational rights to the space are held by the public at large. Any project description in the future EIR for the Site that contemplates development of any of the open space would be an inadequate project description and would eviscerate any lower impact alternative presented in the EIR. One only need to look to the seminal land use case decided by the California Supreme Court regarding this very Site¹ to see that an EIR will not be upheld if the project alternatives are legally inadequate. It would be misleading to the public to suggest that a lesser impact alternative is one that allows the public to use the space to which it already has permanent recreational use rights.

In sum, please be advised of the public's permanent recreational rights to all of the existing open space at the Site and please ensure that a copy of this letter is placed in the project file.

Sincerely,

Meg Fitzgerald

CITY PLANNING COMMISSION

RESOLUTION NO. 4109

RESOLVED, That Proposal No. Z-52.62.2, an application to change the Use District Classification of the hereinafter described parcel of land from a First Residential District to a Commercial District, be, and the same is hereby APPROVED; subject to the stipulations submitted by the applicant and set forth herein:

Commencing at a point on the S/L of California Street distant thereon 187 feet west of the W/L of Presidio Avenue (produced), thence westerly on said line 707.375 feet to a curve to the left having a radius of 15 feet, thence 23.562 feet measured on the arc of the curve to the left to the E/L of Laurel Street, thence southerly on the E/L of Laurel Street 127.227 feet to the curve to the left having a radius of 60 feet, thence 77.113 feet measured on the arc of the curve to the left to a curve to the right having a radius of 120 feet, thence 149.153 feet measured on the arc of the curve to the right to a curve to the right having a radius of 4033 feet, thence 388.710 feet measured on the arc of the curve to the right to a curve to the left having a radius of 20 feet, thence 35.186 feet measured on the arc of the curve to the left to the northwest line of Euclid Avenue, thence N 73° 12' E on the northwest line of Euclid Avenue 312.934 feet to a curve to the left having a radius of 65 feet, thence 42.316 feet, measured on the arc of the curve to the left to the northwesterly line of Masonic Avenue (proposed extension), thence N 35° 54' E; 380.066 feet to the arc of a curve to the left having a radius of 425 feet, thence 254.176 feet measured on the arc of the curve to the left, thence N 52° 36' 29.74" W, 252.860 feet to the point of commencement. Being the major portion of Lot 1A, Block 1032, containing 10.2717 acres, more or less.

RESOLVED, FURTHER, That this change shall be and at all times remain contingent upon observance by the owner or owners and by his or their successors in interest of the conditions contained in the following stipulations as to the use of the land affected.

1. The character of the improvement for commercial purposes of the subject property, or any portion thereof, shall be limited to a building or buildings designed as professional, institutional or office buildings, including service buildings which are normally accessory thereto.
2. The aggregate gross floor area of all such buildings, calculated exclusive of cellars, of basement areas used only for storage or services incidental to the operation and maintenance of a building, and of indoor or other covered automobile parking space, shall not exceed the total area of the property allotted to such use.

- 2 -

3. For each five hundred square feet of gross floor area in such buildings, calculated as in stipulation 2, above, there shall be reserved and kept available on the property or the portion thereof allotted to such use, one off-street automobile parking space, or equivalent open space suitable for the ultimate provision of such parking space as needed for the accommodation of users of the premises.

4. No such building, other than a minor accessory building having a floor area of not more than 400 square feet, shall occupy any portion of the property which is within 100 feet of the line of the Euclid Avenue boundary thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

5. If the subject property, or any portion thereof, is developed as a site for residential buildings, such buildings shall be limited as follows:

a. No residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

b. No dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than thirty three hundred (3300) square feet, nor shall any such dwelling cover more than fifty percent (50%) of the area of such parcel or be less than twelve (12) feet from any other such dwelling, or be set back less than ten (10) feet from any presently existing or future public street, or have a height in excess of forty (40) feet, measured and regulated as set forth in pertinent section of the Building Code of the City and County of San Francisco.

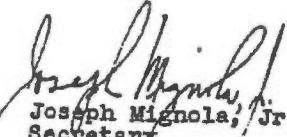

c. No residential building in other portions of the subject property shall have a ground coverage in excess of fifty percent (50%) of the area allotted to such building.

6. Development of the subject property, or of any separate portion thereof, for commercial use as stipulated herein, shall include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building or buildings there shall be submitted to the City Planning Commission, for approval as to conformity with these stipulations, a site plan showing the character and location of the proposed

- 3 -

building or buildings, and related parking spaces and landscaped areas upon the property, or upon such separate portion thereof as is allotted to such building or buildings. It shall be understood that approval of any such plan shall not preclude subsequent approval by the Commission of a revised or alternative plan which conforms to these stipulations.

I hereby certify that the foregoing resolution was adopted by the City Planning Commission at its special meeting on November 13, 1952, and I further certify that the stipulations set forth in the said resolution were submitted in a written statement placed on file.

City and County of San Francisco

Official

EXH 6071 PWA 539
Stipulation as to Character of Improvements on
that portion of Lot 1A, Block 1032 Affected by
Zoning Ordinance 2-52.62.2

Official

The San Francisco Unified School District, being the owner of the above property described, and the applicant in Proposal No. 2-52.62.2 for reclassification thereof from a Second Residential District to a Commercial District, set for hearing before the City Planning Commission of the City and County of San Francisco on October 23, 1952, hereby agrees that the said property shall be developed only as set forth in the following stipulations, which if accepted by the said City Planning Commission shall be observed by the applicant and by its successors in interest for as long as the property remains in the zone classification presently sought. The owner further agrees that no improvements shall be constructed on said property in violation of the conditions hereinafter set forth, and recognizes that the reclassification of the property to a Commercial District is by the Commission's action made contingent, and will remain contingent unless further reclassified, upon adherence to these stipulations.

Stipulations

1. The character of the improvement for commercial purposes of the subject property, or any portion thereof, shall be limited to a building, or buildings designed as professional, institutional or office buildings, including service buildings which are normally accessory thereto.
2. The aggregate gross floor area of all such buildings, calculated exclusive of cellars, of basement areas used only for storage or services incidental to the operation and maintenance of a building, and of indoor or other covered automobile parking space, shall not exceed the total area of the property allotted to such use.
3. For each five hundred square feet of gross floor area in such buildings, calculated as in stipulation 2, above, there shall be reserved and kept available on the property or the portion thereof allotted to such use, one off-street automobile parking space, or equivalent open space suitable for the ultimate provision of such parking space as needed for the accommodation of users of the premises.
4. No such building, other than a minor accessory building, having a floor area of not more than 400 square feet, shall occupy any portion of the property which is within 100 feet of the line of the Euclid Avenue boundary thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

-2-

5. If the subject property, or any portion thereof, is developed as a site for residential buildings, such buildings shall be limited as follows:

a. No residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

b. No dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than thirty three hundred (3300) square feet, nor shall any such dwelling cover more than fifty percent (50%) of the area of such parcel or be less than twelve (12) feet from any other such dwelling, or be set back less than ten (10) feet from any presently existing or future public street, or have a height in excess of forty (40) feet, measured and regulated as set forth in pertinent section of the Building Code of the City and County of San Francisco.

c. No residential building in other portions of the subject property shall have a ground coverage in excess of fifty percent (50%) of the area allotted to such building.

6. Development of the subject property, or of any separate portion thereof, for commercial use as stipulated herein, shall include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building or buildings there shall be submitted to the City Planning Commission, for approval as to conformity with these stipulations, a site plan showing the character and location of the proposed building or buildings, and related parking spaces and landscaped areas upon the property, or upon such separate portion thereof as is allotted to such building or buildings. It shall be understood that approval of any such plan shall not preclude subsequent approval by the Commission of a revised or alternative plan which conforms to these stipulations.

**RE: Fireman's Fund Insurance Company, Determination of Eligibility
National Register of Historic Places**

Dear Mr. Rothman and Ms. Devincenzi:

I am writing to inform you that on August 29, 2018, Fireman's Fund Insurance Company was determined eligible for the National Register of Historic Places (National Register). As a result of being determined eligible for the National Register, this property has been listed in the California Register of Historical Resources, pursuant to Section 4851(a)(2) of the California Code of Regulations.

There are no restrictions placed upon a private property owner with regard to normal use, maintenance, or sale of a property determined eligible for the National Register. However, a project that may cause substantial adverse changes in the significance of a registered property may require compliance with local ordinances or the California Environmental Quality Act. In addition, registered properties damaged due to a natural disaster may be subject to the provisions of Section 5028 of the Public Resources Code regarding demolition or significant alterations, if imminent threat to life safety does not exist.

If you have any questions or require further information, please contact Jay Correia of the Registration Unit at (916) 445-7008.

Sincerely,

A handwritten signature in black ink, appearing to read "Julianne Polanco".

Julianne Polanco

Re: December 13, 2018 Planning Commission Meeting
Item 11: 3333 California Street, Case Number 2015-014028ENV

Dear President Hillis and Commissioners,

Attached are photographs of historically significant characteristics of the site and comments that were presented to the State Historical Resources Commission on May 17, 2018. As a result of the State Commission's approval of our nomination, the site was listed on the California Register of Historical Resources.

Thank you for your consideration of this matter.

Laurel Heights Improvement Association of SF, Inc.
By: Kathy Devincenzi, President
(415) 221-4700

Good afternoon Commissioners. I am Kathy Devincenzi, Vice-President of the Laurel Heights Improvement Association which is a neighborhood association adjacent to the 3333 California Street property. We were fortunate to have had our nomination prepared by such highly qualified historians as Michael Corbett and Denise Bradley. Michael Corbett is widely recognized as one of San Francisco's acclaimed architectural historians. He was the author of the Uptown Tenderloin Historic District nomination with 477 contributing properties, which was accepted by the keeper of the National Register.

Michael was the author of *Port City: The History and Transformation of the Port of San Francisco, 1848-2010* (2011) published by San Francisco Architectural Heritage. Michael was also the principal author of the Port's Embarcadero Historic District nomination report. He is also the author of *Splendid Survivors: San Francisco's Downtown Architectural Heritage* (1979), the survey that formed the basis of the Downtown Plan and remains a standard reference on architecture in the city.

Denise Bradley has over 25 years of experience in providing research, documentation and evaluations of historical significance and served as Senior Landscape Historian for URS Corporation (formerly Dames & Moore) for 10 years before founding her own firm. She has received recent awards for documenting landscapes or studies of cultural resources as to Marin General Hospital, Mission Dolores, Fort Scott, Vallejo's Home and Alcatraz Island. In the past two years, she has evaluated cultural landscapes in the Delta Heritage Feasibility Study, Shellmound Boulevard, Mare Island, Mount Sutro Open Space Reserve, Sunnyvale Civic Center Historic District, and Vallejo, among others.

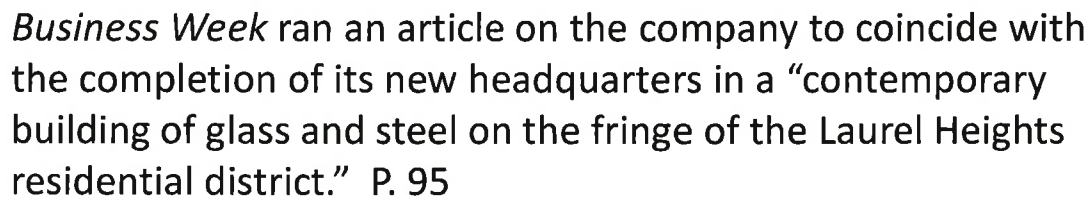

The Fireman's Fund Home Office, a single property including both architectural and landscape architectural elements which were designed to complement each other, is significant under Criterion C as an example of a corporate headquarters in San Francisco that reflects mid-twentieth century modernist design principles.

As an example of the International Style and the idea that form follows function, the building itself expresses the use of new technologies and materials, designing without ornament, an economy of means, a focus on function, an orientation to the landscape, and a process of design that resulted in a characteristic expression in glass and concrete. Key characteristics of a post-World War II suburban corporate headquarters are expressed the design's centrally-sited ...building's low-rise perpendicular wings which frame outdoor spaces designed to function with the building. The landscape was designed to promote the integration between architecture and landscape and uses forms and materials that are characteristic of modernist designs from the mid-twentieth century. The composition is a masterpiece of modern architecture.

4

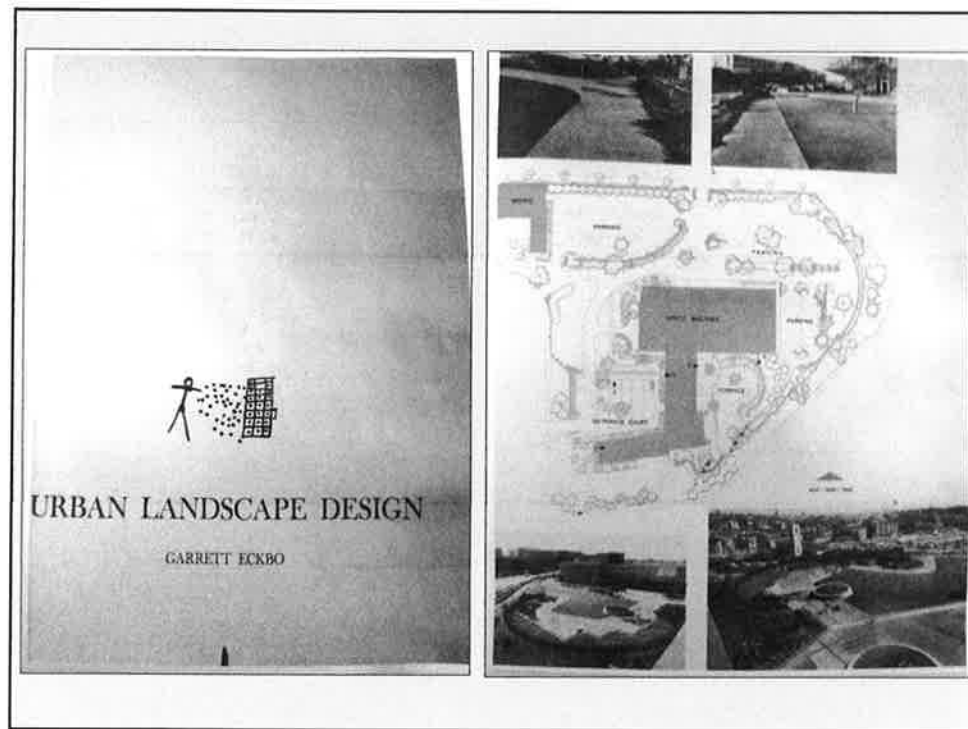

*In September 1957, Architect and Engineer ran a long **cover story** of the building beginning with the company's goal "that the new structure would be the finest and most efficient possible for the conduct of the firm's business and the welfare of its staff" and reporting construction innovations such as special support columns whose dimensions were far smaller than conventional columns, and a layout in which most employees would be within 40 feet of an outside window and a truly superb job of landscaping.*

In 1959, the prominent French journal, *Architecture d'aujourd'hui*, reported on the architecture and landscape design of the property in a special issue on office buildings around the world. Fireman's Fund was the only American building featured among 43 buildings in 16 countries on 3 continents.

The master landscape architect Garrett Eckbo included a description, site plan and nine photographs of Fireman's Fund to illustrate the "Building and Site" chapter of his book *Urban Landscape Design*

The next slides show the horizontality of the composition as the building steps down the hillside. As the nomination explains, the horizontality of the architecture both in its long, low wings, and in the specific design features of the wings—the division of floors by continuous thin edges of concrete and the walls of the floors consisting of long repetitions of similar window units—helped to balance the massing of the Office Building with the surrounding landscape.

These photos of the windows show the modern aluminum materials and the long repetitions of similar window units and the modernist design of the vertical and horizontal dividers in the windows evoking modern art forms. Also, the exterior glass walls provided views into the landscape of the outdoor spaces and at certain times of day reflected landscape features (trees, lawn, walls, patterned pavement, etc.), adding yet another level of integration between interior and exterior spaces. P. 21. This reflection can be seen on these slides.

In 1984, the glass of the windows was tinted, the aluminum frames of the units of the windows were painted brown and the bottom panels of ceramic coated glass were changed from blue to brown. As the nomination explains, this change did not alter the essential features of the building or its “design as a glass box open to its immediate landscape and to distant views.”

Next, we see the exquisite outdoor Terrace— which was set on the east side of the building, framed by the Office and Cafeteria Wings, where it was “protected from the prevailing west wind” and on a portion of the site that had been graded to provide “a good view of a large part of San Francisco.” Here a biomorphic-shaped lawn was framed by a patio, whose exposed aggregate pavement was divided by rows of brick that aligned with the window frames of the building.

Benches attached to the niches of the zig-zag of the seat wall, which enclosed the eastern side of the Terrace, provided places for employees “to relax in the sun during lunch or coffee breaks.” P. 21

Here we see the views of the Transamerica Pyramid and other notable buildings from the Terrace.

In these photos we see the brick aligned with the window frames of the building.

This composite shows all the features just discussed.

Next, we see beautiful geometric detailing in the brick work.

The next 4 slides show the brick wall, which took several different forms and provided a continuous and unifying element around the edges of the site.

It created a boundary wall along some sides of the property and was transformed into low retaining walls that defined a series of planting beds along the some sides of the property.

The brick in the various sections of this wall and in the pavement patterns of the Terrace and Entrance Court was the same as that used in the Office Building and Service Building and helped to integrate the architecture and landscape. P. 21

A good view of the wall stepping down along California Street.

The ziz zag pattern used in the brick wall was employed as edging surrounding the base of an original tree remaining from the Laurel Hill cemetery, paying a sort of homage to its historic status as a representative of that significant garden cemetery, which was the resting place of the builders of the west and 11 United States Senators and the inventor of the cable car..

Here is a composite of the brickwork and walls.

Brick and glass were also integrated into the 1984 entrance gateway . As the nomination explains, the ground level of this structure is clad in the same brick that is used elsewhere on the site and the use of glass on its second level is compatible with the glass windows that dominate the exterior surface of the original building in the Fireman's Fund era. Also, at present, the gateway is partially hidden by trees, lessening its impact..

The additions to the office wing used the same aluminum frame and glass window walls as the original building and enclosed the new auditorium in brick. As with all the additions, the character of the original building remained intact.

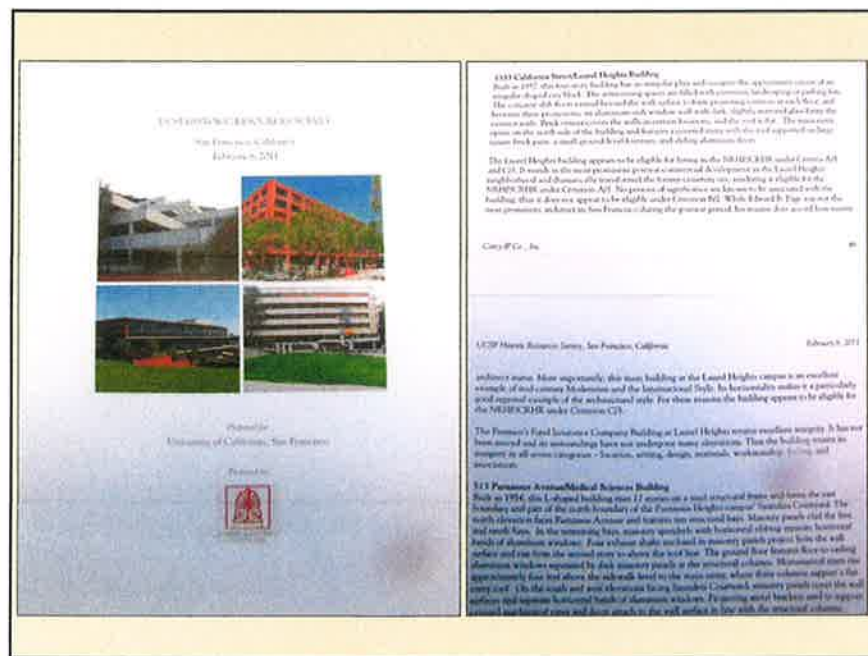

Here we see the Redwood trees planted along the east side of the Office Wing on Presidio Avenue

These two slides show that the exterior landscaping is visible from the interior of the building.

Looking out from café to landscaped terrace.

Masters

In addition to displaying distinctive characteristics of modernism, the property is also significant as the work of three masters, the architect Edward B. Page, the landscape architectural firm of Eckbo, Royston & Williams and its successor and the engineering firm of Gould & Degenkolb and its successor.

Not only was this property developed by 3 masters, Degenbold and Eckbo were giants in their respective fields.

Carey & Company's 2011 UCSF Historic Resources Survey states that the Edward B. Page's **"resume does accord him master architect status.** This survey was commissioned by UCSF when it was owner of the property.

The work on the Fireman's Fund Building that represented a phase in his career and made Edward page locally recognized as a master satisfies the National Register criteria.

His design for the 1954 Mason B. Wells house in Belvedere won an Award of Merit from the Northern California Chapter of the American Institute of Architects...

Three Masters Cont'd

Following the success of the first phase of the Home Office in 1957, Page designed **branch offices in Fresno, Riverside, San Jose, and Los Angeles and he oversaw the architectural work for** branches New York, New Orleans, and Atlanta, where he advised primarily on matters related to the way the insurance business works.” (Nomination p. 43, emphasis added) Under Criterion c, a property may be significant if it represents a work of a master.

As the National Register Bulletin explains, the “work of a master” refers to the technical or aesthetic achievements of an architect or craftsman.” P. 17, As further explained in the Bulletin, a “master” includes “**a known craftsman of consummate skill**, or an anonymous craftsman whose work is distinguishable from others by its characteristic style and quality” as well as “a figure of generally recognized greatness in a field.” P. 20.

“The property must express a particular phase in the development of the master’s career, an aspect of his or her work, or a particular idea or theme in his or her craft.” (See Attachment 2 hereto, U.S. Department of the Interior, *National Register Bulletin, How to Apply the National Register Criteria for Evaluation* (1995) p. 20, emphasis added.) The criteria do not require that an architect be “prolific” or have had significant influence on the architectural community.

Three Masters Cont'd

The nomination explains that:

On the Fireman's Fund project, Page coordinated the contributions of all. He was described as '**the master**' by Loring Wylie, an engineer in the Degenkolb office who had a major role working on the additions of the 1960s. Wylie remembered Page's deep involvement with and lead in solving issues with expansion joints as representative of his high level of competence and control. On another technical matter, he designed an innovative system of dispersed lighting for Fireman's Fund in an effort to provide better working conditions. (Nomination, p. 43)

The nomination documents other projects of Mr. Page.

"In 1947, Page opened his own office in San Francisco. Many of his early projects were in association with others, including the Glen Craggs Housing Project with Wilbur D. Peugh in 1951 and two schools with Cantin & Cantin in 1952

Following the success of the first phase of the Home Office in 1957, Page designed three subsequent additions in 1963-1967, and **branch offices in Fresno, Riverside, San Jose, and Los Angeles**. He also consulted on the designs of branches outside of California including those in New York, New Orleans, and Atlanta,

"As to earlier projects when working in the office of Bakewell & Weihe, "...Page was allowed to work there on his own projects and in 1937-1938 was a draftsman for the Golden Gate International Exposition (G.G.I.E.). Later in life he remembered his design for the Island Club (demolished) at the G.G.I.E. with particular pride....

After receiving his architectural license in 1938, Page worked for himself and for others on small projects from 1939 to 1942. On one of these projects, for Lewis Hobart, another prominent Beaux-Arts architect, he worked on drawings for the floor of Grace Cathedral. From 1942-1947, he worked as the Chief of Architecture and Engineering for San Francisco architect Wilbur D. Peugh supervising wartime projects for U.S. Naval Operations." (Nomination, p. 42)

Three Masters Cont'd

The nomination also documents the mastery of the landscape architect. It discusses a history that accompanied an award presented to EDAW by the American Society of Landscape Architects that noted that ERW “established a compelling portfolio of modernist landscapes” and the partnership became “one of the leading firms in the country, highly regarded for its advanced planning, innovative vocabulary, and the quality of execution.” The nomination also discussed that in 1950, ERW was awarded the Gold Medal in Landscape Architecture by the New York Architectural League. (Nomination p. 46) The nomination also explained that ERW was regularly written about in popular magazines, completed gardens in four states and was a pioneer in expanding the practice of landscape architecture into the scale of neighborhood and community design. (Nomination p. 47) Park and playground projects gained the attention of the national media, and the firm worked on numerous new housing projects and public outdoor spaces including the Venetian Room Roof Garden at the Fairmont Hotel, the entrance court to the Palace of the Legion of Honor and St. Mary’s Park. (Nomination p. 47-48).

The nomination also documents the mastery of the Gould & Degenkolb engineering firm. The Fireman’s Fund building was the first major project of the firm after Degenkolb became a partner and was a successful debut for the partnership, with its innovative structural design that provided open floors with minimal columns and exterior walls of glass. P. 46 The firm designed many of San Francisco’s major structures of the 1940s – 1960s including Park Merced, the Bank of California tower, parking garages at St. Mary’s Square and Civic Center, expansion of the San Francisco airport, and many branches of the Bank of America and Pacific Telephone. P. 45.

CRITERION A: COMMUNITY PLANNING AND DEVELOPMENT

In the post WW II years there was an accelerated general movement of population and growth out of the central cities and into the suburbs.

While there were many reasons for this movement, a primary factor was the growing use of the automobile.

San Francisco was no exception.

Park Merced and Stonestown in 1952; San Francisco State College in 1954: and Fireman's Fund in 1957 are examples of this movement with Fireman's Fund being the leading example of an emerging corporate trend.

One of the strongest traditional patterns at the time was the location of large office buildings downtown.

Between 1946 and 1967, twenty-one large office buildings were built in San Francisco. Nineteen of

these were medium or high rise buildings were built downtown.

The Fireman's Fund new Headquarters was one of the two exceptions to this pattern in both location and design.

It was a low-rise building built in a predominantly residential area.

Apples' new corporate headquarters in Santa Clara shows that the vision pioneered by Fireman's Fund is alive and well 60 years later.

The Fireman's Fund Insurance Company Home Office is eligible for the National Register under Criterion A as one of the principal embodiments of the post World War II decentralization and suburbanization of San Francisco. Fireman's Fund was the first major office building to be built outside of downtown in a suburban setting and it was the first whose design was fully adapted to the automobile.

CRITERION A: COMMERCE

Two conditions of San Francisco's early history and growth, maritime commerce and frequent destructive fires, quickly gave rise to an insurance industry which would play an important role in the local economy and would lead to San Francisco becoming the center for the insurance industry on the west coast.

These destructive fires were the result of the rapid growth of the city and the haphazard construction of its buildings.

In the 1850s alone, fires destroyed large parts of the city on at least six occasions.

At the time fire insurance was provided by distant companies at exorbitant rates, if available at all.

More than thirty local insurance companies formed in San Francisco in the 1850s and 1860s.

Fireman's Fund was formed in 1863 and was the only local insurance company left in business by 1895.

Fireman's Fund succeeded where other local companies failed for a number of reasons:

1. It quickly established branch agencies throughout the United States and abroad;
2. It paid all its claims in a number of high profile situations which gave it a reputation for honesty and reliability;
3. It was a leading innovator within the industry.

Fireman's Fund was the only company to pay 100% of its claims in the Chicago fire of 1871.

By the time of the 1906 earthquake Fireman's Fund was the most trusted and leading locally based insurance company in San Francisco, a position that it has never relinquished.

In the 1906 earthquake and fire its building and all its records were destroyed. Based on "word of mouth" it again paid 100% its claims by again assessing its shareholders.

As noted above, its pre-eminent position was also due to innovation and early adoption of new ideas:

1. In the nineteenth century it was a pioneer in insurance for agricultural products.
2. At the beginning of the twentieth century it was a pioneer in automobile insurance and one of the very first to sell it nationwide.
3. Likewise it led in new fields such as life insurance and health and accident insurance.

In the 1920s, Fireman's Fund grew substantially and was known as " 'the Tiffany' of the insurance world."

Fireman's Fund was to insurance what Bank of America was to banking. Both were home grown businesses which built reputations of excellence on respect for their employees, policyholders and shareholders.

The growth of the postwar years produced a great need to consolidate in one location so the company selected Laurel Heights in 1953.

Fireman's Fund was unique, moving to the suburbs to provide their employees a better working environment closer to their homes.

The Fireman's Fund Insurance Company Building is eligible for the National Register under Criterion A for its association with the growth and development of the San Francisco insurance industry, an important industry in the history of the city from the Gold Rush to the present.

In particular, it represents the post World War II boom in San Francisco's insurance industry when many companies built new office buildings.

At that time, Fireman's Fund was one of the largest insurance companies in the United States. It was the only major insurance company headquartered in San Francisco.

It was a leader among all insurance companies in San Francisco in its embrace of new ideas, symbolized by its move away from downtown to an outlying location.

Historic Preservation

Developers Plan:

Demolish Executive & Cafeteria Wings

Cut 30 ft gap through main building

Add 3 floors to remaining truncated sections

Demolish the Terrace, Children's Childcare Playground; Redwood Trees

Bulldoze All Landscaping

Number of New Housing Units: **558-744**

Schedule to complete critically needed units: **15 years**

Neighborhood Plan:

Retain entire Historic Building completely

Re-purpose Historic Building

Retain the Terrace, Children's Childcare Playground; Redwood Trees

Preserve Landscaping

Number of New Housing Units: **558-744**

Schedule to complete critically needed units: **3 years**

This is **NOT** a Housing Issue but an Historic Preservation Issue.

K. Zushi

EIR responses to comments). But see *Burrtec Waste Indus., Inc. v City of Colton* (2002) 97 CA4th 1133, 1140, 119 CR2d 410 (court refused to apply presumption in negative declaration case when record contained no evidence that required notice was posted, but contained evidence that prior notices had been posted). If a claim of improper notice is later raised, and there is some evidence supporting that claim, evidence of compliance with the notice requirements may be critical in establishing compliance.

§9.20 B. Review Period

The required time periods for public review of draft EIRs are set forth in CEQA and the CEQA guidelines. See Pub Res C §21091(a); 14 Cal Code Regs §§15087, 15105, 15205. Generally, a draft EIR must be circulated for public review for 30 to 60 days, but the public review period for EIRs submitted to the State Clearinghouse must be at least 45 days (unless a shorter period, not less than 30 days, is approved by the State Clearinghouse). 14 Cal Code Regs §15105(a). Under the CEQA Guidelines, the review period should not be longer than 60 days, except in unusual circumstances, and the review period should run from the date of the public review notice (see §9.17). 14 Cal Code Regs §§15087(e), 15105(a). Occasionally, an agency will decide to establish a review period longer than 60 days. Neither the Guidelines nor CEQA case law have defined an "unusual situation" that may justify a longer public review period.

Agencies may adopt time periods for review as part of their CEQA implementing procedures, consistent with the requirements of CEQA, the CEQA Guidelines, and State Clearinghouse review periods (see §§9.21-9.23). Agencies must notify the public and reviewing agencies of the time period for receipt of comments on draft EIRs. 14 Cal Code Regs §15203(a). CEQA and the Guidelines set forth different rules for projects for which only local review is required (see §9.21) and for projects that are submitted for Clearinghouse review (see §§9.22-9.23).

Failure to circulate a draft EIR for the full required time period is an abuse of discretion. *Gilroy Citizens for Responsible Planning v City of Gilroy* (2006) 140 CA4th 911, 922, 45 CR3d 102.

Re: Draft EIR for 3333 California Street, San Francisco, CA 94118
 Planning Department Case No: 2015-014028ENV
 State Clearinghouse No: 2017092053

As comment on the Draft EIR (DEIR), the Laurel Heights Improvement Association hereby submits for evaluation the Community Full Preservation Alternative and Variant (Community Alternative, unless otherwise indicated) along with the evaluation of that Alternative's compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties: Rehabilitation (SOIS) by Nancy Goldenberg, Principal architect and architectural historian with TreanorHL. Ms. Goldenberg was formerly Principal architect at Carey & Company, Inc.

1
 (AL-2)

Ms. Goldengerg's SOIS evaluation is attached hereto as Exhibit 1, and the Community Full Preservation Alternative/Variant is attached thereto as Appendix A.

The Laurel Heights Improvement Association specifically requests that the Environmental Impact Report evaluate the Community Full Preservation Alternative/Variant with the same degree of specificity as the DEIR used to evaluate the alternatives discussed in the DEIR.

At the December 13, 2018 hearing on the Draft EIR, members of the San Francisco Planning Commission stated that the Community Alternative should be evaluated during the environmental review process with the same degree of specificity that the DEIR used to evaluate the alternatives discussed in the DEIR. In addition, members of the San Francisco Historic Preservation Commission expressed interest in understanding more about the community alternative that was discussed by the public in the hearing held before that Commission on December 5, 2018. (See Ex. 2, December 11, 2018 Letter from Andrew Wolfram, President of Historic Preservation Commission to Environmental Review Officer; video of hearing on SFGOV-TV and transcript of hearing reported by court reporter. It is important that a full evaluation of the Community Alternative be performed because DEIR Alternative C: Full

2
 (AL-3)

Preservation - Residential Alternative would have 24 fewer residential units than the proposed Project and 210 fewer units than the proposed Project Variant. DEIR p. 6.75. Based on this discrepancy and other characteristics of the alternatives described in the DEIR, the Draft EIR failed to present a reasonable range of alternatives for evaluation in the DEIR.

2
(AL-3)
cont'd

The Community Full Preservation Alternative would meet the basic objectives of the project described at DEIR p. 2.12, as follows:

3
(AL-2)

- Redevelop a large site into a new high quality walkable mixed-use community with a mix of uses on site including 558 new residences (744 in the Community Alternative Variant), an existing 1,183 asf café, an existing 11,500 gsf childcare center, 5,000 gsf of existing nonconforming office uses and substantial open space, while building these new residential units adjacent to the Laurel Village Shopping Center, one block from Trader Joe's grocery store and one block from the Sacramento Street neighborhood commercial uses.
- Create a mixed-use project that encourages walkability and convenience by opening the existing north/south throughway on the first floor of the main building to the public and maintaining other existing pathways that pass through the landscaping, building substantial new housing units adjacent to the existing Laurel Village Shopping Center, and providing on-site childcare and on-site office use.
- Address the City's housing goals by building the same number of new residential dwelling units on site as the proposed project (and proposed project variant), including on-site affordable units, in an economically feasible project consistent with the City's General Plan Housing Element and ABAG's Regional Housing Needs Allocation for the City and County of San Francisco.
- Open and connect the site to the surrounding community by opening the existing north/south throughway on the first floor of the main building to the public, designating the Eckbo Terrace as privately-owned, publicly accessible open space, maintaining other existing pathways that pass through the landscaping, and maintaining the extensive existing natural landscaping that provides a welcoming atmosphere for the public.
- Create complimentary designs and uses that are compatible with the surrounding neighborhoods by conforming with the scale of surrounding development and maintaining the active, natural landscaped, neighborhood-friendly spaces along the west, south and eastern perimeter of the site.
- Provide a high quality and varied architectural and landscape design that is compatible with its diverse surrounding context, and utilizes the site's topography

and other unique characteristics.

- Provide substantial open space for project residents and community members by maintaining the existing welcoming, natural green space and walkable environment that will encourage continued use of the landscaped areas and community interaction.
- Incorporate open space in an amount equal to or greater than that required under the current zoning, in multiple, varied types designed to maximize pedestrian accessibility and ease of use.
- Include sufficient off-street parking for residential and office uses below grade and childcare center uses above grade to meet the project's needs.
- Work to retain and maintain the integration of the office building into the development to promote sustainability and eco-friendly infill redevelopment.

The Community Alternative would meet most of the basic project objectives and would be superior to the proposed project/variant because it would maintain the historically significant characteristics of the site by preserving the existing main building and integrated landscaping in its present, neighborhood-friendly, natural form.

The Community Alternative would redevelop a large site with the same amount of new residential units as the proposed project but with a lesser number of commercial uses, retaining the existing café, childcare center and 5,000 square feet of office use on site. The Community Alternative would construct the same number of new housing units as the proposed project/variant in a location that is rich with easily accessible retail uses at the adjacent Laurel Village Shopping Center and is located one block from a Trader Joe's grocery store and Sacramento Street neighborhood commercial uses. Also, a Target variety store is located approximately one-two blocks from the site. Given the location of the project site directly adjacent to the Laurel Village Shopping Center but not near the downtown, the lesser amount of on-site retail and office space that the Community Alternative would provide would not materially impair achievement of Objective 1.

The Community Alternative would meet Objectives 2, 4, 7 and 8 by enhancing the public open space by designating the Eckbo Terrace as privately-owned, publicly accessible open space, opening the existing north/south passageway to the public, maintaining the other existing pathways that pass through the landscaping, and maintaining the extensive existing natural landscaping that provides a welcoming atmosphere for the public. Due to the maintenance of the natural landscape, the welcoming atmosphere would be greater under the Community Alternative and the public accessibility would be similar under the Community Alternative with passageways open to walkers from the north, south and west of the site. On balance, the Community

Alternative would satisfy the Objectives 2, 4, 7 and 8 to substantially the same degree as the proposed project.

3
(AL-2)
cont'd

The Community Alternative would increase the City's housing supply to the same degree as the proposed project/variant but would better meet the Objective of including on-site affordable units, in an economically feasible project consistent with the City's General Plan Housing Element and ABAG's Regional Housing Needs Allocation for the City and County of San Francisco. The Community Alternative specifically includes 56 family-size units (average size 1,821 square feet) for middle-income families in the new California Street Front buildings and additional on-site affordable housing as determined by the Board of Supervisors. In contrast, the proposed project does not state the amount or type of affordable housing that it would have on-site or commit to build the amount of affordable units on-site that are currently required by the Planning Code. The ambiguity in the project description maintains other options, such as paying a fee in lieu of building a portion of the affordable housing on-site or requesting an adjustment under Planning Code provisions applicable to development agreements. Further, the proposed project does not indicate that it would build affordable housing for middle-income families on site, so the Community Alternative would better meet Objective 3 by providing housing for middle-income families, which is the income level for which the City's housing production is the most deficient under ABAG allocations. Thus, the Community Alternative would better meet Objective 3 than the proposed project.

The Community Alternative would better meet Objectives 5 and 6 than the proposed project, because the design of the Community Alternative would conform with neighborhood scale and complement its character by building new structures that conform with the scale and character of surrounding buildings and would maintain the landscaped set backs on the west, south and east of the site, which better integrate the site with the surrounding residential community. In contrast, the proposed project/variant would add two to three additional floors to the existing main building that would not be compatible with the predominant 40-foot height limit in the surrounding neighborhoods, would build 40-foot tall structures along the east side of Laurel Street (with rooftop decks) that would not be compatible with the scale of the residences on the western side of Laurel Street, and would remove portions of the landscaped buffer that now exists between the site and those residences by building new residential buildings on portions of that landscaping.

The Community Alternative would meet Objective 9 to the substantially same degree as the proposed project, because it would provide almost one on-site parking space for each residential unit, but the spaces provided would have direct access, so would be more accessible than the mechanically accessible spaces proposed for the project/variant. The Community Alternative would provide above-ground parking spaces for the on-site childcare use.

The Community Alternative would meet Objective 10 to a far greater degree than the proposed project because the Community Alternative would preserve the existing main building and the majority of its integrated landscaping, including maintaining large Monterey Cypress trees that

remain from the Laurel Hill Cemetery (California Registered Historical Landmark number 760). (Ex. 3, Memo from Denise Bradley concerning Location of Trees that were part of the Laurel Hill Cemetery) Thus, the Community Alternative would be a superior example of sustainability and eco-friendly development. In contrast, the proposed project would destroy character-defining features of the main building by dividing it in two, demolishing its wings, destroying its integrated landscaping by building on top of it and conducting substantial excavation including by removing large portions of the slope of Laurel Hill.

3
(AL-2)
cont'd

CONCLUSION

The Community Alternative meets all the basic objectives of the proposed project and is feasible. It would entail far less excavation for underground garages and be completed in approximately three years, as opposed to the seven to fifteen years which the developers request to construct the proposed project. Moreover, the Community Alternative is far superior as to compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties: Rehabilitation. The project objectives do not even mention compliance with those standards as to rehabilitation of a historically significant resource, which is a telling omission and proof that the statement of project objectives in the DEIR is unduly narrow. DEIR p. 2.12.

Very truly yours,

Laurel Heights Improvement Association of SF, Inc.

3333 California Street
San Francisco, California

Secretary of the Interior's Standards Compliancy Evaluation

INTRODUCTION

This report evaluates three proposed designs for 3333 California Street: the Proposed Project (and Project Variant), Preservation Alternative C from the Draft EIR, and a Community Preservation Alternative put forth by the Laurel Heights Improvement Association of SF, Inc. The 10.2-acre property, in the Laurel Heights neighborhood, consists of two buildings and a landscape designed to function as a single entity, dating from 1957. The buildings were designed by Edward B. Page, while the site was the work of Eckbo, Royston and Williams. The complex was created for the Home Office of the Fireman's Fund Insurance Company, the original tenant. The property is listed in the California Register of Historical Resources and has been determined eligible for the National Register of Historic Places.

METHODOLOGY

Nancy Goldenberg, Principal architect and architectural historian with TreanorHL reviewed the Draft EIR, which includes both the proposed design and several preservation alternatives, including full preservation alternative C. Ms. Goldenberg also spoke to Kathy Devincenzi and Richard Frisbee from the Laurel Heights Association regarding their preferred alternative. Ms. Goldenberg is already very familiar with the property, as she has lived in the nearby Anza Vista neighborhood for over 30 years. Each of the three alternatives (proposed project, alternative C, and the Laurel Heights Association's preferred alternative) will be evaluated according to the Secretary of the Interior's Standards for the Treatment of Historic Properties: Rehabilitation. As used herein, the term "Proposed Project" will include the Proposed Project Variant, unless otherwise indicated.

SIGNIFICANCE SUMMARY¹

The following is the significance summary paragraph from the Draft National Register Nomination:

"The Fireman's Fund Insurance Company Home Office is eligible for the National Register under Criteria A and C at the local level. Under Criterion A, it is significant in the area of Commerce for its association with the San Francisco insurance industry, an important industry in the history of the city from the Gold Rush to the present. In particular, it represents the postwar boom in San Francisco's insurance industry when many companies built new office buildings. At that time, Fireman's Fund was one of the largest insurance companies in the United States. It was the only major insurance company headquartered in San Francisco. It was a leader among all insurance companies in San Francisco in its embrace of new ideas, symbolized by its move away from downtown to an outlying location. Under Criterion A, the Fireman's Fund Home Office is significant in the area of Community Planning and Development as one of the

¹ The district significance is summarized from Michael R. Corbett and Denise Bradley, *National Register of Historic Places Registration Form – Fireman's Fund Insurance Company Home Office*, April 19, 2018, Section 8.

principal embodiments of the postwar decentralization and suburbanization of San Francisco. Fireman's Fund was the first major office building to be built outside of downtown in a suburban setting and it was the first whose design was fully adapted to the automobile.

Under Criterion C, the Fireman's Fund Home Office is significant as the work of three masters, the architect Edward B. Page, the engineering firm of John J. Gould & H.J. Degenkolb/Henry J. Degenkolb & Associates, and the landscape architectural firm of Eckbo, Royston & Williams (ERW)/Eckbo, Austin, Dean, and Williams (EDAW). As a modernist, through his experiences in Paris in 1930, Edward Page had direct links to the birth of modern architecture and to its development in the United States. The Fireman's Fund Home Office is his best known and most important work. The Fireman's Fund Home Office – with its innovative structural design that provided open floors with minimal columns and exterior walls of glass – represents the beginning of the reputation of the Gould and Degenkolb engineering firms as among the leading structural engineers in San Francisco in the post-World War II period. ERW/EDAW was recognized as one of the country's leading landscape architectural firms during the period of significance, and their designs and writings contributed to the popularization of the modernist landscape design vocabulary and to modernism as an approach to creating outdoor spaces that addressed contemporary needs within a broad range of settings. The Fireman's Fund Home Office represents an example of the firm's mastery of modern design within a corporate landscape context. Additionally, the Fireman's Fund Home Office, a single property including both architectural and landscape architectural elements which were designed to complement each other, is significant under Criterion C as an example of a corporate headquarters in San Francisco that reflects mid-twentieth-century modernist design principles. The period of significance is 1957-1967, covering the period from the year when the first phase of the buildings and landscape were completed (1957) to the year the final phase of construction was undertaken (1967) by Fireman's Fund. The Fireman's Fund company continued on this site as a leading insurance company in San Francisco and nationally until it sold the property in 1983. Although there are numerous alterations, these alterations do not alter the essential character of a property and it retains a high level of integrity."

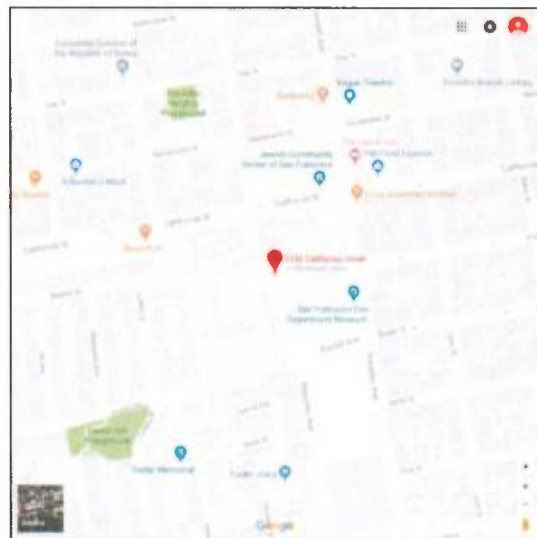

Figure 1 – Location Map

SUMMARY DESCRIPTION

"The Fireman's Fund Insurance Company Home Office is a 10.2-acre property in a central, predominantly residential area of San Francisco called Laurel Heights...The property consists of two buildings and a landscape that were designed to function as a single entity. The main building, referred to in the nomination as the Office Building, is a large three-to-seven-story building located in the center of the property. There is also a much smaller, one-story Service Building in the northwest corner of the property. The two buildings were designed to complement each other in character and materials. The Office Building is a glass walled building with an open character. The Service Building is a brick building with a closed character. The Office Building is an International style building which despite its size is built into its sloping hillside site in such a way as to minimize its presence. Its four wings, each built for different functions, range from three floors to seven floors. It is characterized by its horizontality, its bands of windows separated by the thin edges of projecting concrete floors, and brick trim. The wings of the building frame outdoor spaces whose landscape design connects the outdoors with the indoors both functionally and conceptually. The landscape design includes outdoor spaces for use by employees, parking lots, circulation paths, and vegetation. The principal outdoor spaces are the Entrance Court, the Terrace, and small areas around the Auditorium."²

Figure 2 left: View of Property looking northwest, from Masonic. Figure 3, right: View of property looking east, from the corner of Euclid and Laurel.

The following are the character-defining features of the property, as listed in the Draft National Register Nomination. Since the property has been listed in the California Register of Historical Resources by the California Office of Historic Preservation, and that listing was based, in part, on this list of character-defining features, this is the list that should be included in the EIR.

The character defining features of the Office Building are as follows:

- Plan of the building with wings open along the sides to the immediate landscape and to views of the city.
- Horizontality of massing.
- Horizontal lines of projecting edges of concrete floors.
- Horizontal bands of nearly identical window units.
- Uninterrupted glass walls.
- Window units of aluminum and glass.

² Michael R. Corbett and Denise Bradley, *National Register of Historic Places Registration Form – Fireman's Fund Insurance Company Home Office*, April 19, 2018, Section 7.

- Circular garage ramps.
- Exposed concrete piers over the garage.
- Wrought iron deck railings that match gates in the landscape.
- Brick accents and trim.

Service Building

- Massing of rectangular volumes
- Brick Walls with a minimum of openings

Landscape

Terrace, as the centerpiece of the landscape, designed to integrate the architecture of the building with the site and with the broader setting (through views of San Francisco); key character-defining features include its biomorphic-shaped lawn surrounded by a paved terrace and patio (paved with exposed aggregate concrete divided into panels by rows of brick); brick retaining wall and large planting bed around the east and north sides of the paved patio, custom-designed wood benches, and three circular tree beds constructed of modular sections of concrete.

Entrance Court, providing a connection between the Executive/Visitors Gate on Laurel Street and an entrance to the building on the west side of the Cafeteria Wing; key character-defining features include a central paved parking lot surrounded on its north, east and west sides by narrow planting beds; exposed aggregate sidewalks along the north, east, and west sides of the parking lot; and a low free-standing brick wall along its north side.

Two outdoor sitting areas – one on the east side of the Auditorium and one on its west side – that connect to entrances into the Auditorium; key character-defining features for the area on the west side of the Auditorium include the pavement (exposed aggregate divided into panels by rows of bricks), circular tree bed constructed of modular sections of concrete; and metal benches; key character-defining features for the area on the east side of the Auditorium include the pavement (concrete divided into panels by wood inserted into expansion joints).

Brick wall (constructed of red brick set in running bond pattern similar in appearance to brick used in exterior of main building) that takes several forms and which forms a continuous and unifying element around the edges of the site.

Three gated entrances – one for the employees on California Street and the service and the executive/visitor entrances on Laurel Street – that are integrated into the brick perimeter wall.

Internal Circulation System (entrance drive, service drive, East and West Parking lots).

Vegetation features that help to integrate the character of the Fireman's Fund site with that of the surrounding residential neighborhoods including (1) the large trees in and around the East and West Parking Lots, (2) the lawns on the west, south, and east sides of the property, and (3) the planted banks along Laurel and Masonic Streets.

PROJECT DESCRIPTION

"The Proposed Project would partially demolish the existing office building, divide it into two separate buildings, vertically expand it to include two to three new levels (proposed building heights of 80 and 92 feet) and adapt it for residential use. The two separate buildings would be connected by a covered bridge. Thirteen new buildings ranging in height from 37 to 45 feet would be constructed along the perimeter of the site along California Street, Masonic Avenue, Euclid Avenue, and Laurel Street. The Proposed Project would demolish the existing service building, surface parking lots and circular garage ramp structures. New public pedestrian walkways are proposed through the site in a north-south direction along the line of Walnut Street and in an east-west direction along the line of Mayfair Drive.

A Proposed Project Variant would add three new residential floors (proposed building height of 67 feet) containing 186 additional residential units in the new multi-story building along California Street between Walnut Street and Presidio Avenue."³

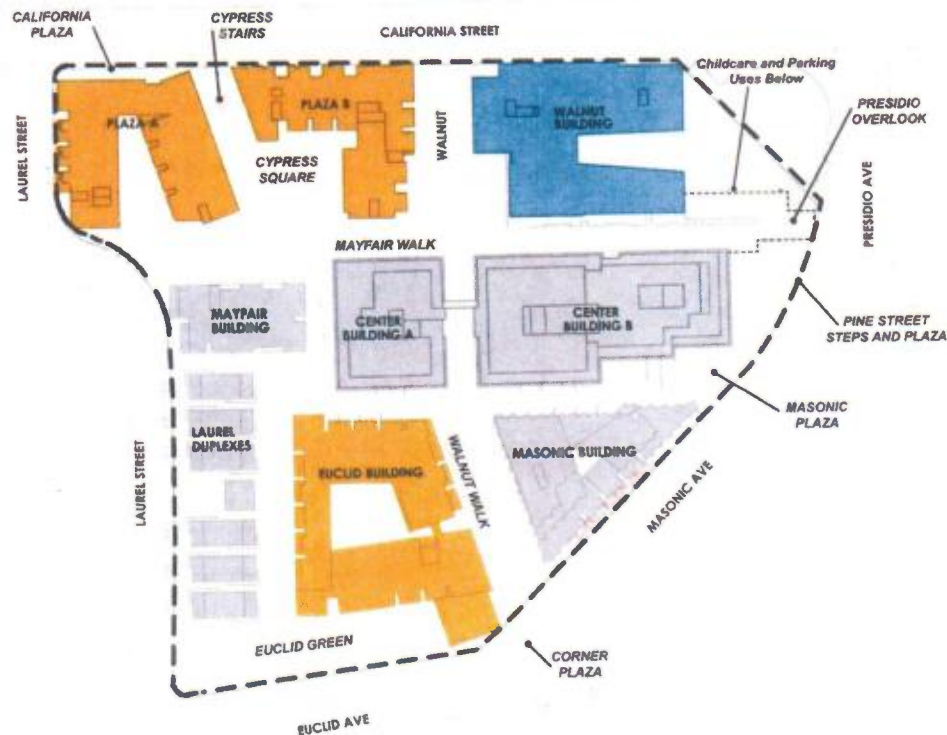

Figure 4 – The Proposed Project site plan

³ The project description is largely taken from the Draft Environmental Impact Report, 3333 California Street Mixed-Use Project, November 7, 2018, pp. S.2 and 2.6.

PRESERVATION ALTERNATIVE C

The Draft Environmental Impact Report lists several project alternatives, some of which have fewer impacts to the historic resource than does the Proposed Project. Full Preservation Alternative C proposes a less intensive development of the site, retaining more of the Main Building and landscape. Under this Alternative, new construction is limited to the northern, and a small area in the western, portion of the site, along California and Laurel Streets. The Main Building would receive a one-level vertical addition, and the glass curtain wall would be replaced with "a compatible design to accommodate the residential use." Along California Street, four new mixed use/multi-family residential buildings would be constructed, with ground floor retail. 534 total residential units would be created.

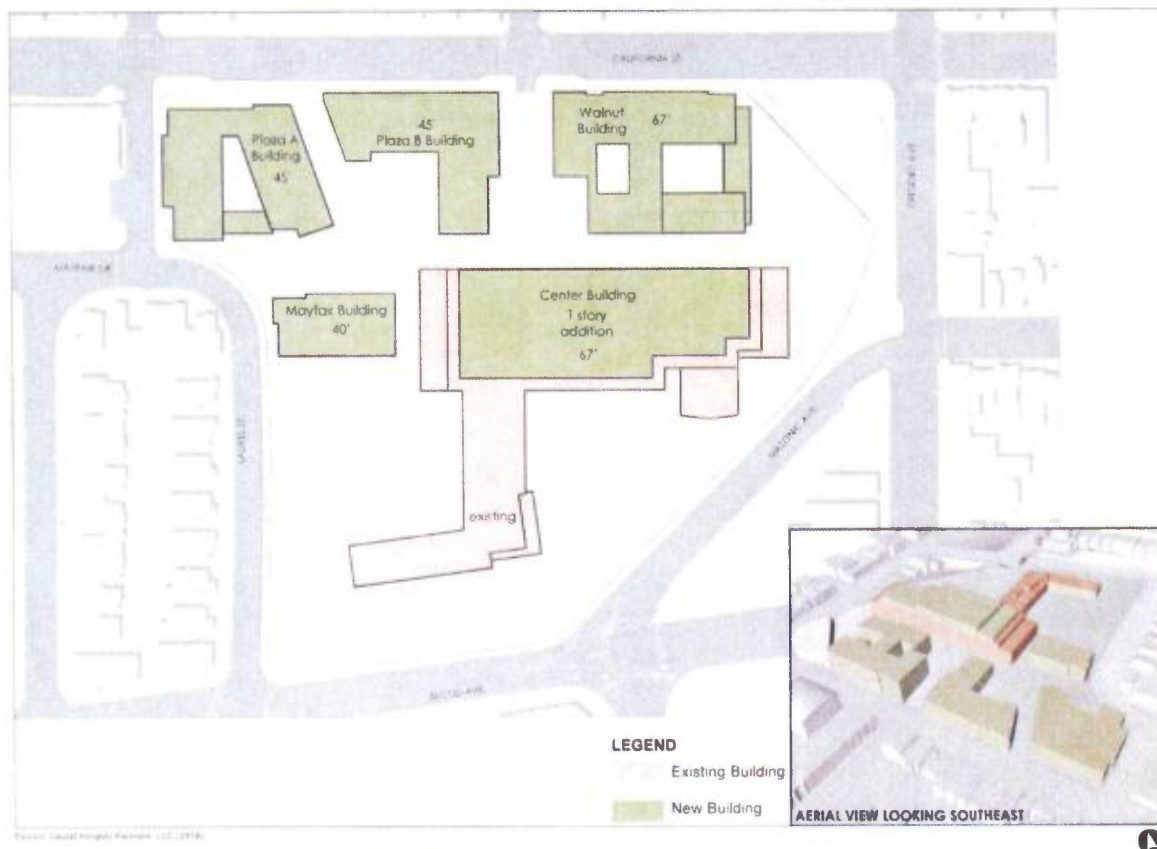

Figure 5 – Full Preservation Alternative C

COMMUNITY FULL PRESERVATION ALTERNATIVE

The Laurel Heights community has come up with its own preservation alternative. This alternative retains more of the historic resource while providing more residential units than does Preservation Alternative C.

4
(AL-2)

The Community Full Preservation Alternative (Community Alternative) would construct the same number of new housing units as the developer's proposed project (558 units) or project variant (744 units) and would be completed in approximately three years rather than the 7-15 years requested by the developer to complete his proposals. It would preserve virtually all of the character-defining features of the main building and its integrated landscaping, which are listed in the California Register of Historical Resources pursuant to Section 4851(a)(2) of the California Code of Regulations. In addition, the Community Alternative would excavate only for a single, one-level underground parking garage and for the foundation for the Mayfair Building. In contrast, the developer proposes to excavate for three new underground garages including a three-level one.

4
 (AL-2)
 cont'd

The Community Alternative would keep the main building in its entirety, only adding light wells to bring light and air into the center. The existing north-south through passage would remain. As in the other proposals, the Service Building would be demolished. A new residential building would be constructed near the intersection of Mayfair Drive and Laurel Street. Two other new buildings would be constructed along California Street, replacing what are now surface parking lots and the former Service Building. These new buildings would match the scale and massing of the residential townhouse buildings across California Street, and would also be designed to be compatible with the Main Building.

For a complete description of this Alternative, please see Appendix A.

Figure 6 – The Community Full Preservation Alternative

SECRETARY OF THE INTERIOR'S STANDARDS ANALYSIS

The following evaluates the Community Preservation Alternative's compliance with the Secretary of the Interior's Standards for Rehabilitation (Standards). Where appropriate, we also compare the compliance of the Community Preservation Alternative with that of the Proposed Project as well as "Preservation Alternative C," as presented in the Environmental Impact Report.

The Standards are listed below. Each of the 10 Standards is shown in italics, with the analysis of how each of the three proposals – the Community Full Preservation Alternative, the Proposed Project, and Preservation Alternative C from the Draft EIR – meets or fails to meet each standard.

1. A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.

While the historic use of the property was office, with an office building set amongst green space and parking, the conversion of the property to residential could be done while retaining the character-defining features of the building and site. While the proposed Project design does not retain these features, the Community Preservation Alternative does. Therefore, the Community Preservation Alternative design complies with Standard 1.

Since the Proposed Project would destroy most of the character-defining features of the building and site, it does not comply with Standard 1, although given the proposed use, this standard can certainly be met, as is demonstrated by the Community Preservation Alternative. Preservation Alternative C, like the Community Preservation Alternative, does meet Standard 1.

2. The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.

The Community Preservation Alternative retains most of the character-defining features of the main building and site. Most of the new construction will occur at the parking lot along California Street, which is not considered character-defining. The main building will be retained in its entirety, except for lightwells that will provide interior illumination. The landscaping will also be retained. The Proposed Project removes the wing from the main building and cuts it in two. The Proposed Project also destroys most of the existing landscaping. Therefore, while the Community Preservation Alternate complies with Standard 2, the Proposed Project does not.

Preservation Alternative C is more compliant with Standard 2 than is the Proposed Project but will have more impact on the property than will the Community Preservation Alternative. Preservation Alternative C proposes to add a story to the Main Building and replace the building's glass curtain wall. Without knowing the design of the vertical addition, or what will replace the curtain wall, it is difficult to determine whether these features will be compatible. Also, it should be noted that many residential buildings now feature curtain walls, so it is unclear why the existing curtain wall is incompatible with residential uses.

4
 (AL-2)
 cont'd

3. Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.

4
 (AL-2)
 cont'd

The Community Preservation Alternate does not propose adding any conjectural features that would create a false sense of historical development. Therefore, the Community Preservation Alternative complies with Standard 3.

Neither the Proposed Project nor Preservation Alternative C propose changes that would create a false sense of historical development, so these designs would also comply with Standard 3.

4. Most properties change over time; those changes that have acquired historic significance in their own right shall be retained and preserved.

As described in the California Register Nomination, the Main Building was constructed in phases. The first part of the building was completed in 1957. However, its siting, plan and structure were designed such that it could accommodate future expansion. This expansion took place from 1963 to 1967, in three phases, which added wings to the building. The work was designed by the original architect, and constructed by the original contractor for the original client (Fireman's Fund). The wings are now over 50 years old, and are considered part of the historic resource even if they were not part of the original construction. Since that time, most alterations have occurred on the interior, typical of open-plan office buildings. Under the Community Preservation Alternative, the wings would be retained; under the Proposed Project they would not be. The Community Preservation Alternative therefore meets Standard 4, while the Proposed Project does not. Similar to the Community Preservation Alternative, Alternative C complies with Standard 4.

5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a property shall be preserved.

The Community Preservation Alternative will retain all distinctive features of the main building and landscape, including the curtain wall and footprint. And, by not raising the height of the building, its horizontality will also be retained. Character defining features of the site will also be retained. (The Service Building, however, will be demolished under this scheme, as it would under the Proposed Project and Preservation Alternative C. While the Service Building is an original feature of the site and contributes to its historic significance, the loss of this building would have only a minor impact on the overall integrity of the property). Therefore, the Community Preservation Alternative complies with Standard 5.

The Proposed Project is demolishing too much of the Main Building and the landscaping to comply with Standard 5. Preservation Alternative C is superior to the Proposed Project but will have a greater impact on the property than will the Community Preservation Alternative. Alternative C proposes to replace the curtain wall and add a vertical addition, which could impact the building's horizontality, which according to the California Register Nomination is an important character defining feature. Therefore, while better than the Proposed Project, Alternative C does not fully comply with Standard 5.

6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design,

color, texture, and other visual qualities and, where possible, materials. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.

4
 (AL-2)
 cont'd

During the design phase, the property, including building and landscape features, should be carefully surveyed to determine the condition of all character defining features. If any of these features are found to be deteriorated, they should be repaired rather than replaced, and any features that are deteriorated beyond repair should be replaced in kind, or, if substitute materials must be used (if, for example, the same material is no longer available), then the substitute material should match the old in design, color, texture and any other visual qualities. If that is done, then the Community Preservation Alternative will comply with Standard 6.

The Proposed Project, however, since it will remove most of the character defining features of the property, will not comply with this Standard. Alternative C, since it retains more of the historic resource, would not fully comply with Standard 6 because it would replace the glass curtain window wall system "with a residential system that would be compatible with the historic character of the resource; e.g. operable windows with small panes divided by a mullion and muntins." DEIR p. 6.77. The Community Alternative would retain and repair the existing window system if feasible for residential use, or replace it with a residential system that would be compatible with the historic character of the resource.

7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.

No harsh chemical or physical treatments are contemplated at this time. If they are avoided, then the Community Alternative will meet Standard 7.

Since the Proposed Project is removing so much of the resource, the SOIS Analysis in the Draft Environmental Impact Report simply claims that Standard 7 does not apply. The Community Alternative and Alternative C could comply with Standard 7 provided that harsh chemical or physical treatments are prohibited.

8. Significant archeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.

Since the project site was formerly part of a cemetery, it is possible that archaeological resources may be encountered during the construction of any project on this site. Language in the specifications must direct construction personnel to stop work should any archeological features be encountered. A professional archeologist would then be alerted to come and identify, document, and safely remove (if warranted) the feature. If such protocols are put into place prior to the start of construction, the project will comply with Standard 8.

According to the EIR, "Mitigation has been identified to reduce the potential impact to archaeological resources to a less-than-significant level. Thus, the Proposed Project or Project Variant would conform with Standard 8." If Alternative C and the Community Preservation Alternative follow similar protocols, then they too would comply with Standard 8.

9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.

4
 (AL-2)
 cont'd

For the Community Preservation Alternate, the exterior envelope of the Main Building will be kept intact, and new construction is proposed primarily along California Street, where currently non-character-defining parking lots exist. These new structures can be designed such that they are compatible with both the Main Building and the existing buildings along the north side of California Street. This can be accomplished by utilizing brick, glass, and concrete as exterior materials (tying into the materials of the Main Building), while maintaining the rhythm and scale of the townhouses across California Street. The Community Alternative will therefore comply with Standard 9. In addition, the Mayfair Building would be designed to be compatible with the Main Building.

The proposed project, on the other hand, does not comply with this Standard. Portions of the Main building will be removed, and most of the landscape will be destroyed. Therefore, the Proposed Project will not comply with Standard 9.

Preservation Alternative C is more compliant than the Proposed Project. However, the massing of the new buildings along California Street is very different from the buildings across California Street, and from the residential development surrounding the site.

10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

For the Community Preservation Alternative, new construction would be relegated to the parking lots along California Street and a Mayfair Building. The Main Building would retain its existing form, and the curtain wall would be retained if feasible for residential use or replaced with a system that would be compatible with the historic character of the resource (however, given that the present curtain wall, according to the California Register nomination, has become darker since the sale of the building to UCSF in 1985, the curtain wall could be revised if the original tint can be determined.) The work proposed for the Main Building would almost entirely occur on the interior, with the exception of proposed lightwells. So, if the proposed new development is removed in the future, the property could easily be returned to its historic appearance.

The Proposed Project would make so many changes to the building and landscape that it would not comply with Standard 10. Alternative C does better at compliance than the Proposed Project. However, with the developer's proposal to replace the curtain wall and add a story to the building, it is difficult to see how the original form and integrity of the property could be returned if the changes were reversed. Therefore, Alternative C would not comply with Standard 10.

Conclusion

The above discussion evaluates the Community Preservation Alternative's compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties: Rehabilitation. It also discusses how and whether the Proposed Project and Alternative C complies with these standards. Here are the results:

Project Name: 3333 California Street
San Francisco, CA
January 7, 2019

Community Preservation Alternative: Complies with all 10 Standards

Proposed Project: Complies with Standards 3 and 8 only.

Alternative C: Complies with Standards 1, 3, 4, 6, 7, and 8. Partially complies with Standards 2, 5 and 9.
Does not comply with Standard 10.

The Community Alternative is clearly superior in its compliance with the Standards than are the other two designs evaluated. In addition, it provides more housing units than Alternative C, and the new construction is more compatible with surrounding neighborhood development.

Date

APPENDIX A

COMMUNITY FULL PRESERVATION ALTERNATIVE**OVERVIEW**

The Community Full Preservation Alternative would construct the same number of new housing units as the developer's proposed project (558 units) or project variant (744 units) and would be completed in approximately three years rather than the 7-15 years requested by the developer to complete his proposals. The Community Full Preservation Alternative would preserve virtually all of the character-defining features of the main building and its integrated landscaping, which are listed in the California Register of Historical Resources pursuant to Section 4851(a)(2) of the California Code of Regulations. The Community Full Preservation Alternative would excavate only for a single, one-level underground parking garage and for the foundation for the Mayfair Building. In contrast, the developer proposes to excavate for three new underground garages including a three-level one.

The Community Full Preservation Alternative would: (1) convert the interior of the main building to residential uses while retaining the existing 1,183 asf café, 11,500 gsf childcare center, and 5,000 gsf of the existing office space (at the developer's option, this existing office space could be converted to residential use), (2) construct three new residential buildings along California Street where parking lots are now located and also construct a new residential building near the intersection of Mayfair Drive and Laurel Street, (3) provide at least 56 flat-type units affordable to and sized for middle-income families, with additional on-site affordable housing determined by the Board of Supervisors, (4) excavate for only a single, one-level underground parking garage and the foundation for the Mayfair Building, (5) require all freight loading and unloading to be conducted in the underground freight loading areas accessed from Presidio

5
(AL-2)

Avenue and all passenger loading and unloading to be conducted inside the site in turnarounds or in the underground parking garage, (6) retain the historically significant landscaping designed by the renowned landscape architects of Eckbo, Royston & Williams which is integrated with the window-walled main building, including the Eckbo Terrace and existing landscaped green spaces along Laurel Street, Euclid Avenue and Presidio Avenue, which would be designated as community benefits in the development agreement, (7) preserve the majority of the 195 mature trees on the site which are comprised of 48 different tree species (Initial Study p. 16), and (8) maintain public vistas of the downtown and Golden Gate Bridge and the historically significant main building and integrated landscaping. The Community Full Preservation Variant Alternative would add 110 more units to the Walnut Building, which could be used for senior housing, and additional units within the other buildings which would result in smaller unit sizes, as described herein. The Community Full Preservation Alternative and Variant would use all the new construction for residential use and would not rezone the site for approximately 54,117 gsf of retail uses or a 49,999 gsf new office building, as the developer proposes.

THE COMMUNITY FULL PRESERVATION ALTERNATIVE WOULD PROVIDE THE SAME AMOUNT OF NEW HOUSING UNITS IN APPROXIMATELY THREE YEARS WITHOUT DESTROYING A HISTORICALLY SIGNIFICANT RESOURCE.

The Community Full Preservation Alternative (Alternative) would preserve virtually all of the character-defining features of the main building and integrated landscaping, which are listed in the California Register of Historical Resources pursuant to Section 4851(a)(2) of the California Code of Regulations. (Ex. A, confirmation of listing) The window-walled main building would be converted to primarily residential use. This Alternative would have the same

5
(AL-2)
cont'd

number of residential units as the developer's proposed project (558 units) and would be constructed in approximately three years because the existing main building would be converted to residential use at the same time as the new residential buildings are constructed. (See Exhibit B, layout of buildings) The Alternative would entail far less excavation, as it would have only one new level of underground parking garages along California Street and a total of approximately 460 on-site parking spaces. In contrast, the developer proposes to construct four new underground parking garages, including up to three levels of parking, to provide a total of 896 parking spaces for the developer's proposed project (970 parking spaces for the developer's proposed variant).

The Community Alternative would retain the existing Eckbo Terrace and green landscaped areas along Laurel Street, Euclid Avenue and Presidio Avenue, except for a small portion to be occupied by the Mayfair Building. The existing Terrace would be designated as Privately-Owned, Publicly-Accessible Open Space in recorded deed restrictions and would be open to the public from 8:00 am to sundown. The existing passageway that runs through the first floor of the existing main building and opens onto the Terrace and thence onto Masonic Avenue would be retained and opened to the public from 8 am to sunset and marked with signage identifying it as a public thoroughway.

The character-defining features of the existing main building that the Community Alternative would retain include all of the following:

Plan of the building with wings open along the sides to the immediate landscape and to views of the distant city.

Horizontal massing.

Horizontal lines of projecting edges of concrete floors.

Horizontal bands of nearly identical window units.

Uninterrupted glass walls.

Window units of aluminum and glass.

Brick accents and trim.

Wrought iron deck railings that match gates in the landscape.

The character-defining features of the existing landscape that the Community Alternative would be retain include all of the following:

In the Eckbo Terrace, which was designed to integrate the architecture of the building with the site and with the broader setting (through views of San Francisco), key character-defining features include its biomorphic-shaped (amoeba-shaped) lawn surrounded by a paved terrace and patio (paved with exposed aggregate concrete divided into panels by rows of brick), brick retaining wall and large planting bed around the east and north sides of the paved patio, custom-designed wood benches, and three circular tree beds constructed of modular sections of concrete.

The Concrete Pergola atop terraced planted beds facing Laurel Street, which creates a welcoming, shaded transition area where the inside and outside merged. (Draft EIR pp. 4.B.12 and 21)

In the Entrance Court, providing a connection between the Executive/Visitors Gate on Laurel Street and an entrance to the building on the west side of the Cafeteria wing, key character-defining features include narrow planting beds adjacent to sidewalks; exposed aggregate sidewalks, and a low free-standing brick wall along its north side.

In the two outdoor sitting areas on the east and west sides of the area now used as an auditorium, key character-defining features for the area on the west side include the pavement (exposed aggregate divided into panels by rows of bricks), circular tree bed constructed of modular sections of concrete, and metal benches; key character-defining features for the area on the east side include the pavement (concrete divided into panels by wood inserted into expansion joints).

The Brick Wall (constructed of red brick set in running bond pattern similar in appearance to the brick used in the exterior of the main building) that takes several forms and which forms a continuous and unifying element around the edges of the site, would be retained except for the areas of the wall that surround the Service Building and which run along California Street. The brick from these areas will be retained, if feasible, and reused as trim on the bottom portions of the new California Street Back Buildings.

The Community Alternative would retain the three gated entrances - the entrance on California Street at Walnut Street, the service entrance at Mayfair and Laurel Street, and the executive/visitor entrance on Laurel Street. In this Alternative, much of the internal circulation system will be retained (entrance drive, service drive and executive/visitor entrance). All passenger loading, pick-ups and drop-offs will be internal to the site, and turnarounds will be provided in front of the main building to the east of the entrance on California/Walnut and in front of the executive/visitor entrance on Laurel Street. (See Ex. C, circulation and loading plan) All freight loading and unloading will be conducted in the underground freight loading areas accessed from Presidio Avenue.

Vegetation features that help to integrate the character of the Fireman's Fund site with that of the surrounding residential neighborhoods that will be retained include (1) the large Cypress trees in the existing west parking lot area, (2) the lawns on the west, south and east sides of the property, and (3) the planted banks along Laurel and Masonic streets.

The service building and circular garage ramps would not be retained.

In the Community Full Preservation Alternative, the existing 1,183 asf café and 11,500 gsf childcare center would remain in their present locations in the main building. At the developer's option, the existing 12,500 gsf of storage in the main building could be converted to parking spaces or used for underground off-loading or other functions. Approximately 5,000 square feet of the existing nonconforming office space in the main building would remain, which the developer could continue to use for offices. At the developer's option, this existing office space could be converted to residential use.

In the Community Alternative, new residential buildings would be constructed along California Street where parking lots are currently located, and a Mayfair building would also be constructed at the same approximate location as the Mayfair building proposed by the developer. The new California Front buildings would be designed for middle-income families, and their average size would be 1,821 square feet. They would be designed to be compatible with both the main building and the existing buildings along the north side of California Street and would maintain the rhythm and scale of the townhouses across California Street. Each California Front building would be 40 feet tall, approximately 28.5 feet wide and 100 feet in length with 25% of that length consisting of a private rear yard. Approximately 14 new buildings containing 56

5
(AL-2)
cont'd

units for middle-income families would be built in California Front between Laurel Street and Walnut Street.

The new California Street Back buildings would face inward toward the existing main building and be constructed with window walls designed to be compatible with the character-defining features of the windows in the existing main building. They would be sculpted around the large Monterey Cypress trees that remain from the Laurel Hill Cemetery, so the lengths of the buildings would vary from approximately 65 to 50 or 40 feet long, and each building would be approximately 28.5 feet wide. They would have 56 units, with the average unit size ranging from 1,575 to 1,215 to 971 square feet depending on location, and the buildings would be 40 feet tall and be constructed between Laurel Street and Walnut Street. For each residential unit in the California Street Front and Back Buildings, one parking space with direct access would be provided in a new one-level underground garage constructed under these buildings.

In the Community Alternative, approximately 292 residential units would be provided in the existing main building, averaging 798 square feet in size. The developer can configure the size of the units and/or eliminate the office use. Internal Light Courts similar to those described on Developer's August 17, 2017 plan sheets A6.15 and A6.16 will be located where feasible. For these units, parking with direct access would be provided in the existing underground garage in the main building.

A new 40-foot tall Walnut Building would be built along California Street between Walnut Street and Presidio Avenue. This building would contain approximately 118 residential units with an average square footage of 809 square feet. The developer can configure the size of

5
(AL-2)
cont'd

the units. For these units, parking with direct access would be provided in a new one-level underground garage to be built under this building.

In the Community Alternative, a new 40-foot tall Mayfair Building would be constructed approximately east of Mayfair Drive at Laurel Street. The Mayfair Building would have 36 residential units with an average size of 1,073 square feet. The Mayfair Building would not contain an underground parking garage. For these units, parking with direct access would be provided in the new underground garages constructed under the California Street Front and Back Buildings. The Mayfair Building would be constructed of window walls designed to be compatible with the character-defining features of the windows in the existing main building. A small portion of a grassy area of the existing landscaping would be occupied by this building.

Other than removing the circular garage ramps, the Community Full Preservation Alternative would not make any of the exterior or interior circulation or site access changes proposed by the developer in August 17, 2017 plan sheets C.202 or L1.01 or in the “PRELIMINARY DESIGN” dated 08/2018. Under the Community Alternative, all Truck Loading or Unloading would occur in the underground garage accessed on Presidio Avenue, and trucks and automobiles will have ingress and egress to these areas for loading, unloading, pickups, drop-offs and parking. Truck Loading or Unloading will be permitted from 8 am to 8 pm only. Passenger vehicles and automobiles will also have ingress and egress to the site through the Walnut Gate at Walnut and California Streets and through the Mayfair Gate at Mayfair and Laurel streets. Passenger vehicles and automobiles will also have access to a turnaround for passenger loading and unloading through the Laurel Street gate and through the Walnut gate.

5
(AL-2)
cont'd

In the Community Full Preservation Alternative Variant (Variant), there would be 228 residential units with an average of 732 square feet in a 7-floor Walnut Building, which would require a height limit change for this area of the property only. Under the Community Variant, there would be 64 new residential units in the California Street Front Buildings with an average of 1,594 square feet, and 64 new residential units in the California Street Back Buildings with an average of 1,332, 1,275 or 850 square feet; these buildings would be 25 feet wide under this Variant, and lengths would vary with location. Under the Community Variant, there would be 48 new residential units in the Mayfair Building, with an average of 805 square feet. All new buildings would be 40 feet tall except the Walnut Building. The developer could configure the size of the residential units. In addition to the existing café, childcare center and 5,000 gsf of office space, in the Community Variant, the main building would be converted to approximately 340 residential units, with an average of 686 square feet.

The Community Alternative/Variant would comply with all applicable laws and regulations, including by making any modifications in the design needed to achieve such compliance or to provide additional space for necessary functions.

In the Community Full Preservation Alternative, the glass curtain wall of the existing main building would be retained and repaired if feasible for residential use, or replaced with a window system that would be designed to be compatible with the character of the historic resource. DEIR pp. 6.66 and 6.77. In the Community Alternative, any replacements of the glass curtain wall would be compatible with the geometric pattern of the windows in the existing main building.

The Community Full Preservation Alternative Variant would have the same characteristics as the Community Alternative, unless otherwise indicated above.

**RE: Fireman's Fund Insurance Company, Determination of Eligibility
National Register of Historic Places**

Dear Mr. Rothman and Ms. Devincenzi:

I am writing to inform you that on August 29, 2018, Fireman's Fund Insurance Company was determined eligible for the National Register of Historic Places (National Register). As a result of being determined eligible for the National Register, this property has been listed in the California Register of Historical Resources, pursuant to Section 4851(a)(2) of the California Code of Regulations.

There are no restrictions placed upon a private property owner with regard to normal use, maintenance, or sale of a property determined eligible for the National Register. However, a project that may cause substantial adverse changes in the significance of a registered property may require compliance with local ordinances or the California Environmental Quality Act. In addition, registered properties damaged due to a natural disaster may be subject to the provisions of Section 5028 of the Public Resources Code regarding demolition or significant alterations, if imminent threat to life safety does not exist.

If you have any questions or require further information, please contact Jay Correia of the Registration Unit at (916) 445-7008.

Sincerely,

Julianne Polanco
State Historic Preservation Officer

Submitted separately (See A-HPC
[Andrew Wolfram, President, Historic
Preservation Commission])

On December 5, 2018, the Historic Preservation Commission (HPC) held a public hearing in order for the commissioners to provide comments to the San Francisco Planning Department on the Draft Environmental Impact Report (DEIR) for the proposed 3333 California Street Project (2015-014028ENV). As noted at the hearing, public comment provided at the December 6, 2018 hearing, will not be responded to in the Responses to Comments document. After discussion, the HPC arrived at the comments below:

- The HPC found the analysis of historic resources in DEIR to be adequate and accurate. The HPC concurs with the finding that the proposed project would result in a significant, unavoidable impact to the identified historic resource. 6
(CR-2)
- The HPC expressed the importance of the historic resource as an integrated landscape and building. 7
(CR-1)
- The HPC agreed that the DEIR analyzed a reasonable and appropriate range of preservation alternatives to address historic resource impacts. 8
(AL-1)
- The HPC expressed interest in understanding more about a "neighborhood alternative" that was discussed by the public during public comment at the hearing. 9
(AL-2)
- The HPC also supported combining some elements of the different alternatives in order to increase the amount of housing in the Full Preservation Alternative C. Commissioner Hyland specifically requested that Alternative C incorporate some elements from alternatives B and D such as increased building heights along California Street (up to 65 feet), the conversion of some areas of office or retail to residential use, and the incorporation of duplexes along Laurel Street. 10
(AL-3)

The HPC appreciates the opportunity to participate in review of this environmental document.

Sincerely,

A handwritten signature in black ink, appearing to read "Andrew Wolfram", with a long horizontal flourish extending to the right.

Andrew Wolfram, President
Historic Preservation Commission

Subject: 3333 California Street Property
 Location of Trees that were part of the Laurel Hill Cemetery

This memo provides a summary of the reference materials, reviewed as part of the Fireman's Fund National Register Nomination, that provide information on the location of trees at the 3333 California Street property that appear to have been part of the Laurel Hill Cemetery landscape.

In his book *Urban Landscape Design*, Garrett Eckbo described the design process for the mid-1950s landscape design for the Fireman's Fund site, which had been prepared by Eckbo, Royston, and Williams (ERW). In this description, he noted how some of the trees from the former cemetery were saved and incorporated into the Fireman's Fund landscape design.

Considerable care was taken in the arrangement of the building, parking areas, and levels [i.e., grading] to save all the existing trees. Some of the trees were left on mounds of earth where the ground was depressed, and others were contained in wells where the ground was raised. In all cases, special pruning, feeding, aeration, and watering were done during construction to help the trees make the necessary adjustments.

The most impressive of the trees saved are the beautiful specimens of Monterey cypress in the parking areas on the California Street side of the building. Here, too, three very large blue gums are retained. In some ways, the most distinctive specimens saved are the large red-flowering eucalyptus near the corner of California street and Presidio, and the magnificent native toyon or Christmas berry in the parking area above Presidio. In addition to these six live oaks and a very large redwood and Monterey pine are saved. (Eckbo 1964:47).

The locations of the cemetery trees that were saved and incorporated into the Fireman's Fund landscape can best be understood through a review of historical aerial photographs that are attached to this memo.

11
 (CR-1)

Figure 1 shows the extent of the vegetation at the former Laurel Hill Cemetery in 1948 before any grading or construction work associated with the Fireman's Fund Home Office had occurred.

Figure 2 shows the 3333 California Street property in 1955 after grading for the Fireman's Fund Home Office had begun. The site has been cleared of all traces of the former cemetery except for select trees; these trees are circled on Figure 2.

Figure 3 shows the 3333 California Street property in 1958 after the completion of the initial phase of construction on the Fireman's Fund Home Office. Former cemetery trees that have been incorporated into the design, as described by Eckbo, are circled on Figure 3.

Figure 4 shows the 3333 California Street property in 1969, after the addition of the parking garage, auditorium, and office wing extension, which occurred between 1965 and 1967. This construction required the removal of some of the cemetery trees, and the ones that remained in 1969 are circled on Figure 4.

Figure 5 shows the current configuration of the 3333 California Street property. The trees which appear to have been part of the Laurel Hill cemetery vegetation are circled on Figure 5; these include:

- two Monterey cypress trees (#24 and #25 on the SBCA Tree Location Map)¹ on a low mound in the East Parking Lot,
- a blue gum eucalyptus (#118 on the SBCA Tree Location Map)² in the West Parking Lot, and
- several Monterey cypress (#119, #120, and #121 on the SBCA Tree Location Map)³ in the West Parking Lot.

Re: Comment on Draft Environmental Impact Report, 3333 California Street Mixed-Use
Project (State Clearinghouse # 2017092053)

Dear Mr. Zushi:

I am writing on behalf of Laborers International Union of North America, Local Union No. 261 and its members living in and around the City and County of San Francisco ("LIUNA") regarding the Draft Environmental Impact Report ("DEIR") prepared for the Project known as 3333 California Street Mixed-Use Project (SCH2017092053 and Case No. 2015-014028ENV), including all actions related or referring to the proposed demolition and redevelopment of existing buildings and proposed construction of thirteen new buildings containing 558 residential units within 824,691 gross square feet (gsf) of residential floor area, 49,999 gsf of office, 54,117 gsf of retail, and a 14,690-gsf child care center on Block 1032/Lot 003 in the City and County of San Francisco ("Project").

After reviewing the DEIR, we conclude that the DEIR fails as an informational document and fails to impose all feasible mitigation measures to reduce the Project's impacts. LIUNA requests that the San Francisco Planning Department address these shortcomings in a revised draft environmental impact report ("RDEIR") and recirculate the DEIR prior to considering approvals for the Project. We reserve the right to supplement these comments during review of the Final EIR for the Project and at public hearings concerning the Project. *Galante Vineyards v. Monterey Peninsula Water Management Dist.*, 60 Cal. App. 4th 1109, 1121 (1997).

RE: Withdrawal of Draft EIR Comment and CEQA and Land Use Notice Request for the project known as 3333 California Street Mixed-Use Project aka State Clearinghouse # 2017092053

Dear Mr. Zushi:

I am writing on behalf of the Laborers' International Union of North America, Local Union No. 261 ("LIUNA"). LIUNA hereby withdraws its request, sent on April 6, 2018, that the City of San Francisco ("City") send mailed or emailed notices related to the project known as 3333 California Street Mixed-Use Project aka State Clearinghouse # 2017092053 ("Project"). Additionally, LIUNA hereby withdraws its DEIR comment, sent on December 11, 2018. If you could please confirm that the notice request and DEIR comment have been withdrawn would be appreciated.

Sincerely,

A handwritten signature in black ink that reads "Hannah Hughes".

Subject: Discrepancies and Comments with 3333 California St. DEIR
Date: Tuesday, January 08, 2019 9:26:07 AM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

To the planning Commission:

I am deeply concerned of what is occurring in my neighborhood, specifically at 3333 California St. Please read the following:

The developer's request for 15 years to construct the project is suspect. This looks like a plan to sell a new entitlement on an up-zoned property. Developers all over town are selling new entitlements rather than build housing. Alternatives analyzed in the Draft EIR would be built in 3 to 5 years. The Community Preservation Alternative would be built within three years.

1
(PD-1)

I fully support the Community Full Preservation Residential Alternative for 3333

2
(AL-2)

It preserves the Historic Characteristics of this wonderful historic site.
 It provides 558 (or 744 in the Variant) housing units.
 It builds them in three years.
 It does not include the massive unneeded and unwanted Retail/Office/Commercial Complex that the Developer continues to insist upon.
 It does not create 8,000 retail auto trips per day.
 It does not generate approx. 15,000 tons of greenhouse gases.
 It preserves both the present childcare center and the existing café.
 It matches the surrounding neighborhoods for character, style, scale and bulk.

I strongly oppose the Developers Destructive Proposal as it brings excessive, unnecessary, unwanted and destructive noise, pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it poses threats to pedestrian safety; it contributes to climate change.

3
(ME-1)

The Community Full Preservation Alternative will generate ZERO retail auto trips to 3333 as opposed to the 8,000 retail caused the Developers Destructive Proposal.

4
(AL-2)

The Community Full Preservation Alternative will protect the small, family owned businesses in Laurel Village, Sacramento St. and Presidio Ave. A quick walk around these neighborhoods will clearly show the immense pressure these businesses are experiencing. More retail is unneeded and unwanted. It will destroy our local businesses. The Neighborhoods are well served by businesses at Laurel Village, Sacramento St., Trader Joe's, City Center, California St. etc. we do not need more, more, more. We do not need the more than 100,000 square feet of Retail, Office, Commercial space that the Developers Destructive Proposal calls for. One of the reasons the Developer destroys this historic site is to create enough space for this unneeded and unwanted Retail/Office/Commercial (ROC) nonsense.

The CPMC development, a Community supported plan by the way, adds 270 housing units and the Developer and neighbors have agreed to have no Retail. Why is 3333 being treated differently by forcing unneeded and unwanted ROC (Retail/Office/Commercial) against the overwhelming opposition of the surrounding residents?

5
(ME-1)

In a recent Petition Drive at Laurel Village over 800 residents signed the Petition opposing the Developers Full Destruction and Massive ROC plan and supporting the Community's residential Alternative. Three people opposed it the Petition. These signatures were gathered in less than 8 hours. In the Petition Drive the 800 signatories opposed rezoning 3333 and also opposed revoking Resolution 4109, an agreement between the City and the surrounding neighborhoods. "A deal is a deal" was how everyone felt. The Community Full Preservation Alternative will already be more than twice as dense as the surrounding neighborhoods so any rezoning is uncalled for, unneeded and unwanted. These signatures are in the hands of the District 2 Supervisor.

6 (AL-2)
7
(PP-1)

The Developers Destructive Proposal is well named. Based on current estimates, it will generate approx. 15,000 tons of Greenhouse Gases (GHG) and the many associated and far more destructive climate changing gases that accompany the primary CO2. The Community's Full Preservation Alternative will, by comparison, generate approx. 4,100 tons of GHG. The Community Alternative mitigates the GHG generated by more than 70 percent, providing a dramatic reduction in a time of climate change. The GHG calculation is our best estimate. Neither Planning nor the Developer will provide the volume of concrete or weight of steel required. The Developer claims to have built many buildings and many complexes, Planning claims to oversee thousands of such projects and yet no one can even make an educated estimate as to the concrete and steel required.

8
(GHG-2)

Could there be something they want to conceal from the public? Much like they concealed the Historic nature of 3333 for over 4 years?

9
(CR-1)

We pollute less and protect the environment: the Community Alternative will ALWAYS generate less than one third the GHG generated the Developers Full Destructive Alternative: **We destroy less:** we preserve the historic site.

We build less: 4 new buildings versus the Developers' 11 new buildings plus creating two tall towers out of the existing main building. **One single level underground parking garage for 450 spaces** versus a complex of parking garages, some of three levels, for 896 spaces; **We excavate less:** 90,000 cubic yards (9,000 dump truck loads) versus 288,000 cubic yards (32,000 dump truck loads); **We preserve and protect our local businesses and shops:** no added unwanted and unneeded and neighborhood destroying family-owned or small retail or business; **We better protect the health and well being of everyone:** no 13,000+ auto trips to pollute the air,

10
(AL-2)

generate the noise, put pedestrians at risk, unload trucks on the streets, etc. **the Community's solution will always be three times better than the Developers solution.**

10 (AL-1)
cont'd

The Developers Destructive Proposal not only destroys the Historic Site it destroys our climate. Concrete is a major contributor to GHG, in fact the GHG generated by the manufacture of cement and steel equals the GHG generated by traffic. **And, 95% of the cement used in the Bay Area is manufactured in the Bay Area so the GHGs are OUR GHGs.** The cement is not made somewhere else in the country it is made here.

11
(GHG-1)

We fully support housing:

The Community has supported the Lucky Penny (95 units), CPMC (270 units) and now 3333 (558) units. Over 1,000 units in a half mile radius. So please don't offend me and misrepresent the Community's position. We support housing and history; we oppose unneeded, unwanted and unnecessary Retail and mindless destruction of a historic site. **AND** we provide housing in as much as 12 years sooner than the Developers Full Destruction Plan does. The YIMBYs should be 100% in favor of the Community's Full Preservation plan and if they're not then they are being grossly hypocritical.

12
(ME-1)

Recent studies have shown that the City's method of calculating auto trips, and the resulting chaos and congestion is deeply flawed, to the point of being misleading. At the time the VMT (Vehicle Miles Travelled) methodology was developed, SF CHAMP last updated Nov. 2014, the Transportation Networking Companies (TNCs) -Uber/Lyft/Chariot etc. were still in their infancy and so the VMT methodology fails to account for their incredibly disruptive impact. The TNCs average, conservatively, in excess of 170,000 trips per day in San Francisco. Studies also show that TNCs increase passenger trips by almost 10%. There are about 2,000 taxi medallions in San Francisco so TNCs do not just replace taxis they overwhelm them by orders of magnitude.

13
(TR-1)

Also, implementation of the VMT methodology is not mandated until 2019 but as Planning and The Developers were unable to explain away the 8,000 Retail Auto trips generated by the existing, and still acceptable, Level of Service methodology, they implemented the VMT methodology with "refinements." Planning calculates the Developers Destructive Proposal using VMT methodology will generate approx. 5,800 total auto trips for 3333 for Retail + Office + Residential which is an entirely bogus number based on questionable assumptions, such as "The SF Guidelines **do not provide a specific methodology to** assess the number of trips...." Planning has therefore, with no supporting documentation or analyses, applied "appropriate refinements to the standard travel demand...."

Rather amazing that these "refinements" all work in the Developers favor. Nowhere in these "refinements" have TNCs been taken into account!

Oh, by the way, the "refinements" used were created for The Mission Rock Project at Seawall Lot 337 and Pier 48 as well as the Pier 70 Mixed Use District Project!

Seawall Lot 337 & Pier 48 summary:

Project

type Mixed-use, open space, residential, commercial

Project area Approx. 28 acres

Proposed building area 1.3 - 1.7 million sf commercial; 750,000 - 1.5 million sf residential; 150,000 - 200,000 sf retail, 850,000 sf structured parking

Seawall Lot 337 & Pier 48

Pier 70 summary: "The 35acre waterfront mixed-use neighborhood will provide housing, waterfront parks, artist space, local manufacturing and rehabilitated historic buildings." Altogether the redevelopment covers 35 acres and up to 3,025 new units of housing—the exact count is still in flux, with a low end of 1,645—and its roots stretch back a decade to a 2007 port plan.

WOW! What remarkably similar projects to 3333. What "refinements" could possibly be comparable?

Simply bogus.

attempts to misrepresent and mislead the public.

The DEIR consistently

inaccurate and invalid and NOTHING demonstrates this better than the above.

It is incomplete, incorrect,

Under their previous, Level of Service, methodology they would have calculated 8,000 retail trips alone.

I I think it

safe to say that the numbers presented by Planning are simply "Developer friendly!". Their VMT methodology with "refinements" will generate fewer trips, especially since there are no criteria for calculating the impact of TNCs, but there is nothing in the legislation that remotely suggests it would generate 35% less trips! This entire section is suspect and Planning must explain this profound discrepancy.

As noted

above, nowhere are the TNCs incorporated into the calculations.

All of which renders the Traffic Analysis incorrect, incomplete, inaccurate, invalid.

The Planning Department proposes to reduce the number of retail parking spaces as a mitigation measure to reduce the significant traffic impact. This is a false assumption and shows the extent to which the Developer and Planning misunderstand, or simply choose not to understand, the impact that the TNCs have.

Planning's mitigation measure is a stone age solution to a digital age problem. How will many people respond to a perceived lack of parking?

They'll simply call a TNC and go

anyway.

Eliminating parking won't eliminate

auto trips it will actually increase auto trips.

MORE trips because of TNCs than if they had to use their own cars or take public transit. People now make trips they would never have made in the past – by any mode of transport.

The

VMT methodology used by the Planning Department fails to account for the impact of

TNCs.

And, the use of TNCs makes the GHG situation worse.

Let's assume I want to go to 3333 by auto. I could personally drive 2 miles to get to the 3333 Retail/Office/Commercial complex, park, then shop or do business, the drive 2 miles home for a total of 4 miles.

Data shows that many people will now use a TNC rather than drive their own cars. This will be even more pronounced if Parking is reduced! So now the

TNC has to come to me, assume 2 miles, and take me the 2 miles to 3333 for a total of 4 miles.

When I go home the same thing happens or an additional 4 miles for a grand total of 8 miles. Twice the GHG generated per trip!

So, not only do we have 8,000 retail auto trips, excluding the effect of TNCs (not addressed) to deal with we have many of them generating significant more GHG per trip!

Planning needs to do a comprehensive analyses using credible data and a credible methodology so that the public knows the extent of the GHG generated.

We are in a crisis with climate change and the methodology shown in the DEIR fails to address this crisis credibly. In fact climate change is more of a threat to the future of San Francisco than housing is and it isn't being addressed accurately in the DEIR.

The Developers Destructive Proposal first demolishes and destroys the Historic Characteristics and nature of 3333.

Then it virtually destroys all of Laurel Hill itself, with the exception of a small sliver at the southwest corner, by excavating the entire site to depths ranging from 15 to 40 ft.

The only area that isn't excavated is under a portion of the existing building! Not sure how they missed that opportunity!

Removal of the demolition debris and the excavated soils will require approx. 32,000 dump truck loads, all of which have to pass through and pollute our neighborhoods.

By contrast, the Community Full Preservation Alternative generates approx. 9,000 dump truck loads, one quarter as many!

After the demolition the Developer has to then deliver all the new materials required to rebuild what they demolished plus 11 new buildings. How many large truck loads, concrete truck loads, etc. will this require?

The Community Alternative only builds 4 new buildings so like the GHG and the debris/soil removals the Community Full Preservation Alternative requires far fewer, probably about one third, or less, as many delivery loads.

A quick look at the turning radii of the trucks, ie. SU-30 Circulation Exhibit and WB-40 Circulation Exhibit clearly demonstrates that all the deliveries during destruction, demolition, excavation, construction and long term operations pose significant threats to traffic safety, pedestrian safety, congestion and pollution. In fact, as WB-40 shows large trucks cannot safely navigate 5 of the 6 major intersections surrounding the site. There are no plans to mitigate this profound situation which will essentially exist from the beginning of the project ad infinitum. Planning and the Developers have simply washed their hands of the problem a la Pontius Pilate.

The Community Full Preservation Alternative will preserve most of the mature trees at 3333, some of which date back to the time of the Laurel Hill cemetery whereas the Developers Destructive Proposal will attempt to spare approx. 4.

The Developers Destructive Proposal surrounds 3333 with five major Loading/unloading zones for TNCs and Freight traffic. Initially the Developers promised that all the unloading would be done underground or on-site and now the site is ringed with these zones! These zones not only eliminate approx. 40 parking spaces but they will create additional traffic congestion and pollution. So we have a ring of loading zones in addition to the inevitable double parking that occurs for deliveries and drop-offs.

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Dear Mr. Zushi

Our family lives at 3320 California Street, a location directly across the street from the planned project and also the block most heavily impacted by this project. We are members of the California Street Homeowners Group, you received the letter of our concerns on Dec 11, 2018, and representatives from our group spoke at the hearing.

Much has been written so we'll leave this note short.

The draft EIR is insufficient in identifying the environmental impacts of the Project and the impacts identified are largely unmitigated.

We strongly support the Residential Alternative plan for 3333. I can assure you that although you may not get a letter from every single resident on "our" block, the support for the residential plan is unanimous.

This plan addresses many of the neighborhood concerns regarding the developers plan including:

1. Can be completed in 3 years, significantly less burdensome for families and elderly
2. Preserves the character of the neighborhood
3. Does not add unwanted and excess retail, supports small business owners
4. Lessens the harmful impacts on the environment
5. Will create far less traffic and safety hazards
6. Does not line the developers pockets at the expense of a community

We DO NOT support the developers plan. The developers plan is clearly profit motivated with a complete lack of concern and respect for the residents of this community.

The residential plan is superior in addressing the city's housing shortage. That is the purpose of this project, correct?

Thank you,
Jim and Jessica Bassuk

Subject: 3333 California St Development Comments

Date: Monday, January 7, 2019 at 1:36:58 PM Pacific Standard Time

From: David Bercovich <davidb@gmail.com>

To: Zushi, Kei (CPC) <kei.zushi@sfgov.org>, Stefani, Catherine (BOS) <catherine.stefani@sfgov.org>, laurelheights2016@gmail.com <laurelheights2016@gmail.com>

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

I live with my family at 3318 California St, Unit 2, San Francisco, CA 94118. Please find my comments below opposing the current development plan and supporting the community alternative. 1
(ME-1)

There is no hardship with the site and so in my opinion no reason to change the zoning to allow the increased height limit, retail etc. There is a reason that the zoning was changed and it should be respected. 2
(AL-2)

There are numerous issues with the current plan including:

- The proposed seven to fifteen- year construction period would hold our neighborhood hostage to the traffic, noise, disruption and dirt that it will create and would likely result in a negative impact on any residents that might need to sell their homes during such an egregiously long construction period. Moreover, the Developers have met with our neighborhood group and advised us on several occasions that they could complete all construction within 2 to 4 years from Project commencement. We surmise that the longer time frame being requested is to reduce the economic risk of the Project and increase return to their investors, perhaps creating many extra years of valuable tax "losses". The Developers need to go back to the drawing board to present a more realistic construction time frame, even if it means altering their proposed design. 3
(PP-1)
- The current proposal has construction staging for three of the four phases and most of this time period directly across from our front doors. We have proposed that the Developer move staging next to each phase in the 10 acre site during construction. 4
(PD-1)
- There is a commercial loading zone being proposed directly across the street from our neighborhood which will create noise and disruption. The Draft EIR's mitigation is to restrict loading to before 7AM and after 7PM, which is even more disruptive to the quiet enjoyment of our homes. Since the Developers have included provisions for all commercial loading to take place underground, there is no justification for the significant adverse impact street side commercial loading would create. 5
(TR-10)
- The garages for our homes back out onto California Street and there was no mention in the Draft EIR of the hazards that will be created as a result of the Project during construction, and particularly with the added traffic that will be created by its proposed retail. 6
(TR-7)

Honorable Kei Zushi,

Much has been written about EIR 3333 California Street project. From where I sit at 3320 Street there have been so little realities for the neighborhood and city as a whole. Massive height increases; lack of true recognition of traffic choked streets; wind tunnel impact on street; darkened corridors; destroyed vistas and treasured flora; major nearly decade long disruption with selfish development; is this what growth means in our City? It is destruction of a community. [I recall some elements of The Invisible Man by Ralph Ellison. Use space for gentle residence.

Remember the false promises of Candlestick?

I fully support the Community Full Preservation Residential Alternative for 3333

It preserves the Historic Characteristics of this wonderful historic site.
It provides 558 (or 744 in the Variant) housing units.
It builds them in three years.
It does not include the massive unneeded and unwanted Retail/Office/Commercial Complex that the Developer continues to insist upon.
It does not create 8,000 retail auto trips per day.
It does not generate approx. 15,000 tons of greenhouse gases.
It preserves both the present childcare center and the existing café.

2
(AL-2)

It matches the surrounding neighborhoods for character, style, scale and bulk.

2
(AL-2)
cont'd

I strongly oppose the Developers Destructive Proposal as it brings excessive, unnecessary, unwanted and destructive noise, pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it poses threats to pedestrian safety; it contributes to climate change.

3
(ME-1)

Let me know if you have any questions.

Dick Frisbie

Robert Bransten

3370 Clay Street

San Francisco, California 94118

Dear Planning Commissioners,

I enthusiastically support the proposed development at 3333 California Street. This development will create more housing in our city, a critical need.

For over fifty years my wife and I have lived just two blocks from California Street and Presidio Avenue. We believe in additional new homes that will allow both city new comers and longtime residents to find affordable and also market rate housing on the city's west side. I also like the proposed five acres of open space and the pedestrian walkways through the site,

1
(ME-1)

Our vibrant city needs to address our housing shortage.

I urge you to support this thoughtful development which creates an opportunity for families to stay in San Francisco.

Subject: 3333 California Street- Support for Neighborhood Alternative Plan
Date: Thursday, January 03, 2019 10:27:56 AM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

To whom it may concern:

I am writing in opposition to the developer's plan for 3333 California Street. The proposal is objectionable for several reasons:

Architecture is not in line with existing neighborhood character.

Retail stores and offices will bring in too much additional traffic and are unnecessary. Existing local stores are more than sufficient for the needs of the neighborhood.

Parking is currently extremely difficult. The developer originally stated loading zones would be on-site or underground however that plan was scrapped. On-street loading zones would eliminate 40 additional street parking spaces.

15-year construction timeline is excessive and unnecessary and as costs spiral invites the sale of an up-zoned property.

THE NEIGHBORHOOD RESIDENTIAL ALTERNATIVE SATISFIES THE NEED FOR ADDITIONAL HOUSING IN SAN FRANCISCO BUT WITH SIGNIFICANTLY LESS DAMAGE TO THE ENVIRONMENT WHILE MAINTAINING THE CHARACTER OF THE NEIGHBORHOOD.

Sincerely,

Barbara and Jim Brenner

homeowners-1809 Lyon Street, San Francisco

Subject: Neighborhood Comment 2015-014028ENV
Date: Tuesday, January 08, 2019 12:43:33 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Dear Mr. Zushi;

The Draft EIR fails to recognize the disproportionate adverse impact the addition of 750 residential units on a 10 acre site will have on the site's immediate neighbors. The Draft EIR only adopts a citywide density metric, and fails to incorporate mitigation for the more local adverse impact. The Draft EIR disregards the immediate adversity such a massive influx of units will have on property owners who chose their homes based on the neighborhood's characteristics.

1
(GC-1)

The Draft EIR fails to include adequate mitigation for the adverse and persistent impact a potential 15 year construction period will have on the neighbors of the Project.

2
(PD-1)

The Draft EIR does not address the traffic impact of ride share drivers driving around the neighborhood waiting for a fare.

3
(TR-2)

The Draft EIR fails to address the deleterious effect of freight loading on a currently entirely residential street. (California between Laurel and Walnut)

4
(TR-10)

The Draft EIR does not mention, much less adequately address, the loss of horizon the Project will create.

5
(CEQA-3)

The Draft EIR does not mention, much less include mitigation requirements for the additional hazards the Project's foreseeable congestion will create for exiting garages on California Street.

6
(TR-7)

The Draft EIR disregards the Project's strategy of privatizing open space which is currently a community resource.

7
(PD-3)

We would welcome the opportunity for dialogue with municipal government representatives and the Developer to resolve these concerns.

Regards,
Joe Catalano and Joan Varrone

CC: Stefani, Catherine (BOS), Dick Frisbie (frfbeatle@gmail.com)

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Dear Mr. Zushi and Planning Department Commissioners:

I've lived in the Laurel Heights neighborhood for nearly 40 years and would like to make the following comments regarding the 3333 California Street Mixed Use Project:

But before I do, I want to be clear that I am 100% in favor of building the 558 (or 744 variant) housing units as soon as possible. I am not an obstructionist, just a concerned resident who understands the desperate need for more housing at all price levels. Further, I was a part of the neighborhood group that was so successful in working with the developer on the "Lucky Penny" (Geary and Masonic) project and hope that the developers of 3333 Cal would see the benefit of collaborating with the neighborhood on this project too, so that the housing can be built as quickly as possible. Many of my neighbors share the same desires and beliefs.

1
(ME-1)

I fully support the Community Full Preservation Residential Alternative for 3333 because:

- It preserves the Historic Characteristics of this wonderful historic site.
 - It provides 558 (or 744 in the Variant) housing units.
 - It builds them in three years.
 - It does not include the massive unneeded and unwanted Retail/Office/Commercial Complex that the Developer continues to insist upon.
 - It does not create 8,000 retail auto trips per day.
 - It does not generate approx. 15,000 tons of greenhouse gases.
 - It preserves both the present childcare center and the existing café.
 - It matches the surrounding neighborhoods for character, style, scale and bulk.
- 2
(AL-2)

I strongly oppose the Developers Destructive Proposal as it brings excessive, unnecessary, unwanted and destructive noise, pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it poses threats to pedestrian safety; it contributes to climate change.

Please accept my apologies: I meant to say Dear Mr. Zushi.

On Jan 6, 2019, at 9:32 PM, Adam Cole <adamcole415@gmail.com> wrote:

Dear Mr. Sushi and Commissioners — I live two blocks from 3333 California Street. I OBJECT to the "Proposed Project" and "Variant" (collectively, "developer's proposal") and urge the Planning Department to accept and review and the Commission to adopt the Community Residential Alternative. 1
(ME-1)
2
(AL-2)

I have lived in this neighborhood for 23 years and value its character, which has kept its residential charm all that time, but which the developer's proposal threatens.

I object to the developer's proposal for two main reasons.

First, the developer is proposing to take up to **15 years** to complete it. That's absurd. The Golden Gate Bridge was completed in four years. Fifteen years of construction is also deeply unfair to us who live here and must suffer the noise. The timeframe also casts doubt on the developer's bona fides, suggesting that the goal isn't to develop the property at all but to flip it after approval or otherwise manipulate the City's approval process. Each of these concerns by itself militates against approval of the developer's proposal. 3
(PD-1)

Second, the developer's proposal will result in a massive increase in car traffic in the neighborhood, which we can't handle. Thousands more car trips a day will congest and destroy the historic residential feel of this area. 4
(TR-3)

The Community Residential Alternative addresses these and other issues and draws the right balance between the need for more housing and preservation of this historic neighborhood. 5
(AL-2)

Thank you for your consideration.

Re: Case No. 2015-014028ENV

Dear Planning Commissioners:

We are a married couple who have lived in Laurel Heights on California Street, one block from the site of the proposed real estate development, for over 45 years. [Over the decades, we've seen many big changes to our neighborhood—some positive, and some negative—but this Prado development proposal, which violates the zoning laws and the character of the district, is by far, the most disturbing to date.] ¹ (ME-1)

We recognize the pressing need for more affordable housing in San Francisco, and we support construction of housing on this site, but the current proposal, which Prado wants 7-15 years to complete, includes unnecessary retail space, threatens the quality of life, and mars the beauty of Laurel Hill by altering the Historic Building, obscuring the beautiful views, and destroying the majority of 185 old growth trees that we cannot afford to lose in an era of toxic air and climate change. ² (ME-1)

The high density of the proposed project as described in the Draft Environmental Impact Report, ³ (GC-1) will increase traffic flow and congestion, increase noise and pollution, and contribute to the loss of parking, in a neighborhood where it's already almost impossible to find adequate street parking, ⁴ (TR-11) even for residents with G-Stickers. It's important to realize that not only will the construction of the Prado project permanently eliminate 40 currently available non-metered parking spaces to accommodate five loading/unloading zones for TNCs (Uber, Lyft, Chariot) and freight traffic, but it will also take away another 200 non-metered parking spaces, which surround the 10 acre site on

Euclid and Laurel Streets for the entire 15 years of construction. That is parking that residents, as well as businesses in Laurel Village Shopping Center need desperately, and that severe impact on our community is not addressed anywhere in the DEIR. Essentially, Prado's current DEIR changes what should be a residential development into a full scale retail destination.

4
(TR-11)
cont'd

In addition to Prado's proposal, there are three other large real estate projects already approved to be built in this same neighborhood over the next few years:

5
(CU-1)

*A residential building (95 units) at the current site of the former Lucky Penny Restaurant at Geary and Masonic.

*A residential development (270 units), covering two and a half blocks at the current site of CPMC on California Street.

*A new housing development nearby on Sacramento Street.

Along with the Prado project, these will bring thousands of new residents to Laurel Heights in the coming years, so the YIMBY argument that there is no new housing in the Western Addition makes little sense once you take into account how many new buildings will be going up in our neighborhood simultaneously. In fact, in a recent petition drive at Laurel Village, over 800 residents signed the petition opposing the developer's plan for ROC (retail, office, and commercial) space, and fully supporting a development consisting of new housing only.

Fortunately, there is a much better way to address the need for a development at Laurel Hill that both meets the housing demands and still protects the Historic Building as well as the beautiful landscaping that surrounds it. It's called the Neighborhood Full Preservation Alternative. It provides the same number of residential housing units as the Prado project, 558 with a 744 variant, protects the majority of the 185 mature trees, and does not include major retail that would only negatively compete with Laurel Village Shopping Center, which borders the site. For perspective, Laurel Village already has two supermarkets, Cal-Mart and Bryan's, Starbucks and Peet's coffee, a liquor store, Ace Hardware, several restaurants, including Beautiful! and Rigolo Cafe, 3 banks, Bank of America, Wells Fargo and First Republic, Walgreen's Pharmacy, multiple doctors, dentists, and psychotherapy offices, Peninsula Beauty, a GAP store, several boutiques and a variety of other businesses. Sacramento Street, which is one block away from the development, has numerous restaurants, including The Magic Flute, Spruce, Sociale, Cafe Luna and Osteria, The Vogue movie theater, 3 dry cleaners, multiple boutiques, antique shops, nail salons, hair salons, a automotive repair shop, several liquor stores, a shoe repair shop, and many other businesses, all within a short walking distance of Laurel Hill. It is also important to remember that the development is directly across California Street from the San Francisco Jewish Community Center, which offers a pool, a fitness center, a spa, a concert hall, a full calendar of performances, lectures, and a host of other amenities.

6
(AL-2)

We don't need new retail in Laurel Heights. We are inundated with retail right now. We need affordable housing—built without changing existing zoning laws, without 10 story buildings, without

7
(ME-1)

over 100,000 square feet of additional retail, office and commercial space. We should be using the construction primarily for affordable housing, which would allow for some units big enough for middle class families. The Neighborhood Alternative does all that and can be built in about 3 years, not 7-15.

7
(ME-1)
cont'd

Among the many things that make the Neighborhood Alternative a much better solution than any of the alternatives presented in the DEIR are as follows: it preserves the characteristics of this wonderful historic site, it provides 558 (or 744 in the Variant) housing units, it does not create 8000 retail auto trips per day, it does not generate approximately 15,000 tons of greenhouse gases, it preserves both the present childcare center and the existing cafe, and it matches the surrounding neighborhood for character, style, scale and bulk. In short, it is the ideal solution—providing housing without destroying what makes Laurel Heights a desirable place to live in San Francisco.

8
(AL-2)

Please consider supporting our plan. Thank you.

Very truly yours,

Bill Cutler and Judy Doane

Re: Objection to 15-year developer development project (the “Destructive 3333 Project” or D3333P)

Premises: 3333 California Street, San Francisco

I am very concerned about, and object to, the current developers’ development plan.

1
(ME-1)

I understand it is currently scheduled to take fifteen (15) years to complete. Apart from the incredibly drawn out length of such a project, the negative effects (such as dust, noise, diminished parking, danger to children, seniors and others), such a development does not fit within the natural, historic, familial, social and aesthetic contours of our community. Not to mention the environmental risks. Wouldn't such a project be more appropriate for Geary Blvd or similar streets. Moreover, the developers' stated uses are unlikely to be needed in the future. The increasing closing of retail and office premises due to online shopping and work-at-home jobs makes such proposed uses doubtful even fanciful, perhaps to be replaced by even less human friendly high-tech data or A.I. centers by the time occupancy is permitted.

2

4
(ME-1)

I and other community members propose a smaller development (the "Community Full Preservation Alternative" or CFPA) that will still add substantial needed housing but take only three (3) years to complete. The CFPA does not include the massive unneeded, unwanted and probable dead-on-arrival retail/office/commercial complex that the Destructive 3333 developer continues to insist upon. CFPA does not create outmoded 13,000+ retail auto trips per day; it does not generate approximately 15,000 tons of greenhouse gases. The CFPA preserves both the present childcare center and the existing café, a source of deep, positive social capital in our community. It matches the surrounding neighborhoods for character, style, scale and bulk.

5
(AL-2)

I strongly oppose the Destructive 3333 Project as it brings excessive, long-term, unwanted and destructive noise, dust (on top of the recent lung-damaging smoke from the wildfires), other pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it diminishes community members socializing; it poses threats to pedestrian safety, especially the more fragile members of our community; it contributes to climate change; it will leave a bad taste in the mouth of those who remain in the community or are forced to leave due to damage cause by the D3333P; and worse. The Community Full Preservation Alternative will however generate ZERO retail auto trips to 3333 as opposed to the 12,000-15,000 retail caused the developers' Destructive 3333 Project.

6
(ME-1)
7
(AL-2)

Please do not permit the Destructive 3333 Project to go forward.

Gentlepeople,

I live on Masonic and support the 3333 California development. Having attended the 3333 California NIMBY meeting, I believe that their arguments are specious.

They say that they want housing, although less than proposed, and that they do not want commercial because it will threaten the Laurel Shopping Center merchants. They call out the assault made by Trader Joe's and Target and insist that no more competition be allowed. They do not development on busy arterial streets.

I am a retired professor who is only able to live in the city where I worked because a small, affordable (at the time) multi-family unit was available. development of my building was fiercely contested by neighbors.

The developer's plans call for townhouses on the one edge of the site that faces single family detached dwellings.

The argument for preservation of an unworthy office building is a desperate attempt to preserve an enclave for the rich. Why should we declare any neighborhood off-limits for housing that will serve a diverse mix of residents? This neighborhood is well served by transit, is close to stores for modest income shoppers, and has a great library branch.

Subject: 3333 California: Let's Make it a dense housing solutuon
Date: Monday, December 10, 2018 3:37:29 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Hi,

The UCSF laurel heights campus is a nice park setting, but it's not a landmark. Let's use this wonderful, transit-rich spot to add some density to the inner richmond.

I do not believe the current campus is in any way worth preserving. Let's go dense.

Thanks,

Shanan Delp

San Francisco Voter.

Re: Draft EIR for 3333 California Street, San Francisco, CA 94118
Planning Department Case No: 2015-014028ENV
State Clearinghouse No: 2017092053

1. The DEIR Fails to Disclose the Uncertainty as to Whether the SFPUC Has Sufficient Water Supply Available to Serve the Project Site from Existing Entitlements and Resources and Whether SFPUC Would Require New or Expanded Water Supply Resources or Entitlements.

1
(UT-1)

The July 27, 2018 letter from the San Francisco City Attorney to the State Water Resources Control Board (SWRCB) discloses that SFPUC would have to greatly increase water rationing in a sequential-year drought if SWRCB adopted proposed amendments to the Water Quality Control Board Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary that were then under consideration (Plan Amendment). (Ex. A, excerpts of letter from City Attorney to SWRCB, pp. 1-3) The letter states that if the Plan Amendments were adopted, if a sequential-year drought occurs, San Francisco's diversions from the Tuolumne River - on which the SFPUC relies to meet approximately 85% of demand for drinking water throughout the Bay Area - could be severely reduced. (Ex. A, p. 3) The letter discloses that if the Plan Amendments were implemented, SFPUC could have to increase water supply rationing over the 20% level allowed by the SFPUC's current drought management plan and indicates that it is uncertain that SFPUC will be able to develop sufficient replacement supplies in approximately four years before the SWRCB's intended implementation of the Plan Amendment in 2022. (Ex. A, p. 4)

In *Delta plan approved: cities face water cuts*, the San Francisco Chronicle reported that the SWRCB approved this Plan Amendment, which would require cuts to water supplies that could cause households in the Bay Area to curb water use by 20 percent or more. (Ex. B) Please state whether the SWRCB approved the Plan Amendments and explain the potential consequences of those Plan Amendments on SFPUC's water supply for San Francisco and the possibility of increased water rationing. (Ex. B) While agencies have an opportunity to propose alternative proposals, the passage of this Plan Amendment has created uncertainty as to San Francisco's water supply which the DEIR for 3333 California Street fails to acknowledge. CEQA

requires an agency to disclose uncertainty about water supply.

1
(UT-1)
cont'd

The water supply assessment performed for the proposed 3333 California Street project was performed before the Plan Amendment was passed. That water supply assessment was based on the SFPUC's urban water management plan which was based on estimations of water supplies that pre-dated the plan amendments.

The 3333 California Street Initial Study projects that the proposed project would use an estimated 73,000 gallons of water per day, which would result in a net increase of approximately 53,000 gallons per day. The net increase per year would be 19,345,000 gallons (53,000 x 365). The Initial Study concludes that the increase could be accommodated "by the anticipated water supply for San Francisco." That anticipated water supply for San Francisco has now changed as a result of the Plan Amendments. Although the DEIR appears to have been released after the Plan Amendment was passed, it failed to disclose the uncertainty about changes in the anticipated SFPUC water supply .

2. The DEIR Fails to Disclose the Uncertainty as to Whether the Proposed Project or Project Variant, in Combination With Past, Present and Reasonably Foreseeable Future Projects Could Result in a Cumulatively Considerable Contribution to Cumulative Impacts on Water Supply Systems.

2
(UT-1)

Since the City Attorney's letter indicates that the SWRCB expects SFPUC to develop additional supplies of water, the DEIR should have disclosed the uncertainty about the cumulative impact of the proposed project's contribution to the demand for water supplies together with the water supply demand of other reasonably anticipated projects, in the current context that new projects to develop additional water supplies may be needed.

The DEIR should explain the potential cumulative impacts of developing potential additional water supplies to serve existing SFPUC customers and customers drawing on SFPUC water supplies in current and foreseeable developments in the context of significant water reductions in a sequential-year drought. The DEIR should disclose any uncertainty as to whether sufficient additional water supplies can be developed before 2022 to avoid SFPUC customer rationing above 20% in sequential-drought years and estimate the amount of water that could be used by SFPUC customers in current and reasonably foreseeable development and the amount of water that could be available in sequential-drought years.

Very truly yours,

Kathryn R. Devincenzi

Ms. Jeanine Townsend
Clerk to the Board
State Water Resources Control Board
1001 I Street
Sacramento, CA 95814
LSJR-SD-Comments@waterboards.ca.gov

RE: *San Francisco's Comments to Plan Amendment and Final SED.*

Dear Ms. Townsend,

This office represents the San Francisco Public Utilities Commission ("SFPUC"), operator of the Hetch Hetchy Regional Water System ("RWS"), which provides water to over 2.6 million people throughout the Bay Area. On behalf of the SFPUC and the City and County of San Francisco ("San Francisco"), we respectfully request that the State Water Resources Control Board's ("Board") consider our comments to the proposed updates to the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary ("Plan Amendment") and reconsider its decision to preclude any additional comments on the Final Substitute Environmental Document for the Plan Amendment ("Final SED").

On July 18, 2018, San Francisco requested that the Board recirculate the Final SED, or, at the very least, expand the scope of permissible comments to include comments on the Final SED, extend the comment deadline by 30 days, and postpone the public hearing ("San Francisco's Letter"). By letter dated July 19, 2018, the Board denied San Francisco's request in its entirety, stating that recirculation is not required under the California Environmental Quality Act ("CEQA") or the CEQA Guidelines because the changes in the Final SED "do not result in any new potentially significant adverse impacts on the environment, any substantial increase in the severity of potentially significant adverse impacts on the environment, or establish any new feasible project alternatives or mitigation measures."¹ But San Francisco never asserted that recirculation was required under those bases.

Instead, as noted in San Francisco's Letter, Title 14, California Code of Regulations, section 15088.5(a)(4) provides that recirculation is also required if "[t]he draft [Environmental

¹ Letter from Eileen Sobeck, Executive Director, State Water Resources Control Board, to Dennis Herrera, City Attorney, and Jonathan Knapp, Deputy City Attorney, San Francisco City Attorney's Office, July 19, 2018, at 2.

State Water Resources Control Board
 Page 2
 July 27, 2018

Impact Report (“EIR”)] was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.” (*See also* Cal. Code Regs., tit. 23, § 3779(e).) The Board’s analysis in the Final SED of San Francisco’s potential actions in response to implementation of the Plan Amendment is “fundamentally and basically inadequate and conclusory in nature” because, among other reasons, it excludes any consideration of increased water supply rationing. The Board’s July 18, 2018 letter did not respond to this argument at all.

Under protest, and without waiving any legal claims that the Board has violated, among other things, its obligation to recirculate the Final SED under the CEQA Guidelines and California Code of Regulations, Title 23, California Code of Regulations, section 3779(e), San Francisco submits the following comments and urges the Board not to adopt the Plan Amendment or the Final SED.

San Francisco’s Comments on the Plan Amendment

1. The Board Is Not Authorized to Require Implementation of the Water Quality Objectives Through the Adoption of Regulations.

The Plan Amendment states—we believe for the first time since the Board’s Plan Amendment process began over six years ago—that “the State Water Board may implement the [water quality] objectives by conducting water right proceedings, *which may include adopting regulations*, conducting adjudicative proceedings, or both, that take into consideration the requirements of the Public Trust Doctrine and the California Constitution, article X, section 2.”² The Board states that the addition of the phrase “including adopting regulations” is intended to clarify the “implementation measures within the State Water Board’s authority.”³ However, the Board has no authority to implement the Plan Amendment through such quasi-legislative means.

This newly stated implementation authority—*i.e.*, conducting water rights proceedings by rulemaking—appears to be a continuation and expansion of the Board’s recent flawed proposal to adopt a Regulation on Waste and Unreasonable Water Uses to implement conservation measures by rulemaking. As the SFPUC informed the Board in a letter dated December 22, 2017, in the context of the waste and unreasonable use regulations, the Board does not have authority to restrict or limit the exercise of water rights without due process of law.⁴ Water rights are real property that can be restricted only after the opportunity for a hearing and the presentation of evidence. To do otherwise would constitute an unlawful confiscation of property without due process of law. The Board’s exercise of authorities under the Public Trust Doctrine and article X section 2 of the California Constitution is adjudicative in nature, and demands fact-finding and balancing of numerous factors and consideration of the water rights of other diverters. This can only be accomplished by conducting comprehensive water right adjudicative proceedings. The Board’s rulemaking authority simply does not extend to restrictions on the otherwise lawful exercise of water rights.

² Appendix K at 26 (emphasis added).

³ Master Response 2.1 at 4. *See also id.* at 12

⁴ Comment Letter – Proposed “Prohibiting Wasteful Water Use Practices” Regulation, jointly submitted by the San Francisco Public Utilities Commission and the Bay Area Water Supply & Conservation Agency, December 22, 2017, attached hereto as Exhibit 1.

State Water Resources Control Board
 Page 3
 July 27, 2018

Further, even if the Board had the authority to implement the Plan Amendment through rulemaking, the Final SED fails to analyze the exercise of such authority as required by CEQA. This new proposed basis of implementation authority was not described in the Draft SED or prior versions of the proposed program of implementation and the public and affected parties have not had an opportunity to comment on the potentially significant environmental impacts of a rulemaking implementation approach. Moreover, the Final SED does not fully describe the proposed action and does not analyze the potential environmental impacts from a rulemaking approach such as might be the case if the Board does not take water rights priorities into account when it allocates responsibilities to water users to meet the flow requirements in the Plan Amendment. By not describing a known potential implementation action in the Final SED, the Final SED inappropriately segments environmental review of the proposed action. As a result, the Final SED fails to identify potentially significant impacts that may result from the proposed action and the potential effects of the action as a whole. The Board must recirculate the proposed program of implementation to more fully describe how the Board might “conduct water right proceedings [by] adopting regulations,” revise the Final SED to analyze the potential environmental impacts associated with that approach, and recirculate the Final SED.

San Francisco’s Comments on the Final SED

1. The Board Failed to Analyze Impacts to the Bay Area from Increased Water Supply Rationing.

In its Responses to Comments, the Board recognizes that if it implements the Plan Amendment and a sequential-year drought occurs, San Francisco’s diversions from the Tuolumne River—on which the SFPUC relies to meet approximately 85% of demand for drinking water throughout the Bay Area—could be severely reduced.⁵ For example, assuming a reoccurrence of the historical hydrological conditions preceding and including the 1987-92 drought, under a 40% unimpaired flow (“UIF”) objective San Francisco would, on average, be responsible for contributing approximately 116 million gallons per day (“mgd”) per year for each year of the six-year drought period, or more than 43% of the water needed in the Bay Area.⁶ San Francisco has repeatedly explained to the Board that faced with such severe reductions it would be compelled to increase water supply rationing throughout the RWS service area.⁷ Yet the

⁵ See e.g., Board’s Responses to Comments, Master Response 8.5, at 17 (where the Board incorrectly, as explained below, identifies the potential deficit to San Francisco’s water supply as 119,000 acre-feet/year or approximately 106 million gallons per day (“mgd”)).

⁶ See Declaration of Matt Moses in Support of Comments by the City and County of San Francisco to the Draft Substitute Environmental Document in Support of Potential Changes to the Bay-Delta Plan, *see* Attachment 1 to the Moses Decl., SFPUC Analysis of Proposed Changes to Tuolumne River Flow Criteria, March 14, 2017 (“2017 SFPUC Water Supply Analysis”), at 17, Table 9 (showing that the reduction would be 129,884 acre-feet (“AF”)/year for each of the 6 years; 129,884 AF = 116 mgd.) This analysis assumes an RWS demand of 265 mgd, which is San Francisco’s contract obligation and consistent with projected 2040 RWS demand.

⁷ The analysis in these Comments assumes a 51.7% flow contribution by San Francisco. As a water supply provider to over 2.6 million people throughout the Bay Area, San Francisco must utilize worst-case scenarios for water supply planning purposes. In presenting the potential water supply, environmental, and socioeconomic effects from certain interpretations of the Raker Act and the Fourth Agreement San Francisco does not waive arguments it may have about how the Raker Act or Fourth

State Water Resources Control Board
 Page 4
 July 27, 2018

Board's analysis of San Francisco's potential actions in response to implementation of the Plan Amendment entirely excludes consideration of *any* increase in water supply rationing over the 20% level allowed by the SFPUC's current drought management plan.⁸ Instead, the Board has based its entire analysis of San Francisco's potential actions in response to the Plan Amendment on the unsupported assumption that San Francisco will be able to develop sufficient replacement water supplies in approximately four years, *i.e.*, prior to the Board's intended implementation of the Plan Amendment in 2022.⁹ It is patently unreasonable for the Final SED to omit consideration of even the *possibility* that San Francisco would need to increase water supply rationing in these circumstances. And as we explained in our July 17, 2018 letter, this critical omission precludes meaningful public review of and comment on the most reasonably foreseeable water supply, environmental, and economic effects of the Plan Amendment on the Bay Area.

2. The Board Failed to Use San Francisco's Eight-and-a-Half-Year Design Drought in its Modeling of Water Supply Impacts.

Following the 1987-92 drought, the SFPUC implemented the "design drought," which is a water supply planning methodology that ensures the SFPUC will retain adequate storage to withstand an eight-and-a-half year drought without imposing more than 20% system-wide rationing.¹⁰ The SFPUC subsequently approved the design drought as part of its adoption of the goals and objectives for the Water System Improvement Program ("WSIP").¹¹ The Final SED rejects use of San Francisco's design drought because it represents hydrological conditions more severe than historically experienced by the RWS.¹² CEQA requires, however, that the Board

Agreement should or will be interpreted in future proceedings before the Board, the Federal Energy Regulatory Commission, courts of competent jurisdiction, or in any other context.

⁸ See *e.g.*, Board's Responses to Comments, Master Response 1.1: General Comments ("Master Response 1.1"), at 47 (where the Board states it intends to implement the Plan Amendment by 2022); *see also* Master Response 8.5 at 49 (where the Board explains that rationing by the SFPUC throughout the RWS service area in response to the Plan Amendment would not exceed 20%, the maximum level of system-wide rationing that the SFPUC allows in its current drought management plan).

⁹ See *e.g.* Board's Responses to Comments, Master Response 1.1 at 47.

¹⁰ See *e.g.*, Comments by the City and County of San Francisco to the Draft Substitute Environmental Document in Support of Potential Changes to the Bay-Delta Plan ("San Francisco's 2017 Comments"), March 17, 2017, at 18-19, n.26 (explaining that the SFPUC's design drought is based on the hydrology of the six years of the worst sequential historical drought, 1987-1992, plus the two and a half years of the 1976 1977 drought, for a combined total of an eight-and-a-half-year design drought sequence).

¹¹ San Francisco Public Utilities Commission, Resolution No. 08-0200, attached hereto as Exhibit 2 (where the SFPUC approved the performance objective to "[m]eet dry-year delivery needs through 2018 while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts," which incorporates the eight-and-a-half year design drought methodology).

¹² Master Response 8.5 at 15, 18.

State Water Resources Control Board
 Page 5
 July 27, 2018

consider impacts to San Francisco from implementation of the Plan Amendment in accordance with the SFPUC's existing, adopted policies, such as its design drought.¹³

San Francisco developed its design drought after having lived through the consequences of basing the SFPUC's water supply operations "in accordance with rules based only on historical data."¹⁴ Prior to the 1987-1992 drought, the SFPUC had based its water supply planning on "the experience of many years of historical operation, including the knowledge of previous drought events such as had occurred in 1976-1977."¹⁵ It was therefore inadequately prepared when the 1987-1992 drought broke new records. As explained by the General Manager of the SFPUC during that drought, San Francisco "learned the painful lesson as to the adverse impacts that are caused by not planning for a drought worse than any experienced to date . . . when the hydrology of the Tuolumne River and the City's operations through 1990 and early 1991 had created a situation where a 45 percent rationing program among City customers was initiated – a level of rationing that was found to be intolerable and not achievable."¹⁶ "[G]iven the dire consequences of just being wrong in the forecasting of the length of drought that may hit the City" San Francisco responsibly relies on its water supply planning methodology to ensure it retains adequate water supplies during sequential-year droughts.¹⁷ CEQA requires that the Board must take into account San Francisco's design drought when assessing impacts to the Bay Area from implementation of the Plan Amendment.

3. Although the Board Concedes that the SFPUC's Hydrological Model is More Precise than the Board's Model, it Refuses to Use the SFPUC's Modeling Results.

The Board concedes that the SFPUC's Hetch Hetchy and Local System Model ("HHLSM") model is more precise than the Board's Water Supply Effects ("WSE") model for calculating water supply effects to the RWS service area, yet the Board fails to use the HHLSM modeling results in the Final SED.¹⁸ For example, instead of using the correct HHLSM figure

¹³ Master Response at 52 (emphasis added) (where Board mischaracterizes San Francisco's adherence to the approved design drought methodology, the SFPUC's associated modeling of water rationing that would be required under a 40% UIF objective across the historical hydrology, and San Francisco's other supporting evidentiary submissions and related comments as a mere "statement of intent" that the Board may disregard at its own discretion: "*a statement of intent regarding future extreme water rationing is not sufficient and reliable information on which to base an environmental analysis of related impacts.*")

¹⁴ Affidavit of Anson B. Moran ¶¶ 7, 16 Project No. 2299, January 26, 1994 (referred to below as "Moran Decl."), attached to San Francisco's 2017 Comments as Exhibit 7.

¹⁵ Moran Decl. ¶ 7.

¹⁶ *Id.* ¶ 8.

¹⁷ *Id.* ¶ 16.

¹⁸ Master Response 8.5 at 16 (explaining, [w]hile the HH/LSM is a more detailed model that simulates operation of the RWS service area, the WSE model and water bank balance provide similar water supply effects as the HH/LSM under the SFPUC middle demand level and SED Scenario 2"); *id.* at 18 (where the Board acknowledges, "[t]he SED uses a simple method to assess potential water supply reductions in the absence of having access to a model that simulates the operation of the entire RWS service area.").

EXHIBIT B

Delta plan approved; cities face water cuts

By Kurtis Alexander

Dozens of California communities dependent on the cool, clear water of the High Sierra, from Central Valley farm towns to San Francisco, will see cuts to their water supplies under a plan approved Wednesday by state water regulators.

The reductions, which could force households in the Bay Area to curb water use by 20 percent or more, are the product of a decade-long effort to restore the health of the state's struggling rivers and fish.

But the move by the state water board to

Carlos Avila Gonzalez / The Chronicle

Old River meanders in the Sacramento-San Joaquin Delta in Contra Costa County. The plan approved Wednesday is part of an effort to restore the health of the state's rivers and fish.

boost flows in the waterways by limiting draws, starting with the San Joaquin River basin, is not as strict as initially proposed. The plan leaves open the door for water agencies to trade other improvements to the rivers, such as enhancing salmon habitat, for smaller water cuts. The water agencies have until March to flesh out alternative proposals.

"We've gone out of our way to give multiple opportunities," said Felicia Marcus, chair of the State Water Resources Control Board, which met in Sacramento for 10 hours Wednesday. But "we're not just going to walk away."

At the heart of the water board's Bay Delta Plan is protecting the Sacramento-San Joaquin River Delta. The West Coast's largest estuary and the hub of California's water supplies has seen its waters choked and dirtied amid relentless pumping by cities and farms. The salmon population has collapsed, and the harm has rippled up the food chain to bears, birds and whales.

While San Francisco has long been removed from California's vicious water wars, having coveted rights to supplies in Yosemite, the city's primary source has not escaped this battle. The first phase of the Bay Delta Plan calls for limiting pumping on the San Joaquin River and its three major tributaries, which include the

Tuolumne River that feeds San Francisco's Hetchy Hetchy Reservoir. The water board is in the process of developing similar measures for the Sacramento River basin.

The apparent softening of the Bay Delta Plan on Wednesday comes after fierce opposition from an unlikely alliance between San Francisco and thirsty agricultural districts, with support from the Trump administration. The powerful bloc has argued that the fallout from water cuts would bring undo hardship to residents and businesses.

The water suppliers, joined by the state Natural Resources Agency, introduced their own last-minute proposal that downplayed the need for water cuts on rivers while emphasizing the importance of timing their water draws with fish runs and restoring habitat.

"This (plan) provides us more flexibility, more tools to address the issues that are facing you," Michael Carlin, deputy general manager of the San Francisco Public Utilities Commission, told the water board. The SFPUC provides water to San Francisco and about two dozen other Bay Area communities.

Gov. Jerry Brown and Gov.-elect Gavin Newsom had been advocating for such a compromise plan to head off a prolonged legal fight. Sen. Dianne Feinstein this month even introduced federal water legislation that, while controversial, included a provision for restoration funding in the event of a deal.

The plan put forth by the water agencies and the state Natural Resources Agency not only included the San Joaquin River basin, the first target of the water board, but the Sacramento River watershed.

It offered up about \$1.8 billion for habitat fixes, coming from fees on water agency customers across the state, and state government money. It also conceded to some water reductions, giving up as much as 1 million acre feet of water statewide. That's nearly three times what Hetch Hetchy holds.

State water board members praised the alternative plan as a good start and said it represented a commitment to working toward the goal of improving the health of the delta. The board instructed its staff to look more closely at the document before the issue returns in March.

Environmental groups and the fishing industry, which have advocated for stronger protections for rivers and wildlife, flatly criticized the plan from the water agencies.

"Many elements of their proposal have already been tried and failed or represent no change from the status quo," said Jon Rosenfield, lead scientist at the Bay Institute.

As it stands, as much as 80 percent of the flow in the San Joaquin River basin is tapped by cities and farms during peak spring runoff. Environmentalists and fishermen have wanted to limit draws to 50 percent, saying salmon won't survive without the reduction, while cities and farms have opposed any major cuts.

State water officials split the difference, approving a plan that allows no more than 60 percent of flows to be diverted, on average.

The decision means urban and agricultural water users in the San Joaquin River watershed will generally have to draw 7 to 23 percent less water, depending on the year, according to state estimates.

The SFPUC believes its customers could be forced to reduce water use 40 percent during prolonged dry spells. The city's water rights are inferior to those of other water agencies on the Tuolumne River.

City officials say they'll develop other sources of water, such as groundwater reserves and perhaps desalination, to make up for lost water. But that will take time and money. Building out supplies, according to city estimates, could trigger rate hikes of 17 percent over 15 years, on top of already scheduled increases.

The loss of water to agriculture is estimated to result in a 2.5 percent drop in produce output in the San Joaquin River basin, according to the state. The area is a hotbed of almonds, alfalfa and peaches.

Farm groups say during drought years, crop production could fall even more.

The Trump administration has joined the agricultural industry in trying to scale back the Bay Delta Plan. President Trump has accused California of "foolishly" leaving water in the rivers while the U.S. Bureau of Reclamation has threatened to take legal action if its supplies on the Stanislaus River are curtailed, which the plan calls for.

- 1. The DEIR Fails to Adequately Analyze Whether the Proposed Project/Variant Would Cause Substantial Additional VMT and/or Substantially Induce Automobile Travel and/or Have a Cumulative Impact on VMT and/or Substantially Induce Automobile Travel in Combination with Other Reasonably Foreseeable Development and Projects.**

1
(TR-4)

The Draft EIR admits that the proposed project or project variant would cause substantial additional Vehicles Miles Traveled (VMT) and/or substantially induce automobile travel. DEIR p. 4.C.74. The DEIR fails to estimate the total amount of VMT that would result from this significant impact on VMT and claims that the amount of parking included in the proposed project or project variant would result in VMT that would be beyond the significance threshold for the non-residential use. *Ibid.* Similarly, the DEIR admits that the proposed project or project variant's incremental, cumulative effects on regional VMT would be significant, when viewed in combination with past, present and reasonably foreseeable future projects. DEIR p. 4.C. 102. The DEIR claims that both the project and cumulative impact on VMT would be reduced to a less than significant level by reducing retail parking provided by the proposed project/variant. DEIR pp. 4.C. 80 and 103.

In these comments, the term "project" shall include the proposed project and the proposed project variant, unless otherwise indicated.

The DEIR's traffic analysis is inadequate because it fails to state the total Vehicle Miles Traveled (VMT), understates the impact by discussing VMT per person in the AM and PM peak periods, fails to analyze VMT likely to result from special aspects of the project configuration and fails to support its conclusions with substantial evidence. In particular, the DEIR's central claims that the amount of parking included in the proposed project would result in VMT that would be beyond the significance threshold for non-residential use and that merely reducing some of the retail parking spaces would mitigate the impact to a less than significant level, are

San Francisco Planning Department
January 8, 2019
Page 2

unsubstantiated and not supported by substantial evidence.

1
(TR-4)
cont'd

A. The DEIR Is Inadequate Because It Lacks An Estimate and Discussion of Total Net New Travel Demand (Net New Person Trips) and Understates the Project Impacts by Providing Estimates and Discussion of Net New Person Trips during A.M and P.M. Peak Hours.

2
(TR-1)

The San Francisco Planning Department *Transportation Impact Analysis Guidelines for Environmental Review*, October 2002 (*San Francisco Guidelines*), provide that:

Travel demand analysis shall include textual information, supported by tables or figures detailing the project's trip generation, trip distribution, trip assignment and modal split characteristics.

Net new travel demand generated by the project is to be estimated, based on the difference between existing and proposed land uses. Person trip generation rates per unit of square footage for each land use, or other unit as shown in Appendix C, are to be used for estimating levels of activity for the proposed project...

To "net-out" existing land uses that will be replaced, the existing levels of trip activity should, in most cases, be based on actual observations rather than on estimates based on rates in these *Guidelines* or other sources.

Each analysis should apply the trip generation rates from the *Guidelines* individually to the proposed uses, compare the proposed trips to existing levels of trip activity, and show the differences ("net new") by land use and in aggregate.

The Travel Demand Analysis is to include the following, unless otherwise directed in the work scope (Note that different or additional analysis periods may be defined in the scope of work process):

- Trip Generation Information: Project trip generation information (total person trips) by land use for existing and proposed uses. The total unadjusted daily and P.M. peak hour trips by mode can be calculated. The number of daily and peak hour vehicles (autos) generated by the project should also be calculated by using the auto occupancy rates noted in the tables in Appendix E.
- Work and Non-Work Trip Generation Information: Since work and non-work trips have different characteristics in terms of distribution and the mode of travel, the number of work and non-work (visitor) trips should be calculated separately. Appendix C provides the methodology to compute the work and non-work

(visitor) trips for a specific land use.

- Trip Distribution, Assignment and Modal Split Information: Net new person trips distributed to various directions of travel and assigned to the appropriate modes of travel (auto, transit, walk, and other) should be calculated, presented in tables and a graphic diagram (for vehicle and transit trips), and discussed in the text. Modal assignments should also be calculated for daily and the P.M. Peak Hour.

The weekday P.M. Peak Period is generally 4:00-6:00, and traffic counts shall generally be conducted during this period, unless otherwise specified in the scope of work. The peak hour must be determined from the counts (normally recorded in 15 minute intervals) for the entire peak period, and should represent the single hour within the peak period with the highest counts. The Planning Department may also request data for other periods to reflect the peak period of trip generation by the land use. (Ex. A, *San Francisco Guidelines* pp. 9-10)

The DEIR failed to estimate the net new travel demand that would be generated by the project, as required by the *San Francisco Guidelines*, at pages 9-10. (Ex. A, pp. 9-10) EIR Table 4.C.11 at page 4. C.54 estimated the total new travel demand generated by the project (person-trip generation rates per unit of square footage for each land use, or other unit as shown in Appendix C) based on the proposed project land uses. However, the DEIR lacks an estimate of the total existing levels of trip activity at the project site, so that the “net-out” of existing land uses that will be replaced can be determined, as required by the *San Francisco Guidelines*. The DEIR failed to provide estimates of the total existing levels of vehicle trips that currently occur at the project site and merely provided estimates of existing vehicle-trips in the Weekday AM. Peak Hour and Weekday P.M. Peak Hour. DEIR p. 4.C.60. Instead of the total increase, the DEIR only discusses “the anticipated increase in weekday a.m. and p.m. peak hour vehicle trips resulting from the proposed project and project variant, as compared to existing conditions.” DEIR p. 4.C.60. The DEIR reports the total net-new external vehicle-trips “during the weekday a.m. peak hour” and the net-new external vehicle-trips “during the weekday p.m. peak hour” for the proposed project and project variant. DEIR p. 4.C.60. The estimated total increase in vehicle-trips is missing. The absence of this information is misleading to the decision maker and the public because the DEIR lacks estimation of the total increase in vehicle-trips that would be caused by the proposed project/variant.

In addition, the DEIR fails to “show the differences (‘net new’) by land use and in aggregate,” as specified in the *San Francisco Guidelines*, at p. 9. DEIR Table 4.C.15, at page 4.C.60 lacks information as to net-new vehicle-trips by land use or in the aggregate, and merely presents estimates of net-new external vehicle trips in the “Weekday A.M. Peak Hour” and “Weekday P.M. Peak Hour.” The DEIR’s focus on peak-hour net-new vehicle trips is more relevant to traffic level of service impacts than to the greenhouse gas emissions that could result from total net-new vehicle trips. However, the lack of the information renders the DEIR

San Francisco Planning Department
January 8, 2019
Page 4

inadequate because it lacks estimates of the net-new trips by each proposed land use, depriving decision makers of important information they would use to mitigate effects by tailoring land use.

2
(TR-1)
cont'd

In addition, the DEIR fails to provide the “total unadjusted daily and P.M. peak hour trips by mode,” which is generally required by the *San Francisco Guidelines* at page 9 unless otherwise directed in the work scope. DEIR Table 4.C.14 provides adjusted daily and A.M. and P.M. peak hour person-trip generation by mode; the estimates in that table had been reduced by the internal trip capture rates set forth in DEIR Table 4.C.12 at page 4.C.55. In that table, the total weekday A.M. peak hour person-trip generation was reduced by 409 alleged internal person-trips and the table reported the net external person-trips as 1,917. The adjusted 1,917 trips figure was carried over and reported as total A.M. Peak Hour person-trips per mode on Table 4.C.14 and those 1,917 person-trips were divided into 1,197 auto trips, 295 transit trips, 376 walk trips and 49 other trips (bicycle, motorcycle, transportation network companies, and other modes). Thus, the DEIR failed to provide unadjusted daily and P.M. peak hour trips by mode as specified in the *San Francisco Guidelines*.

The DEIR provides no explanation of the manner in which the walk trips in Table 4.C.14 were calculated or the manner in which the alleged internal trip rates set forth in Table 4.C.12 were calculated, and the general source reference to Kittleson & Associates 2018 and the *San Francisco Guidelines*, 2002 provide no reference to an explanation or calculations supporting those Tables. The total of the alleged external walk trips and internal trips indicates that the walk trips are inaccurately estimated or the calculations in the tables are inaccurate. Table 4.C.14 reports 376 A.M. Peak Hour walk trips for the proposed project, which is 19.6 percent of the total A.M. Peak Hour person-trips (376/1,917), and 398 P.M. Peak Hour walk trips for the proposed project, which is 19.07 percent of the P.M. Peak Hour total person-trips. (398/2,086). Table 4.C.12 reports 409 internal person-trips of the total 2,326 person-trips for the A.M. Peak Hour, which is 17.6 percent of the total A.M. peak hour internal trips, and 485 internal person-trips of the total 2,571 for the P.M. Peak Hour, which is 18.9 percent of the total P.M. Peak Hour internal trips. Adding the percentages of the alleged internal trips to the alleged walk trips reported on these two tables, 37.2 percent of the A.M. Peak Hour Trips would be performed by walking externally or by internal trips (376 plus 409) and 37.97 percent of the P.M. Peak Hour trips would be performed by walking externally or by internal trips (398 plus 485). Since it takes approximately one minute to walk across the site, it is likely that the internal trips consist of walk-trips rather than bicycle trips. The totals of the alleged walk trips and internal trips in peak periods, indicate that the DEIR overstated one or both of these trip rates, and the DEIR lacks substantial evidence that they were correctly stated.

The text at DEIR page 4.C.58 indicates that Table 4.C.14 reports “Overall” person-trips, and if this is the case, walk trips are being double-counted and the total person trips represented as external trips in Table 4.C.14 are inaccurate and were improperly reduced by alleged internal trips before person-trips were reported in Table 4.C.14. That DEIR text reports that “Overall, on

▼

a daily basis, various types of land use would result in percentages of person-trips. Overall, residential use would generate 14% of walk trips, office use would generate 3%, general retail would generate 36%, restaurant uses would generate 40% and the day care center would account for 3-6% of trips for each model. These percentages add up to approximately 100 percent, so Table 4.C.14 likely reports total walk trips and total person-trips, rather than external trips only (as indicated by the heading “External Person-Trip Generation by Mode”), and it is likely that such table inaccurately double-counted walk trips, because walk-trips had been subtracted from total person-trips on Table 4.C.12 before the person-trip generation figures were carried over to Table 4.C.14.

2
 (TR-1)
 cont'd

The text at DEIR 4.C.57 also indicates that walk trips were double counted. The DEIR states there that “Based on Table 4.C.14, about 61 percent of daily person-trips generated by the proposed project would be auto person-trips, 14 percent would be transit trips, 21 percent would be walk trips, and 4 percent of trips would be taken by other modes, including bicycles, motorcycles, and for-hire vehicles.” DEIR p. 4.C.57. These mode shares add up to approximately 100 percent of trips and the 21 percent of walk trips is consistent with the 376 walk trips of the 1,917 total person-trips reported on Table 4.C.14. That DEIR text is not consistent with an additional 17-18 percent of trips being internal trips, as alleged in Table 4.C.12. Since the project site is easily traversed within approximately one minute or less, it is reasonable to assume that internal trips on this site would be walking trips. If there is any evidence contrary to this assumption, please present it.

The DEIR also lacks the actual site traffic counts for the P.M. peak period which the *San Francisco Guidelines* require:

3
 (TR-14)

The weekday P.M. Peak Period is generally 4:00-6:00, and traffic counts shall generally be conducted during this period, unless otherwise specified in the scope of work. The peak hour must be determined from the counts (normally recorded in 15 minute intervals) for the entire peak period, and should represent the single hour within the peak period with the highest counts. *San Francisco Guidelines*, 2002, p. 10.

Instead of actual P.M. peak period counts, the DEIR only collected vehicle counts at 13 intersections within the transportation study area, existing site driveways, and nearby sidewalks. DEIR p. 4.C.2.

In addition, the DEIR failed to estimate and state the total daily vehicles miles traveled (VMT) expected from the proposed project and proposed project variant, as required by the City’s scope of work:

4
 (TR-4)

KAI will utilize the San Francisco Transportation Information Map to obtain vehicle miles traveled data from the Planning Department data, which includes average daily VMT estimates for use for the region and the project’s traffic analysis zone (TAZ 709)...

Using the data collected in Task 2, KAI will document vehicle trafficwithin the study area, which includes the following:

Discussion of vehicle miles traveled for the uses proposed by the project for the region and the Project's traffic analysis zone (TAZ). DEIR Appendix D, pp. 4-5.

The DEIR admits that the proposed project or project variant would cause substantial additional VMT and/or substantially induce automobile travel but fails to estimate the amount of additional VMT that the project/variant would generate or compare that to a significance standard that states an amount of VMT that would be below the significance threshold. The lack of this information makes it impossible for the decision maker to understand the amount of additional VMT which the project/variant would cause that is above the significance standard.

Instead, at page 4.C.8 the DEIR compares regional average daily miles traveled for residential, office and retail uses with alleged average daily vehicle miles traveled in TAZ 709, which includes the project site, and with citywide average vehicle miles traveled per capita. Again, total vehicle miles traveled in TAZ 709 are not provided, depriving the decision maker of important information that would be easy to understand. Also, no explanation of the methodology used to achieve the data stated for TAZ 709 is provided, rendering the source of the data used in the DEIR unsupported by substantial evidence.

The DEIR also lacks substantial evidence to show that the significance standard of average regional VMT for residential, office or retail uses is a reasonable baseline against which potentially significant increases in VMT caused by the project should be measured, especially since the project is located in a central city which is targeted for significant population increase and since the proposed project would exceed the citywide average VMT for office and retail uses. The population of the City is projected to grow significantly as a result of ABAG proposals to concentrate population in central cities. (Ex. B) As a result, ABAG estimates that total VMT in the region will increase as a result of population growth even though VMT per capita will decrease. (Ex. B) Thus, use of a regional average VMT standard as the significance standard for the proposed project, omits VMT expected from population and employment growth in the City and fails to evaluate whether project GHG increases could impact communitywide GHG reduction targets. Also, the regional averages include VMT from many existing developments, but if VMT is to be reduced regionally, it is reasonable to expect new developments to produce much less VMT than the average reduction sought by the region of 15%. Thus, the DEIR lacks substantial evidence to support the adequacy of the significance standard used, especially in view of special aspects of the proposed project, including the five loading zones proposed for the perimeter of the site. Substantial evidence does not support the DEIR's conclusion as to the degree of effectiveness of reducing the retail parking spaces to the degree proposed in the DEIR.

Table 4.C. 3 at DEIR page 4.C.8 and 50 shows that TAZ 709 (and the project) would exceed the citywide average VMT by 14.7% for office use and 53.7% for retail uses, although the

San Francisco Planning Department
January 8, 2019
Page 7

tables do not compute or substantiate the percentage exceedance to make it easy to understand the information. This data indicates that the proposed retail component of the project/variant could cause substantial additional VMT, because the TAZ 709 VMT from retail uses is in conflict with the goal stated in 2010 of local reduction in “municipal and communitywide GHG reduction targets of 15 percent below then-current levels by 2020.” DEIR p. 4.C.50. The DEIR is inadequate because it fails to analyze this potentially significant impact as resulting from retail uses and claims, without substantiation, that “the amount of parking included in the proposed project or project variant would result in VMT that would be beyond the significance threshold for the non-residential use. The DEIR fails to explain this conclusion and there is no evidence in the DEIR or Appendix D that supports it.

4
(TR-4)
cont'd

The DEIR is also inadequate because its significance analysis fails to discuss the fact that the VMT from TAZ 709 retail uses exceeds the citywide average by 53.7%. DEIR pp. 4.C.74. It discusses only TAZ 709 and regional average daily VMT per capita. Thus, the DEIR is inadequate because its significance discussion failed to inform the decision makers that VMT from retail uses in TAZ 709 (in which the proposed project is located) exceed the citywide average by 53%. This information would be of importance to the decision maker and the public because it shows that reducing the square footage proposed for retail development in the proposed project would be a significant option to consider to reduce VMT.

2. The DEIR Lacks Substantial Evidence to Support Its Conclusion that Reducing the Project’s Retail Parking Supply Would Mitigate the Project’s Significant Impact on VMT to a Less Than Significant Level.

The DEIR contains no evidence that supports the conclusion that “the amount of parking included in the proposed project or project variant would result in VMT that would be beyond the significance threshold for non-residential use. DEIR p. 4.c.74. In fact, the only source that specifically addresses the issue treats the retail or office square footage as the cause of the net new vehicle travel demand generated by the project. Appendix C of the *San Francisco Guidelines* 2002, estimates travel demand based on square footage of land use, and states that these metrics are to be used to estimate net new travel demand generated by the project. Appendix C of the *San Francisco Guidelines* 2002 contains trip generation rates for office, retail and other uses based on square footage of space or number of residential units. (Ex. A) These Guidelines indicate that the parking space alone is not the cause of the VMT generated. It is not reasonable to assume that the parking space alone would generate VMT because there would be no reason to travel to the site and park if there were no new retail or new office uses that are the driver’s intended destination. The parking space is not the driver’s destination. The retail, office, residential or other use would be the driver’s destination. Moreover, nothing in the DEIR substantiates the claim that the retail parking spaces are the cause of VMT, rather than the retail restaurants, retail goods and other retail services.

To the contrary, the DEIR inconsistently admits that numerous factors other than the

San Francisco Planning Department
January 8, 2019
Page 8

amount of parking included in the proposed project or project variant would influence VMT:

Factors affecting travel behavior include the presence of parking, development density, the diversity of land uses, design of the transportation network, access to regional destinations, distance to high-quality transit, development scale, demographics, and transportation demand management. The transportation authority's SF-CHAMP accounts for a variety of factors to estimate VMT throughout San Francisco, but SF-CHAMP is not sensitive to site-level characteristics such as project-specific TDM measures or the amount of parking provided on a site, which itself is considered a TDM measure. DEIR p. 4.C.74.

Thus, diversity of land uses and development density are factors that affect travel behavior. There is no evidence that would support the DEIR's inaccurate conclusion that the amount of parking provided in the project alone would result in significant VMT. DEIR p. 4.C.74.

The DEIR also points to the City's Transportation Demand Management Program (TDM) which seeks to reduce VMT by allowing property owners to select from TDM measures that are under the control of the property owner. The DEIR merely states the "[o]ne of the individual measures in the TDM menu that the City researched was parking supply, as described below." DEIR p. 4.C.75. The statement that parking is one of the individual TDM measures is vague and does not provide enough relevant information to support the conclusion that the project parking would cause the significant VMT.

Further, the DEIR states that the City's TDM program provides options that depend on the development of a project's parking supply compared to the neighborhood parking rate and that the "neighborhood parking rate is the number of existing parking spaces provided per dwelling unit or per 1,000 square feet of non-residential uses for each TAZ within San Francisco." DEIR p. 4.C.76. At page 33, the *Transportation Demand Management Technical Justification* states that if a Development Project is parked at or below the neighborhood parking rate, the Development project would receive points for this TDM measure. This discussion does not support the DEIR's conclusion that a reduction in retail parking spaces at the rate proposed in the DEIR would reduce the significant VMT impact to insignificance. (Ex. C)

The only evidence that addresses the effect of the amount of retail parking showed the opposite. Attachment 1 to the April 4, 2016 Wade Wietgreffe Memorandum shows that there is negligible increase in automobile trips per space if a retail establishment has at least 100 retail parking spaces, so reducing the retail spaces provided in excess of 100 spaces would have negligible effect upon VMT. (Ex. D) Given the proposed 54,117 square feet of retail uses, the proposed project parking rate of 3.66 spaces \times 54,117/1000 = 198 retail spaces. Given the proposed mitigation of not exceeding the alleged existing neighborhood parking rate of 1.55 spaces per 1000 gross square feet of retail uses by 38% (or providing 2.14 retail spaces per 1000 gross square footage of retail spaces ($38\% \times 1.55 = .589$ plus $1.55 = 2.139$), the retained retail

4
(TR-4)
cont'd

San Francisco Planning Department
January 8, 2019
Page 9

parking spaces would amount to 115.8 retail parking spaces ($2.14 \times 54,117/1000 = 115.756$ spaces) Thus, the project proposes to reduce retail parking spaces to 115.8 spaces as opposed to the 198 initially proposed retail spaces (the 198 retail parking spaces includes 60 community public parking spaces. DEIR p. 4.C.80. The DEIR counts the 60 commercial public parking spaces as part of the retail spaces that would be provided by the proposed Project/Variant, so the 60 community spaces could be used by retail users of the project. DEIR p. 4.C.77.

4
(TR-4)
cont'd

The DEIR inaccurately claims that various publications support its conclusions as to the effect of parking spaces on causing VMT.

The DEIR claims that the August 2010 report of California Air Pollution Control Officers Association, *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures* (CAPCOA report) quantifies project-level land use, transportation, energy use, and other measures of effects on GHG emissions. DEIR p. 4.C.75. The DEIR claims that the CAPCOA report identifies a maximum 12.5 percent reduction in VMT related to parking supply (PDT-1), but does not provide a citation to a page in the report that would support this claim. The discussion PDT-1 in the CAPCOA report actually states at page 207 that the range of effectiveness of limiting parking supply is a 5 to 12.5 percent vehicle miles traveled (VMT) reduction and that measure PDT-1 would accomplish a change in parking requirements and types of supply within the project site in a **multi-faceted strategy** consisting of elimination (or reduction) of minimum parking requirements, creation of maximum parking requirements and provision of shared parking. (Ex. E)

The DEIR and proposed project/variant do not adopt such mitigation measures, and the project's proposal to provide 896 new parking spaces for various uses (970 for the project variant) is inconsistent with the PDT-1 strategies. DEIR S.49. More importantly, the CAPCOA report states at page 207 that the reduction can be counted only if spillover parking is controlled (via residential permits and on-street market rate parking (See PPT-5 and PPT-7). The CAPCOA report makes it clear at page 209 that:

Trip reduction should only be credited if measures are implemented to control for spillover parking in and around the project, such as residential parking permits, metered parking, or time-limited parking. (Ex. E)

The DEIR does not establish that such measures have been implemented, and there are substantial areas in the vicinity of the project (known based on personal information of Kathryn Devincenzi), where parking is not time-limited such as on Mayfair Drive, southern Euclid Avenue west of Collins Street, western Collins Street south of Euclid Avenue, and Heather Street near the project site. (Ex. F, photographs taken on 1-7-19 showing no time limits for parking on said portions of Euclid and Collins streets) Given the lack of controls for spillover parking in the area, the CAPCOA report does not support the DEIR's conclusion that reduction of retail parking

San Francisco Planning Department
January 8, 2019
Page 10

spaces on site would result in mitigation of the significant VMT impact to a less than significant level.

In addition, CAPCOA PDT-4 as to requiring residential area parking permits, specifies at page 217 that:

This project will require the purchase of residential parking permits (RPPs) for long-term use of on-street parking in residential areas. Permits reduce the impact of spillover parking in residential areas adjacent to commercial areas, transit stations, or other locations where parking may be limited and/or priced. Refer to Parking Supply Limitations (PPT-1), Unbundle Parking Costs from Property Cost (PPT-2), or market Rate Parking Pricing (PPT-3) strategies for the ranges of effectiveness in these categories. The benefits of Residential Area Parking Permits strategy should be combined with any or all of the above mentioned strategies, as providing RPPs are a key complementary strategy to other parking strategies.

Similarly, residential permit parking is required in each of the two combinations of parking strategies that could reduce VMT at page 61 of the CAPCOA report.

Since the proposed project would not implement the key parking control strategy of requiring residents or employees of the project site to purchase residential parking permits, the CAPCOA report does not support credit for trip reduction based on the proposed project's mere reduction in retail on-site parking supply, which the DEIR relies upon. The DEIR's inadequacy is obvious because the project would allow its residents, employees and visitors to park in the surrounding neighborhoods which have some parking spaces that are not time-limited and also to park for free for at least an hour and a half in the adjacent Laurel Village Shopping Center parking lot which has over two hundred fifty-two (252) above-ground parking spaces. (Conversation between Richard Frisbie and Ron Giampaoli, owner of Cal-Mart, December 18, 2018). The Spot Angels website also reports free parking spaces within walking distance of Laurel Village. (Ex. G)

Further the CAPCOA report at page 40 states that it "does not provide, or in any way alter, guidance on the level of detail required for the review or approval of any project. For the purposes of CEQA documents, the current CEQA guidelines address the information that is needed," and refers to footnote 2 which states: "See: California Natural Resources Agency: 2007 CEQA Guidelines - Title 14 California Code of Regulations, Sections 15125, 15126.2, 15144, and 15146."

In addition, as to limiting parking supply, the CAPCOA report provides that factors other than limiting parking supply must be considered and states at page 208:

Though not specifically documented in the literature, the degree of effectiveness of this

4
(TR-4)
cont'd

measure will vary based on the level of urbanization of the project and surrounding areas, level of existing transit service, level of existing pedestrian and bicycle networks and other factors which would complement the shift away from single-occupant vehicle travel.

As discussed herein, the proposed addition of five loading zones around the site would attract additional vehicle trips but the EIR failed to take into account the VMT that would result from these new trips and failed to provide substantial evidence to support its conclusion that reducing retail parking supply in the manner stated in the DEIR would mitigate project VMT to a less than significant level.

The DEIR is also inadequate in that it relies upon the generalization that recent research indicates that an area with more parking influences higher demand for more automobile use without taking into account the large number of parking spaces proposed for the project. The DEIR relies upon a study by Rachael Weinberger that is cited in footnote 73, but the cited pages are not provided in the DEIR or Appendix D. However, the study deals only with the effects of residential parking spaces at home and does not predict the effect of retail parking spaces. (Ex. H, abstracts of Weinberger study)

The DEIR also relies upon a study of *Residential Street Parking and Car Ownership* that is also not provided in the DEIR or Appendix D, but cited in footnote 74. Again, the DEIR merely claims that the Zhan study deals the “the number of cars per household” and does not claim that the study says anything about the effect of retail parking supply. DEIR p. 4.C.75. Similarly, the DEIR relies on a study of households in New Jersey cited in footnote 75 that is not contained in the DEIR or Appendix D. Again, the DEIR does not claim that this study considers retail parking supply.

The DEIR also relied on the generalization that a study of nine cities across the United States concluded that “parking provision in cities is a likely cause of increased driving among residents and employees in those places.” DEIR p. 4.C.76. Again, this study is not contained in the DEIR or Appendix D and says nothing about the effectiveness of reducing retail parking supply alone to the degree described in the DEIR, while still providing over 100 retail parking spaces and abundant parking for residential and office uses. The quoted portion of the study said nothing about the effectiveness of reducing the retail parking alone or the degree of increased driving associated with the provision of parking, so is too vague to support the conclusion set forth in the DEIR that reducing the retail parking to the degree proposed in the DEIR would mitigate the VMT impact to insignificance.

The DEIR also refers at page 4.C.76 to Fehr and Peers research that allegedly claims that reductions in off-street vehicular parking for office, residential and retail developments reduce the overall automobile mode share associated with those developments, relative to projects with the same land uses in similar contexts that provide more off-street vehicular parking. The

San Francisco Planning Department
January 8, 2019
Page 12

conclusion which the DEIR draws from this research indicates that it has no relation to retail parking spaces: "In other words, more off-street vehicular parking is linked to more driving, indicating that people without dedicated parking spaces are less likely to drive." DEIR p. 4.C.76. In the context of the proposed mitigation for the proposed 3333 California Street project, which would reduce retail parking spaces from 198 to 116 (which would include 60 commercial parking spaces for the community), the generalization set forth in the Fehr and Peers research does not constitute substantial evidence that the reduction in retail parking to the degree proposed in the DEIR would reduce the significant VMT impact to insignificance. Again, the Fehr and Peers research cited in footnote 77 is not in the DEIR or Appendix D.

4
(TR-4)
cont'd

In addition, the DEIR is legally inadequate in failing to present information on the number of retail parking spaces that the mitigation measure M-TR-2 proposes to eliminate, and requires the reader to perform a calculation to arrive at number of retail parking spaces proposed to be eliminated. DEIR p. 4.C.80. This type of obtuse discussion in an EIR is unlawful under CEQA. CEQA requires that information be presented in manner that is understandable to the decision maker and the public, but the transportation analysis in this DEIR is characterized by a hide-the-ball approach, replete with unexplained conclusions and unsubstantiated allegations. Under CEQA, conclusions that require blind trust in the decision maker are inadequate. The calculations of the amount of retail parking proposed to be reduced stated in this comment letter were performed by the author of this comment statement and are not set forth in the DEIR. Demand is made that the DEIR state the number of retail parking spaces that Mitigation Measure M-TR-2 on page 4.C.80 of the DEIR proposes to eliminate to mitigate the significant VMT impact and set forth the manner of calculating the number of retail spaces to be eliminated. After this information is provided in a revised EIR, please circulate it for public comment.

3. The DEIR Lacks Any Substantiation or Explanation of the Alleged Neighborhood Parking Rate, and Substantial Evidence Does Not Support Its Conclusions as to the Accuracy of the Alleged Rate and TAZ 709 Data.

Importantly, the alleged neighborhood parking rate is not substantiated or supported by substantial evidence in the DEIR or Appendix D. The DEIR lacks a description of the methodology used to calculate, and times of collecting data related to, the alleged existing neighborhood parking rates for residential, retail or other non-residential uses set forth in Table 4.C.19 of the DEIR on page 4.C.77-79 or the daily existing VMT per capita for Households (Residential), Employment (Office) and Visitors (Retail) in TAZ 709 at page 4.C.50 of the DEIR. Table 4.C.10 at page 4.C.50 of the DEIR cites the San Francisco Planning Department Information Map, accessed May 25, 2018, as the source of the data as to the existing average daily vehicle miles traveled in TAZ Zone 709. However, that map provides only conclusions and the DEIR does not contain a summary of the data used to produce the alleged average daily vehicle miles traveled or explain the methodology used to collect or produce the data or the dates on which the data was collected or estimates made. Due to the lack of sufficient substantiation or description of a reputable methodology, substantial evidence does not support the allegations in

San Francisco Planning Department
January 8, 2019
Page 13

the DEIR that the data in Table 4.C.10 of the DEIR accurately represents the existing average daily vehicle miles traveled.

4
(TR-4)
cont'd

The data in the DEIR concerning the existing neighborhood parking rate is also unsubstantiated and fails to constitute substantial evidence that such data accurately represents the existing neighborhood parking rates for the uses claimed, including for residential, retail and other (office and daycare). The DEIR is inadequate because it fails to provide substantiation of the methodology for collecting data as to the alleged existing neighborhood parking rates or the times of collection of the data or the estimations made. As the Source of the data contained in Table 4.C.19 of the DEIR, the DEIR cites "Kittleson and Associates, Inc. 2018; San Francisco Planning Department, 2018." These citations merely identify the alleged source of the conclusions and the date.

Footnote 80 of the DEIR states that Planning department staff reviewed assessor and planning department records and street view/serial photos to estimate off-street parking associated with retail uses along California and Sacramento streets near the project site to derive the appropriate neighborhood parking rate for this analysis. No summary or description of such information is provided in the DEIR or Appendix D. Although footnote 80 does not refer to any review related to office or childcare uses, the DEIR cites footnote 80 as support for the claim that the analysis splits non-residential into retail and other non-residential (office and daycare) uses and compares those to the neighborhood parking rate, which accounts for parking associated with retail and other non-residential uses along California Street and Sacramento Street near the project site. DEIR p. 4.D.77. The methodology used in such analysis is not discussed in the DEIR or Appendix D. There is no substantiation for the parking rates for office and childcare uses.

Also, the note to Table 4.C.19 states that the existing parking rate for residential uses reflects data for TAZ 709 and other nearby TAZs (within three-quarters of a mile based on walking distance). The DEIR lacks any explanation of the type of data for TAZ 709 that was used to estimate the existing parking rate for residential use in the area described or substantiate the reliability of the methodology used to arrive at the existing parking rate for residential uses set forth in the DEIR. It is unclear whether the residential parking rate was estimated in some manner based on VMT, surveys of vehicle ownership or some other means and whether the dates on which the base data was collected, if any, was representative of existing conditions in the project area. The DEIR is inadequate because it lacks substantial evidence indicating that the methodology for collecting or analyzing the data was reliable, a sufficient explanation of the nature of the data collected for the identified land uses and the times at which the data was collected, and explanation of why the data gathered was representative of conditions in the project area. Surely, there should be memoranda explaining or analyzing any data collected, but none are discussed or cited in the DEIR or Appendix D. In essence, the TAZ data and the existing neighborhood parking rate data stated in the DEIR are lacking in the factual support needed to constitute substantial evidence under CEQA. Unsupported conclusions do not

San Francisco Planning Department
January 8, 2019
Page 14

constitute substantial evidence under CEQA. The DEIR's alleged TAZ data and alleged existing neighborhood parking rates are unsubstantiated black holes that lack the transparency required to constitute substantial evidence supported by fact under CEQA.

4
(TR-4)
cont'd

Similarly, the DEIR admits that parking supply is not an input into SF-CHAMP, but claims that "based on recent research, the existing parking supply within a TAZ has a relationship with VMT for that TAZ." DEIR p. 4.C.76. The "recent research" is not described or substantiated with a citation to a document, and the claim that the existing parking supply within a TAZ is related to the VMT for that TAZ is too general to support the conclusion as to the effectiveness of the proposed mitigation drawn in the DEIR. The degree or nature of the alleged relationship is not explained or substantiated as providing a reasonable basis for calculating the existing neighborhood parking rate or the effectiveness of mitigation provided by reducing retail parking supply.

The DEIR also inadequately relies upon the ambiguous claim that even "though parking is not specifically an input in SF-CHAMP, the amount of existing parking is captured in the estimates of VMT outputs from SF-CHAMP because it is an existing condition on the ground. Therefore, it is likely that a new development that does not propose parking at or below the neighborhood parking rate would not reduce VMT below the existing VMT per capita rate for that TAZ." DEIR p. 4.C.76. The DEIR cites nothing as substantiation for this vague claim, rendering it suspect and lacking in substantial evidence. The claim that the existing neighborhood parking rate is likely captured in the estimates of VMT outputs from SF-CHAMP is so vague as to be unusable and does not provide a basis for calculating the alleged neighborhood parking rates from VMT attributable to the area or some amount of it. The claim that there is some relationship between VMT and the neighborhood parking rate fails to provide enough relevant information from which a conclusion can reasonably be drawn that a mere relationship provides a basis for calculating the existing neighborhood parking rate from VMT outputs or the effectiveness of reducing retail parking supply as a mitigation measure.

Also, the DEIR does not claim that the Planning Department or Kittleson and Associates estimated or calculated the existing neighborhood parking rates using VMT outputs. The DEIR's allegations as to the existing neighborhood parking rate and the VMT for TAZ 709 fail to qualify as substantial evidence, as they do not supply enough relevant information and reasonable inferences from this information that a fair argument can be made to support the conclusions made in the DEIR. 14 California Code of Regulations section 15384(a). The DEIR's claims as to the existing neighborhood parking rate for the project area and the VMT for TAZ 709 are unsupported allegations. Substantial evidence under CEQA does not include unsubstantiated opinion or narrative, evidence that is not credible, argument, or speculation. Public Resources Code sections 21080(e), 21082.2(c); 14 California Code of Regulations sections 15064(f)(5)-(6), 15384.

In calculating the alleged existing parking rate for retail and other nonresidential uses on

San Francisco Planning Department
January 8, 2019
Page 15

“California and Sacramento streets, as provided by the planning department,” the DEIR ignored the existing retail uses on Presidio Avenue, which are adjacent to the project site and included in TAZ 709. Also, the DEIR fails to describe the areas on California and Sacramento streets that were included in the alleged measurement, so fails to demonstrate that they were reasonable estimates of the area from which the neighborhood parking rate should be determined. DEIR p. 4.C. 77. Demand is made that the City provide detailed explanation of the method of calculating the existing neighborhood parking rates used in the DEIR, the method and nature of collecting the data underlying the rates, the dates on which data was collected and the basis for determining that the data accurately reflects the existing neighborhood parking rate for the project area.

Importantly, the January 20, 2016 Governor’s Office of Planning & Research *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA* does not recommend basing the evaluation on estimates of neighborhood parking rates. (Ex. I) Rather, OPR recommended that:

Because new retail development typically redistributes shopping trips rather than creating new trips, estimating the total change in VMT (i.e. the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project’s transportation impacts. (Ex. I, p. III:23.)

Moreover, there is not substantial evidence in the record that the project’s proposed retail would be local-serving. The proposed 198 retail parking spaces indicates that the retail would not be local serving and the plans do not specify the square footage of the retail spaces. August 17, 2017 plan sheet A4.03 shows a very large retail space whose square footage is not specified. (Ex. J, compare sheet A4.03 with sheet A4.02) Thus, there is a fair argument that the project would have a large anchor tenant which would draw non-local-serving retail. Demand is made that the DEIR calculate the estimated total daily VMT that the project would generate, including the total VMT for each land use type. Also, the five proposed loading zones proposed to be installed in streets surrounding the site further support a fair argument that the retail uses would attract non-local customers. (Ex. L)

Agencies do not have unlimited discretion to adopt their own thresholds for significance of impacts, including impacts on VMT. Agencies may adopt their own thresholds or rely upon thresholds recommended by other agencies, “provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.” CEQA Guidelines section 15064.7(c).

Thresholds of significance are not a safe harbor under CEQA; rather, they are a starting point for analysis:

[T]hresholds cannot be used to determine automatically whether a given effect will or will not be significant. Instead, thresholds of significance can be used only as a measure of whether a certain environmental effect “will normally be determined to be significant”

4
(TR-4)
cont'd

San Francisco Planning Department
January 8, 2019
Page 16

or “normally will be determined to be less than significant” by the agency....In each instance, notwithstanding compliance with a pertinent threshold of significance, the agency must still consider any fair argument that a certain environmental effect may be significant. (Ex. I, OPR proposed transportation impact analysis guidelines, p. III:17-18, citing *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108)

4
(TR-4)
cont'd

Substantial evidence does not support the City’ decision to adopt the thresholds for estimating VMT increase used in the DEIR or the rate of mitigation adopted in the DEIR.

Thus, the EIR must consider the fair argument presented above that reducing the retail parking spaces in the manner described in Mitigation Measure M-TR-2, with reference to a percentage of the existing neighborhood parking rates, will not reduce the Significant VMT impact of the proposed project/variant to a less than significant level.

Also, the DEIR’s claim that the existing neighborhood parking rate for retail uses is 1.55 conflicts with information on retail parking rates applicable to the project area. The Note in Table 4.C.19 at DEIR page 4.c.77 claims that the existing parking rate for retail and other non-residential uses reflects data from California Street and Sacramento streets, as provided by the Planning Department,” but fails to describe a specific document produced by either Kittleson and Associates, Inc. or the San Francisco Planning Department that contains such data. Thus, the record does not contain substantial evidence to support the DEIR’s claim that reducing retail parking to the extent proposed would mitigate the significant impact to insignificance. Similarly, footnote 80 on DEIR p. 4.C.77 claims that Planning Department staff reviewed assessor and planning department records and street view/aerial photos to estimate off-street parking associated with retail uses along California and Sacramento streets near the project site to derive the appropriate neighborhood parking rate for this analysis, but fails to provide such data or a description of a specific document that would support the analysis described. For these reasons, the DEIR lacks substantial evidence to support its conclusion that the existing neighborhood parking rate is 1.55 parking spaces per gsf of retail uses.

Resolution 4109, which applies to the 3333 California Street site, requires 1 automobile parking space for each 500 square feet of gross floor area on the property, which is 2 parking spaces for each 1,000 square feet of commercial building floor area. (Ex. K) Under the NC-S, Neighborhood Commercial Shopping Center zoning applicable to the Laurel Village Shopping Center, Planning Code section 151 requires for retail sales and services, one off-street parking space for each 500 square feet of Occupied Floor Area up to 20,000 where the Occupied Floor Area exceeds 5,000 square feet, plus one for each 250 square feet of Occupied Floor Area in excess of 20,000. Thus, the general standard applicable to Laurel Village is 2 parking spaces for each 1,000 square feet of Occupied Floor Area up to 20,000 square feet. Based on this information, there is a reasonable possibility that the existing neighborhood parking rate in the project area is greater than 1.55 parking spaces per gsf of retail uses, and the DEIR’s claims as to

San Francisco Planning Department
January 8, 2019
Page 17

the existing neighborhood parking rate are inaccurate or unsubstantiated.

4
(TR-4)
cont'd

The DEIR is also deficient because it used different thresholds for assessing VMT significance (exceeding regional VMT per employee minus 15 percent) and whether mitigation measures would reduce the significant VMT impact to less than significant, which is based on whether the retail parking exceeds the existing neighborhood rate of 1.55 spaces per 1,000 gross square feet. DEIR p. 4.C.80. This comparison of apples and oranges makes the analysis in the DEIR inadequate and confusing to the decision maker and the public. The deficient comparison is also contrary to the OPR proposes transportation impact guidelines, which state at p. III:16 that:

Models and methodologies used to calculate thresholds, estimate project VMT, and estimate VMT reduction due to mitigation should be comparable. (Ex. I, p. III:16)

4. The DEIR Is Inadequate Because It Used Inaccurate Models to Forecast Vehicle-Trips and the DEIR's Traffic Demand Analysis is Inadequate Because It Omits Substantial Traffic that Would be Attracted to Five New Loading Zones Proposed to Be Installed on the Streets Surrounding the Property, Including VMT from Transportation Network Companies Such as Uber and Lyft.

5
(TR-2)

The DEIR estimated the Existing Daily Vehicle Miles Traveled per Capita for the project site, TAZ 709, from data contained in the San Francisco Planning Department Transportation Information Map. (DEIR p. 4C.8 and Table 4.C.3 Existing Daily Vehicle Miles Traveled per Capita. Table 4.C.3 presented an alleged summary of the daily VMT per capita for the region, City and TAZ 709, in which the project site is located. DEIR p. 4.C.8.

Scope of Work for the 3333 California Street transportation demand analysis confirms that the DEIR used the TAZ zone information to estimate VMT:

Vehicle Miles Traveled: KAI will utilize the San Francisco Transportation Information Map to obtain vehicle miles traveled data from the Planning Department data, which includes average daily VMT estimates by us for the region and the project's traffic analysis zone (TAZ 709). DEIR Appendix D, Scope of Work-Final dated July 11, 2017, p. 3.

For purposes of the VMT analysis, KAI assumes the baseline (Year 2020) conditions VMT for the region and the Project's transportation analysis zone for each of the uses proposed by the Project and Variant will be the same as Existing. DEIR Appendix D, Scope of Work-Final dated July 11, 2017, p. 6.

The DEIR explains that the San Francisco Transportation Authority uses a model called SF-CHAMP to estimate VMT by private automobiles and taxis for different land uses within

▼

San Francisco Planning Department
January 8, 2019
Page 18

individual TAZs:

The San Francisco Transportation Authority (transportation authority) uses SF-CHAMP to estimate VMT by private automobiles and taxis for different land use types within individual TAZs. Travel behavior in SF-CHAMP is calibrated by transportation authority staff based on observed behavior from the California Household Travel Survey 2010-2012, census data regarding automobile ownership rates and county-to-county worker flows, and observed vehicle counts and transit boardings. SF-CHAMP uses a synthetic population, which is a set of individual actors that represents the Bay Area's actual population, who make simulated travel decisions for a complete day. The transportation authority uses a tour-based analysis for office and residential uses, which examines the entire chain of trips over the course of a day, not just trips to and from the project. DEIR p. 4.C.7.

As explained herein, the SF-CHAMP model does not include trips made by transportation network companies.

As explained at DEIR p. 4.C.27, the analyses in CEQA documents typically present the existing environmental setting as the baseline conditions against which the project conditions are compared to determine whether an impact is significant. The DEIR used the TAZ data to estimate baseline conditions:

For purposes of the VMT analysis, the baseline conditions VMT for the region and the project's transportation analysis zone for each of the uses proposed by the project and project variant would be the same as existing. DEIR p. 4.C.30

The DEIR analyzed impacts of the proposed project or project variant by comparing the baseline conditions described in the "Baseline Conditions" discussion (pp. 4.C.27-4.C.31) to conditions under full buildout of the proposed project or project variant. DEIR p. 4.C.46. For the cumulative analysis, future year 2040 cumulative conditions are compared to project buildout conditions for the proposed project and project variant. The year 2040 was selected because it is the latest year that travel demand forecasts are available from the transportation authority's travel demand forecasting model, SF-CHAMP. DEIR p. 4.C.46.

The 3333 California Street proposed project/variant includes significant changes to the transportation network that would attract substantial numbers of automobiles, delivery vehicles, trucks and other vehicles to five new loading zones proposed to be installed on streets surrounding the perimeter of the site. Plan sheet C2.02 shows four new passenger loading zones proposed to be installed on streets surrounding the perimeter of the property and PRELIMINARY DESIGN 08/2018 shows one new 100-foot commercial loading zone proposed on California Street near the northwestern edge of the property. (Ex. L) The DEIR is inadequate because it omitted VMT that could be generated by automobiles, delivery vehicles, trucks and

5
(TR-2)
cont'd

San Francisco Planning Department
January 8, 2019
Page 19

other vehicles attracted to these new loading zones, and such omission is substantial in view of the explosive growth of transportation network companies and food and other delivery vehicles documented herein. DEIR p. 6.86 indicates that commercial loading zones would be used for FedEx and Amazon Fresh, which use delivery vans that are typically about 30 feet long.

The SF-CHAMP model, which was used to estimate project travel in the DEIR, did not include the traffic attracted to these loading zones.

The City is aware that the SF-CHAMP model, used to perform estimates of various transportation issues in the DEIR, is out of date and so inaccurate that it is in the process of being revised. The model used to produce the DEIR's transportation analyses is inadequate and inaccurate because it was based on observed behavior that occurred before the explosion of transportation network companies such as Uber and Lyft, which are causing huge increases in VMT. The DEIR shows that the SF-CHAMP did not take into account the VMT that can be anticipated from transportation network companies attracted to the project/variant site by the five loading zones proposed to be added to the perimeter of the site. The DEIR states at page 4.C.7 that:

The San Francisco Transportation Authority (transportation authority) uses SF-CHAMP to estimate VMT by private automobiles and taxis for different land use types within individual TAZs. Travel behavior in SF-CHAMP is calibrated by transportation authority staff based on observed behavior from the California Household Travel Survey 2010-2012, census data regarding automobile ownership rates and county-to-county worker flows, and observed vehicle counts and transit boardings.

The Traffic study in the DEIR states that to estimate the travel demand for the project, the trip generation, mode split and distribution of trips generated by the Project and Variant will be based on data from the *SF Guidelines* information for Superdistrict 2 and the current U.S. Census American Community Survey Five-Year (2011-2015) Estimates journey-to-work data. DEIR Appendix D, p. 7.

For estimating the trip-making patterns of the proposed project or project variant, the DEIR developed a methodology using the National Cooperative Highway Research Program Report 684 and the 2010 and 2011 Institute of Transportation Engineers Journal which was similar to the approach used in the analysis of other recently completed EIRs, including the Mission Rock Project at Seawall Lot 337 and Pier 48, and the Pier 70 Mixed Use District Project. DEIR 4.C.56; DEIR Appendix D page 22.

The two studies cited in footnote 2 and 3 on page 22 of Appendix D of the DEIR are the Transportation Research Board, National Cooperative Highway Research Program Report 684, 2011, *Enhancing Trip Capture Estimation for Mixed-Use Developments* and the ITE Journal, 2010 and 2011, *Improved Estimation of Internal Trip Capture for Mixed-Use Development and*

5
(TR-2)
cont'd

6
(TR-1)

San Francisco Planning Department
January 8, 2019
Page 20

Alternative Approaches to Estimating Internal Traffic Capture of Mixed-Use Projects. These deal with per capita trip capture rates, not total VMT generated. Also, the DEIR fails to provide an explanation of the methodologies discussed in the referenced publications or of the modified trip generation model specific to the 3333 California Street project that the DEIR claims was developed. Thus, the DEIR does not contain substantial evidence that would support the reliability of the modified methodology used to estimate trip-making patterns of the proposed project/variant. An explanation of the modified model and the cited publications are not contained in the DEIR or Appendix D.

6
(TR-1)
cont'd

However, Appendix D explains that these studies were only the initial point for the analysis because the NCHRP Report 684 and ITE provided information on unconstrained internal trip capture rates for the proposed projects which “represent the highest possible values, resulting from the most favorable balance of land uses.” DEIR Appendix D, p. 23. Kittleson then adjusted the initial information to estimate internal trip capture rates used in the analysis that “are constrained by the need for the number of trips generated by the producer uses to match the number of trips received by the attractor uses. Using the unconstrained internal trip capture rates as an initial point of analysis, the project- and scenario-specific internal trip capture rates were identified through an iterative balancing process. DEIR Appendix D, p. 23.

That iterative process was not explained in the DEIR or Appendix D, so the ultimate conclusion reached as to internal trip capture rates was evidently based on interpretation by Kittleson rather than on calculations or fact-based analysis, and the absence of such information renders the DEIR’s conclusions as to the internal trip capture rate inadequate under CEQA. Unsupported opinion does not constitute substantial evidence under CEQA.

Also, the internal trip capture rates included in Attachment C, and presented in Tables 6 and 7 at DEIR Appendix D pp. 9, lack rates of the internal trip capture rates for the entire day and contain rates for internal trip capture only in the A.M. and P.M. peak hour periods. DEIR Appendix D, Attachment C, p. 131. Kittleson fails to describe any support for its use of only alleged internal trip capture rates for peak periods.

Significantly, the Table 6 shows that the NCHRP and ITE unconstrained trip capture rate of 20% is the same rate as Kittleson estimated for residential uses in the project variants, which are supposed to be determined on the basis of constrained internal trip capture rates. Kittleson estimated that the internal trip capture rate for residential use in the office project variant would be 20% and the internal trip capture rate for residential use in the multi-family variant would be 19.9%. DEIR Appendix D, p. 9. The DEIR contains no support for the conclusion that constrained residential trip capture rates linked with beginning and ending points should be the same as the unconstrained residential trip capture rates that are not linked with a beginning and ending. OPR does not recommend using different methods to estimate VMT reduction. (Ex. I, p. III:16)

The fact that the residential trip capture rates Kittleson calculated for the project variants are the same as the unconstrained rates “which represent the highest possible values, resulting from the most favorable balance of land uses,” indicates that Kittleson used a most favorable interpretation of data rather than conservative estimates to produce a biased and inaccurate conclusion. Also, since Kittleson used data for peak periods to estimate the internal trip capture rates for the project, it would be reasonable to assume that residents of the project site would drive the most at that time traveling to and from work, rather than make the highest possible number of internal trips during peak periods at the site. Since Kittleson provides no calculations to estimate total trip capture rates, and its estimates of peak period residential trip capture rates are suspect, the DEIR lacks substantial evidence to support its estimation of internal trip capture rates of the project/variant which the DEIR used to estimate daily auto trips.

6
 (TR-1)
 cont'd

In Table 9 in Appendix D p. 27, Kittleson also projected mode share by trip purpose using P.M. peak hour mode share rather than 24-hour mode share, as provided by the *SF Guidelines* 2002 in Appendix C-4. Table 9 fails to compare work with non-work trips that total 100% of trips by the land use type. Instead, Table 9 presents comparisons of percentages of trips that occur by auto, transit, walking or other mode, for unspecified amounts of work and non-work trips so that the percentage of daily work and non-work trips cannot be determined. DEIR Appendix D, p. 27.

Also, the mode shares and average vehicle occupancy rates used in the DEIR were based on the United States Census Bureau five-year estimates of commute trip travel behavior from the 2011-2015 American Community Survey for Census Tract 154, which includes the project site. DEIR p. 4.C.57. As documented herein, TNC use became significant in 2016, so was not accurately taken into account in the mode shares, trip generation and distribution of trips used in the DEIR..

The DEIR estimated travel demand based on information in the 2002 *SF Guidelines* that predated the astronomical increase in TNA and food delivery trips and failed to provide an estimate of total VMT that would be caused by the project. The DEIR does not claim that its traffic demand analysis included any adjustment to add the traffic demand (and VMT) that would be caused by the current usage of vehicles such as TNCs and food or other delivery vehicles that would be attracted to the five proposed new loading zones surrounding the site. Rather, it claims that some person-trips would be reduced by an unexplained methodology dealing with internal trip capture.

The October 1, 2002 *Executive Summary* of the San Francisco Travel Demand Forecasting Model Development prepared for the San Francisco County Transportation Authority explains that its travel demand model was developed to provide detailed forecasts of travel demand for various planning applications and that its model components were estimates using various data that was in existence before 2002. (Ex. M, SFCTA Executive Summary and November 16, 2018 Wietgrief email stating that SF-CHAMP model is the model the City uses to

7
 (TR-2)

San Francisco Planning Department
January 8, 2019
Page 22

estimate VMT by transportation analysis zone.) The SFCTA website indicates that SF-CHAMP was last updated in 2014. (Ex. N, excerpts from SFCTA DataMart) If the SF-CHAMP was updated based on any data that came into existence after 2014, please describe in detail the changes in such data that relate to TNC and food delivery traffic, neighborhood parking rates, and VMT (and related issues including mode share, average vehicle occupancy and trip distribution) and provide supporting documentation. Assuming that the last update to SF-CHAMP was in 2014, the date upon which that model was based pre-dated the explosion of transportation network companies such as Uber and Lyft.

7
(TR-2)
cont'd

Since the 2002 San Francisco Guidelines were adopted, there has been explosive growth in TNC and food and other delivery vehicle trips.

City documents already acknowledge the substantial evidence exists that shows the transportation network companies are generating substantial VMT in the City. Page 1 of the September 28, 2017 San Francisco Planning Department *Transportation Impact Analysis Guidelines - Update* states that the Department's Transportation Impact Analysis Guidelines for assessing project's transportation impacts under CEQA were last updated in 2002. (Ex. O) The update further explains that:

To assess these impacts, the department estimates how many trips people in newer developments may take, the ways they travel, and their common destinations based on the findings of the Citywide Travel Behavior Survey - Employees and Employers (May, 1993); the Citywide Travel Behavior Survey - Visitor Travel Behavior (August, 1993); revolving five-year estimates from US Census, American Community Survey data; San Francisco County Transportation Authority San Francisco Chained Activity Model, which is based upon, among other sources, observed behavior from California Household Travel Survey (2010-2012), and major San Francisco transportation studies...

Also, since that time, San Francisco has experienced changes in the demographics of the population, the types of new jobs, and the cost of housing, among other variables that affect travel behavior. Some of these changes create greater constraints on our transportation systems, including more competition for curb space. **One of the major changes has been with emerging mobility services and technologies that have changed the way some people travel (using transportation network companies such as Uber and Lyft) and interact with goods (home deliveries). These changes also affect the percentages of how people travel (known as mode splits in the transportation analysis methodology).** For example, we understand anecdotally that people may be shifting from using their own vehicles or transit to instead use transportation network companies such as Uber and Lyft. (Ex. O, p. 2, emphasis added)

At that time, staff was considering substantive updates to the following topics:

San Francisco Planning Department
January 8, 2019
Page 23

Process - scoping our topics from transportation review earlier in the process based upon the characteristics of the project, site, and surroundings (e.g., through a checklist)...

Loading - Refine estimates of passenger and commercial loading demand, attempting to account for rise in for-hire vehicles and e-commerce deliveries.

Vehicle Miles Traveled/Induced Auto Travel - Potential quantification of the relationship between parking supply and induced automobile travel.

Traffic Hazards - Update definitions of types of traffic hazards as well and standards that can be implemented to potentially avoid traffic hazards (which may be incorporated into walking/accessibility and bicycling).

Construction - consideration of the effects of excavation on overall project construction and the resulting duration/intensity of construction phases. (Ex. O, p. 3)

Substantial data collection and analysis is currently underway, primarily at newer development sites and will result in the creation of refined estimates of how many trips people in newer developments take, the ways they travel, and their common destinations and updating of the travel demand methodology used in the guidelines. (Ex. O, p. 4) Importantly, data was being collected and analyzed on estimates of passenger and commercial loading demand. *Ibid.* Graphics distributed during the update to the Planning Commission showed that between 1/1/2003 and 1/1/2017 the San Francisco population had increased by 92,000 persons and Bay Area Population by 900,000. (Ex. P, second page)

The October 2018 Draft Report *TNCs & Congestion* by the San Francisco County Transportation Authority states that:

Congestion in San Francisco worsened between 2010 and 2016...During this period significant changes occurred in San Francisco...San Francisco added 70,000 new residents and over 150,000 new jobs, and these new residents and workers added more trips to the City's transportation network. Finally, new mobility alternatives emerged, most visibly TNCs.... (Ex. Q, p. 3)

In recent years, the vehicles of transportation network companies (TNCs) such as Uber and Lyft have become ubiquitous in San Francisco and many other major cities...In San Francisco, this agency (the San Francisco County Transportation Authority or SFCTA) estimated approximately 62 million TNC trips in late 2016, comprising about 15% of all intra-San Francisco vehicle trips and 9% of all intra-San Francisco person trips that fall (2). [sic] The rapid growth of TNCs is attributable to the numerous advantages and conveniences that TNCs provide over other modes of transportation, including point-to-point service, ease of reserving rides, shorter wait times, lower fares (relative to taxis),

7
(TR-2)

ease of payment, and real-time communication with drivers. The availability of this new travel alternative provides improved mobility for some San Francisco residents, workers and visitors, who make over one million TNC trips in San Francisco every week, though these TNC trips may conflict with other City goals and policies...(Ex. Q, p. 3)

7
 (TR-2)
 cont'd

When compared to employment and population growth and network capacity shifts (such as for a bus or bicycle lane), TNCs accounted for approximately 50% of the change in congestion in San Francisco between 2010 and 2016, as indicated by three congestion measures: vehicle hours of delay, vehicle miles travelled, and average speeds.

Employment and population growth- encompassing citywide non-TNC driving activity by residents, local and regional workers, and visitors - are primarily responsible for the remainder of the change in congestion....Daily vehicle hours of delay (VHD) on the roadways studied increased by about 40,000 hours during the study period. We estimate TNCs account for 51% of this increase in delay, and for about 25% of the total delay on San Francisco roadways and about 36% of total delay in the downtown core in 2016, with employment and population growth accounting for most of the balance of the increased [sic] in delay...**Daily vehicle miles travelled (VMT) on study roadways increased by over 630,000 miles. We estimate TNCs account for 47% of this increase in VMT, and for about 5% of total VMT on study roadways in 2016...**Average speeds on study roadways declined by about 3.1 miles per hour. We estimate TNCs account for 55% of this decline...(Ex. p. 4, emphasis added)

Similarly, during the AM peak, midday, and PM peak periods, TNCs cause about 40% of the increased vehicle miles travelled, while employment and population growth combined are responsible for about 60% of the increased VMT. However, in the evening time period, TNCs are responsible for over 61% of the increased VMT and for about 9% of total VMT....(Ex. Q, p.5)

As the *TNCs & Congestion* report documents, TNCs comprise a significant share of intra-San Francisco travel:

According to recent studies, between 43% and 61% of TNC trips substitute for transit, walk, or bike travel or would not have been made at all. (Ex. Q, pp. 11-12)

Given the rapid pace of technological change in the transportation sector, other factors may also be contributing to changes in congestion. For example, increased use of online shopping and delivery services might exacerbate roadway congestion due to an increase in delivery vehicle trips and loading duration. (Ex. Q, p. 12)

The SFCTA *TNCs & Congestion* report also states that in 2010 TNC use was negligible and in 2016 it was significant, and that SF-CHAMP version 5.2 does not account for TNCs. (Ex. Q, p. 16)

San Francisco Planning Department
January 8, 2019
Page 25

A 2017 national study of ride-hailing from the University of California, Davis Institute of Transportation Studies, *Disruptive Transportation: The Adoption, Utilization, and Impacts of Ride-Hailing in the United States*, found that 49% to 61% of ride-hailing trips would not have been made at all, or by walking, biking, or transit. (Ex. R, p. 2) After using ride-hailing, the average net change in transit use was a 6% reduction among Americans in major cities, and ride-hailing attracts Americans away from bus services (a 6% reduction) and light rail services (a 3% reduction). (Ex. R, p. 2)

The map at page 6 of the *TNCs & Congestion* report shows that TNCs are responsible for approximately 30-60% of vehicle delay on California Street in the project area. (Ex. R) The graphs on page 7 of that report show that TNCs account for 61% of the increase in vehicle miles travelled in Supervisor District 2, with employment change accounting for 21% and population change accounting for 16%. (Ex. R, pp. 6-7)

San Francisco County Transportation Authority's *TNCs Today*, Final Report, June 2017 is consistent with its 2018 *TNCs & Congestion* report. (Ex. S, pp. 1-5, 8) *TNCs Today* reports that on a typical weekday, TNCs make over 170,000 vehicle trips within San Francisco, which is 15% of all intra-San Francisco vehicle trips. (Ex. S, p. 1) Intra-SF TNC trips generate approximately 570,000 vehicle miles of travel (VMT) on a typical weekday, comprising as much as 20% of intra-SF-only VMT. (Ex. S, p. 2) Recent SFMTA Travel Decisions Survey results indicate that TNCs are growing in significance as a share of overall San Francisco travel, doubling in mode share served between 2014 and 2015. (Ex. S, p. 3) Approximately 290,000 TNC person trips are estimated to occur within San Francisco during a typical weekday, which represents approximately 9 % of all weekday person trips within the City. (Ex. S, p. 9) During weekdays, TNCs have a clear pattern of peak usage that coincides with the existing AM and PM peak periods. (Ex. S, p. 10) The third highest rate of TNC pickups and drop-offs in the City occurs in Supervisorial District 2, in which the 3333 California Street site is located. (Ex. S, p. 13) Estimated total VMT produced by TNCs on a typical weekday is approximately 570,000 VMT, and intra-SF TNCs generate as much as 20% of weekday VMT for intra-SF vehicle trips and at least 6.5 % of total weekday VMT in San Francisco. (Ex. S, p. 15) Most of the VMT generated by TNCs occurs during the AM and PM peak hours, with significant VMT also occurring during the evening hours, following the PM peak. (Ex. S, p.15-16)

The October 2018 Draft Report *TNCs & Congestion* by the San Francisco County Transportation Authority also states at page 12 that increased use of online shopping and delivery services might exacerbate roadway congestion due to an increase in delivery vehicle trips and loading durations. In addition, the report states that TNC passenger pick up and drop off activity may also result in increased congestion by disturbing the flow in curb lanes or traffic lanes. (Ex. Q, -p. 12)

According to the October 2018 Draft Report *TNCs & Congestion* by the San Francisco County Transportation Authority, during most of the day, approximately 40% to 50% of the

7
(TR-2)
cont'd

↓

Page 26

increase in vehicle hours of delay is attributable to TNCs, but in the evening, almost 70% of the increase in vehicle delay is due to TNCs. (Ex. Q, p. 33)

7
(TR-2)
cont'd

Although the DEIR does not explain the data used to derive the neighborhood parking rates used in Table 4.C.19, SFCTA documents show that the data included only off-street parking spaces, so did not include parking in loading zones or other on-street areas by transportation network companies. The April 6, 2016 Memorandum from Wade Wietgreffe concerning *General Non-Residential Off-Street Parking Rate Estimation for San Francisco* states at page 2 that the “Transportation Authority estimated a general non-residential off-street parking rate as the number of public and private off-street parking spaces per 1000 square feet of non-residential land use. Summaries of non-residential square footage and off-street parking supply for the TAZ and other nearby TAZs within .75 miles of network-based walking distance were made to derive a parking rate that is representative of the neighborhood and is not artificially truncated at arbitrary TAZ boundaries. Off-street, publicly available parking data were available through SFPark and off-street, private parking estimates were taken from the Transportation Authority’s Parking Supply and Utilization Study. (Ex. T, pp. 1-2) The map following that page entitled *Non-Residential Parking Supply Estimated from SF Park Data* shows TAZ level estimates of parking supply rates for San Francisco, based on off-street parking supply from SFPark and scaled up by 35 to match citywide totals to match the *estimated* supply from the PSUS parking estimation model. (Ex. T) The source of the estimates on the map are cited as “2013 Parcel Land Use and Zoning District Methodology, San Francisco Planning Department.” (Ex. T, map following p. 2)

8
(TR-4)

5. The DEIR Is Inadequate Because It Lacks the Analyses Set Forth in the *SF Guidelines*.

The DEIR does not contain the calculations or substantiation for trip distribution, assignment and modal split information required by the 2002 *SF Guidelines*, which state that “**person trip generation rates per unit of square footage for each land use, or other unit as shown in Appendix C, are to be used for estimating levels of activities for the proposed project.**” (Ex. A, p. 9, emphasis added) Those *SF Guidelines* also state that:

9
(TR-1)

Trip Distribution, Assignment and Modal Split Information: Net new person trips distributed to various directions of travel and assignment of the appropriate modes of travel (auto, transit, walk, and other) should be calculated, presented in tables and a graphic diagram (for vehicle and transit trips), and discussed in the text. Modal assignments should also be calculate for daily and the P.M. Peak Hour...

The weekday P.M. Peak Period is generally 4:00 - 6:00 , and traffic counts shall generally be conducted during this period, unless otherwise specified in the scope of work. The peak hour must be determined from the counts (normally recorded in 15 minute intervals) for the entire peak period, and should represent the single hour within the peak period with the highest counts. (Ex. A, pp. 9-10)

↓

San Francisco Planning Department
January 8, 2019
Page 27

The DEIR lacks information on the calculation of total daily trip generation of the project and the calculation of daily modal assignments and net new person-trips. Instead, the DEIR inadequately presents information on peak hour AM and PM trip generation, thus understating the trip generation of the project and the resulting VMT that produces greenhouse gas emissions. The mode share presented in Table 9 of Appendix D of the DEIR at p. 27 “reflects the weekday PM peak hour mode share.” Table 10 also presents only AM and PM peak hour data and lacks daily modal share information, so total mode share cannot be understood. The DEIR is misleading to decision makers and the public.

The 2002 *SF Guidelines* state that since work and on-work trips have different characteristics in terms of distribution and mode of travel, the number of work and non-work (visitor) trips should be calculated separately; Appendix C provides the methodology to compute the work and non-work (visitor) trips for specific land use. (Ex. A, p. 9-10) The DEIR does not calculate the percentage splits between work and non-work trips for specific land uses in the manner specified in Table C-2 based on the trip generation rates in Table C-1 of the 2002 *SF Guidelines*. For example - for residential use, Table C-2 states that 33% of daily trips are from work trips and 67% are from non-work trips; for office use 36% of daily trips are from work and 64% from non-work use; for retail 4% of daily trips are from work and 96% from non-work use.

However the DEIR lacks the calculation of the daily or PM peak hour percentage splits of work/non-work trips based on the trip generation rates per 1000 square feet of land use or number of residential units presented in Table C-1. The 2002 *SF Guidelines* make clear at p. 9 that “Person trip generation rates per unit of square footage for each land use, or other unit shown in Appendix C, are to be used for estimating levels of activity for the proposed project.” The DEIR lacks these person trip generation rates per square footage of land use and understates person trips by presenting information on trips during weekday AM and PM peak periods.

Appendix E to the DEIR lacks substantiation or calculation of the total work and non-work trips for each trip purpose and merely sets forth unsubstantiated claims as to the amount of work and non-work trips divided into auto, transit, walk and other travel, rather than by square footage of land use. Table 9 lacks the total amount or percentage of work and non-work trips for residential, office, retail, restaurant and other use, and merely presents unsubstantiated percentages of work and non-work uses in the various categories of auto, transit, walk and other. Table 9's claim that 54.5% of residential trips are made with autos and 54.8% of residential non-work trips are made with autos provides no meaningful information to the decision maker as to the total amount of residential trips that are made or the percentage of residential trips made based on the land use devoted to residential use or the split between work and non-work trips attributable to residential uses. That split is the basis for the mode share split calculation required by Table C of the *SF Guidelines*. Table 9 of the DEIR fails to provide information needed to calculate VMT for each mode share. VMT is produced by total trips, not only in the AM and PM.

9
(TR-1)
cont'd

In addition, the figures set forth in the DEIR also conflict with the vehicle trip distribution information provided in the *SF Guidelines*. Table E-4 of the 2002 *SF Guidelines* provides the daily distribution of work trips to SD-2, but the DEIR lacks information on daily distribution and merely provides data on weekday AM and PM peak hour distribution. Ex. A; DEIR p. 4.C.57. Again, the DEIR Table is not substantiated and is supported only by an unexplained reference to Kittleson & Associates 2017 and *SF Guidelines* 2002. The DEIR did not follow the *SF Guidelines* as to calculation of trip distribution.

The external person-trip generation by mode presented in Table 4.C.14 at page 4.C.58 of the DEIR is unsubstantiated and unsupported by substantial evidence. The support cited for this Table is merely Kittleson & Associates 2018 and *SF Guidelines* 2002. No explanation of the method or basis of calculation of the modes is provided, and modes are not provided as to trip purpose or type of trip (whether residential, office, retail or daycare). The allegations in the Table constitute unsupported conclusions and do not amount to substantial evidence.

There is also no calculation or substantiation to support the average vehicle occupancy as to mode share set forth in Table 9 of Appendix D page 12. The source cited for the average vehicle occupancy and PM peak hour mode share are merely general references to Kittleson & Associates 2017, the American Community Survey Five-Year (2011-2015) Estimates, and *SF Guidelines*, 2002. While the American survey may provide information as to residential non-work trips, there is no evidence that it provides information as to work or other trips, such as retail trips.

Also, the mode shares and average vehicle occupancy rates used in the DEIR consist of unsupported conclusions and are not supported by substantial evidence. The mode shares and average vehicle occupancy rates “for residential work trips” were based on the U.S. survey 2011-2015 estimates (DEIR p. 4.C.57), but the DEIR does not provide a supporting reference for the residential non-work trips, office work-trips or non-work trips, retail work trips or non-work trips, restaurant work-trips or non-work trips or daycare work or non-work trips. The DEIR is inadequate for failing to provide an explanation of the manner in which this information was derived. Also, as stated above, in *TNCs & Congestion*, **since TNC use became significant in 2016**, there is not substantial evidence that the increased mode shares by TNCs were taken into account in arriving at the DEIR’s conclusions, and the DEIR’s transportation analysis is inadequate for failing to take such information into account.

As to Mode Share, the DEIR states at page 4.C.57 that:

Person-trips generated by the proposed project and project variant were distributed to San Francisco’s four Superdistricts and the greater Bay Area and then assigned to travel modes based on mode shares presented in the *SF Guidelines* in order to determine the number of auto, transit, walk and “other” trips. The “other” mode includes trips taken by bicycle, motorcycle, for-hire vehicles such as transportation network companies, taxis,

and other modes. The person-trips shown as “auto” person trips reflect the total number of persons traveling by automobile and some automobiles would transport more than one person or multiple people, each of whom is making one person trip. Vehicle trips are calculated as the number of auto person trips divided by the average vehicle occupancy. Mode shares and average vehicle occupancy rates for residential work trips are based on United States Census Bureau five-year estimates of commute trip travel behavior from the 2011-2015 American Community Survey for Census Tract 154, which includes the project site. External person-trip generation estimates by mode and vehicle types are shown in Table 4.C.14: External Person-Trip Generation by Mode.

9
 (TR-1)
 cont'd

Thus, the DEIR used inaccurate estimates of mode share that pre-dated the great increase in TNCs that occurred in 2016.

DEIR Appendix D explains at page 27 that mode share by trip purpose (work or non-work) is presented in Table 9. The internal trips presented in Table 7 would be expected to occur for the most part by walking and bicycling. As a result, the preliminary modal split percentages presented in Table 9 would change. Table 10 provides a comparison of modal splits before and after the calculation of internal trips for the Mixed-Use Office Scenario and Mixed-Use Multi-Family Housing Scenario. The resulting person-trips by mode and external person- and vehicle-trips are shown in Table 11.

The traffic study in Appendix D of the DEIR admits at page 22 that the *SF Guidelines* do not provide a specific methodology to assess the amount of trips that could remain within a large mixed-use project site and claims that refinements were made to the standard travel demand analysis “to account for the size and land use mix of the project.” However, the DEIR lacks explanation of the nature of the refinements made and substantiation of the accuracy of the methodology used to estimate the internal trip capture rates. Thus, substantial evidence does not support the DEIR’s conclusions as to the internal trip capture rates stated in the DEIR.

As explained herein, the internal trip capture rates used in the DEIR for the proposed project are not supported by the referenced studies or other reports. Similarly, the conclusions as to mode share and average vehicle occupancy stated in Appendix D at page 27-29 are also unsupported by explanation or analysis. Again, the source of the conclusions is only Kittleson and an un referenced page of the 2002 *SF Guidelines*.

The traffic study in DEIR Appendix D also explains at page 22 that:

To better estimate the trip-making patterns of the proposed project, a modified trip generation model specific to the 3333 California Street project was developed. The methodology was developed using the National Cooperative Highway Research Program Report 684, ITE, and is similar to the approach used in the analysis of the Mission rock Project at Seawall Lot 337 and Pier 48, and the Pier 70 Mixed-Use District Project.

San Francisco Planning Department
January 8, 2019
Page 30

The two studies cited in footnote 2 and 3 on page 22 of Appendix D of the DEIR are the Transportation Research Board, National Cooperative Highway Research Program Report 684, 2011, *Enhancing Trip Capture Estimation for Mixed-Use Developments* and the ITE Journal, 2010 and 2011, *Improved Estimation of Internal Trip Capture for Mixed-Use Development and Alternative Approaches to Estimating Internal Traffic Capture of Mixed-Use Projects*.

9
(TR-1)
cont'd

However, the DEIR fails to provide any explanation of the methodologies discussed in the referenced publications, which the DEIR cites as support for its estimates of the internal trip capture rate. The cited publications are not contained in the DEIR or Appendix D.

In addition, the DEIR's mode share analysis is inaccurate and inadequate because it fails to take into account the current mode share of vehicle trips currently occurring by transportation network companies such as Uber and Lyft and the 3333 California Street project proposal to add five new loading zones around the perimeter of the site which will attract such transportation network companies and other delivery vehicles.

Also, the DEIR fails to estimate the amount of VMT which the proposed non-residential use (54,117 gsf of retail and 49,999 gsf of new office use - DEIR p. 2.8) of the project/variant would cause substantially induce. Simply admitting that the project would cause substantial VMT would be caused is inadequate under CEQA because it fails to supply information to decisionmakers and the public as to the degree of the significant impact and nature of the cause(s).

10
(TR-4)

6. The EIR's Traffic Analysis Fails to Adequately Analyze VMT Generated by Customers of the Proposed New Retail Uses.

The DEIR claims that the following thresholds of significance and screening criteria used to determine if a land use project would result in significant impacts under CEQA are consistent with CEQA section 21099 and the thresholds of significance for other land uses recommended in OPR's Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA (OPR proposed transportation impact guidelines):

For residential projects, a project would generate substantial additional VMT if it exceeds the regional household VMT per capita minus 15 percent. This metric is consistent with OPR's proposed transportation impact guidelines stating that a project would cause substantial additional VMT if it exceeds both the existing city household VMT per capita minus 15 percent and existing regional household VMT per capita minus 15 percent.

For office projects, a project would generate substantial additional VMT if it exceeds the regional VMT per employee minus 15 percent.

For retail projects, the planning department uses a VMT efficiency metric approach for

San Francisco Planning Department
January 8, 2019
Page 31

retail projects; a project would generate substantial additional VMT if it exceeds the regional VMT per retail employee minus 15 percent.

10
(TR-4)

For mixed-use projects, each proposed land use is evaluated independently, per the significance criteria described above. DEIR p. 4.C.49.

For mixed-use projects or retail land use, the threshold of significance used in the DEIR is *not* consistent with the OPR proposed transportation impact guidelines). Those OPR proposed transportation impact guidelines actually state at page III:16 that:

Retail Projects. Lead agencies should usually analyze the effects of a retail project by assessing the change in total VMT, because a [sic] retail projects typically re-route travel from other retail destinations. A retail project might lead to increases or decreases in VMT, depending on previously existing retail travel patterns.

Page III:23 of those OPR Guidelines state that:

Because new retail development typically redistributes shopping trips rather than creating new trips, estimating the total change in VMT (i.e. the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project's transportation impacts.

The DEIR failed to analyze adequately the project's potential change in total VMT because it only analyzed VMT caused by employees of the new retail uses. THE DEIR is inadequate because it failed to analyze VMT caused by customers of the proposed new retail uses. Also, as previously stated, the DEIR is inadequate because it determined whether increased VMT was significant based on a comparison with VMT per capita for various land use, rather than based on a comparison with total VMT. Given the increase in employment and population in the City and the rapid growth in TNCs, substantial evidence does not support the DEIR's use of significance standards for the proposed project/variant based on VMT per capita.

The 3333 California project site is in Superdistrict 2. (San Francisco Transportation Information Map, accessed December 26, 2018) According to Appendix D of the San Francisco Planning Department Transportation Analysis Impact Guidelines, October 2002, TABLE E-12 VISITOR TRIPS to SD-2 – RETAIL, percentages of automobile trips made to retail locations in SD-2 from residents in the districts described below are made at the rates listed below:

11
(TR-1)

64.3 % of visitors from All Origins
78.4 % of visitors from Superdistrict 1
56.5 % of visitors from Superdistrict 2
60.9 % of visitors from Superdistrict 3
81.2 % of visitors from Superdistrict 4

San Francisco Planning Department
January 8, 2019
Page 32

65.8 % of visitors from the East Bay
81.2 % of visitors from the North Bay
95.1 % of visitors from the South Bay and
62.5 % of visitors from other locations. (Ex. A, excerpts of said Appendix D)

11
(TR-1)
cont'd

Page C-1 of Appendix C to the San Francisco Planning Department Transportation Impact Analysis Guidelines state that the “essential data necessary for the calculation of trip generation is contained in Tables C-1 and C-2, and in the trip distribution, mode split, and auto occupancy tables contained in Appendix E.” (Ex. A, attached) Table C-1 of that Appendix shows that Eating/Drinking uses have higher trip rates than General Retail and all other uses except Supermarket, at the following rates of trips per 1,000 gross square feet of space:

General Retail	150.0
Supermarket	297.0
Eating/Drinking	
Quality Sit-Down	200.0
Composite Rate	600.0
Fast Food	1400.0
Office	
General	18.1
Residential (all types)	
2+ bedrooms	10.0/unit
1 Bedroom/studio	7.5/unit
Senior Housing	5.0/unit (Ex.----)

These rates were used by the City in the EIR for the 901-16th Street and 1200-17th Street project in estimating trip generation for project retail; San Francisco rates were also used for estimating trip generation for project residential uses and calculating Daily Person trips in that Draft EIR for that project. (Ex. U, pp. IV.A.31, 32) The retail mode splits and AVO were based on the *San Francisco Guidelines* Appendix E, and showed that retail work trips accounted for only 4% of the daily auto retail person trips (262/5923) and retail non-work trips accounted for 96% of the daily auto retail person trips (5661/5923). *Ibid.* That EIR also showed, based on the *San Francisco Guidelines* Appendix E, that the Average Vehicle occupancy for retail work trips was 1.23 but the Average Vehicle Occupancy for retail non-work trips was 1.90. *Ibid.* According to Appendix E of the *San Francisco Guidelines*, 64.3 % of all visitor trips to SD-2 were made by automobile, with 1.88 persons per auto. (Ex. A)

Table C-2 of Appendix C of the San Francisco Transportation Impact Analysis Guidelines shows at page C-4 that the percentage splits between work and non-work trips for Retail (including Supermarkets & Eating/Drinking Establishments) is 4% work and 96% non-work for a daily 24-hour period. (Ex. A) Of the 54,117 gross square feet of total retail uses in the proposed 3333 California Street project, 40,004 gsf would be for general retail, 4,287 gsf for sit-down restaurant and 9,826 gsf for composite restaurant. (DEIR pp. S-49) According to Table

San Francisco Planning Department
January 8, 2019
Page 33

4.C.11 of the DEIR, of the total 19,644 daily person-trip generation estimated for the proposed project, 12,753 person trips generated by the project would be from total retail uses, or 64.9 % of the daily person trips. Since 96% of the retail trips would be for non-work trips, 96% of the 12,753 retail non-work person trips, or 12,243 daily person trips would be generated by customer, or non-work retail trips.

11
(TR-1)
cont'd

Thus, the DEIR is inadequate because it failed to include approximately 12,243 daily person trips that would be generated by retail customers of the project, or non-work retail trips. Omission of this information misleads the decision maker and the public as to the true impacts of the project.

The DEIR failed to analyze whether a likely increase in VMT per retail customer, or non-work trips, could cause substantial additional VMT. DEIR p. 4.C.80. The DEIR only analyzed whether the likely increase in VMT per employee associated with provision of retail parking spaces may increase VMT per employee enough to exceed the threshold of 15 percent below the regional average for retail uses. DEIR p. 4.C.80. Based on the information set forth herein showing that 12,243 daily person trips would be generated by retail customers, the DEIR lacks substantial evidence to show that the significance standard used in the DEIR was a reasonable measure of VMT increase for the proposed project/variant, especially since the standard considered retail work-trips and not retail customer-trips. For these reasons, including the fact that the DEIR failed to analyze 64.9% of the daily person trips from total proposed retail uses, the DEIR also lacks substantial evidence to support its conclusion that reducing the retail parking supply in the manner stated in Mitigation Measure M-TR-2 would reduce the significant impact of the proposed project and variant on VMT to a less than significant level. DEIR 4.C.80.

12
(TR-4)

Vehicle miles traveled (VMT) measures the amount and distance vehicles would travel on the roadway as a result of a project or plan. (Ex. C, TDM Technical Justification, p. 6) That justification confirms that transportation demand management programs are “designed to reduce *Vehicle Miles Traveled* by residents, tenants, employees, and visitors.” Thus, the DEIR is inadequate for failing to analyze potentially significant increase in visitor travel.

The DEIR also lacks a coherent and complete explanation of which retail uses would use the parking spaces being provided for retail uses. The DEIR contains numerical estimates of “Long-Term” and “Short-Term” proposed parking space supply for Retail, Sit-down and Composite retail uses. DEIR p. 4.C.118. Is the proposed Long-Term supply intended for employees of the retail uses and the proposed Short-Term supply intended for customers of the retail uses? Since it is a reasonable assumption that the proposed Short-Term supply is intended for customers of the retail uses, customers of the retail uses are expected to drive to the site, but the EIR inadequately lacks any estimate of the impact of that driving by retail customers on increased VMT, or the cumulative impact of retail customer driving with driving by customers of the adjacent Laurel Village Shopping Center. With respect to the mitigation measures proposed to reduce retail parking spaces, would those measures reduce long-term or short-term retail

San Francisco Planning Department
January 8, 2019
Page 34

parking spaces?

The DEIR's analysis of the cumulative impact on VMT was also deficient for the reasons stated above.

The EIR also fails to analyze the combined or cumulative effect on VMT caused by the proposal to construct new project retail uses along two blocks of California Street that are immediately adjacent to the existing two-block long retail neighborhood shopping center of Laurel Village. The combination of the two adjacent shopping areas would likely attract more retail customers to the project area due to the potentially increased variety of retail uses and availability of a wider range of retail services including substantial amounts of new restaurant uses (both composite and sit-down) proposed for the project site. Due to the amount of potential added retail options that the proposed project would add to the area (54,117 gsf), the project area including the Laurel Village Shopping Center would likely become a shopping destination which would attract more customer traffic in combination than would occur with either component of the retail uses alone. Due to the increased attraction of retail customers to a retail shopping destination, the DEIR is seriously inadequate for failing to have analyzed the VMT likely caused by retail customers of the proposed project/variant as a project impact, and also as a cumulative impact on the VMT likely generated by the project retail uses in combination with the VMT generated by existing retail uses in the Laurel Village Shopping Center. The proposed addition of a Whole Foods market at the City Center on Geary Boulevard at Masonic, which is two blocks from the project site, together with the VMT caused by visitors to the Target store currently located at that site, and the visitors to the Trader Joe's market located on Masonic one block away from the project site, should also have been included in a cumulative impact analysis. In sum, based on my experience in shopping at Laurel Village, the proposed project could cause significantly increased VMT in the area of the proposed project because the area would become more of a shopping destination than it is presently. Thus, the EIR is inadequate for failure to estimate VMT from retail customers as an impact of the project and as a cumulative impact with VMT from existing customers of Laurel Village Shopping Center and other nearby commercial uses.

7. Feasible Mitigation Should Be Adopted to Reduce the Project's Significant Impact on VMT and its Incremental Cumulative Effects on Regional VMT.

The following Mitigation Measure should be adopted as a condition of approval of the proposed project/variant.

MITIGATION MEASURE - NO RESIDENTIAL PARKING PERMITS FOR RESIDENTS OF, OR PERSONS WORKING AT, THE PROJECT.

In order to reduce VMT from project residents or workers parking in the areas surrounding the project site, as a condition of approval, the project sponsor shall be

12
(TR-4)
cont'd

13
(TR-5)

required to agree to a deed restriction recorded against the property providing that persons living at 3333 California Street and workers employed at 3333 California Street shall not be entitled to apply for a residential parking permit in the residential parking permit area that includes the 3333 California Street site, and the project sponsor shall be required to fund development of a program at the City agency that governs issuance of residential parking permits (currently believed to be MTA) in an amount not to exceed \$2 million (two million dollars) to be used to enable that agency to modify and screen applications for residential parking permits and identify persons residing or working at 3333 California Street who would not be eligible to apply for residential parking permits and to implement amendments to application procedures for residential parking permits sufficient to enable the agency to identify persons residing or working at 3333 California Street. This condition shall be incorporated into any approval of the project, including without limitation into any approval rendered by the Board of Supervisors or the Planning Commission.

8. The DEIR Inadequately Analyzes Whether the Proposed Project/Variant Would Cause Major Traffic Hazards.

14
 (TR-7)

A. The Project Would Cause Significant Hazards of Collision with Oncoming Vehicles.

Plan sheet C.4.03 shows that trucks with a 50-foot wheelbase would turn into the oncoming traffic lane/area when turning right from Euclid Avenue to onto Laurel Street, when travelling right at the curve of Laurel Street where it intersects Mayfair Drive, and when turning right from Laurel Street onto California Street. (Ex. V) At each of these locations, trucks with a 50-foot wheelbase would turn into the oncoming traffic lane/area. (Ex. V) At the curve of Laurel Street where it intersects Mayfair Drive, traffic often backs up onto northbound Laurel Street in peak hours and after school hours due to vehicles stopping on northerly bound Laurel Street while they are waiting to turn left into the Laurel Village Shopping Center. I have also seen vehicles traveling southbound on Laurel Street adjacent to the Laurel Village Shopping Center backup as they approach the entrance to the Laurel Village Shopping Center to the right, due to vehicle back-ups at the entrance to the Shopping Center. According to plan sheet C.403, a truck traveling northbound on the curve of Laurel Street which has a 50-foot wheelbase would turn into the oncoming traffic lane where vehicles southbound on Laurel Street back up, thereby creating a risk of collision. Such trucks turning right at the corner of Laurel Street eastbound onto California Street would also turn into the oncoming westbound traffic lane on California Street as they approach the 100-foot commercial loading zone proposed to be installed next to the bus stop on eastbound California Street. Such truck turns would also cause a collision hazard, because vehicles often back up in the eastbound lanes on California Street at the intersection of Laurel Street in the peak afternoon traffic periods. Plan Sheet C.4.06 shows that buses with a 40-foot wheelbase turning right in these areas would also turn into oncoming traffic lanes and have

↓

San Francisco Planning Department
January 8, 2019
Page 36

the same risk of collision. (Ex. V) The DEIR is inadequate because it failed to analyze adequately this traffic hazard impact and and analyze and adopt mitigation measures that could reduce the significant impact from causing major traffic hazards.

14
(TR-7)
cont'd

B. The Project Would Cause a Potentially Significant Hazard to Pedestrians.

15
(TR-8)

The DEIR failed to analyze adequately the significant hazard to pedestrians that would result from unloading operations conducted at the proposed 100-foot long commercial loading zone proposed to be installed on California Street adjacent to the project site. Preliminary Design 08/2018 and plan sheets C2.02 and L1.01 show that this 100-foot commercial loading zone would be adjacent to a "PEDESTRIAN ACCESS POINT" and the pedestrian sidewalk on California Street. (Ex. L) Trucks off-loading freight from this loading zone would likely cross the sidewalk to deliver freight to the site, and some such crossings would likely traverse that pedestrian access point. The proposed 100-foot commercial loading zone is adjacent to a major pedestrian access point in the proposed project. The off-loading of freight in this area could cause major hazards to pedestrians using the sidewalk in this area. The DEIR is inadequate because it failed to analyze this potentially significant impact and provide mitigation measures to avoid or substantially reduce this impact.

The following mitigation measure is feasible and would mitigate this hazard to a less than significant level:

MITIGATION MEASURE. All freight loading or unloading will be conducted in the underground garages provided in the proposed project/variant.

C. The Proposed Project/Variant Would Cause a Major Hazard From Vehicle Speed Reductions On Pine Street Approaching the Proposed Bulb-Out on Presidio Avenue at Pine Street Such that There Would be Increased Risk of Rear-End Collisions or Other Hazards.

16
(TR-7)

Sheet C2.02 shows a new proposed bulb-out would be installed adjacent to the right westbound traffic lane on Pine Street at the corner of Presidio Avenue and Pine Street. (Ex. L) Pine Street is a Major Arterial containing three one-way lanes of westbound travel. DEIR 4.C.5. During commute hours, traffic is very heavy on Pine Street westbound, with substantial vehicles traveling from downtown work locations. The proposed bulb-out at this location would cause traffic to slow down at the intersection of Pine Street and Presidio Avenue where visibility is already impaired due to the upward slope. Due to vehicles slowing down near this bulb-out, the proposed project would have increased risk of rear-end crashes or other hazards to vehicles traveling on this major artery and also could cause potential traffic back-ups which would also cause increased risk of collisions. The DEIR is inadequate for failing to analyze this potentially significant impact and mitigation measures that could reduce the impact to insignificance. The DEIR's claim that the project's proposed streetscape changes, including bulbouts, would not

San Francisco Planning Department
January 8, 2019
Page 37

increase the risk of rear-end crashes or other hazards is conclusory and not supported by substantial evidence. The following mitigation measure would mitigate this impact to insignificance:

MITIGATION MEASURE: Eliminate the proposed bulb-out at the intersection of Pine Street and Presidio Avenue as shown in plan sheet C2.02.

D. The DEIR Is Inadequate in Failing to Analyze the Potentially Significant Hazards From TNC and Delivery Vehicles Double-Parking Near Proposed Loading Zones.

The five proposed new loading zones proposed to be installed on streets surrounding the project would attract TNCs and other delivery vehicles. Such vehicles are known to stop in the street when there is not an easily accessible or available turn-in area, such as when a loading zone is occupied. Literature previously discussed herein documents this hazard from TNCs. The DEIR fails to analyze adequately the traffic hazards caused by such vehicles potentially stopping in the street near the proposed project loading zones, including without limitation the increased hazards from the risk of collisions.

E. The DEIR Fails to Analyze Potentially Significant Traffic Hazards From Vehicles Queueing at Project Site Driveways.

The DEIR acknowledges that based on a review of existing conditions, the addition of project-generated traffic could result in queues and potential conflicts with existing traffic operations in the vicinity of the proposed Laurel Street driveway between California Street and Mayfair Drive with potential conflicts being between vehicles entering/exiting the Laurel Village Shopping Center surface parking lot and vehicles accessing the proposed project's below-grade parking garage from the Laurel Street northernmost driveway. DEIR p. 4.C.81. During times of peak demand, queues can spill back across the sidewalk and onto Laurel Street and affect operations of the adjacent, closely spaced intersections at California Street and at Mayfair Drive. *Ibid.* The DEIR included an improvement measure which is not binding for this impact. The DEIR is inadequate in failing to include as a binding mitigation measure the proposed queue abatement measures stated in Improvement Measure I-TR-3 and the following measure, which should be adopted as conditions of approval of the proposed project:

MITIGATION MEASURE: If significant queues develop on Laurel Street near the intersections of Mayfair Drive or California Street, entrance to the project garages on Laurel Street will be limited to residential occupants of the buildings along California Street. If such queues are reported to the Planning Director, the Planning Department will propose and support modifications to project approvals that will be sufficient to abate such queues to be approved by the Board of Supervisors, Planning Commission or other applicable authority.

CONCLUSION

For the reasons set forth above, the DEIR is inadequate under CEQA and must be revised and the revision submitted for public comment.

Very truly yours,

Kathryn R. Devincenzi

**TRANSPORTATION IMPACT ANALYSIS GUIDELINES
FOR ENVIRONMENTAL REVIEW**

October 2002

The Planning Department
City and County of San Francisco

II . Overview of Process and Procedures

These guidelines update and revise the *Guidelines for Environmental Review: Transportation Impacts* (July, 1991) and *Interim Transportation Impact Analysis Guidelines for Environmental Review* (January 2000), and supersede all previously published transportation analysis guidelines. This document reflects the most current data available regarding San Francisco travel characteristics. A major portion of the analysis guidance is based on the findings of the *Citywide Travel Behavior Survey - Employees and Employers* (May, 1993), the *Citywide Travel Behavior Survey - Visitor Travel Behavior* (August, 1993), and updates or enhancements to those reports. In addition, the *Guidelines* employ certain findings and assumptions from major San Francisco study reports, including those for: Mission Bay (Case No. 1996.771E; EIR certified September 17, 1998); Transbay Terminal/Caltrain Extension (Case No. 2000.048E); and Van Ness Avenue (Case No. 1987.586; EIR certified on December 17, 1987). The data in the Citywide Travel Behavior Study (CTBS) was subsequently confirmed by the 1995 *Citywide Travel Behavior Study* that was sponsored by the San Francisco County Transportation Authority.

It should be noted that these are only guidelines. It must not be assumed that the information provided herein constitutes a complete scope of work for any transportation analysis. The *Guidelines* provide a broad overview, while individual transportation study scopes of work are required to provide a level of detail tailored to fit the size and complexity of transportation issues associated with particular projects. Moreover, once a scope of work is prepared and approved under the direction of the Planning Department, the specific direction contained within that scope will provide a more precise focus than that which appears in these *Guidelines*.

For clarification, the following represents an overview of the process involved in the preparation of a transportation impact analysis for environmental review purposes. No estimate or assumption is made or inferred regarding time lines for the various steps.

- (1) The project sponsor or a designated representative files an Environmental Review (EE) application with the Planning Department following the instructions contained in that application form (available at the Department and on-line). When the application is accepted by the Department, a case number is assigned and a staff person from the Department's Major Environmental Analysis section is designated as the coordinator for environmental review. This individual will likely be different than the staff person handling the Transportation Impact Report. All Department staff assigned to the project will coordinate activities throughout the review process. Filing for environmental review generally (but not always) precedes starting the review of transportation issues.
- 2) Determination concerning whether a transportation impact report is required is based on the scale, location, and/or potential level of activity of the proposed

3. Travel Demand Analysis

Travel demand analysis shall include textual information, supported by tables or figures detailing the project's trip generation, trip distribution, trip assignment and modal split characteristics.

Net new travel demand generated by the project is to be estimated, based on the difference between existing and proposed land uses. Person trip generation rates per unit of square footage for each land use, or other unit as shown in Appendix C, are to be used for estimating levels of activity for the proposed project. The rates were developed by an examination of various studies and sources, including the Citywide Travel Behavior Study, the ITE Trip Generation manual and special purpose studies, many of which are specific to San Francisco. No single source or analysis provides, by itself, an adequate means to define trip generation for all the situations encountered in San Francisco. Trip generation rates may sometimes need to be determined by other means, such as surveys of similar land uses, if so specified in the scope of work.

To "net-out" existing land uses that will be replaced, the existing levels of trip activity should, in most cases, be based on actual observations rather than on estimates based on rates in these *Guidelines* or other sources.

Each analysis should apply the trip generation rates from the *Guidelines* individually to the proposed uses, compare the proposed trips to existing levels of trip activity, and show the differences ("net new") by land use and in aggregate.

The Travel Demand Analysis is to include the following, unless otherwise directed in the work scope (Note that different or additional analysis periods may be defined in the scope of work process.) :

- Trip Generation Information: Project trip generation information (total person trips) by land use for existing and proposed uses. The total unadjusted daily and P.M. peak hour trips by mode can be calculated. The number of daily and peak hour vehicles (autos) generated by the project should also be calculated by using the auto occupancy rates noted in the tables in Appendix E.
- Work and Non-Work Trip Generation Information: Since work and non-work trips have different characteristics in terms of distribution and the mode of travel, the number of work and non-work (visitor) trips should be calculated separately. Appendix C provides the methodology to compute the work and non-work

(visitor) trips for a specific land use.

- Trip Distribution, Assignment and Modal Split Information: Net new person trips distributed to various directions of travel and assigned to the appropriate modes of travel (auto, transit, walk, and other) should be calculated, presented in tables and a graphic diagram (for vehicle and transit trips), and discussed in the text. Modal assignments should also be calculated for daily and the P.M. Peak Hour.

The weekday P.M. Peak Period is generally 4:00-6:00, and traffic counts shall generally be conducted during this period, unless otherwise specified in the scope of work. The peak hour must be determined from the counts (normally recorded in 15 minute intervals) for the entire peak period, and should represent the single hour within the peak period with the highest counts. The Planning Department may also request data for other periods to reflect the peak period of trip generation by the land use.

4. Transportation Impact Analysis

Analysis for all projects is to be conducted for project-specific impacts, and for cumulative impacts.

A. Traffic Impacts

Project-Specific Impacts. The project generated traffic impacts must be calculated for intersections identified in the scope of work using the methodologies explained in Appendix B. LOS levels for the specified intersections must be discussed in the text and presented in a table showing Existing, Existing plus Project and Cumulative intersection levels of service. The traffic attributable to the project is normally assumed to be included in the cumulative forecast, and should not be added to the cumulative totals. The percent contribution of the project should be shown both as a percentage of the total cumulative traffic and as a percentage of the growth in traffic (cumulative less existing) for each intersection.

The specific intersections to be analyzed will be identified in the approved scope of work for the transportation analysis, and based on an initial assessment of areas that could be impacted by the project. When a wide area may be impacted, the intersections selected for analysis may only be those that would experience the greatest change or have the greatest likelihood of degrading to an unacceptable LOS with the addition of the project traffic.

Cumulative (Horizon Year) Impacts. The transportation impact analysis should present and discuss the cumulative traffic impacts. The horizon year (normally 10 to 20 years in the future, depending on the location) should be used for the cumulative analysis year unless otherwise specified in the scope of work. The analysis is to assume a growth factor of one percent per year for "background" traffic, unless an areawide cumulative

Appendix C

TRIP GENERATION METHODOLOGY

The trip generation approach in these "Guidelines" has been revised to reflect updated information that has become available since the 1991 version of the "Guidelines." The intent of this revised approach is to make the maximum use of relevant and refined data from the "Citywide Travel Behavior Survey" (CTBS) and other sources (such as the ITE "Trip Generation" reports, the San Francisco Land Use Database and transportation studies), and to better integrate trip generation with other aspects of the analysis process. As more refined data becomes available, it will also be incorporated into the methodology outlined here. Some of the changes may include the use of employee densities in the trip generation process, and the introduction of an adjustment factor to recognize linked and internal trips.

The essential data necessary for the calculation of trip generation is contained in Tables C-1 and C-2, and in the trip distribution, mode split, and auto occupancy tables contained in Appendix E. Multiple sources of information, as are cited in footnotes of Tables C-1 and C-2 and the "Selected Sources" were necessary to develop the rates and factors in the tables since no one source was complete in itself nor provided the linkage between the different collection and analysis methodologies. Some judgement derived from experience with San Francisco development and transportation activities was also applied to the development and refinement of the information. The tables in Appendix E are derived from the data in the CTBS reports.

The land uses in Tables C-1 and C-2 represent the majority of the projects being developed in San Francisco. However, there are a number of uses that might occur on an infrequent basis which are not specifically represented. In those cases, it may be appropriate to use other data sources or studies for trip generation rates which would be specified during the scoping process. Data sources could include field surveys or acceptable published data such as that from the Institute of Transportation Engineers (ITE) and the San Diego Association of Governments (SANDAG). In its *Trip Generation* publication, the Institute of Transportation Engineers (ITE) provides one of the largest sources of commonly used trip generation data. Most of this data, however, was collected in a suburban environment with low transit usage and land use and travel patterns different than San Francisco. Furthermore, the rates are based on vehicle trips as opposed to person trips, and there is no corresponding auto occupancy data for the sources. In some cases, it may be possible to use the data with an appropriate conversion to person trips. This would require the assumption of an auto occupancy rate and a percentage of non-auto trips. For example, if the auto occupancy rate were 1.3 and the "Other modes" trips were 10%, the conversion factor would be $1.3/0.90$, or 1.44. One hundred ITE vehicle trips would equate to 144 person trips.

C-1

NET NEW TRIPS: PROCEDURES FOR ADJUSTMENTS BASED ON EXISTING LAND USES ON THE PROJECT SITE

For project sites that are not vacant or were occupied until recently, adjustments to calculated daily and p.m. peak hour project-generated additional person trips may be made to account for the existing activities on a project site. Whenever feasible, any such adjustment should be based on conducting counts of actual existing commercial trip-making at the project site per specific direction from Planning Department MEA transportation staff. Unless surveys of existing modal splits and distributions are available or conducted, appropriate modal splits and distributions should be applied for the geographic area in which the project site is located in order to estimate net changes for each mode, e.g., vehicles, transit, walking, or other. Net new trips would be derived as follows:

- Calculated additional trips for the project (for daily & pm peak hour)
- Existing observed trips (from actual counts)
- = Net new trips

Whenever it would be impractical to conduct actual counts of existing commercial trip-making activity at a project site, e.g., because the business has recently ceased operations, procedures for estimating and netting out existing trips shall be developed only according to specific direction from Planning Department MEA transportation staff. Whenever the level of trip-making associated with previous uses appears to have been low and/or prior uses have been discontinued for a substantial period of time, application of the concept of net new trips would be inappropriate and the analysis should be based on estimates of trip generation for the proposed project without adjustments.

In cases of existing or recently discontinued residential uses proposed to be replaced by any type of new project, Planning Department residential trip rates from Appendix C and appropriate modal split/distribution census tract data based on procedures described in Appendix D should be applied to estimate existing trips. Net new trips should, in turn, be derived by subtracting existing trips from new trips estimated to be generated by the proposed project.

Whenever a project is proposed to replace an existing or recently discontinued parking facility, netting out existing trips linked to the parking facility is generally inappropriate. The inherent character of parking facilities is to accommodate vehicular trips generated by commercial (and sometimes residential) land uses in the vicinity and to concentrate these vehicular trips in immediate proximity to the parking facility's access points. The basic analytical presumption should be that drivers who have previously parked in a parking facility to be displaced by a proposed project will seek to find other parking nearby and thus these vehicular trips should be treated as remaining at the intersections within the project study area. Therefore, while some reassignments to reflect greater dispersal of vehicles previously using a parking facility on the project site may be appropriate, the reassigned vehicles should be assumed to remain in the project study area. Thus, netting out of vehicles associated with a parking facility on the project site is generally not appropriate. One clear exception to this presumption would apply when the proposed project would replace the underlying land use which primarily accounts for users of the associated parking facility. Appropriate treatment for other exceptional situations should be according to specific direction from Planning Department MEA transportation staff.

TABLE C-1
TRIP GENERATION RATES & EMPLOYEE DENSITIES
FOR TYPICAL LAND USES

	TRIP RATES		EMPLOYEE DENSITY
LAND USE TYPE	RATE PER LAND USE (1)	PM PEAK HOUR (% DAILY)	AVERAGE DENSITY PER EMPLOYEE (2)
Office

TABLE C-2

PERCENTAGE SPLITS BETWEEN WORK & NON-WORK TRIPS

LAND USE TYPE	WORK/NON-WORK SPLIT	
	DAILY 24-HOUR PERIOD	PM PEAK HOUR
Office		
General	36%/64%	83%/17%
Government	20%/80%	83%/17%
Retail (including Supermarkets & Eating/Drinking Establishments)	4%/96%	4%/96%
Hotel/Motel	12%/88%	60%/40%
Manufacturing/Industrial	40%/60%	67%/33%
Residential	33%/67%	50%/50%
Sources: South of Market FEIR; Mission Bay 1990 FEIR		
For commercial uses, 100% of all work trips during the PM peak hour and 50% of all non-work trips during the PM peak hour should be treated as outbound.		
For residential uses, all PM peak work trips and 33% of all PM peak hour non-work trips should be treated as inbound to the project; resident inbound/outbound trip directions may or may not correspond to peak outbound regional travel direction.		

TRIP DISTRIBUTION, MODE SPLIT AND TRIP ASSIGNMENT METHODOLOGY

The steps in the transportation analysis process following trip generation include trip distribution, mode split and trip assignment. Unless a travel demand model is used, the procedure described below should be followed.

Commercial Land Uses

Once it is determined how many person trips are generated by a project, it is necessary to determine the travel mode for the trips, the number of vehicle (auto) trips, the distribution of the trips, and the assignment of the trips to the appropriate transportation network (e.g., street network or transit service). The modal split and distribution can vary by the type of trip (e.g., work or non-work (visitor)), and the land use at the destination (e.g., office, retail, other). To aid in the process, the tables in Appendix E have been prepared using data from the Citywide Travel Behavior Study (CTBS). The data is provided according to the location of the proposed commercial project: the four Superdistricts (SD) in San Francisco, plus the C-3 District within Superdistrict 1. Because the data has been compiled by generalized locations and categories, it may not provide the maximum possible precision for any one project. Overall, however, it provides an adequate representation, and its use will maintain a consistency and comparability between the analyses of different projects.

For the C-3 District, work trips are categorized "Office" and "All Other." The visitor (non-work) trips for the C-3 District are categorized as "Office," "Retail" and "All Other." For the four Superdistricts, there is one category for work trips and two categories for visitor trips: "Retail" and "All Other." Some other areas of the city (e.g., Van Ness Avenue) also have tables that were derived from studies for those areas.

The number of trips by mode can be derived by applying the "Mode %" figure to the total trips. In order to calculate the number of auto vehicle trips, the number of auto trips needs to be divided by the "Persons Per Auto." For the C-3 District, the number of auto vehicle trips equals the number of "Drive Alone" trips plus the "Rideshare" trips that have been divided by "Persons Per Auto, Rideshare."

The tables in Appendix E provide a general distribution of trips (e.g., SD-3, South Bay) which will be useful in directing certain trips to a particular freeway or transit screenline. A graphic representation of these general distributions normally aids in presenting the tabular data. In the next step, judgment must be used to assign the trips to particular links on the street network or to a transit screenline or a feeder bus line to the mainline corridor service. This information needs to be included in the study report, and a graphic presentation is especially important for the street network. Of course, consistency needs to be maintained between the tabular data

EXHIBIT B

Target Results Preview

Initial Vision Scenario does two things:

1. Creates more housing and more affordable housing

This is all “good” news for the targets:

- Meets the housing target
- Improves jobs-housing-transit alignment
- Reduces housing costs for low-income households

2. Brings more people into the region

This is both “good” and “bad” for the targets:

- New residents ride transit, walk and bike more than existing residents and GHG/capita and VMT/capita go down
- But they still drive. As a result, total VMT goes up, which increases collisions and particulate emissions from autos

Initial Vision Scenario: How was it developed?

Housing Growth Distribution Criteria

- Locally identified growth in Priority Development Areas or new Growth Opportunity Areas
- Additional housing units based upon a jurisdiction's selected Place Type for a PDA or Growth Area
- Greater housing density proximate to significant transit investments (Existing Transit or Resolution 3434 Transit Expansions)
- Major mixed-use corridors with high potential for transit-served, infill development

TRANSPORTATION DEMAND MANAGEMENT TECHNICAL JUSTIFICATION

JUNE 2016

UPDATED JANUARY 12, 2018

San Francisco
Planning

SAN FRANCISCO

Vehicle Miles Traveled

Vehicle Miles Traveled measures the amount and distance vehicles would travel on the roadway as a result of a project or plan. An increase in Vehicle Miles Traveled results in an increase of emissions of air pollutants, including greenhouse gases, as well as increased consumption of energy.⁴ Typically, development at a greater distance from other uses, located in areas with poor access to non-auto modes of travel, would generate more driving than one that is located proximate to other complementary uses and/or where there are transportation options other than the car.⁵

Shift

Encourage Sustainable Travel. The Shift component of the Transportation Sustainability Program creates a TDM Program through an ordinance amending the Planning Code. TDM measures are recognized as effective in reducing Vehicle Miles Traveled generated by projects by supporting transportation choices, including walking, bicycling, public or

private transit, car-share, carpooling and other sustainable modes. The TDM Program requires property owners to implement TDM measures that support project residents, tenants, employees, and visitors in making sustainable trip choices thereby reducing their Vehicle Miles Traveled.

The SHIFT component of the Transportation Sustainability Program is consistent with the approach being put forward by the Office of Planning and Research and SB 743, as well as numerous other local, regional, and state policies as described in Chapter 2 of the TDM Technical Justification. It is also consistent with best practices of other jurisdictions around the country, while being tailored to varying San Francisco settings.

⁴ U.S. Environmental Protection Agency, *Our Built and Natural Environments 2nd Ed*, June 2013.

⁵ Office of Planning and Research, *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA*, January 2016.

Chapter 3

Applicability and Targets

This chapter provides a justification for the TDM Program applicability, including exemptions and targets. In addition, this section describes a Cambridge, Massachusetts case study on which components of the TDM Program was modeled.

Land Use Categories and Accessory Parking

Planning Code Section 169 lists the types of Development Projects that the TDM Program applies to. Each Development Project is required to meet a target. The target is based upon the land use(s) associated with the Development Project and the number of Accessory Parking spaces proposed for the land use. The more *Accessory Parking* proposed for a land use, the higher the target for the Development Project to achieve.

The rationale for tying the target to Accessory Parking is based on relevant literature and local data collection, discussed further in Chapter 4 of the TDM Technical Justification, which indicate that areas with more parking are associated with more overall vehicular traffic than areas with less parking. Similarly, as discussed further in Chapter 4 of the TDM Technical Justification, individuals who do not have dedicated offsite parking at their origins or destinations are less likely to drive than those who do. Therefore, more incentives and tools to support non-auto modes and disincentives to using personal vehicles are needed at a site with a greater amount of Accessory Parking spaces than a site with fewer Accessory Parking spaces to encourage sustainable travel and reduce Vehicle Miles Traveled. These incentives, disincentives, and tools that affect mode choice are TDM measures. This approach does not restrict the ability of a property owner to build Accessory Parking up to existing Planning Code requirements or allowances; instead, it provides flexibility to property owners in developing a TDM Plan to reduce Vehicle Miles Traveled that best fits

the needs of the Development Project and neighborhood.

The purpose of trips made to land uses often varies. In order to simplify application of the TDM Program, definitions were classified into four land use categories based upon reducing Vehicle Miles Traveled from the primary trip generator associated with that land use.¹⁴ The four land use categories were organized, based upon research, into categories representing a continuum from highest to lowest estimated number of vehicle trips per parking space provided for primary users (visitors and customers, employees, or residents): Land Use Category A represents uses with the highest rate of vehicle trips per parking space and Land Use Category D represents uses with the lowest rate of vehicle trips per parking space.

¹⁴ Exceptions are schools and hospitals, where those trips and associated parking are much shorter in duration and are often a side trip within a larger tour. Therefore, the visitor/customer trips are more effectively influenced at the origin (e.g., home) and/or ultimate destination (e.g., work) of those tours. In addition, it may be necessary to accommodate driving trips for medical visits.

provision of off-street parking and the choice to drive among individuals traveling to or from the site (similar to the focus of one of the questions in the nine city United States study). Following data collection and an empirical review of the data, this research found that reductions in off-street vehicular parking for office, residential, and retail developments reduce the overall automobile mode share associated with those developments, relative to projects with the same land uses in similar contexts that provide more off-street vehicular parking.⁵¹ In other words, more off-street vehicular parking is linked to more driving and that people without dedicated parking spaces are less likely to drive.

Based upon the recent research, besides Shuttle Bus Service, a reduced Parking Supply is the most effective TDM measure available in the menu. Therefore, for the purposes of the TDM Program, the maximum point value a Development Project could receive from the Parking Supply measure was assigned a high value of 11 points. Eleven options are provided for this TDM measure, depending upon the Development Project's parking supply compared to the neighborhood parking rate.

The neighborhood parking rate is number of existing Accessory Parking spaces provided per Dwelling Unit or per 1,000 square feet of non-residential uses for each transportation analysis zone within San Francisco. A full description of the methodology for estimating the neighborhood parking rate is included in Appendix B of the TDM Technical Justification document and may be refined over time. If a Development Project is parked at or below the neighborhood parking rate, the Development project would receive points for this TDM measure.⁵²

Using the neighborhood parking rate as a basis for assigning points accounts for the variability in geography throughout San Francisco and the effect this can have on travel behavior. The purpose of the TDM Program is to reduce the Vehicle Miles Traveled that would be otherwise estimated to occur from new development (in SF-CHAMP or other transportation modeling software) based upon the new development's transportation analysis zone location. SF-CHAMP provides an estimate of Vehicle Miles Traveled at the geographic scale of a transportation analysis zone, but it does not include inputs for site level characteristics like TDM measures, including Accessory Parking supply. Although not an input into SF-CHAMP, based upon the recent research, the existing Accessory Parking supply within a transportation analysis zone has a relationship with the Vehicle Miles Traveled for that transportation analysis zone. Therefore, a new development would mostly likely not reduce Vehicle Miles Traveled as it relates to Parking Supply, if the new development is not parked at least at or below the neighborhood parking rate.

Factors Rejected for Point Value Assignment

Other factors were considered in assigning point values, such as cost, other City policy goals, and Municipal Code requirements, but those factors were dismissed because they do not reflect the core purpose of the TDM Program of reducing Vehicle Miles Traveled. In regards to cost, the economics of each project will vary greatly as to whether the TDM measures selected for the project will result in an additional cost or cost savings. For example, the upfront cost of constructing a garage structure parking and underground parking is approximately \$50,000 to \$80,000 per space, respectively, in 2014

⁵¹ Fehr and Peers, 2015b.

⁵² In the future, as more research is conducted and as part of updates to the TDM Program Standards, Planning staff may recommend to the Planning Commission that Development

Projects parked above the neighborhood parking rate should receive negative points.

EXHIBIT D

Memorandum

Date: 04.04.2016

To: Wade Wietgreffe, San Francisco Planning Department
 Carli Paine, San Francisco Municipal Transportation agency

From: Drew Cooper, Michael Schwartz, San Francisco County Transportation Authority

Subject: Land Use Categories

The City and County of San Francisco recommends introduction of a Transportation Demand Management (TDM) ordinance which, if approved, will require developers to choose from a menu of improvements to reduce their project's impact on the transportation network through a reduction in vehicle miles traveled (VMT). While the goal of reduced VMT applies to all new development, the applicable measures and points target varies depending on the land use. With this in mind, the TDM Program (Program) has four (4) land use categories. Each use outlined in Section 102 of the Planning Code (Definitions) has been assigned to a category and must meet the requirements of that category.

The remainder of this memo describes the trips associated with the land use and parking spaces for each of the categories.

Category A: Land uses in Category A most closely reflect retail use. Sample land uses include formula retail, museums, entertainment venues, and grocery stores. Many Category A trips are associated with visitors and customers. These trips tend to be shorter in nature, and each parking space accommodates significantly more driving than parking spaces in other groups (see Attachment 1). TDM measures in this category are intended to reduce VMT from visitors and customers (as opposed to store employees), and the targets reflect the higher trip rate associated with each parking space.

Category B: Land uses in Category B most closely reflect office use. Sample land uses include Office, Child Care Facility, and School. While these uses may be associated with some visitor/customer trips, many of the trips will be made by employees and the TDM measures should focus on reducing employee related VMT. Since parking spaces associated with Category B land uses tend to have less turnover (and therefore lower VMT) than Category A, the Program assigns lower targets per parking space.

Category C: Projects in Category C reflect residential use. Parking spaces in Category C generate fewer trips than Category B, reflected in the Program targets. TDM measures for projects in this category target VMT reduction for residents.

Category D: Land uses in Category D are associated with the lowest amount of trip generation, due to lower employment density and a low rate of visitors/customers. Sample land uses in Category D include Manufacturing, Power Plant, and Shipyard. TDM measures for Category D target employee VMT reduction and Program targets are commensurately lower than all other categories.

Quantifying Greenhouse Gas Mitigation Measures

A Resource for Local Government
to Assess Emission Reductions from
Greenhouse Gas Mitigation Measures

August, 2010

Lack of Detailed Information: The quantification methods provided in this report have been developed to allow them to be applied to a range of project conditions and still yield accurate and reliable results. In order to do this, the methods require data inputs that reflect the specific conditions of the project. Because the project has not yet been completed, however, certain information about the project will not be known and must be either estimated or assumed based on standard procedures. For example, at the time of the CEQA process a project proponent might know the number of residential dwelling units that will be in the project, but not know the actual square footage individual units will have. Similarly, while the project proponent may know a general type of non-residential land uses planned, these are often generalized categories such as retail and do not reflect the true diversity and range of source category parameters that would occur between the specific types of retail that the project eventually has. Nor can a project proponent predict specific appliances that will be in buildings or frequency of use. Further, most projects rely on generalized trip rate and trip lengths information that are not specific to the project; these estimates may over or underestimate the actual trip rates and trip lengths generated by the project. In each of these cases, estimates of future conditions are made based on accepted procedures and available data. This Report does not provide, or in any way alter, guidance on the level of detail required for the review or approval of any project. For the purposes of CEQA documents, the current CEQA guidelines address the information that is needed.²

The lack of precise and accurate data inputs limits the quality of the quantified project baseline and mitigated emissions, however. This limitation can be minimized to the extent the project proponent is able to provide better predictive data, or establish incentives, agreements, covenants, deeds, or other means of defining and restricting future uses to allow more precise estimates of the emissions associated with them. Some of these means of refining the data may also be creditable as mitigation of the project. The approval of any such enhancements of the data, or credit as mitigation, is at the discretion of the agency reviewing the project.

Use of Case Studies: One method of enhancing the data available for a project is the use of case studies. Case studies generally have detailed information regarding a particular effect. However, there are limitations of using this information to quantify emissions in other situations since adequate controls may not have been studied to separate out combined effects. There may be features or characteristics in the case-study that do not translate to the project and therefore may over or underestimate the GHG emission reductions. For the most part, case studies were not used as the primary source in the development of the quantification methods in this report. Where case studies were used to enhance underlying data, the studies were carefully reviewed to ensure that appropriate controls were used and the data meet the quality requirements of this Report.

² See: California Natural Resources Agency: 2007 CEQA Guidelines – Title 14 California Code of Regulations, Sections 15125, 15126.2, 15144, and 15146.

at these levels based on empirical evidence.⁴ Maximums are provided for the location/development type of the project. The Global Maximum values can be found in the top row of Chart 6-2.

These include:

- Urban: 75% VMT
- Compact Infill: 40% VMT
- Suburban Center (or Suburban with NEV): 20%
- Suburban: 15% (limited empirical evidence available)

Specific Rules for Subcategories within Transportation- Because of the unique interactions of measures within the Transportation Category, each subcategory has additional rules or criteria for combining measures.

- ❖ **Land Use/Location Strategies – Maximum Reduction Factors:** Land use measures apply to a project area with a radius of ½ mile. If the project area under review is greater than this, the study area should be divided into subareas of radii of ½ mile, with subarea boundaries determined by natural “clusters” of integrated land uses within a common watershed. If the project study area is smaller than ½ mile in radius, other land uses within a ½ mile radius of the key destination point in the study area (i.e. train station or employment center) should be included in design, density, and diversity calculations. Land use measures are capped based on empirical evidence for location setting types as follows:⁵

- Urban: 65% VMT
- Compact Infill: 30% VMT
- Suburban Center: 10% VMT
- Suburban: 5% VMT

- ❖ **Neighborhood/Site Enhancements Strategies – Maximum Reduction Factors:** The neighborhood/site enhancements category is capped at 12.7% VMT reduction (with Neighborhood Electric Vehicles (NEVs)) and 5% without NEVs based on empirical evidence (for NEVs) and the multiplied combination of the non-NEV measures.
- ❖ **Parking Strategies – Maximum Reduction Factors:** Parking strategies should be implemented in one of two combinations:
 - Limited (reduced) off-street supply ratios plus residential permit parking and priced on-street parking (to limit spillover), or
 - Unbundled parking plus residential permit parking and priced on-street parking (to limit spillover).

⁴ As reported by Holtzclaw, et al for the State of California. Note that CTR strategies must be converted to overall VMT reductions (from work-trip VMT reductions) before being combined with strategies in other categories.

⁵ As reported for California locations in Holtzclaw, et al. “Location Efficiency: Neighborhood and Socioeconomic Characteristics Determine Auto Ownership and Use – Studies in Chicago, Los Angeles, and San Francisco.” *Transportation Planning and Technology*. 2002, Vol. 25, pp. 1–27.

Transportation

MP# LU-1.7 & LU-2.1.1.4

PDT-1

Parking Policy / Pricing

3.3 Parking Policy/Pricing

3.3.1 Limit Parking Supply

Range of Effectiveness: 5 – 12.5% vehicle miles travelled (VMT) reduction and therefore 5 – 12.5% reduction in GHG emissions.

Measure Description:

The project will change parking requirements and types of supply within the project site to encourage “smart growth” development and alternative transportation choices by project residents and employees. This will be accomplished in a multi-faceted strategy:

- Elimination (or reduction) of minimum parking requirements⁵²
- Creation of maximum parking requirements
- Provision of shared parking

Measure Applicability:

- Urban and suburban context
- Negligible in a rural context
- Appropriate for residential, retail, office, industrial and mixed-use projects
- Reduction can be counted only if spillover parking is controlled (via residential permits and on-street market rate parking) [See PPT-5 and PPT-7]

Baseline Method:

See introduction to transportation section for a discussion of how to estimate trip rates and VMT. The CO₂ emissions are calculated from VMT as follows:

$$\text{CO}_2 = \text{VMT} \times \text{EF}_{\text{running}}$$

Where:

VMT = vehicle miles traveled

EF_{running} = emission factor for running emissions

Inputs:

The following information needs to be provided by the Project Applicant:

- ITE parking generation rate for project site
- Actual parking provision rate for project site

⁵² This may require changes to local ordinances and regulations.

Transportation

MP# LU-1.7 & LU-2.1.1.4

PDT-1**Parking Policy / Pricing****Mitigation Method:**

$$\% \text{ VMT Reduction} = \frac{\text{Actual parking provision} - \text{ITE parking generation rate}}{\text{ITE parking generation rate}} \times 0.5$$

Assumptions:

Data based upon the following references:

- [1] Nelson\Nygaard, 2005. Crediting Low-Traffic Developments (p. 16)
<http://www.montgomeryplanning.org/transportation/documents/TripGenerationAnalysisUsingURBEMIS.pdf>

All trips affected are assumed average trip lengths to convert from percentage vehicle trip reduction to VMT reduction (% vehicle trips = %VMT).

Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions ⁵³
CO ₂ e	5 – 12.5% of running
PM	5 – 12.5% of running
CO	5 – 12.5% of running
NOx	5 – 12.5% of running
SO ₂	5 – 12.5% of running
ROG	3 – 7.5% of total

Discussion:

The literature suggests that a 50% reduction in conventional parking provision rates (per ITE rates) should serve as a typical ceiling for the reduction calculation. The upper range of VMT reduction will vary based on the size of the development (total number of spaces provided). ITE rates are used as baseline conditions to measure the effectiveness of this strategy.

Though not specifically documented in the literature, the degree of effectiveness of this measure will vary based on the level of urbanization of the project and surrounding areas, level of existing transit service, level of existing pedestrian and bicycle networks and other factors which would complement the shift away from single-occupant vehicle travel.

⁵³ The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis.

Transportation

MP# LU-1.7 & LU-2.1.1.4

PDT-1**Parking Policy / Pricing****Example:**

If the ITE parking generation rate for the project is 100 spaces, for a low range a 5% reduction in spaces is assumed. For a high range a 25% reduction in spaces is assumed.

- Low range % VMT Reduction = $[(100 - 95)/100] * 0.5 = 2.5\%$
- High range % VMT Reduction = $[(100 - 75)/100] * 0.5 = 12.5\%$

Preferred Literature:

To develop this model, Nelson\Nygaard [1] used the Institute of Transportation Engineers' *Parking Generation* handbook as the baseline figure for parking supply. This is assumed to be unconstrained demand. Trip reduction should only be credited if measures are implemented to control for spillover parking in and around the project, such as residential parking permits, metered parking, or time-limited parking.

Alternative Literature:

- 100% increase in transit ridership
- 100% increase in transit mode share

According to *TCRP Report 95, Chapter 18* [2], the central business district of Portland, Oregon implemented a maximum parking ratio of 1 space per 1,000 square feet of new buildings and implemented surface lot restrictions which limited conditions where buildings could be razed for parking. A "before and after" study was not conducted specifically for the maximum parking requirements and data comes from various surveys and published reports. Based on rough estimates the approximate parking ratio of 3.4 per 1,000 square feet in 1973 (for entire downtown) had been reduce to 1.5 by 1990. Transit mode share increased from 20% to 40%. The increases in transit ridership and mode share are not solely from maximum parking requirements. Other companion strategies, such as market parking pricing and high fuel costs, were in place.

Alternative Literature Sources:

Other Literature Reviewed:

None

Transportation

PDT-4

Parking Policy / Pricing

3.3.4 Require Residential Area Parking Permits

Range of Effectiveness: Grouped strategy. (See PPT-1, PPT-2, and PPT-3)

Measure Description:

This project will require the purchase of residential parking permits (RPPs) for long-term use of on-street parking in residential areas. Permits reduce the impact of spillover parking in residential areas adjacent to commercial areas, transit stations, or other locations where parking may be limited and/or priced. Refer to Parking Supply Limitations (PPT-1), Unbundle Parking Costs from Property Cost (PPT-2), or Market Rate Parking Pricing (PPT-3) strategies for the ranges of effectiveness in these categories. The benefits of Residential Area Parking Permits strategy should be combined with any or all of the above mentioned strategies, as providing RPPs are a key complementary strategy to other parking strategies.

Measure Applicability:

- Urban context
- Appropriate for residential, retail, office, mixed use, and industrial projects

Alternative Literature:

- -0.45 = elasticity of vehicle miles traveled (VMT) with respect to price
- 0.08% greenhouse gas (GHG) reduction
- 0.09-0.36% VMT reduction

Moving Cooler [1] suggested residential parking permits of \$100-\$200 annually. This mitigation would impact home-based trips, which are reported to represent approximately 60% of all urban trips. The range of VMT reductions can be attributed to the type of urban area. VMT reductions for \$100 annual permits are 0.09% for large, high-density; 0.12% for large, low-density; 0.12% for medium, high-density; 0.18% for medium, low-density; 0.18% for small, high-density; and 0.12% for small, low-density. VMT reductions for \$200 annual permits are 0.18% for large, high-density; 0.24% for large, low-density; 0.24% for medium, high-density; 0.36% for medium, low-density; 0.36% for small, high-density; and 0.24% for small, low-density.

Abstract

Little research has been done to understand the effect of guaranteed parking at home—in a driveway or garage—on mode choice. The research presented here systematically examines neighborhoods in the three New York City boroughs for which residential, off-street parking is possible but potentially scarce. The research is conducted in two stages. Stage one is based on a Google Earth® survey of over 2,000 properties. When paired with the City's tax lot database, that survey served as the basis to estimate on-site parking for New York City neighborhoods. With parking availability estimated, a generalized linear model based on census tracts as the unit of analysis, is used to estimate the maximum likelihood parameters that predict the proportion of residents who drive to work in the Manhattan Core. The research shows a clear relationship between guaranteed parking at home and a greater propensity to use the automobile for journey to work trips even between origin and destinations pairs that are reasonably well and very well served by transit. Because journey to work trips to the downtown, for most cities, and New York City is no exception, are the most easily served by transit we infer from this finding that non-journey to work trips are also made disproportionately from these areas of high on-site parking.

Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA

Implementing Senate Bill
743 (Steinberg, 2013)

January 20, 2016

Residential and Office Projects. A tour-based analysis is usually the best way to analyze VMT associated with residential and office projects. Where tour-based models are employed for office project analyses, because workplace location influences overall travel, either employee work tour VMT or VMT from all employee tours may be attributed to the employment center (and the same should be used to set the significance threshold). For this reason, screening maps (discussed in more detail below) using tour-based regional travel demand models can be used where they are available. Where tour-based tools or data are not available for all components of an analysis, an assessment of trip VMT can serve as a reasonable proxy. For example, where research-based evidence on the efficacy of mitigation measures is available for trip-based, then estimating the threshold, analyzing unmitigated project VMT, and mitigation would all need to be undertaken using a trip-based methods, for an apples-to-apples comparison. In this case, home based trips can be the focus for analysis of residential projects; home-based work trips can be the focus of the analysis for office projects.

For office projects that feature a customer component, such as a government office that serves the public, a lead agency can analyze the customer VMT component of the project using the methodology for retail development (see below).

Models and methodologies used to calculate thresholds, estimate project VMT, and estimate VMT reduction due to mitigation should be comparable. For example:

- A tour-based estimate of project VMT should be compared to a tour-based threshold, or a trip-based estimate to a trip-based VMT threshold.
- Where a travel demand model is used to estimate thresholds, the same model should also be used to estimate trip lengths as part of estimating project VMT
- Where only trip-based estimates of VMT reduction from mitigation are available, a trip-based threshold should be used

Retail Projects. Lead agencies should usually analyze the effects of a retail project by assessing the change in total VMT, because a retail projects typically re-route travel from other retail destinations. A retail project might lead to increases or decreases in VMT, depending on previously existing retail travel patterns.

Considerations for All Projects. Lead agencies should not truncate any VMT analysis because of political or other boundaries. CEQA requires environmental analyses to reflect a "good faith effort at full disclosure." (CEQA Guidelines § 15151.) Thus, where methodologies exist that can estimate the full extent of vehicle travel from a project, the lead agency should apply them to do so. Analyses should also consider both short- and long-term effects on VMT.

January 20, 2016

General Principles to Guide Consideration of VMT Thresholds

The CEQA Guidelines set forth the general rule for determining significance:

The determination of whether a project may have a significant effect on the environment calls for **careful judgment** on the part of the public agency involved, **based to the extent possible on scientific and factual data**. An ironclad definition of significant effect is not always possible because **the significance of an activity may vary with the setting**. For example, an activity which may not be significant in an urban area may be significant in a rural area.

(CEQA Guidelines § 15064(b) (emphasis added).) SB 743 directs OPR to establish specific “criteria for determining the significance of transportation impacts of projects[.]” (Pub. Resources Code § 21099(b)(1).)

As noted above, CEQA Guidelines Section 15064(b) confirms that context matters in a CEQA analysis. Further, lead agencies have discretion in the precise methodology to analyze an impact. (*See Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 409 (“the issue is not whether the studies are irrefutable or whether they could have been better” ... rather, the “relevant issue is only whether the studies are sufficiently credible to be considered” as part of the lead agency’s overall evaluation).) Therefore, lead agencies may perform multimodal impact analysis that incorporates those technical approaches and mitigation strategies that are best suited to the unique land use/transportation circumstances and specific facility types they are evaluating. For example, pedestrian safety need not be addressed on the mainline portion of a limited access freeway that prohibits pedestrian travel. Likewise, where multimodal transportation is to be expected, analysis might address safety from a variety of perspectives.

To assist in the determination of significance, many lead agencies rely on “thresholds of significance.” The CEQA Guidelines define a “threshold of significance” to mean “an identifiable **quantitative, qualitative or performance level** of a particular environmental effect, non-compliance with which means the effect will **normally** be determined to be significant by the agency and compliance with which means the effect **normally** will be determined to be less than significant.” (CEQA Guidelines § 15064.7(a) (emphasis added).) Agencies may adopt their own, or rely on thresholds recommended by other agencies, “provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.” (*Id.* at subd. (c).) Substantial evidence means “**enough relevant information** and reasonable inferences from this information that a fair argument can be made to **support a conclusion, even though other conclusions might also be reached.**” (*Id.* at § 15384 (emphasis added).)

Thresholds of significance are not a safe harbor under CEQA; rather, they are a starting point for analysis:

[T]hresholds cannot be used to determine automatically whether a given effect will or will not be significant. Instead, thresholds of significance can be used only as a measure of whether a certain environmental effect “will normally be determined to be significant” or “normally will be determined to be less than significant” by the agency. ... In each instance, notwithstanding compliance with a pertinent threshold of significance,

January 20, 2016

the agency must still consider any fair argument that a certain environmental effect may be significant.

(*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal. App. 4th 1099, 1108-1109.)

Finally, just as the determination of significance is ultimately a “judgment call,” the analysis leading to that determination need not be perfect. The CEQA Guidelines describe the standard for adequacy of environmental analyses:

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to **make a decision which intelligently takes account of environmental consequences**. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is **reasonably feasible**. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The **courts have looked not for perfection but for adequacy, completeness, and a good faith effort** at full disclosure.

(CEQA Guidelines § 15151 (emphasis added).)

These general principles guide OPR’s recommendations regarding thresholds of significance for vehicle miles traveled set forth below.

D. Recommendations Regarding Significance Thresholds

Section 21099 of the Public Resources Code states that the criteria for determining the significance of transportation impacts must promote: (1) reduction of greenhouse gas emissions; (2) development of multimodal transportation networks; and (3) a diversity of land uses.

Various state policies establish quantitative greenhouse gas emissions reduction targets. For example:

- Assembly Bill 32 requires statewide greenhouse gas reductions to 1990 levels by 2020, and continued reductions beyond 2020.
- Pursuant to Senate Bill 375, the California Air Resources Board establishes greenhouse gas reduction targets for metropolitan planning organizations to achieve based on land use patterns and transportation systems specified in Regional Transportation Plans and Sustainable Community Strategies. Targets for the largest metropolitan planning organizations range from 13% to 16% reduction by 2035.
- Executive Order B-30-15 sets a GHG emissions reduction target of 40 percent below 1990 levels by 2030.
- Executive Order S-3-05 sets a GHG emissions reduction target of 80 percent below 1990 levels by 2050.
- Executive Order B-16-12 specifies a GHG emissions reduction target of 80 percent below 1990 levels by 2050 specifically for transportation.

January 20, 2016

than significant transportation impact. (In other words, a project that generates greater than 85 percent of regional per capita VMT, but less than 85 percent of city-wide per capita VMT, would still be considered to have a less than significant transportation impact.) Residential development in unincorporated county areas generating VMT that exceeds 15 percent below VMT per capita in the aggregate of all incorporated jurisdictions in that county, *and* exceeds 15 percent below regional VMT per capita, may indicate a significant transportation impact. These thresholds can be applied to both household (tour-based) VMT and home-based (i.e. trip-based) VMT assessments.

Recommended threshold for office projects: A project exceeding a level of 15 percent below existing *regional VMT per employee* may indicate a significant transportation impact.

Office projects that would generate vehicle travel exceeding 15 percent below existing VMT per employee for the region may indicate a significant transportation impact. In cases where the region is substantially larger than the geography over which most workers would be expected to live, it might be appropriate to refer to a smaller geography, such as the county. Tour-based analysis of office project VMT, for example development of a tour-based screening map, typically should consider either total employee VMT or employee work tour VMT. Where tour-based information is unavailable for threshold determination, project assessment, or assessment of mitigation, home-based work trip VMT may be used throughout the analysis to maintain an “apples-to-apples” comparison.

Recommended threshold for retail projects: A net increase in total VMT may indicate a significant transportation impact

Because new retail development typically redistributes shopping trips rather than creating new trips,⁷ estimating the total change in VMT (i.e. the difference in total VMT in the area affected with and without the project) is the best way to analyze a retail project’s transportation impacts.

By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT. Lead agencies generally, therefore, may presume such development creates a less than significant transportation impact. Regional-serving retail development, on the other hand, which can lead to substitution of longer trips for shorter ones, might tend to have a significant impact. Where such development decreases VMT, lead agencies may consider it to have a less than significant impact.

framed in terms of efficiency is superior to a simple numerical threshold because CEQA is not intended as a population control measure”).)

⁶ As used in these recommendations, the term “regional” refers to the metropolitan planning organization or regional transportation planning agency boundaries within which the project would be located.

⁷ Lovejoy et al. 2012.

January 20, 2016

accessibility created by transportation infrastructure investments (whether at the project or program level), the resulting changes in VMT might provide an appropriate basis for tiering.

Mitigation and alternatives.

Induced VMT has the potential to reduce or eliminate congestion relief benefits, increase VMT, and increase other environmental impacts that result from vehicle travel. If those effects are significant, the lead agency will need to consider mitigation or alternatives. In the context of increased travel induced by capacity increases, appropriate mitigation and alternatives that a lead agency might consider include the following:

- Tolling new lanes to encourage carpools and fund transit improvements
- Converting existing general purpose lanes to HOV or HOT lanes
- Implementing or funding travel demand management offsite
- Implementing Intelligent Transportation Systems (ITS) strategies to improve passenger throughput on existing lanes

Tolling and other management strategies can have the additional benefit of preventing congestion and maintaining free-flow conditions, conferring substantial benefits to road users as discussed above.

F. Analyzing Safety Impacts Related to Transportation

Public Resources Code section 21099 suggests that while automobile delay is not an environmental impact, lead agencies may still evaluate project impacts related to safety. The CEQA Guidelines currently suggest that lead agencies examine projects' potential to "[s]ubstantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)".

As with any other potential impact, CEQA requires lead agencies to make a judgment call "based to the extent possible on scientific and factual data." (State CEQA Guidelines § 15064(b).) Also like any other potential impact, "the significance of an activity may vary with the setting." (Ibid.) Lead agencies must base their evaluations of safety on objective facts, and not personal or subjective fears. The purpose of this section is to review some relevant considerations in evaluating potential transportation-related safety impacts.

Transportation by its nature involves some degree of collision risk. Every project will affect transportation patterns, and as a result may involve some redistribution of that risk.

Lead agencies may consider whether a project may cause substantially unsafe conditions for various roadway users. This section is not intended to provide a comprehensive list of potential transportation safety risks, but rather guidance on how to approach safety analysis given numerous potential risks.

Generally:

- Safety analysis in CEQA should focus on risk of fatality or injury, rather than property damage.
- Lead agencies should focus on concerns that affect many people, not just an individual.

CITY PLANNING COMMISSION

RESOLUTION NO. 4109

RESOLVED, That Proposal No. Z-52.62.2, an application to change the Use District Classification of the hereinafter described parcel of land from a First Residential District to a Commercial District, be, and the same is hereby APPROVED; subject to the stipulations submitted by the applicant and set forth herein:

Commencing at a point on the S/L of California Street distant thereon 187 feet west of the W/L of Presidio Avenue (produced), thence westerly on said line 707.375 feet to a curve to the left having a radius of 15 feet, thence 23.562 feet measured on the arc of the curve to the left to the E/L of Laurel Street, thence southerly on the E/L of Laurel Street 127.227 feet to the curve to the left having a radius of 60 feet, thence 77.113 feet measured on the arc of the curve to the left to a curve to the right having a radius of 120 feet, thence 149.153 feet measured on the arc of the curve to the right to a curve to the right having a radius of 4033 feet, thence 388.710 feet measured on the arc of the curve to the right to a curve to the left having a radius of 20 feet, thence 35.186 feet measured on the arc of the curve to the left to the northwest line of Euclid Avenue, thence N 73° 12' E on the northwest line of Euclid Avenue 512.934 feet to a curve to the left having a radius of 65 feet, thence 42.316 feet, measured on the arc of the curve to the left to the northwesterly line of Masonic Avenue (proposed extension), thence N 35° 54' E, 380.066 feet to the arc of a curve to the left having a radius of 425 feet, thence 254.176 feet measured on the arc of the curve to the left, thence N 52° 36' 29.74" W, 252.860 feet to the point of commencement. Being the major portion of Lot 1A, Block 1032, containing 10.2717 acres, more or less.

RESOLVED, FURTHER, That this change shall be and at all times remain contingent upon observance by the owner or owners and by his or their successors in interest of the conditions contained in the following stipulations as to the use of the land affected.

1. The character of the improvement for commercial purposes of the subject property, or any portion thereof, shall be limited to a building or buildings designed as professional, institutional or office buildings, including service buildings which are normally accessory thereto.
2. The aggregate gross floor area of all such buildings, calculated exclusive of cellars, of basement areas used only for storage or services incidental to the operation and maintenance of a building, and of indoor or other covered automobile parking space, shall not exceed the total area of the property allotted to such use.

- 2 -

3. For each five hundred square feet of gross floor area in such buildings, calculated as in stipulation 2, above, there shall be reserved and kept available on the property or the portion thereof allotted to such use, one off-street automobile parking space, or equivalent open space suitable for the ultimate provision of such parking space as needed for the accommodation of users of the premises.

4. No such building, other than a minor accessory building having a floor area of not more than 400 square feet, shall occupy any portion of the property which is within 100 feet of the line of the Euclid Avenue boundary thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

5. If the subject property, or any portion thereof, is developed as a site for residential buildings, such buildings shall be limited as follows:

a. No residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

b. No dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than thirty three hundred (3300) square feet, nor shall any such dwelling cover more than fifty percent (50%) of the area of such parcel or be less than twelve (12) feet from any other such dwelling, or be set back less than ten (10) feet from any presently existing or future public street, or have a height in excess of forty (40) feet, measured and regulated as set forth in pertinent section of the Building Code of the City and County of San Francisco.

c. No residential building in other portions of the subject property shall have a ground coverage in excess of fifty percent (50%) of the area allotted to such building.

6. Development of the subject property, or of any separate portion thereof, for commercial use as stipulated herein, shall include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building or buildings there shall be submitted to the City Planning Commission, for approval as to conformity with these stipulations, a site plan showing the character and location of the proposed

- 3 -

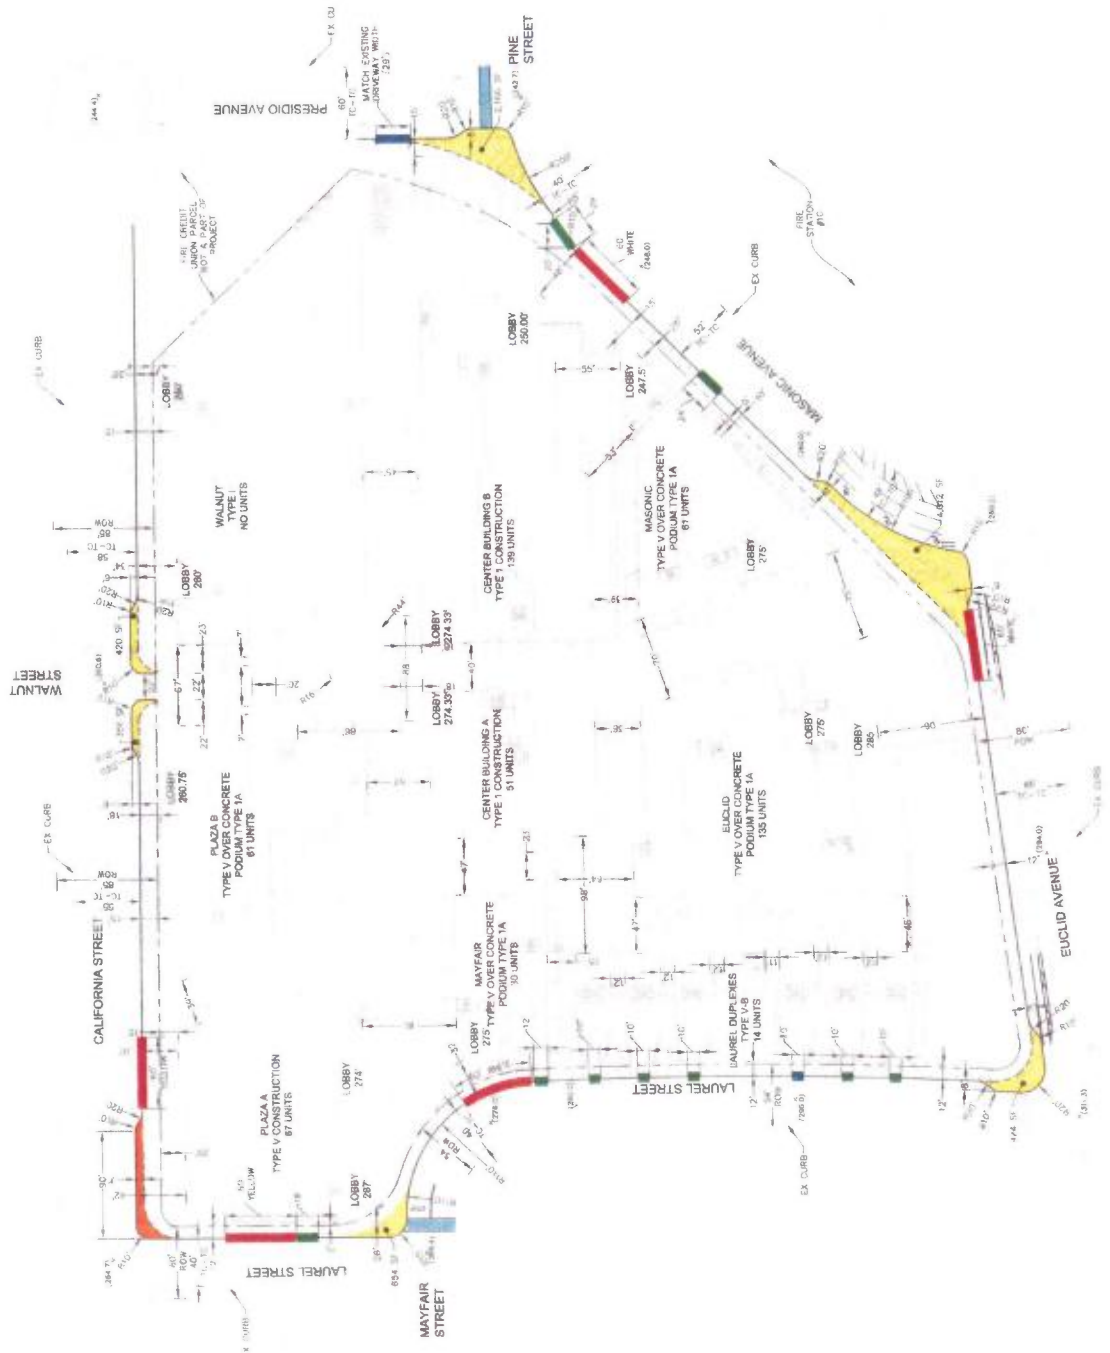

building or buildings, and related parking spaces and landscaped areas upon the property, or upon such separate portion thereof as is allotted to such building or buildings. It shall be understood that approval of any such plan shall not preclude subsequent approval by the Commission of a revised or alternative plan which conforms to these stipulations.

I hereby certify that the foregoing resolution was adopted by the City Planning Commission at its special meeting on November 13, 1952, and I further certify that the stipulations set forth in the said resolution were submitted in a written statement placed on file.

Hello Kathy,

The below webpage includes documentation for the SF-CHAMP model, the model we use to estimate vehicle miles traveled by transportation analysis zone. The executive summary under model documentation discusses the transportation (aka traffic) analysis zones.

**San Francisco Travel Demand
Forecasting Model Development**

Executive Summary

**Final
Report**

prepared for
San Francisco County Transportation Authority

prepared by
Cambridge Systematics, Inc.

Updated by:
San Francisco County Transportation Authority

October 1, 2002

1.0 Introduction

■ Overview

The San Francisco County Travel Demand Forecasting Model (San Francisco Model) was developed for the San Francisco County Transportation Authority (SFCTA) to provide detailed forecasts of travel demand for various planning applications. These applications included developing countywide plans, providing input to microsimulation modeling for corridor and project-level evaluations, transit planning, and neighborhood planning. The objective was to accurately represent the complexity of the destination, temporal and modal options and provide detailed information on travelers making discrete choices. These objectives led to the development of an activity-based model that uses a synthesized population as the basis for decision-making rather than zonal-level aggregate data sources. The activity-based model has nine primary components.

Most of the model components were estimated using household survey data collected by the Metropolitan Transportation Commission (MTC) for San Francisco residents only. Each model component was calibrated using various observed data sources, then the full model was validated using traffic count and transit ridership data for each of five time periods. The model is applied as a focused model, which combines trip-making from the entire Bay Area (derived from the MTC's BAYCAST trip tables) with the travel demand from San Francisco residents produced by the activity-based model.

■ Contents of this Report and Related Reports

This executive summary discusses all nine model components and provides an overview of the data required to run the model. It is designed to provide an overview of the process and a brief summary of the results. There were numerous technical reports developed during the process; these should be referred to for more detail. The primary reports are listed below:

- Data Development
- Population Synthesis
- Vehicle Availability Model
- Tour and Trip Generation and Time-of-day Models
- Destination Choice Models

3.0 Data Development

There were three primary areas of data development: data collected as part of the stated preference survey, the development of the synthetic population data, and data used as input to the San Francisco model. There are individual reports for each of these areas. An overview of these data is provided below.

■ Stated Preference Survey

The stated preference survey was conducted for 609 households in San Francisco in June, 1999 to collect data on transit and auto travel characteristics. The primary focus of the survey was to collect preference data on transit reliability, crowding and personal security and auto parking availability and cost. The survey was conducted by Corey, Canapary and Galanis and the design of the survey was completed by Mark Bradley Research and Consulting, with other members of the Cambridge Systematics team.

The purpose of the survey was to provide data that can be incorporated into the mode choice model estimation process, in the areas of transit reliability, crowding and personal security and auto availability and cost. The analysis of these data was conducted as part of the mode choice model process.

■ Synthetic Sample Generation

A prototypical sample of persons and households was generated for San Francisco County using three primary data sources: the U.S. Census Public Use Microdata Sample (PUMS), the population and employment data developed for San Francisco County, and other socioeconomic data developed for the MTC. There is a hierarchy of zonal systems for these three datasets:

- Six Public Use Microdata Areas (PUMAs), containing
- 127 MTC Traffic Analysis Zones (MTAZs), containing
- 766 San Francisco Traffic Analysis Zones (SFTAZs).

Figure 3.1 shows the boundaries of the SFTAZs and MTAZs. The PUMAs are not shown because they are relatively large areas used to preserve the anonymity of long form respondents.

The prototypical sample contains marginal distributions across three dimensions:

- Household size and number of workers (nine categories);
- Household income (four categories); and
- Age of head of household (three categories).

There are a total of 108 possible combinations of the above dimensions (9x4x3). The nine categories for household size/number of workers were chosen because they efficiently distinguish between important household life-cycle groups. The specific breakdowns for income and age were chosen because they correspond to categories that are available in the MTC future year land use files, so updating the populations to future years can be kept consistent with MTC breakdowns within zones. Also, all of these categorizations are compatible with the Census tables available in the Census Transportation Planning Package (CTPP) Urban Element.

Figure 3.1 Map of San Francisco Model & MTC regional model TAZ boundaries

■ Other Model Data

Aggregate Zonal Data

Some of the data used by the model components are aggregate zonal data developed as either necessary inputs or because these are desired for testing planning policies. Table 3.1 provides a list of these aggregate variables and the model components that use these variables. The socioeconomic data were developed from parcel-level data aggregated to traffic analysis zones and adjusted to match control totals, as follows:

- The San Francisco Planning Department provided a current parcel database and a current business and employment database. The parcel database provides current estimates of residential units at the block and lot level and the business and employment database contains current estimates of employment by type at the block and lot level. These are aggregated to the traffic analysis zones.
- The San Francisco Planning Department, the Presidio Trust, the San Francisco Redevelopment Agency and the Port of San Francisco maintain lists of new development projects under construction, approved, and under review, as well as information on development potential for major area plans. These are used to allocate forecast data by traffic analysis zone.
- The Association of Bay Area Governments' *Projections '98* was used as a control total for countywide forecasts of population and employment. The San Francisco Planning Department has subsequently updated these forecasts to reflect the *Projections 2000* data.

The employment data in San Francisco uses a different categorization compared to the MTC data. The original MTC databases classified employment by six categories – retail, service, other, agricultural, manufacturing and trade. The new San Francisco socioeconomic databases classified employment by a different set of six categories:

- Cultural, institutional and educational services (CIE),
- Medical and health services (MED),
- Management, information, and professional services (MIPS),
- Production, distribution and repair (PDR),
- Retail and entertainment (RETAIL), and
- Visitor (VISITOR).

These employment categories were defined by the San Francisco Planning Department in the 1998 Citywide Land Use Study. Most models retained the distinctive employment categories, but some used a common set of categories across all areas, where basic information on the SIC codes falling under each category was used to regroup the MTC categories into four San Francisco categories – PDR, MIPS, Retail and Service.

Pedestrian environment factors (PEF) were developed to evaluate urban design projects and estimate changes in pedestrian and bicycle modal options. PEFs will allow local planners to:

■ Vehicle Availability Model

The vehicle availability model is a multinomial logit model that predicts the vehicles available in each household for each San Francisco resident. Given the location of the household, the characteristics of the household members, and the primary work place location of each of its workers, the model estimates the probabilities of having none, one, two, or three or more vehicles available.

A large number of households (42.9%) in San Francisco in 1990 had only one vehicle and the average number of vehicles for all households was 1.16. The number of vehicles is defined as automobiles plus trucks; also available in the survey data are the numbers of motorcycles, mopeds and bicycles owned by the household, but these were not included in the number of vehicles available for household travel. The model was limited to four alternatives (0, 1, 2, or 3+ vehicles available) because of the relatively small number of households with four or more vehicles available (1.8%). The average number of vehicles in the fourth alternative (households with three or more vehicles available) was 3.36.

Information was assembled from a number of sources to create the estimation data set. For example, the household survey came from MTC, population and employment datasets were developed by the consultant team working with Planning Dept data, Pedestrian Environment Factors were developed by SFCTA staff with assistance from staff of other city departments and consultant team, and parking costs based on small survey undertaken by consultant team. The structure of this data set is a file with one record for each San Francisco household in the travel survey, with data on income, location, and the age and employment status of the various household members. (Driver's license status was not used in estimation, because it is not available in the PUMS Census data used to apply the models.) The household file was supplemented by adding zonal data, level of service data, and accessibility data. The zonal data included population, households, and employment by type, area in square miles, area type, pedestrian environment factor, and parking costs. The level of service data included both auto and transit travel times and costs between the residence zone and each household member's workplace. The accessibility data included measures of how many jobs of various types could be reached by transit or car in various travel time bands.

■ The Full Day Pattern Models

As Table 4.1 indicates, the full day pattern model predicts:

- The purpose class of the primary home-based tour (work, education, other, or none)
- The trip chain type of the primary home-based tour (1 or more stops before, after, neither, or both)
- The number of home-based secondary tours (0, 1, or 2+)

6.0 Model Validation

Details of the model validation results are in the corresponding model validation report. Highlights of these results are presented here for travel behavior and trip assignment.

■ Travel Behavior Validation

Travel behavior was validated by comparing travel data in a household travel survey to related travel data in the travel demand forecasting model. For the validation of the 1998 SFCTA regional travel demand forecasting model, we compared the trip data in the 1990 Census, the 1990 MTC household survey data with the same data in the model.

The model components were calibrated individually using various observed data sources, including the decennial census, household surveys, observed traffic counts and transit ridership, vehicle registrations, and many other sources. The specific sources used to calibrate each individual model are described below. This effort involved calibrating each model separately, then reviewing highway and transit assignment results for each of the five time periods to make additional adjustments in the model components. The adjustments were all made to constants within the models, there were no adjustments to model coefficients. Highlights of results of the calibration are summarized below for each model component.

Vehicle Availability

The vehicle availability model was calibrated primarily on two key variables, number of workers per household and super-district, using the 1990 Census as the primary source of observed data. A second validation test was used to evaluate the total number of vehicles estimated by the vehicle availability model compared to Department of Motor Vehicle (DMV) estimates of auto registrations. These data were different by 5 percent. Unfortunately, the 1990 MTC survey, which was used to estimate the model, contained different results for vehicle availability than the 1990 Census. Since, the 1990 Census has a much larger sample size; these data were used to calibrate the vehicle availability model. The results, therefore, have indirect effects on the market segmentation of autos and workers that were carried out in the mode split model.

Full-Day Pattern Tour Models

The full-day pattern tour models were calibrated by converting tours to trips and comparing these to the 1996 MTC household survey of San Francisco and Bay Area residents, expanded to match the 1998 population. The MTC survey trips were summarized as only those weekday trips in the survey that had an origin and destination within San Francisco County. The comparison of trips was developed from the full-day pattern tour model by reallocating the following "trips" from each "tour" for comparison purposes. The 1996 MTC Survey was used because the number of trips within San Francisco County was very low in the 1990 MTC Survey because of under-reporting of trips that occurred in this survey. The under-reporting of trips is not consistent across time periods or across trip purposes, which may have influenced model estimation that was based on the 1990 MTC survey. The differences between trips by time period was confirmed with initial assignments by time periods using the un-calibrated San Francisco model that revealed the off-peak time periods were significantly under-estimated compared to traffic counts. The vast majority of under-reporting of trips in the 1990 MTC survey were in other tours. A comparison of the calibrated San Francisco model trips to the 1996 MTC survey by tour type and time of day shows that the all trips by tour type and by time of day are within +/- 10 percent compared to the 1996 MTC survey.

Trip rates per household were compared by trip purpose and time of day. Trip rates overall are similar, but the trips per household by trip purpose are quite different. The San Francisco model differentiates between trips to work or school with an intermediate stop from those without an intermediate stop and thus has fewer trips identified as work or school trips and many more trips identified as non-home-based. The comparison of trip rates across time period is reasonable, except that early AM and evening time periods are somewhat under-estimated compared to the MTC survey. This is most likely a result of the model estimation process, which was based on the 1990 MTC survey that showed significantly fewer trips in these time periods.

Destination (Primary and Intermediate Stop) Choice Models

The destination choice models were calibrated against the 1990 MTC survey data for primary destinations by purpose and trip length frequency distributions. The results reflect very reasonable allocation of destinations among four areas of the City and those destinations located outside the City. Another evaluation of work locations is the estimate of employment that results from the work location model compared to actual employment by neighborhood. Because some of these data were not actually observed, these results were considered reasonable when compared to estimated values by neighborhood. The biggest differences were the two neighborhoods in the Core business district, which were underestimating employment, but calibration results also show that the destinations in the core are within three percent for each tour type and are actually overestimated in these results.

The destination choice model was also calibrated by comparing trip length and duration frequency distributions. The observed trip lengths are derived from the 1990 MTC survey and reported as the average time and distance to/from the primary destination. These results

show reasonable average trip lengths for all tour types. Trip duration frequency distributions were evaluated to determine reasonable by tour purpose. Observed and estimated values of trip duration by travel time increment reflect reasonable comparisons.

The validation of the intermediate stop choice model was challenging because similar models of destination choice have not included separate validation of the intermediate stop choice component for comparison. The validation test was to review the total tour length by tour purpose compared to the observed values. Distance was selected as the primary validation test for this model to isolate the location of the destination from the congestion effects during a particular time period. The results of this validation test are that both work and other tours are over-estimated slightly by the model, while work-based tours are under-estimated. Additional calibration adjustments to try and reconcile these differences were not pursued because further adjustments would have negatively impacted the results of the highway assignments by time period.

Mode Choice (Tour and Trip) Models

The tour and trip mode choice models were calibrated by tour purpose. Alternative-specific constants for each mode were adjusted to match observed modal shares from the 1990 MTC Household Survey. The structure of the activity-based models require that tour models are calibrated first to match tours by mode and market segment, then trip models are calibrated to match trips by trip mode and tour mode. The trips resulting from applying the calibrated alternative-specific constants were then assigned to highway and transit networks and compared to observed traffic counts and transit boardings by mode. The calibration results for tour and trip modes show a very close match between estimated and adjusted observed tours and trips by mode and purpose.

Initially, estimated transit boardings were discovered to be much higher than observed boardings, particularly for local bus and MUNI Metro transit modes. There are four possible reasons for the transit over-estimation; there may be too many trips generated by the pattern models (too many trips going in to mode choice); the transfer rate may be too high; the calibration targets observed in the 1990 MTC survey may be incorrect; or, the observed transit boardings may be too low.

A comparison of estimated versus observed traffic volumes on the highway network confirmed that the number of trips generated by the pattern models was reasonable when compared to independent estimates of travel. An analysis of the estimated transfer rates also confirmed that the number of estimated transfers for San Francisco residents is reasonable. Therefore, it was concluded that either the transit calibration target values generated from the household survey were too high or the observed transit boardings are low. Because the transit boardings are calculated annually by MUNI, they were held constant and both the observed and estimated transit shares were adjusted to better match boardings.

Planning
Information:
415.558.6377

PURPOSE OF HEARING:

The Planning Department uses the Transportation Impact Analysis Guidelines for assessing project's transportation impacts as part of the California Environmental Quality Act. The department is undergoing comprehensive updates to the guidelines, which the department last updated in 2002. The purpose of this informational hearing is to provide an understanding on the transportation topics within the guidelines, a brief overview of the update, status of the update, feedback sought, and the anticipated outcomes and schedule.

The public can find more information and sign up to receive notifications from the department about updates here: <http://sf-planning.org/transportation-impact-analysis-guidelines-environmental-review-update#resources>.

THE WAY IT IS NOW:

The Environmental Planning division within the Planning Department reviews projects for potential impacts on the environment, a process known as environmental review. The Planning Department conducts environmental review pursuant to the California Environmental Quality Act (CEQA). As part of environmental review, the Planning Department reviews background technical studies, such as transportation impact studies, to assess a project's effects on the physical environment.

These background technical studies support the conclusions of the environmental impact evaluation and guide decision-makers during project approval. To assist in the preparation of transportation impact studies, the Planning Department provides to consultants and city staff a guidance document, the Transportation Impact Analysis Guidelines. The Planning Department periodically updates the guidelines, with the last update in 2002.

The current guidelines updated and revised the Guidelines for Environmental Review: Transportation Impacts (July, 1991) and Interim Transportation Impact Analysis Guidelines for Environmental Review (January 2000). The current guidelines cover the following transportation topics (in the order presented in the guidelines):

- Traffic
- Transit
- Parking
- Pedestrian
- Bicycle
- Freight Loading and Service
- Passenger Loading
- Construction

To assess these impacts, the department estimates how many trips people in newer developments may take, the ways they travel, and their common destinations based on the findings of the Citywide Travel Behavior Survey - Employees and Employers (May, 1993); the Citywide Travel Behavior Survey - Visitor Travel Behavior (August, 1993); revolving five-year estimates from US Census, American Community Survey data; San Francisco County Transportation Authority San Francisco Chained Activity Model, which is based upon, among other sources, observed behavior from California Household Travel Survey (2010-2012), and major San Francisco transportation studies.

The guidelines are just that. The Planning Commission does not formally adopt the guidelines. The department may use the guidelines for multiple projects, but the department has discretion on applying specifics within the guidelines on a project by project basis. The guidelines provide basic details regarding methodologies and standards, but individual transportation study scopes of work are required to provide a level of detail tailored to fit the size and complexity of transportation issues associated with particular projects. Once the department approves a scope of work, the specific direction contained within that scope will provide a more precise focus than that which appears in the guidelines.

Since 2002, the department has instituted various updates to the conditions, data, and methodology within the guidelines. Records of these updates exist in various materials. One substantial example of updates that occurred was a March 2016 Planning Commission resolution that removed automobile delay from CEQA and added vehicle miles traveled as a transportation criterion. Since that time, the state has not issued subsequent guidance and the department has taken a leadership role in working with other jurisdictions on updates to their own transportation criteria. The state also changed the CEQA Guidelines to remove parking, by itself, as a significant impact under CEQA.

Also since that time, San Francisco has experienced changes in the demographics of the population, the types of new jobs, and the cost of housing, among other variables that affect travel behavior. Some of these changes create greater constraints on our transportation systems, including more competition for curb space. One of the major changes has been with emerging mobility services and technologies that have changed the way some people travel (using transportation network companies such as Uber and Lyft) and interact with goods (home deliveries). These changes also affect the percentages of how people travel (known as mode splits in the transportation analysis methodology). For example, we understand anecdotally that people may be shifting from using their own vehicles or transit to instead use transportation network companies such as Uber and Lyft.

THE WAY IT WOULD BE:

The department is in the midst of updating the guidelines comprehensively. The purpose of the update is to achieve high quality deliverables, meaningful analysis, efficient reviews, and better project outcomes through clear standards, methodology, and criteria; understandable, transparent, and predictable process; updated mitigation measures, designs, outcomes, and policies; user-friendly figures; and illustrative examples of project analysis.

To address some of the changes since 2002 described in earlier paragraphs, San Francisco has undertaken a substantial amount of planning and policy work the last 15 years. For example, the San Francisco Municipal Transportation Agency was only three months old when the department last updated the guidelines; now the SFMTA includes a planning division. Over these years, interagency coordination to address issues has also improved. This includes coming together on things like transportation ordinances; developing land use and transportation area plans together; creating an inter-agency team that reviews projects compliance with the better streets plan; and embarking on a long-range transportation vision for San Francisco. Some of these planning and policies changes have affected the CEQA transportation review process. For example, our analysis has placed greater emphasis on safety, in reaction to San Francisco's Vision Zero commitments. On the other hand, the work of these agencies and some of these policies result in fewer projects with significant transportation impacts and sometimes avoid them altogether. Therefore, the department is focusing the guidelines updates on addressing CEQA issues and not focusing on other issues that San Francisco can better address through policies, programs, and projects.

Potential Updates

This update may change process for transportation review, thresholds of significance, and analysis methodology concerning transportation impacts. It may also affect the transportation review process. At this point in time, staff is considering the following substantive updates to the following topics (in the order the department will present the topics in the guidelines):

- Process – scoping out topics from transportation review earlier in the process based upon the characteristics of the project, site, and surroundings (e.g., through a checklist)
- Walking/Accessibility– Assessing the need to conduct a quantitative capacity analysis and update definitions and examples of hazards and accessibility impediments.
- Bicycling– Assessing the need to update definitions and examples of hazards and accessibility impediments.
- Transit – Assessing the need to conduct a quantitative capacity analysis and revisiting the need, methodology and thresholds for transit delay.
- Emergency Access – Update definitions and examples of inadequate emergency access.
- Loading – Refine estimates of passenger and commercial loading demand, attempting to account for rise in for-hire vehicles and e-commerce deliveries.
- Vehicle Miles Traveled/Induced Auto Travel – Potential quantification of the relationship between parking supply and induced automobile travel.
- Traffic Hazards – Update definitions of types of traffic hazards as well and standards that can be implemented to potentially avoid traffic hazards (which may be incorporated into walking/accessibility and bicycling).
- Construction – Consideration of the effects of excavation on overall project construction and the resulting duration/intensity of construction phases.

- Parking – Further updates that reflect Senate Bill 743, including potentially a checklist or map-based approach for when projects will not require a parking demand and supply estimate and secondary effect analysis.

PROCESS

For this effort, the department is undertaking a few different efforts to inform the updates, as described below.

Travel Demand

Substantial data collection and analysis is currently underway, primarily at newer development sites. This data collection will result in the creation of refined estimates of how many trips people in newer developments take, the ways they travel, and their common destinations.

The department contracted with a transportation consulting firm, Fehr & Peers, to develop a methodology for collecting data and updating the travel demand methodology used in the guidelines. Fehr & Peers has collected the following data and are in the process of analyzing and interpreting this data in order to update:

- The number of trips people in newer developments take using 24-hour person counts using cameras at all access points to 81 sites across San Francisco (including 19 office, 11 hotel, 30 retail, and 22 residential sites);
- The estimates of passenger and commercial loading demand, using 24-hour time lapse recordings (5-minute resolution) at one designated loading zone for 70 sites; and
- The way people travel (using transit, car, bike etc.) and their destinations, using PM peak period (3PM – 7PM) intercept surveys (i.e., by intercepting people to ask questions) at 72 sites.

The department will review the results of the analysis and determine what estimates to incorporate into the guidelines update or whether the department or others will need to collect additional data to provide such estimates.

Kick-Off Meeting and Survey

The department held a kick-off meeting for the guidelines update on July 27, 2017. We invited several local and regional government agencies (i.e., the SF Fire Department, SF Police Department, SF Municipal Transportation Agency, SF Public Works, SF Public Utilities Commission, SF Department of Public Health, SF Office of Community Investment and Infrastructure, University of California – SF, Mayor's Office of Disability and Mayor's Office and Community and Workforce Development, SF County Transportation Authority, Caltrans, BART, Caltrain, SamTrans, and AC Transit) and environmental planning and transportation planning consultants.

At the meeting, the department presented an overview of the guidelines update and a topic by topic technical breakdown of current guidelines and what the department is considering updating in terms of analysis methodology and thresholds of significance. Following the presentation, attendees could attend breakout sessions for each topic to provide technical approach feedback. We also followed up with a survey soliciting general feedback, as well as adding questions soliciting specific technical feedback on each topic based on what we heard from attendees at the kick-off meeting. We received approximately 30 responses to the follow-up survey when we closed the feedback period on August 25, 2017.

From the kick-off meeting and survey, we received feedback about some recurring themes, which are themes we regularly encounter from members of the public commenting on CEQA documents: how to analyze the impacts of Transportation Network Companies (e.g., loading and vehicle miles traveled), loading issues, particularly related to people with disabilities and senior citizens, and project's compliance with various codes and policies.

Planning Commission Hearing

One of the basic purposes of CEQA is to inform decision makers and the public about the potential, significant environmental effects of activities *before* decision makers decide to approve or deny a project. The decision making process since 2002 has likely become more complicated. However, the fundamental purposes of CEQA have not changed. Therefore, a goal of the outcomes from the guidelines update is to provide informative analysis to the Planning Commission and the public regarding the CEQA transportation impacts of projects. For this hearing, we are soliciting feedback on how the department can do just that. Members of the public can provide feedback at the Planning Commission Hearing or by sending an email to CPC.TransportationReview@sfgov.org until by 5 PM on October 20, 2017.

Future

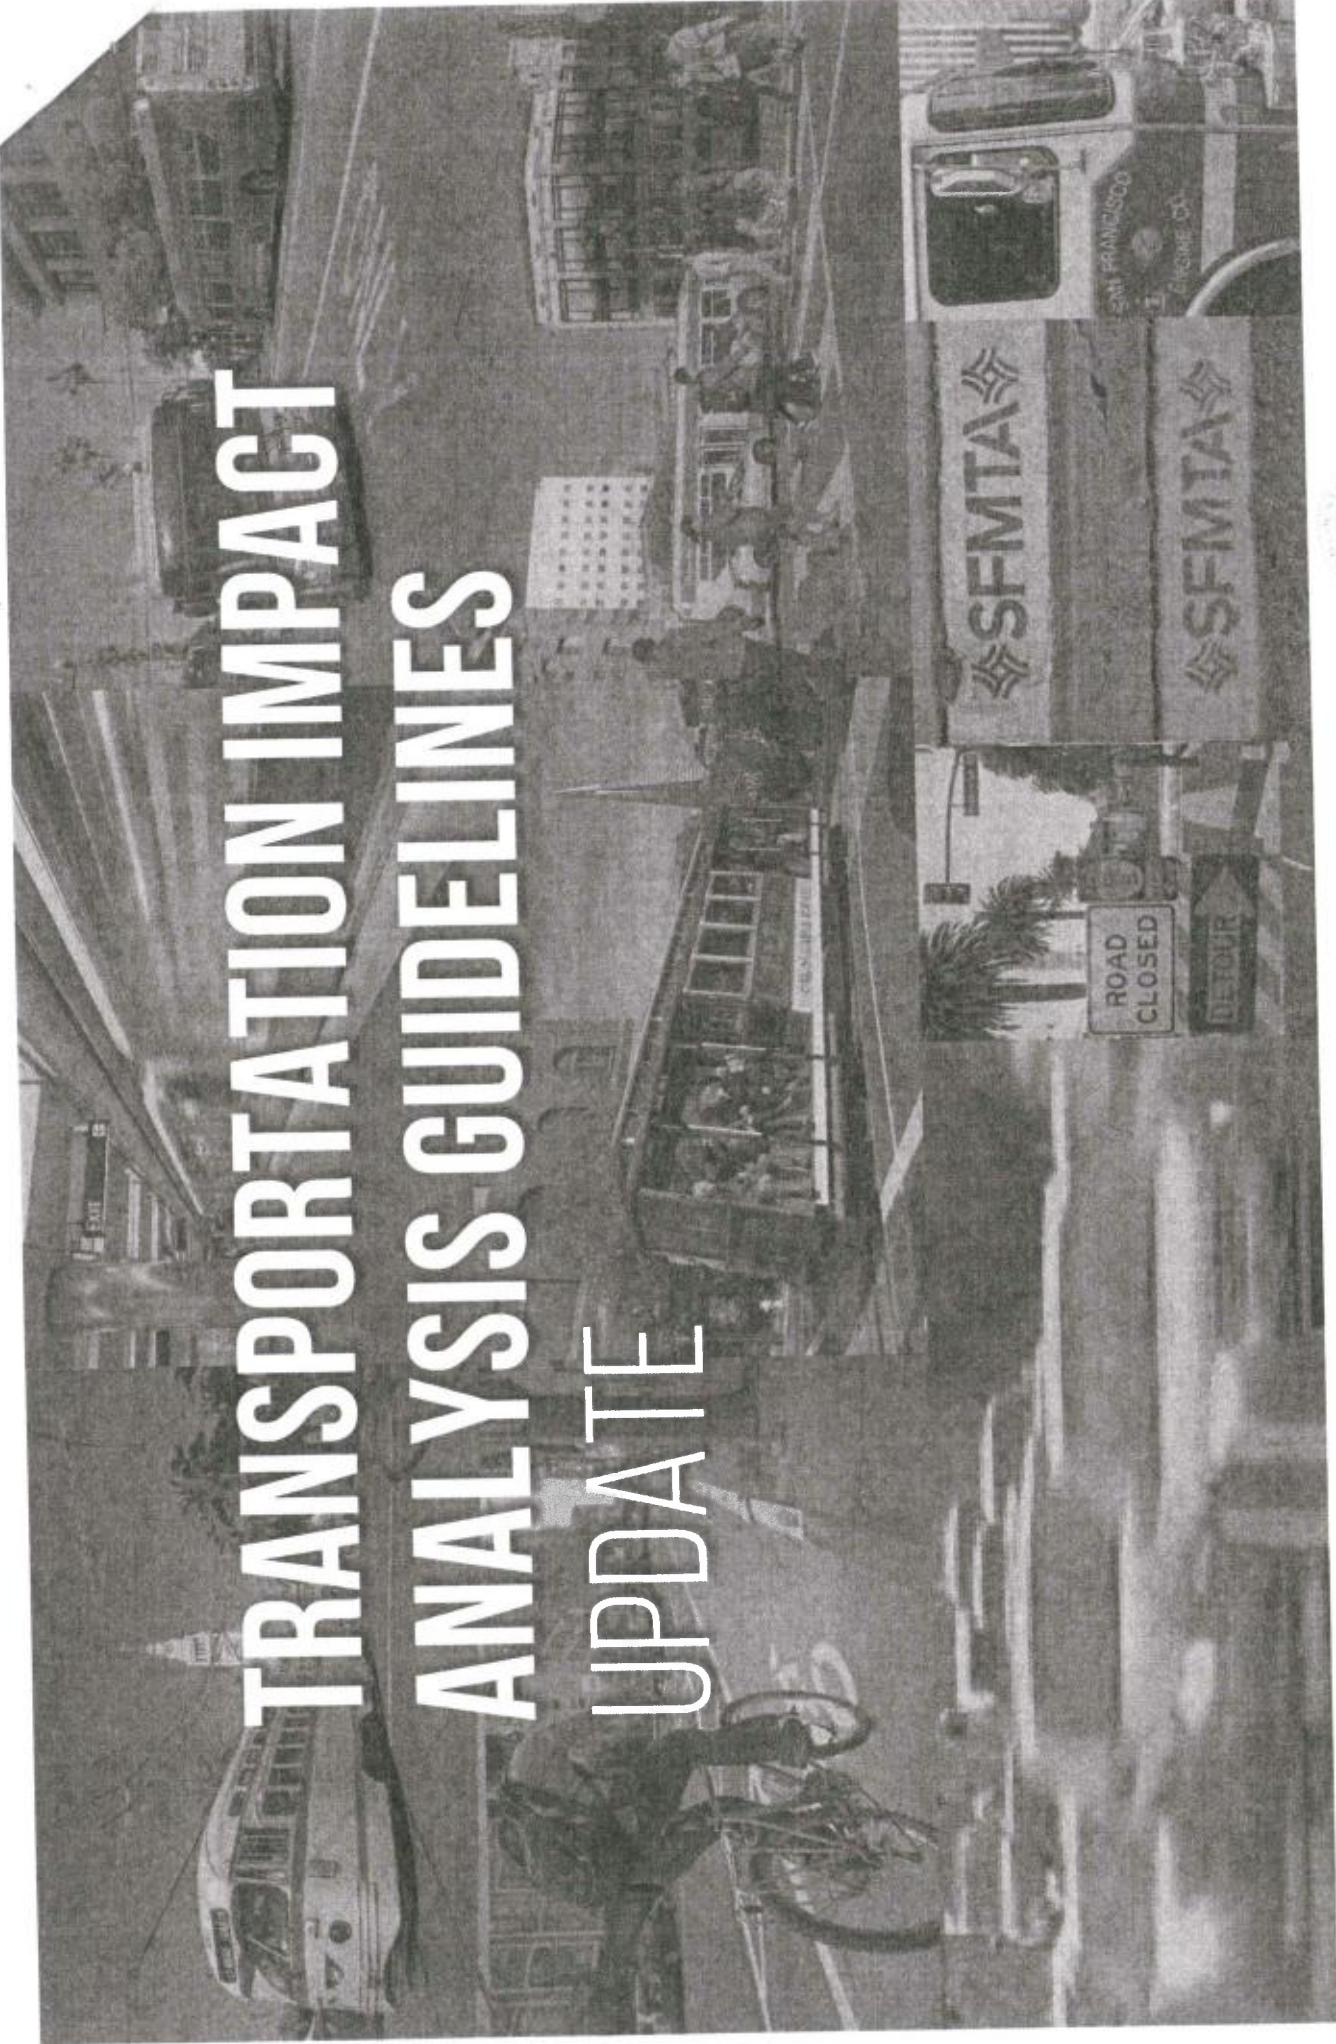

Based upon feedback from the Planning Commission at this hearing, the public by October 20, and earlier outreach efforts, the department will summarize feedback received into a memorandum outlining which topics the department is considering as part of the guidelines update. The department will categorize feedback not related to CEQA and will forward that feedback to agencies who may be responsible for addressing it. In addition, the department will continue to engage on the guidelines updates consultants (e.g., brownbags) and San Francisco agencies, particularly the San Francisco Municipal Transportation Agency and San Francisco County Transportation Authority, and regional and state transportation agencies as relevant.

The department will issue a series of memorandums in 2017 and 2018 that provide updates to topics within the guidelines. Staff will be posting these memorandums, as well as other relevant materials, to this webpage: <http://sf-planning.org/transportation-impact-analysis-guidelines-environmental-review-update#resources>.

OVERVIEW AND KEY FINDINGS

"TNCs and Congestion" report provides the first comprehensive analysis of how Transportation Network Companies Uber and Lyft collectively have affected roadway congestion in San Francisco.

Key findings in the report:

The report found that Transportation Network Companies accounted for approximately 50 percent of the rise in congestion in San Francisco between 2010 and 2016, as indicated by three congestion measures: vehicle hours of delay, vehicle miles travelled, and average speeds.

Employment and population growth were primarily responsible for the remainder of the worsening congestion.

Major findings of the TNCs & Congestion report show that collectively the ride-hail services accounted for:

- 51 percent of the increase in daily vehicle hours of delay between 2010 and 2016;
- 47 percent of the increase in vehicle miles travelled during that same time period; and
- 55 percent of the average speed decline on roadways during that same time period.
- On an absolute basis, TNCs comprise an estimated 25 percent of total vehicle congestion (as measured by vehicle hours of delay) citywide and 36 percent of delay in the downtown core.

Consistent with prior findings from the Transportation Authority's 2017 TNCs Today report, TNCs also caused the greatest increases in congestion in the densest parts of the city - up to 73 percent in the downtown financial district - and along many of the city's busiest corridors. TNCs had little impact on congestion in the western and southern San Francisco neighborhoods.

The report also found that changes to street configuration (such as when a traffic lane is converted to a bus-only lane), contributed less than 5 percent to congestion.

TNCs & Congestion

GRAFT REPORT 1 OCTOBER 2018

Executive Summary

Congestion in San Francisco worsened between 2010 and 2016. The Transportation Authority's Congestion Management Program monitoring indicates that average AM peak arterial travel speeds decreased since 2009 by -26%, while PM peak arterial speeds have decreased by -27% during this same time period. Vehicle hours of delay on the major roadways increased by 40,000 hours on a typical weekday, while vehicle miles travelled on major roadways increased by over 630,000 miles on a typical weekday.

During this period significant changes occurred in San Francisco. Roadway and transit networks changed, including the implementation of transit red carpet lanes, the expansion of the bicycle network, and the opening of the Presidio Parkway (rebuilt Doyle Drive). San Francisco added 70,000 new residents and over 150,000 new jobs, and these new residents and workers added more trips to the City's transportation network. Finally, new mobility alternatives emerged, most visibly TNCs.

In recent years, the vehicles of transportation network companies (TNCs) such as Uber and Lyft have become ubiquitous in San Francisco and many other major cities. Worldwide, the total number of rides on Uber and Lyft grew from an estimated 190 million in 2014 to over 2 billion by mid-2016 (1). In San Francisco, this agency (the San Francisco County Transportation Authority or SFCTA) estimated approximately 62 million TNC trips in late 2016,

comprising about 15% of all intra-San Francisco vehicle trips and 9% of all intra-San Francisco person trips that fall (2).

The rapid growth of TNCs is attributable to the numerous advantages and conveniences that TNCs provide over other modes of transportation, including point-to-point service, ease of reserving rides, shorter wait times, lower fares (relative to taxis), ease of payment, and real-time communication with drivers. The availability of this new travel alternative provides improved mobility for some San Francisco residents, workers and visitors, who make over one million TNC trips in San Francisco every week, though these TNC trips may conflict with other City goals and policies.

The purpose of this report is to identify the extent to which TNCs contributed to increased roadway congestion in San Francisco between 2010 and 2016, relative to other potential contributing factors including employment growth, population growth, and changes to the transportation system. This information is needed to help the Transportation Authority fulfill our role as the county Congestion Management Agency and inform our policy and planning work. As the Congestion Management Agency for San Francisco, the Transportation Authority is required by state law to monitor congestion and adopt plans for mitigating traffic congestion that falls below certain

thresholds. The report is also intended to inform the Transportation Authority board which is comprised of the members of the San Francisco Board of Supervisors, as well as other state and local policy-makers, and the general public, on the relationship between TNCs and congestion in San Francisco.

This document:

- Identifies common measures of roadway congestion;
- Discusses factors that contribute to roadway congestion; and
- Quantifies the relative contributions of different factors, including population, employment, road network changes and TNCs, to observed changes in congestion in San Francisco between 2010 and 2016, by location and time of day.

The report utilizes a unique TNC trip dataset provided to the Transportation Authority by researchers from Northeastern University in late 2016, as well as INRIX data, a commercial dataset which combines several real-time GPS monitoring sources with data from highway performance monitoring systems. These data are augmented with information on network changes, population changes, and employment changes provided by local and regional planning agencies, which are used as input to the Transportation Authority's activity-based regional travel demand model SF-CHAMP.

DO TNCs AFFECT CONGESTION?

Yes. When compared to employment and population growth and network capacity shifts (such as for a bus or bicycle lane), TNCs accounted for approximately 50% of the change in congestion in San Francisco between 2010 and 2016, as indicated by three congestion measures: vehicle hours of delay, vehicle miles travelled, and average speeds. Employment and population growth—encompassing citywide non-TNC driving activity by residents, local and regional workers, and visitors—are primarily responsible for the remainder of the change in congestion.

- Daily vehicle hours of delay (VHD) on the roadways studied increased by about 40,000 hours during the study period. We estimate TNCs account for 51% of this increase in delay, and for about 25% of the total delay on San Francisco roadways and about 36% of total delay in the downtown core in 2016, with employment and population growth accounting for most of the balance of the increased in delay.
- Daily vehicle miles travelled (VMT) on study roadways increased by over 630,000 miles. We estimate TNCs account for 47% of this increase in VMT, and for about 5% of total VMT on study roadways in 2016.
- Average speeds on study roadways declined by about 3.1 miles per hour. We estimate TNCs account for 55% of this decline.

FIGURE 1. CHANGE IN VEHICLE HOURS OF DELAY BY TIME PERIOD BY FACTOR

WHEN DO TNCS AFFECT CONGESTION?

During the AM peak, midday, and PM peak periods, TNCS cause between 43% and 48% of the increased delay and account for about 20% of total delay during these time periods. Employment growth and population growth combined account for just over half of the increased delay. In the evening time period, TNCS are responsible for 69% of the increased delay, and for about 40% of the total delay.

FIGURE 2. CHANGE IN VEHICLE MILES TRAVELED BY TIME PERIOD BY FACTOR

Similarly, during the AM peak, midday, and PM peak periods, TNCS cause about 40% of the increased vehicle miles travelled, while employment and population growth combined are responsible for about 60% of the increased VMT. However, in the evening time period, TNCS are responsible for over 61% of the increased VMT and for about 9% of total VMT.

FIGURE 3. CHANGE IN SPEED (MILES PER HOUR) BY TIME PERIOD BY FACTOR

TNCS are responsible for about 45%-55% of the decline in average speed during most times of day, and are responsible for 75% of the declines in speed during the evening time period.

FIGURE 4. % CHANGE IN VEHICLE HOURS OF DELAY

WHERE DO TNCs AFFECT CONGESTION?

TNCs increase congestion throughout the city, but their effects are concentrated in the densest parts of the city, and along many of the city's busiest corridors, as shown in **Figure 4**. In Supervisorial District 6, TNCs add almost 6,000 daily hours of delay, accounting for about 45% of the increased delay, and 30% of total weekday delay. In District 3, TNCs add almost 5,000 daily hours of delay, accounting for almost 75% of the increased delay and about 50% of total delay. TNCs are responsible for approximately 40%-60% of increases in VMT in many areas of the city. District 6 and District 10 have experienced the greatest increases in VMT between 2010 and 2016, and TNCs account for 41% and 32% of the increases in these districts, respectively.

FIGURE 5: CHANGE IN VEHICLE HOURS OF DELAY BY SUPERVISOR DISTRICT BY FACTOR

FIGURE 6: CHANGE IN VEHICLE MILES TRAVELED BY SUPERVISOR DISTRICT BY FACTOR

What Factors Affect Congestion San Francisco?

POPULATION AND EMPLOYMENT

Population and employment changes can directly affect roadway congestion. Increases in population will lead to increases in trip-making as people seek to participate in activities such as working, shopping, and going to school. Depending on travelers' choices of travel modes (such as walking, biking, taking transit, or driving), roadway motor vehicle congestion may be affected. Between 2010 and 2016, the population of San Francisco increased 8.8% from approximately 805,000 people to 876,000 (3). While about half of San Francisco trips are by walking, transit, and biking, a significant share of trips involve private vehicles, likely leading to increased congestion. Similarly, increases in employment lead to total travel as more people go to work. Between 2010 and 2016, employment in San Francisco increased significantly (28.4%) from approximately 545,000 jobs to over 700,000 jobs (4). According to the Census, approximately 48% of commute trips to, from or within San Francisco were by automobile.

NETWORK CAPACITY

Changes to network capacities affect roadway congestion. Increases in roadway capacity may alleviate motor vehicle congestion, at least in the short term, while decreases in roadway capacity may increase congestion. The analyses in this paper capture capacity changes between 2010 and 2016 and therefore encompass network capacity changes such as the rebuilding of Doyle Drive and medium-term changes such as the reallocation of right-of-way to transit red carpet lanes and bicycle lanes. To a more limited extent, the analyses could reflect short-term changes in capacity, for example the effect on congestion of construction-related, permitted lane closures that may temporarily reduce capacity for a number of days or hours. However, there is no data on unpermitted short-term capacity reductions associated with construction, delivery or other activities, and thus they are not considered in this analysis. In addition to roadway network changes, changes to transit network capacities may influence roadway congestion by inducing people to shift modes or take new trips, and are included in this analysis.

TNCs

As the TNCs Today report documents, TNCs comprise a significant share of intra-San Francisco travel. TNCs may decrease congestion by inducing mode shifts to more sustainable modes by providing first- and last-mile connections to transit services, or by reducing auto ownership levels and thus incentivizing people to make more transit, bike and walk trips. In addition, higher TNC

vehicle passenger occupancies resulting from “ridesplitting” where TNCs are shared concurrently could, in theory, reduce the number of vehicle trips if they are replacing a trip that would otherwise be in a vehicle with fewer occupants. Conversely, TNCs may increase congestion if their convenience causes a walk, transit, or bike trip to shift to a TNC vehicle trip. According to recent studies, between 43% and 61% of TNC trips substitute for transit, walk, or bike travel or would not have been made at all (5,6,7,8). TNC passenger pick up and drop off activity may also result in increased congestion by disturbing the flow in curb lanes or traffic lanes. Finally, out-of-service miles (or “deadhead” miles) resulting from TNCs repositioning themselves to more optimal locations for getting new passengers, or from driving to pick up passengers who have reserved rides (whether single passenger or shared), also increases the amount of vehicular traffic and congestion.

OTHER FACTORS

Given the rapid pace of technological change in the transportation sector, other factors may also be contributing to changes in congestion. For example, increased use of online shopping and delivery services might exacerbate roadway congestion due to an increase in delivery vehicle trips and loading durations. Conversely, if these deliveries are in place of multiple vehicle trips that would have been made by individuals, they may reduce roadway congestion. New emerging mobility alternatives such as dockless shared bikes and scooters may reduce congestion if they induce mode shifts away from vehicle trips, though if these trips are shifted from transit, walk, or bike their effect on congestion would likely be minimal.

EMPIRICAL ANALYSIS

This study is structured as a before-and-after assessment between 2010 conditions when TNC activity was negligible and 2016 conditions when it was significant. We derived measures of roadway conditions in both years from GPS-based speed data licensed from INRIX as previously described. We estimated the relationship between the change in TNC activity and the change in roadway travel time, assuming zero TNCs in 2010, and incorporating a 2016 “counterfactual” scenario in which TNCs do not exist.

We do this using a fixed-effects panel data regression model (9). The fixed-effects models estimate coefficients based on the change between 2010 and 2016 conditions. There is precedent for using both before-and-after analysis and panel data models in transportation analysis, including to study changes in congestion (10), TNC growth (11), and the effects of new technology (12).

We converted the observed travel times to implied volumes using volume-delay functions (VDFs). This time-implied volume is the model’s dependent variable, and the conversion ensures that it is linearly related to the background volumes and TNC volumes. There is one observation for each directional roadway segment, for each time-of-day, with data in 2010 and in 2016 for each observation. To control for road and transit network changes, as well as changes in socioeconomic conditions, the model includes the

background traffic volume as a variable, as estimated by SF-CHAMP version 5.2. Because SF-CHAMP version 5.2 does not account for TNCs, this background traffic reflects the expected traffic volume change with no TNCs. The model also includes measures of TNC activity for each observation, with those measures set to zero in 2010. **Table 1** shows the model estimation results.

The estimated parameter on the SF-CHAMP background volume is approximately 0.92, not significantly different than 1. This is logical, because we expect that each vehicle added in background traffic should have an effect on congestion of adding about 1 vehicle to the implied volume. The Presidio Parkway scaling factor accounts for major construction that was underway on those links in 2010 but not 2016.

We include two measures of time and location-specific TNC activity. The TNC volume parameter measures net effect of TNCs. If TNCs purely substitute for other car trips, the estimated TNC parameter should be 0 as they substitute for other vehicles already counted in the background volumes. Negative values would be consistent with TNCs reducing traffic, while a value of positive 1 would be consistent with TNCs purely adding itself to background traffic. The estimated coefficient of 0.69 can be interpreted as meaning that TNCs do not purely add to traffic through induced travel or shifts from non-vehicular modes.

TABLE 1 FIXED-EFFECTS PANEL ESTIMATION RESULTS

PARAMETER ESTIMATES

Variable	Parameter	Standard Error	T-statistic
SF-CHAMP background volume	0.9172	0.0541	16.952
Presidio Parkway scaling factor	-0.3648	0.0189	-19.327
TNC Volume	0.6864	0.0720	9.5387
Average impact duration of TNC PUDO on major arterials (s)	144.75	7.7195	18.751
Average impact duration of TNC PUDO on minor arterials (s)	79.486	12.114	6.5617

MODEL STATISTICS

Number of Entities	7081
Number of Time Periods	2
R-squared between groups	0.5819
R-squared within groups	0.2985

Conclusion

Congestion in San Francisco worsened between 2010 and 2016. The Transportation Authority's Congestion Management Program monitoring indicates that average AM peak arterial travel speeds decreased since 2009 by -26%, while PM peak arterial speeds have decreased by -27% during this same time period. Vehicle hours of delay on the study roadways increased by 40,000 hours on a typical weekday, while vehicle miles travelled on study roadways increased by over 600,000 miles on a typical weekday. In addition, travel times have become less reliable.

During this period significant changes occurred in San Francisco. Roadway and transit networks changed, including the rebuilding of Doyle Drive, the implementation of transit red carpet lanes, and the expansion of the bicycle network. San Francisco added 70,000 new residents and over 150,000 new jobs, and these new residents and workers add more trips to the city's transportation network. Finally, new mobility alternatives emerged, most visibly TNCs. TNCs have become an important travel option in San Francisco.

By late 2016, TNCs were estimated to generate over one million intra-San Francisco vehicle trips in a typical week, representing approximately 15% of all intra-SF vehicle trips, and the number and share of TNC trips in San Francisco has undoubtedly increased since 2016. The rapid growth of TNCs is attributable to the numerous advantages and conveniences that TNCs provide over other modes of transportation, and the availability of this new travel alternative has undeniably provided improved mobility for many San Francisco residents and workers.

TNC vehicle trips contribute significantly to increased congestion. After accounting for the effects of increased employment, increased population, and transportation network changes, TNCs are estimated to cause 51% of the increase in vehicle hours of delay, 47% of the increase in vehicle miles traveled, and 55% of the decline in speeds citywide between 2010 and 2016.

It is important to note that the effect of TNCs on congestion varies considerably by time-of-day. During most of the day, approximately 40% to 50% of the increase in vehicle hours of delay is attributable to TNCs, but in the evening, almost 70% of the increase in vehicle delay is due to TNCs. Similarly, during most of the day approximately 40% on the increase in vehicle miles traveled is due to TNCs, but in the evening TNCs account over 60% of increased VMT. Speeds declined by about 2 to 3 miles per hour during most of the day, with TNCs accounting for about 45% to 55% of this decrease. However, evening speeds declined by almost 4.5 miles per hour on study roadways, and TNCs are estimated to cause 75% of this decrease.

The effects of TNCs on congestion also varies significantly by location. The greatest increases in vehicle hours of delay occurred in Supervisorial Districts 3, 5 and 6, with over 70% of the increase in delay in Districts 3 and 5 due to TNCs, and about 45% of the increase in delay in District 6 due to TNCs. Vehicle miles traveled increased most significantly in Districts 6 and 10, with TNCs accounting for 41% and 32% of the increased VMT in these districts, respectively. While the total increase in VMT in Districts 3 and 5 were less than observed in other districts, the share of this increase attributable to TNCs in these districts was between 65% and 75%, the highest in the city. Average speeds have declined in all districts, with the greatest relative declines occurring in Districts 3, 6, 9 and 10.

Keywords: shared mobility, carsharing, ridesharing, ride-hailing, Uber, Lyft, travel behavior

RECOMMENDATION CITATION:

Clewlow, Regina R. and Gouri S. Mishra (2017) Disruptive Transportation: The Adoption, Utilization, and Impacts of Ride-Hailing in the United States. Institute of Transportation Studies, University of California, Davis. Research Report UCD-ITS-RR-17-07

- Among adopters of prior carsharing services, 65% have also used ride-hailing. More than half of them have dropped their membership, and 23% cite their use of ride-hailing services as the top reason they have dropped carsharing.

Vehicle Ownership and Driving

- Ride-hailing users who also use transit have higher personal vehicle ownership rates than those who only use transit: 52% versus 46%.
- A larger portion of “transit only” travelers have no household vehicle (41%) as compared with “transit and ride-hail” travelers (30%).
- At the household level, ride-hailing users have slightly more vehicles than those who only use transit: 1.07 cars per household versus 1.02.
- Among non-transit users, there are no differences in vehicle ownership rates between ride-hailing users and traditionally car-centric households.
- The majority of ride-hailing users (91%) have not made any changes with regards to whether or not they own a vehicle.
- Those who have reduced the number of cars they own and the average number of miles they drive personally have substituted those trips with increased ride-hailing use. Net vehicle miles traveled (VMT) changes are unknown.

Ride-hailing and Public Transit Use

- After using ride-hailing, the average net change in transit use is a 6% reduction among Americans in major cities.
- As compared with previous studies that have suggested shared mobility services complement transit services, we find that the substitutive versus complementary nature of ride-hailing varies greatly based on the type of transit service in question.
- Ride-hailing attracts Americans away from bus services (a 6% reduction) and light rail services (a 3% reduction).
- Ride-hailing serves as a complementary mode for commuter rail services (a 3% net increase in use).
- We find that 49% to 61% of ride-hailing trips would have not been made at all, or by walking, biking, or transit.
- Directionally, based on mode substitution and ride-hailing frequency of use data, we conclude that ride-hailing is currently likely to contribute to growth in vehicle miles traveled (VMT) in the major cities represented in this study.

TNCs Today

A Profile of San Francisco Transportation Network Company Activity

Executive Summary

Transportation network companies (TNCs) such as Uber and Lyft are an increasingly visible presence on San Francisco streets, but there has been no comprehensive data source to help the public and decision-makers understand how many TNC trips occur in San Francisco, how much vehicle travel they generate, and their potential effects on congestion, transit ridership, and other measures of system performance. The California Public Utilities Commission (CPUC) regulates TNCs and requires data reporting by TNCs, but will not share these data with local jurisdictions and the public.

The purpose of this report is to provide information on TNC activity in San Francisco, in order to help the San Francisco County Transportation Authority (Transportation Authority) fulfill its role as the Congestion Management Agency for San Francisco County. The report is also intended to inform the Transportation Authority board which is comprised of the members of the San Francisco Board of Supervisors, as well as state and local policy-makers in other arenas, and the general public, on the size, location and time-of-day characteristics of the TNC market in San Francisco.

The information presented is a profile of estimated local TNC usage (trips made entirely within San Francisco) from mid-November to mid-December of 2016. The TNC data was originally gathered by researchers at Northeastern University from the Application Programming Interfaces (APIs) of Uber and Lyft and then shared with the Transportation Authority. The Transportation Authority's data team cleaned and analyzed the data for presentation here.

While this document provides a broad range of descriptive information about TNC trips, it does not evaluate the effects of these TNC trips on the performance of the San Francisco transportation system, nor does it explain TNC customer trip purposes, demographic characteristics, or longer term effects on vehicle ownership and residential and employment location. This report does not identify the extent to which TNCs affect congestion. Many factors contribute to increased congestion—population and employment growth, construction activity, increased delivery and other transportation services, and TNCs.

Subsequent reports and studies by the Transportation Authority and others will address these important analytic and policy topics in depth, including the effects of TNCs on roadway congestion, public transit operations and ridership, disabled access, and equity.

The report is structured around six primary questions:

HOW MANY TNCs OPERATE IN SAN FRANCISCO TODAY?

- The San Francisco Treasurer's Office estimates that 45,000 Uber and Lyft drivers may operate in San Francisco, and in 2016 sent notices requiring them to register their business with the city.
- Almost 21,000 drivers are estimated to have complied with the requirements to register their business with the city. Of that number, only 29% are San Francisco residents.
- On a typical weekday, over 5,700 TNC vehicles operate on San Francisco streets at peak times, with the peak period occurring between 6:30pm and 7:00pm. On Fridays, over 6,500 TNC vehicles are on the street during the peak of 7:30pm to 8:00pm. This is over 15 times the number of taxis on the street at these times of day.

HOW MANY TNC TRIPS ARE OCCURRING IN SAN FRANCISCO?

- On a typical weekday, TNCs make over 170,000 vehicle trips within San Francisco, which is approximately 12 times the number of taxi trips, and 15% of all intra-San Francisco vehicle trips. This represents a conservative estimate of total TNC trips in San Francisco because the study's dataset does not include trips with a regional origin or destination.
- Assuming TNC occupancy rates are similar to taxi occupancy rates, it is estimated that at least 9% of all San Francisco person trips use TNCs.

WHEN ARE TNC TRIPS OCCURRING IN SAN FRANCISCO?

- Significant numbers of TNC vehicle trips occur on both weekdays and weekends, with the highest number on Fridays with over 222,500 trips, and the lowest number on Sundays with approximately 129,000 trips.
- On weekdays, TNC usage is concentrated during the AM and PM peak periods when congestion is greatest, and extends into the evenings on Friday. Saturday and Sunday TNC trips occur primarily in the afternoon and evening.

least 6.5% of average total weekday VMT citywide, and may account for more than 10% of weekend VMT, primarily during the AM peak, PM peak, and early evening time periods. These estimates include both in-service and out-of-service vehicle miles.

- Approximately 20% of total TNC VMT are out-of-service miles. This is significantly lower than the more than 40% of taxi VMT that are out-of-service miles. The greater efficiency of TNCs is likely due to the higher number of TNC vehicles and more efficient technology.

WHERE ARE TNC TRIPS OCCURRING IN SAN FRANCISCO?

- TNC trips are concentrated in the densest and most congested parts of San Francisco including the downtown and northeastern core of the city. At peak periods, TNCs are estimated to comprise 25% of vehicle trips in South of Market.
- TNC trips are concentrated on the busiest arterials, yet also operate extensively on neighborhood streets, including along major public transit lines.

DO TNCs PROVIDE A HIGH DEGREE OF GEOGRAPHIC COVERAGE THROUGHOUT THE ENTIRE CITY?

- TNCs provide broader service across the city than taxis, particularly in the western neighborhoods.
- TNCs provide fewer trips per population and employment in southern and southeastern areas of the city, which may reflect the presence of fewer TNC vehicles, or neighborhood preferences or demographics.

For more information, or to obtain a downloadable file of Transportation Authority processed data, visit the TNCs Today website at www.sfcta.org/tncstoday.

HOW MANY VEHICLE MILES TRAVELED (VMT) DO TNCs GENERATE WITHIN SAN FRANCISCO?

- Intra-SF TNC trips generate approximately 570,000 vehicle miles of travel (VMT) on a typical weekday, comprising as much as 20% of intra-SF-only VMT, at

Introduction

Transportation network companies (TNCs) such as Uber and Lyft are visible presences on San Francisco's streets, in both the downtown core as well as in the city's neighborhoods. These companies allow people to use a smartphone app to request and pay for rides sourced from a pool of available drivers. These services are taxi-like in that they provide point-to-point transportation primarily in private vehicles. The success of TNCs in attracting rides in San Francisco and other cities reflects the high unmet demand for premium services and the extensive benefits they provide to users who can afford their services. Initially TNCs offered some distinct advantages over taxis including the ability to easily reserve a ride, the ability for both driver and passenger to contact each other and to know the location of the other using GPS, ease of payment, cheaper fares, shorter wait times, and more availability at all times of day due to a larger supply of vehicles. Taxis now offer some of these features, although the supply of taxis is still significantly smaller than TNCs, and taxi fares are higher.

The advantages of TNCs over taxis and other transportation modes are in part a result of the technological innovation of directly connecting travelers and drivers, but are also in part an outcome and reflection of the relatively light regulatory requirements under which TNCs operate, relative to taxis and other for-hire vehicles. The biggest difference between TNCs and other modes is the significantly lower barrier for drivers to enter the market. California state law grants municipalities the ability to regulate taxis, and in San Francisco, the taxi medallion system limits the number of taxi vehicles that can serve the city. In addition, taxis are subject to price controls, must provide access to all areas of the city, must provide service to people with

disabilities, have greater insurance requirements, and are subject to driver background checks and vehicle inspections. In contrast, there is no limit on the number of TNCs that may operate on San Francisco streets, no price controls, no geographic service area requirements, minimal disabled access requirements, limited driver background checks and few vehicle inspection or driver training requirements (TRB 2015).

There is a perception that TNC vehicles now comprise a significant number of the vehicles on San Francisco streets, having increased rapidly since TNCs started operating in the city seven years ago. However, there has been little data to either confirm or refute this perception. The California Public Utilities Commission (CPUC), which regulates TNCs due to the inter-city, non-hail nature of the service they provide, requires TNCs to report to the CPUC an extensive set of information on service provision including where and when trips are starting and ending, the availability of disabled-accessible vehicles, traffic incidents, and hours and miles logged by drivers. However, the CPUC has refused to share these TNC data with San Francisco, stating that it is authorized to withhold official information if disclosure of the information is against the public interest (CPUC Letter to the Transportation Authority, 2017). However, recent SFMTA Travel Decisions Survey results indicate that TNCs are growing in significance as a share of overall San Francisco travel, doubling in mode share served between 2014 and 2015 (SFMTA 2014, SFMTA 2015). In addition, it has been noted that Uber reported an annual tripling of trips in San Francisco (TRB 2015). However, these data sources provide no reliable estimates of the true number of TNC trips occurring in San Francisco, where TNC trips are occurring, or when TNC trips are occurring.

THIS TODAY: A PROFILE OF SAN FRANCISCO TRANSPORTATION NETWORK COMPANY ACTIVITY: FINAL REPORT
 SAN FRANCISCO COUNTY TRANSPORTATION AUTHORITY

Purpose

The purpose of this report is to provide information on TNC activity in San Francisco, in order to help the San Francisco County Transportation Authority (Transportation Authority) fulfill its role as the Congestion Management Agency for San Francisco County. The report is also intended to inform the Transportation Authority board which is comprised of the members of the San Francisco Board of Supervisors, as well as state and local policymakers in other arenas, and the general public, on the size, location and time-of-day characteristics of the TNC market in San Francisco.

This document provides estimates of how many TNCs are operating in San Francisco during all times of day and days of week, imputes the number, location, and timing of intra-San Francisco TNC trips based on TNC driver trip acceptance information (referred to in this report as pickups) and TNC driver drop off information (referred to as drop-offs). The report estimates the amount of daily vehicle miles travelled (VMT) generated by TNCs, and contextualizes these relative to the other travel modes operating in San Francisco, including private vehicles, public transit, walking and biking. TNC trips between San Francisco and other counties (regional TNC trips) are not included in these estimates, and as a result these numbers represent a lower-bound estimate of the number of actual TNC vehicles and trips operating in San Francisco. Note that the data on which this report is based does not include any information on TNC trip purposes, travel party size, fares paid, traveler attributes such as gender, income, disability, mode choice shifts, or induced travel.

The information presented is a profile of local TNC usage in San Francisco from mid-November to mid-December of 2016, excluding dates around the Thanksgiving 2016 holiday. The TNC data was originally gathered by researchers at Northeastern University from the Application Programming Interfaces (APIs) of Uber and Lyft which show the locations of available vehicles to mobile apps, and then was shared with the Transportation Authority through a research collaboration over the past year. The other data referenced in the report come from a variety of sources including Caltrans, the San Francisco Municipal Transportation Agency (SFMTA), and the Transportation Authority's SF-CHAMP travel demand model.

This document does not evaluate the near-term impacts of TNCs on the performance of the San Francisco transportation system, nor does it explain potential longer-term effects of TNC provision on vehicle ownership or residential and employment location.

This report does not identify the extent to which TNCs affect congestion. Many factors contribute to increased congestion—population and employment growth, construction activity, increased delivery and other transportation services, and TNCs. Subsequent reports by the Transportation Authority through this project and the larger Emerging Mobility Services and Technology (EMST) policy framework and the Connect SF long-range planning process, both being undertaken in coordination with other City agencies, will address these important analytic and policy questions in depth.

Methodology

This research team developed and applied multiple procedures to estimate TNC trips within San Francisco. First, the team acquired data on TNC vehicle locations that was gathered from the Uber and Lyft APIs. The research team then cleaned this location data, removing unnecessary, anomalous, or redundant information. Finally, the team identified trips and imputed missing attributes.

DATA COLLECTION

In order to provide real-time information to drivers and passengers, Lyft and Uber expose certain data through public-facing APIs. This information includes nearby vehicle locations, estimated times-to-pickup, and sometimes, estimated costs. The data exposed through the APIs also includes, among other things, a vehicle identifier associated with a sequence of time-stamped coordinates, and the service types associated with that vehicle, such as UberX or UberPOOL. Sending a request to the API returns a text file response containing this information for the nearest available vehicles. When a vehicle becomes unavailable, either because the driver has turned off their app or they have accepted a ride request, the vehicle disappears from the datastream. Similarly, when the vehicle becomes available, either because the driver has turned on their app or they have completed a ride request, it reappears in the datastream. Researchers at Northeastern University implemented a systematic method for collecting this datastream such that it geographically covers all of San Francisco. The Northeastern University researchers collected information on vehicle locations every five seconds for approximately six weeks. The data collection methodology has no impacts on either drivers or riders.

DATA CLEANING

The research team collected data by sampling available TNC vehicles using a geographic grid that covers all of San Francisco. This sampling procedure means that any available Uber or Lyft vehicle may be detected by multiple sampling locations. Furthermore, because data is being collected almost continuously in time for each sampling location, the same vehicle will often appear repeatedly in the datastream for each individual sampling location. The first step in the data preparation process involved cleaning the information in the datastream. In addition, the raw data may at times contain anomalous data, which was also screened out to ensure the reasonableness of the GPS traces. The result was a set of unique GPS traces for each TNC vehicle.

TRIP IDENTIFICATION, TRIP MATCHING AND ATTRIBUTE IMPUTATION

Cleaning resulted in a set of unique "pre-trip" vehicle trajectories that reflect when a vehicle became available (due to the driver dropping off a passenger or starting a shift) and when the vehicle became unavailable (due to the driver accepting a passenger or ending a shift). Once pre-trips and pickup and drop-off locations were defined, "trips" were imputed by linking the pickup and trip drop-off locations. Lyft trips were created first because the Lyft API reveals a persistent vehicle identifier, with which it is possible to build an aggregate matrix of Lyft flows from pickup locations to dropoff locations by detailed time-of-day. This matrix of flows is used to estimate the vehicle miles traveled generated by TNCs. Uber's API does not have persistent identifiers that are necessary to connect pickup and dropoff locations, so the research team used the Lyft matrix of pickup and dropoff flows by travel analysis zone (TAZ) and time-of-day as a starting point, and then proportionally fitted the matrix to match Uber trip pickup locations and drop-off locations by time-of-day.

A unique aspect of the Uber and Lyft driver labor market is that drivers may drive for both services simultaneously. As a result, these driver vehicles may appear in both the Uber and Lyft datastreams. It is necessary to identify these "matched pre-trips" in order to avoid double-counting of TNC pre-trips and trips. Matched pre-trips were identified by comparing the start and end times of the pre-trips and selecting only those pre-trips whose start and end times both occurred within a limited time window, as well as selecting only pre-trips that traversed the same set of network links in the same sequence. The pre-trip (and associated trip) were then assigned to either Lyft or Uber, based on which pre-trip ended first, representing the first platform on which a driver accepted the trip.

For pre-trips, out of service travel times and distances could be calculated directly from the cleaned and processed datastream. For Lyft trips, trip travel times could be derived from the datastream. Because the datastream does not contain the information on the actual paths used by TNCs on trips, it was necessary to impute distances between observed pickup and dropoff locations using information from the Transportation Authority's SF-CHAMP model. For Uber trips, both travel times and distances were imputed from the model system.

DATA LIMITATIONS

It must be emphasized that the TNC information documented in this report does not represent direct observa-

HOW MANY TNC TRIPS ARE OCCURRING IN SAN FRANCISCO?

Two types of TNC trips were estimated: vehicle trips and person trips. The number of TNC vehicle trips is important because more vehicle trips generally leads to increased congestion and conflicts with other street users, while more person trips may indicate enhanced mobility. Again, only those trips with both pickup and drop-off location within San Francisco are considered in the following summaries.

"Vehicle trips" in Table 2 refers to movements by motor vehicles with origins and destinations entirely within San Francisco. Vehicles may carry different numbers of people, or may be public transit vehicles or taxis. Trucks are excluded. Approximately 170,000 TNC vehicle trips are estimated to occur within San Francisco during a typical weekday. This represents approximately 15% of all weekday vehicle trips that both start and end within the city, as shown in Table 2. There are approximately 12 times as many TNC trips as taxi trips during a typical weekday.

Figure 3. Average Wednesday Intra-SF Vehicle Trips by Mode

Table 2. Weekday Intra-SF Vehicle Trips by Mode

MODE	VEHICLE TRIPS	%
Private Auto	940,000	83%
Public Transit Vehicle	11,000	1%
Taxi	14,000	1%
TNC	170,000	15%
TOTAL	1,135,000	100%

Source: TNC data, SF-CHAMP travel model, SFMTA

Person trips refers to movements by people with origins and destinations in San Francisco. Person trips are different than vehicle trips because person trips include walking and biking trips (which don't require motor vehicles), and also because private vehicles, public transit vehicles and taxis may carry more than one person. For TNCs and taxis, vehicle trips were converted to person trips using an assumed occupancy rate of 1.66, based on observed taxi data (Schaller, 2017). This assumed occupancy rate affects the TNC share of overall travel. Use of a lower occupancy rate would result in lower TNC person trip mode shares. Approximately 290,000 TNC person trips are estimated to occur within San Francisco during a typical weekday. This represents approximately 9% of all weekday person trips within the city, as shown in Table 3.

Table 3. Weekday Intra-SF Person Trips by Mode

MODE	PERSON TRIPS	%
Drive	1,099,000	34%
Public Transit	512,000	16%
Bike	103,000	3%
Walk	1,193,000	37%
Taxi	24,000	1%
TNC	283,000	9%
TOTAL	3,214,000	100%

Source: TNC data; SF-CHAMP travel model; SFMTA

WHEN ARE TNC TRIPS OCCURRING IN SAN FRANCISCO?

The timing of TNC trips is important because trips that occur during peak periods and weekdays are more likely to exacerbate congestion and delay on roads, affecting both general traffic, surface public transit as well as conflicts with bicycles and pedestrians.

■ TNC 9%

SOURCE: TNC data; SF-CHAMP

Figure 5 shows the total number of estimated TNC vehicle trips and taxi trips by day-of-week. It shows that TNC trips increase as the week progresses, reaching their peak volume on Friday and hitting their lowest volume on Sunday. This indicates that TNCs are serving both the weekday and

HOW MUCH VMT DO TNCs GENERATE WITHIN SAN FRANCISCO?

The amount of VMT, or vehicle miles travelled, that is generated by TNCs is important because VMT is a fundamental measure of transportation system performance. Higher levels of VMT are associated with greater levels of emissions of greenhouse gases such as CO₂ as well as other pollutants. In addition, higher levels of VMT are also associated with greater roadway congestion and conflicts. For TNCs and taxis, two types of VMT are important, in-service VMT and out-of-service VMT. In-service VMT refers to the vehicle miles traveled when transporting a passenger. Out-of-service VMT refers to the vehicle miles traveled while circulating to pickup a passenger.

Tables 4–6 show the total trips, total VMT, average total trip length, in-service trip length, out-of-service trip length, and percent out-of-service trip length by day-of-week for local TNCs and taxis. These tables indicate that TNCs and taxis are generally similar in terms of average in-service trip length. However, a notably smaller share of TNCs' total trip lengths are out-of-service miles, while a significant share of total taxi trip length (over 40%) are out-of-service miles. The greater efficiencies of TNCs, as reflected in a lower share of out-of-service miles, are likely primarily a reflection of the larger fleets of TNC drivers operating on the road at any given time, enabling shorter distances to pickup locations. In addition, TNCs' routing software may be more efficient than the taxi dispatch systems. Most critically, Table 4 indicates that the estimated TNC total VMT on a typical weekday is approximately 570,000 VMT, and this estimate is clearly conservative given that it:

- Includes only intra-SF TNC trips (such as trips to and from San Francisco International Airport).
- Underestimates out-of-service VMT because it excludes the additional distance from acceptance location to where the passenger is actually picked up.
- Excludes VMT associated with TNC drivers commuting to SF from non-SF home origins.

This TNC VMT estimate indicates that intra-SF TNCs generate as much as 20% on weekday VMT for intra-SF vehicle trips and at least 6.5% of total weekday VMT in San Francisco, given Caltrans' most recent estimate of weekday VMT traveled on San Francisco streets and highways (Caltrans 2014). Saturday roadway volumes are lower than weekday volumes, yet Saturday TNC VMT is even greater than average weekday TNC VMT. It is possible that TNCs may account for approximately 10% of VMT on Saturdays.

Table 4. Average Weekday Intra-SF Trip Lengths

	TNCS	TAXIS
Trips	170,400	14,400
VMT	569,700	65,900
Average Total Trip Length	3.3	4.6
Average In-service Trip Length	2.6	2.6
Average Out-of-service Trip Length	0.7	2.0
% Out-of-service Trip Length	21.0%	43.6%

Table 5. Average Saturday Intra-SF Trip Lengths

	TNCS	TAXIS
Trips	220,700	12,300
VMT	703,600	53,600
Average Total Trip Length	3.2	4.4
Average In-service Trip Length	2.6	2.4
Average Out-of-service Trip Length	0.6	1.9
% Out-of-service Trip Length	18.6%	44.1%

Table 6. Average Sunday Intra-SF Trip Lengths

	TNCS	TAXIS
Trips	129,100	6,700
VMT	471,200	31,900
Average Total Trip Length	3.7	4.8
Average In-service Trip Length	2.9	2.6
Average Out-of-service Trip Length	0.8	2.2
% Out-of-service Trip Length	20.7%	45.5%

Figure 20 (next page) illustrates the amount of estimated in-service and out-of-service VMT generated by local TNCs and taxis for typical weekdays, Saturdays and Sundays. TNCs generate more than 10 times as many VMT as taxis on a typical weekday, while generating 12 times as many trips.

Figure 21 (next page) shows the distribution of weekday VMT by time-of-day for TNCs and taxis. It indicates that most of the VMT generated by TNCs occurs during the AM peak and PM peak hours, with significant VMT also occurring during the evening hours, following the PM peak. VMT generated during periods of peak demand likely exacerbates existing peak period congestion.

THIS TODAY: A PROFILE OF SAN FRANCISCO TRANSPORTATION NETWORK COMPANY ACTIVITY: 2019 ANNUAL REPORT
SAN FRANCISCO TRANSPORTATION NETWORK COMPANY 2019 ANNUAL REPORT

Memorandum

Date: 04.06.2016

To: Wade Wietgreffe, San Francisco Planning Department

From: Drew Cooper, SFCTA

Subject: General Non-Residential Off-Street Parking Rate Estimation for San Francisco

The purpose of this memo is to document the estimation of a generalized non-residential off-street parking rate to be used in the TDM program in order to evaluate the parking requirements for new development at a fine-grained spatial level. The Transportation Authority did not make any attempt to separate or consider the distinctions of the various types of non-residential land uses, due to complications in relating off-street publicly available parking to the particular land uses it serves, although this analysis could be done if deemed desirable.

METHODOLOGY

The Transportation Authority estimated a general non-residential off-street parking rate as the number of public and private off-street parking spaces per 1000 square feet of non-residential land use. For each TAZ, we summarize the non-residential square footage and off-street parking supply for the TAZ and other nearby TAZs within 0.75 miles of network-based walking distance, with decreasing weight given to more distant TAZs.¹ We did this in order to derive a parking rate that is representative of the neighborhood and is not artificially truncated at arbitrary TAZ boundaries, and because parking for land uses within the TAZ may actually be located outside of the TAZ.

Land Use Data: Land use data were provided at a parcel level by the San Francisco Planning Department for 2013, and summarized to Traffic Analysis Zones (TAZs), which are the geographic unit used by SF-CHAMP travel demand model. Table 1 describes the types of land use included.

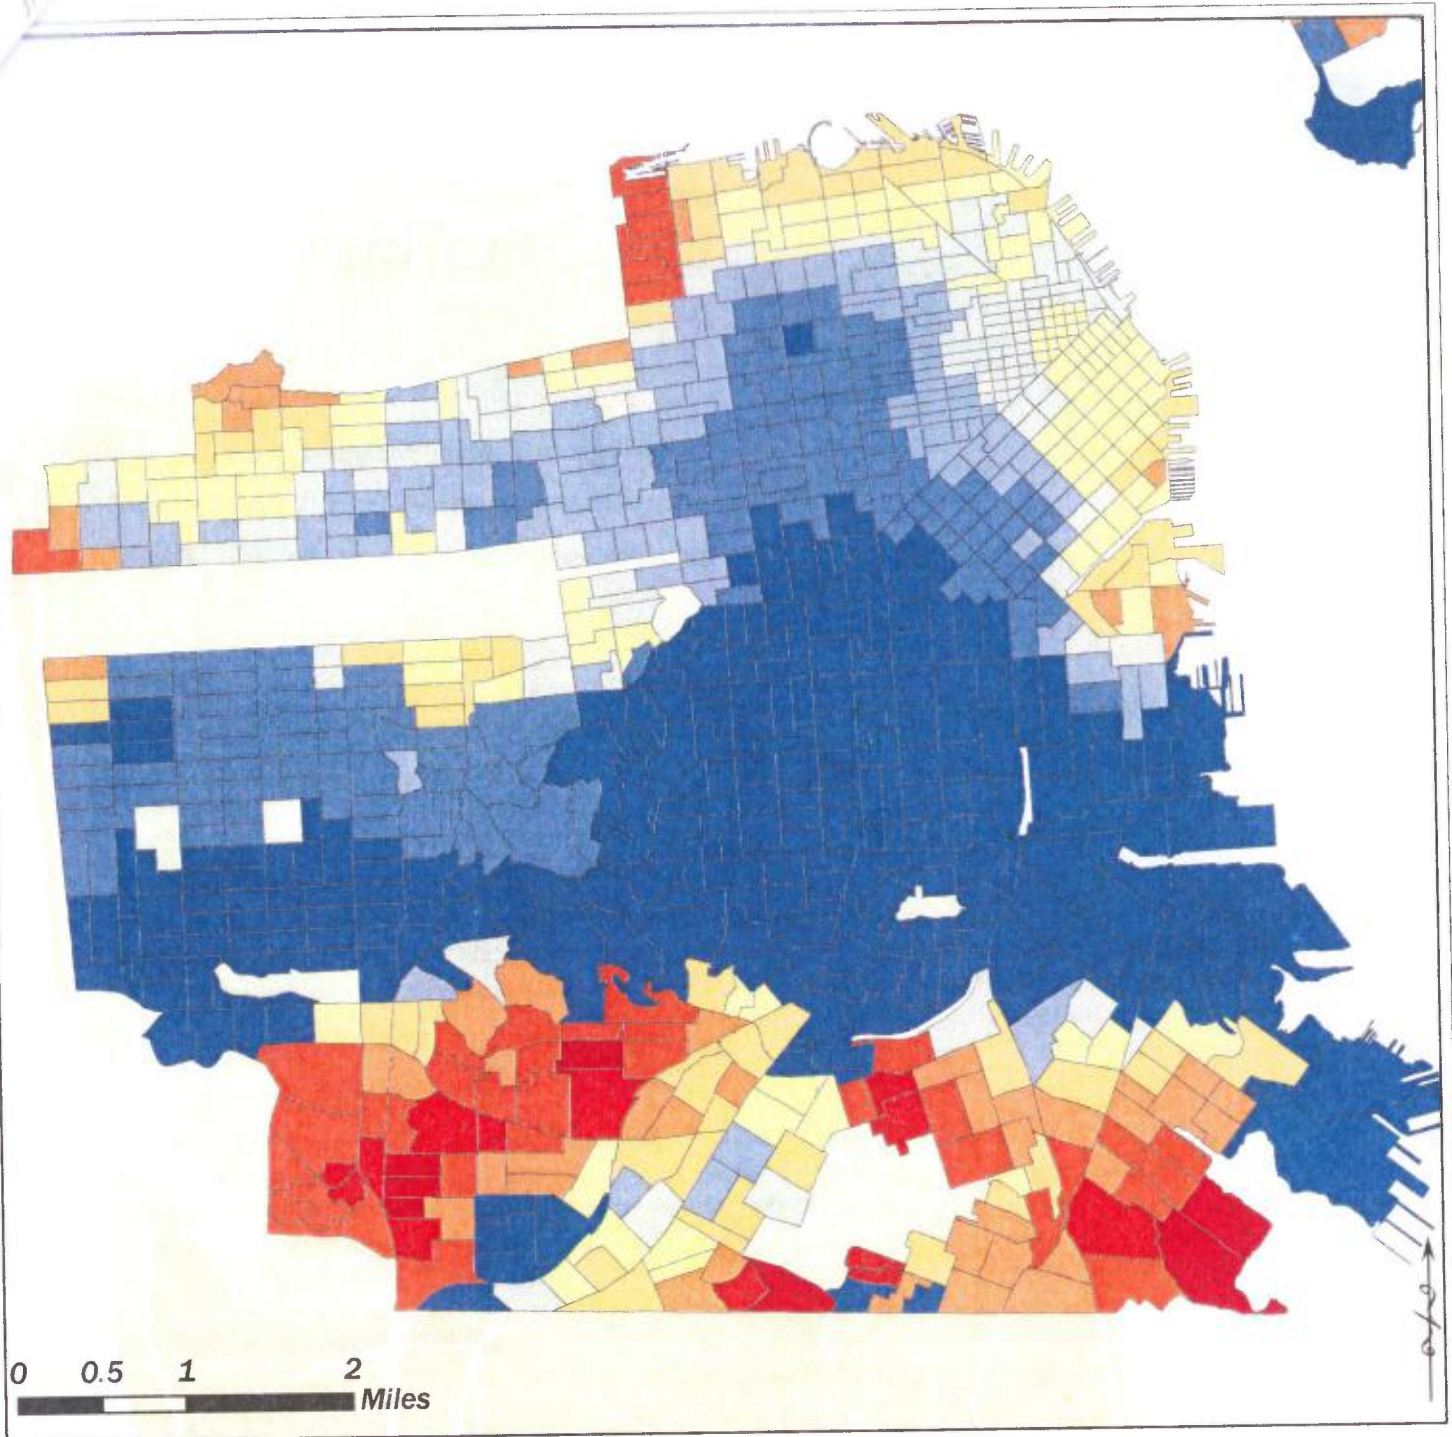

Table 1: Non-Residential Land Uses for Parking Rate Estimation

LAND USE CATEGORY	DESCRIPTION
CIE	Cultural, Institutional & Educational Services
MED	Medical and Health Services
MIPS	Management, Information & Professional Services
PDR	Production, Distribution & Repair
RETAIL	Retail / Entertainment
VISITOR	Visitor Lodging

¹ The weight is a function of distance in the formula $w = e^{-11.8d}$, where d is the distance in miles.

Parking Data: Off-street, publicly available parking data were available through SFPark. Off-street, private parking estimates were taken from the Transportation Authority's Parking Supply and Utilization Study.

Network Data: Pedestrian network-based walking distances were taken from SF-CHAMP 2012 Base Year model run.

Non-Residential Parking Supply Rate (Parking Spaces per kSF)

Non-Residential Parking Supply Estimated from SF Park Data

This map shows TAZ-level estimates of parking supply rates for San Francisco, based off-street parking supply from SFPark and scaled up by 3% to match citywide totals to match the estimated supply from the PSUS parking estimation model

Trip Distribution

The trip distribution in Table IV.A-10 shows the trip distribution patterns assumed for the proposed project and would include origins or destinations within San Francisco, the East Bay, North Bay, South Bay, and beyond. San Francisco trips are separated into four "Superdistrict" areas of San Francisco as shown in Appendix M in the TIS as 1, 2, 3, and 4. Each Superdistrict corresponds to a quadrant of San Francisco. The project site is located in Superdistrict 3, but the proposed project would include trips to other Superdistricts as described further below.

Table IV.A-10 – Trip Distribution Patterns

Origin/ Destination	Retail (Work)	Retail (Non-Work)	Residential	Aggregate PM peak hour
Superdistrict 1	8%	6%	60%	27%
Superdistrict 2	11%	9%	5%	8%
Superdistrict 3	24%	61%	10%	40%
Superdistrict 4	8%	5%	5%	5%
East Bay	16%	6%	6%	6%
North Bay	6%	2%	2%	2%
South Bay	28%	11%	12%	12%
Total	100%	100%	100%	100%

Source: DKS Associates, 2014; SF Guidelines, 2002.

As shown in **Table IV.A-10**, a majority of the non-work, retail trips would travel within San Francisco with the largest percentage of those, 61 percent, traveling within Superdistrict 3, where the project is located. Outside San Francisco, most retail trips would travel to or from the South Bay area. The distribution of residential work and non-work trips correspond to the general distribution of employment in San Francisco, with 60 percent of trips destined to greater downtown San Francisco (SD-1) and the remaining 40 percent split between outlying San Francisco neighborhoods and surrounding areas.

These trip distribution patterns have been applied to the vehicle trip generation for the existing and proposed uses on the project site. This process produces a weighted or aggregate trip distribution pattern based on the total PM peak hour vehicle trips each land use would generate and are shown in **Table IV.A-10**.

Freight and Service Loading Demand

The longest truck expected to be accessing the project site would be 45 feet. Based on the service vehicle type distribution, loading demand for approximately 76 percent of the time would be in the form of shorter vehicles (cars, pickups, vans, and small delivery trucks), whose length would be 20 feet or less.

As shown in **Table IV.A-11**, it is estimated that less than one daily truck trip would be generated for the proposed general retail use, about 26 trips for the proposed restaurant use, 20 trips for the community market use, and 14 daily truck trips would be generated for the residential use, for a total of 59 daily truck trips. It is estimated that the proposed project's loading demand would be approximately three loading trips during an average hour and approximately four loading trips during the peak hour.

Re: Draft EIR for 3333 California Street, San Francisco, CA 94118
Planning Department Case No: 2015-014028ENV
State Clearinghouse No: 2017092053

In these comments, the term "project" shall include the proposed project and the proposed project variant, unless otherwise indicated.

1. The DEIR Fails to Adopt Feasible Mitigation Measures for the Significant Impact From Construction Noise.

The Draft EIR (DEIR) admits that construction of the proposed project or project variant would expose people to or generate noise levels in excess of applicable standards or cause a substantial temporary or periodic increase in ambient noise levels. DEIR p. 4.D.36. Despite this significant impact, the DEIR fails to adopt feasible mitigation measures required by the California Environmental Quality Act (CEQA). The DEIR is inadequate because it proposes only that the project sponsor prepare a noise control plan at a later time that would be approved by the Planning Department, and the DEIR does not specify the required contents of the plan and does not adopt a specific performance standard for mitigation of the significant noise impact.

The following mitigation measures are feasible and must be adopted to substantially reduce the significant impact from construction noise:

MITIGATION MEASURE - NOISE-1: COMPLIANCE WITH SAN FRANCISCO NOISE ORDINANCE

1. As a condition of approval of the project, contractors or representatives of the project sponsor shall comply with the provisions of Article 29 of the San Francisco Police Code as to Regulation of Noise, except as indicated herein.

MITIGATION MEASURE - NOISE-2: SPECIFIC NOISE CONTROL MEASURES

1
(NO-4)

San Francisco Planning Department

January 8, 2019

Page 2

2. As a condition of approval of the project, the noise control plan for the proposed project shall include all of the construction noise control measures described in Mitigation Measure M-NO-1: Construction Control Measures set forth at DEIR pp. 4.D.42-51. Notwithstanding the foregoing, the monitoring noise stations shall be required to provide continuous noise monitoring at the nearest potentially impacted receptors whenever construction activities are being conducted and not merely from 7 am to 3 pm on Saturdays.

Also notwithstanding the foregoing, night noise permits shall not be sought except in an emergency and at the time that any night noise permits are requested, the Construction Manager shall also provide written copies of the application for a night noise permit and all accompanying writings to the Laurel Heights Improvement Association by email to KRDevincenzi@gmail.com and frfbeagle@gmail.com or such other email address as LHIA may provide for notice.

MITIGATION MEASURE - NOISE-3: PROHIBITION ON NIGHT CONSTRUCTION WORK EXCEPT IN EMERGENCY

3. At the 3333 California Street site, construction work shall not be performed at night during the hours of 8:00 pm of any day and 7:00 am of the following day except in an emergency.

MITIGATION MEASURE - NOISE-4: PROCEDURES FOR NOTICE TO RESIDENT ASSOCIATION OF APPLICATION FOR A PERMIT TO PERFORM CONSTRUCTION WORK AT NIGHT

4. A complete copy of any application for a special permit to perform construction work at night pursuant to section 2908 of the San Francisco Police Code or any other law or regulation must be provided by contractors or representatives of the project sponsor to the Laurel Heights Improvement Association (LHIA) at the same time as it is submitted to the Department of Public Works (DPW) or the Department of Building Inspection (DBI) or any other government agency, and DPW, DBI and any other government agency shall consider comments and/or objections made by LHIA as to any such application. Representatives of the project sponsor shall provide complete copies of any such application to LHIA by email to KRDevincenzi@gmail.com and to frfbeagle@gmail.com or to such other email addresses as LHIA may provide for notice.

MITIGATION MEASURE - NOISE-5: PROVISIONS FOR NOISE MEASUREMENTS

1
(NO-4)
cont'd

5. As a condition of approval of the project, the Department of Public Health Noise Prevention and Control Officer shall arrange for a qualified noise measurement professional(s) to be on call to travel to 3333 California Street and take noise measurements upon complaint about the level of noise by any resident of the area. The qualified noise professional shall arrive at the 3333 California Street site and commence the noise measurements within 15 minutes of receipt by the City of any complaint about the level of noise emanating from the project. The cost of such noise measurement and all related work and travel shall be assessed against the project sponsor as a condition of approval of this project. Receipt of a noise complaint by the City shall include without limitation initial receipt of a noise complaint by DBI, DPW, the Department of Public Health, the Police Department, 311, or any other government agency to which a noise complaint may be made. Copies of all writings regarding noise measurements made by such qualified noise measurement professional(s) and remedial action required or recommended shall be provided immediately to the Laurel Heights Improvement Association at the email addresses described above.

In the event the qualified noise measurement professional retained by the Department of Public Health fails to arrive at the 3333 California Street site and take noise measurements in accordance with this provision, the project sponsor shall deposit the sum of \$20,000.00 (twenty thousand dollars) with the Laurel Heights Improvement Association, and that Association shall be entitled to use these funds to retain a qualified noise professional to perform all the measurements and activities described in this provision. As said sums are drawn down to \$2,000, the project sponsor shall deposit additional \$10,000 payments with said Association for ongoing noise measurements and mitigation in accordance with this provision. The project sponsor hereby grants permission for any qualified noise professional described in this provision to enter onto the 3333 California Street site and take noise measurements and monitor noise conditions and mitigation measures.

MITIGATION MEASURE - NOISE-6: PROHIBITION ON VARIANCES TO NOISE REGULATIONS

6. In relation to construction or operational noise that occurs at 3333 California Street, the Directors of Public Health, Public Works, Building Inspection, or the Entertainment Commission, or the Chief of Police or any other government representative, may **not** grant variances to noise regulations, over which they have jurisdiction pursuant to Section 2916 of the SF Police Code. The variance procedure provided by section 2910 of the SF Police Code shall not apply to construction or operational noise that occurs at 3333 California Street.

MITIGATION MEASURE - NOISE-7: STORAGE AND IGNITION OF

CONSTRUCTION EQUIPMENT IN UNDERGROUND GARAGE

7. To the greatest extent feasible, project sponsor shall store all construction equipment in the existing underground garage located on the project site at all times when such equipment is not in use, and all construction workers shall start up, turn on or perform ignition of all construction equipment in that underground garage.

MITIGATION MEASURE - NOISE-8: PROOF OF USE OF MUFFLERS AND SOUND ATTENUATING DEVICES

8. Project sponsor shall provide to the Laurel Heights Improvement Association (LHIA) written evidence that impact tools and equipment shall have intake and exhaust mufflers recommended by the manufacturers thereof and approved by the Director of Public Works or the Director of Building Inspection as best accomplishing maximum noise attenuation, and written evidence that pavement breakers and jackhammers shall also be equipped with acoustically attenuating shields or shrouds recommended by the manufacturers thereof and approved by the Director or Public Works or the Director of Building Inspection as best accomplishing maximum noise attenuation, as described in section 2907 of the SF Police Code. Project sponsor shall provide such written evidence to LHIA by email to the addresses described above for each impact tool or equipment to be used at the 3333 California site at least 48 hours prior to use of any such impact tool(s) and equipment on the site.

MITIGATION MEASURE - NOISE-9: NOTICE TO RESIDENTS' ASSOCIATION OF NOISE COMPLAINTS AND REPORTS

9. The Construction Manager or other designated person will provide copies of the noise monitoring log on a weekly basis to the Laurel Heights Improvement Association at the email addresses herein. The log shall include any complaints received, whether in connection with an exceedance or not, as well as any complaints received through calls to 311, DBI, or any other government agency if the contractor is made aware of them (for example, via a DBI notice, inspection, or investigation). The Construction Manager or other designated person shall also contemporaneously submit to the Laurel Heights Improvement Association copies of all reports submitted to the Planning Department Development Performance Coordinator.

2. **The DEIR Is Inadequate Because It Fails to Analyze and Mitigate the Proposed Project's Significant Adverse Impact on a Scenic Vista, Substantial Damage to Scenic Resources and Substantial Degradation of the Existing Visual Character or Quality of the Site and Its Surroundings.**

cont'd

2
(CEQA-3)

San Francisco Planning Department
January 8, 2019
Page 5

2
(CEQA-3)
cont'd

Page V.C-11 of the Final EIR for the 2004 and 2009 Housing Element states that a project would have a significant effect on the environment is it would:

1. Have a substantial adverse effect on a scenic vista;
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcropping, and other features of the built or natural environment which contribute to a scenic public setting;
3. Substantially degrade the existing visual character or quality of the site and its surroundings, or
4. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area or which would substantially impact other people or properties.

Since the project site was determined eligible for the National Register of Historic Places and has been listed in the California Register of Historical Resources, its aesthetic qualities are protected by CEQA and are not exempt from CEQA review. Both the existing office building and its integrated landscaping are historically significant resources. (Ex. A, final version of nomination that was approved by State Historical Resources Commission)

A. The Proposed Project Would Have a Substantial Impact on Scenic Vistas.

The project site is atop Laurel Hill and commands valued scenic vistas of the downtown and eastern portion of the City and also of the Golden Gate Bridge and other neighborhoods of the City to the northwest. During my years living in the neighborhood, I have seen innumerable members of the public enjoy these views during daytime as well as during nighttime. I have seen jubilant crowds of people view lunar eclipses from the sidewalks atop Laurel Hill at the corner of Laurel Street and Euclid Avenue and from the landscaped green spaces surrounding the main office building. Some photographs I have taken which show the existing condition of some of these views are attached hereto. (Ex. B , photographs taken on October 24, 2017 and January 7, 2019) These photographs show that the portions of the Bank of America Building, Transamerica Pyramid, Salesforce Building and Golden Gate Bridge can be seen from the high ground at Laurel Street and Euclid Avenue, from the landscaped green spaces surrounding the main office building and from public sidewalks along Laurel Street and Euclid Avenue. Also, the historically significant architecture of the main building can be seen across the landscaping on the perimeter of the site, and the site was designed so that the building and landscaping would function as an integrated composition.

The public has used the green landscaped areas surrounding the main building as

3
(CR-1)
4
√(PD-5)

San Francisco Planning Department
January 8, 2019
Page 6

recreational space for many years, and the public has acquired a permanent right of recreational use in these areas. (Ex. D, letter of attorney Fitzgerald)

4 (PD-5)
cont'd

The proposed project would construct new buildings on the south site of the site near Euclid Avenue and Masonic Avenue and on the western portion of the site near Laurel Street that would obstruct these public scenic vistas and obstruct the public view of the historically significant main building as viewed from the surrounding landscaping. Also, the proposed new buildings constructed on the landscaped areas surrounding the site would block public access to such vistas. In addition, the project proposes to add new trees/shrubs near the perimeter of the south side of the site and also street trees at this location that would also impair and/or obstruct these scenic vistas. (Ex. E, developer's renderings)

5
(CEQA-2)

The Final EIR for the 2004 and 209 Housing Element acknowledges that new residential housing could result in an impact related to scenic vistas if it would be developed in a manner that obstructs views from a scenic vista from a public area or introduces a visual element that would dominate or upset the quality of a view. (Ex. F. p. V.C-11) Figure V.C-1 shows street views of an important building in the area of the 3333 California site. Does this Figure describe a streetview of the main building at 3333 California Street as an important building?

The Community Preservation Alternative/Variant would avoid this significant impact on public vistas because it would retain the existing landscaped areas largely in their present form and existing public vistas from sidewalks and open space used by the public. Also, DEIR Alternatives B and C would retain the existing landscaped areas largely in their present form and avoid this significant impact on public vistas. DEIR 6.35 and 6.67.

6
(AL-2)

Under CEQA, the City may not approve the Proposed Project/Variant, because a feasible alternative is available that would avoid or substantially reduce the project's significant impact upon scenic resources.

7
(AL-3)

Mitigation Measure: Approve an alternative that would preserve the existing landscaped areas surrounding the main building on the southern and western portions of the site in their present form and do not locate any new construction on these areas.

B. The Proposed Project Would Substantially Damage Scenic Resources, Including but not Limited to Trees, Slopes of Laurel Hill and other Features of the Built or Natural Environment Which Contribute to a Scenic Public Setting.

8
(CEQA-3)

The Final EIR for the 2004 and 2009 Housing Element acknowledges that: "New construction could result in impacts related to damaging scenic resources if new housing would directly affect environmental features, such as topographic features, landscaping, or a built

↓

landmark that contributes to a scenic public setting,” and that “2009 Housing Element Policy 11.6 preserves landmark buildings, some of which could be considered a scenic resource of the built environment.” Ex. F, p. V.C-24-25. [As previously stated in my comments of June 8, 2018 on the Initial Study for 3333 California Street, which are incorporated by reference herein, the proposed project would excavate and remove substantial portions of the topography and existing slope of Laurel Hill (a scenic high point known for its scenic vistas), [the historically significant landscaping and the historically significant built environment that contributes to a scenic public setting. The proposed project would remove 185 onsite trees, including 19 onsite Significant Trees (i.e. trees within 10 feet of the public right-of-way that meet specific height, trunk, diameter, and canopy width requirements) and 15 protected street trees along California Street. (Initial Study p. 69.) The project would remove significant portions of the landscaping surrounding the main building and all of the Terrace designed by the renowned landscape architecture firm of Eckbo, Royston and Williams. Also, new buildings constructed on presently landscaped areas would obstruct public views of the historically significant main building that contributes to the scenic setting as a significant example of modern architecture in the International Style.

The Mitigation Measure above would avoid or substantially reduce this significant impact on the environment.

C. The Proposed Project Would Substantially Degrade the Existing Visual Character or Quality of the Site and Its Surroundings.

The Final EIR for the 2004 and 2009 Housing Element acknowledges that new construction could result in impacts related to visual character if new housing would be developed with greater densities or heights than surrounding land uses or introduce incompatible uses in such a way as to substantially degrade the character or quality of the site. (Ex., p. 25.)

The proposed density of the project would be over twice the predominant density of the surrounding residential areas (which are predominantly RH-2 areas) and would add two-three stories to the main building to increase its height to 80 and 92 feet, which would be over twice the scale of the existing neighborhood, which has a predominant 40-foot height limit. The proposed project would fail to comply with 2009 Housing Element Policy 1.1, that requires housing projects to respect existing neighborhood character. (See, for example, Ex. G, photographs of residences along western side of Laurel Street). For the reasons stated above, the proposed project would develop the site with densities and heights that are substantially greater than the densities and heights of the surrounding land uses and would construct new buildings where historically significant landscaping integrated with the main building now exists, thereby substantially degrading the connection between the building and the existing landscaping. The Mitigation Measure set forth above would avoid this significant impact on the environment.

(GEO-1)

10

(CR-1)

11

(CEQA-3)

D. The Proposed Project Could Create a New Source of Glare or Substantial Light Which Could Adversely Affect Day or Nighttime Views in the Area or Which Could Substantially Impact Other People or Properties.

11
 (CEQA-3)
 cont'd

The Final EIR for the 2004 and 2009 Housing Element acknowledges that new housing could result in impacts related to glare and light if new housing would introduce new sources of glare or light that are unusual for an urban area, and that new housing could introduce new sources of glare and glare if reflective glass or if bright, decorative or security lighting is used. Renderings of the project show a predominant glass-design, and security lighting would be needed along the proposed pathways and other areas on site. Since the exact type of materials and lighting is not known, the project has the potential to produce significant impacts on light and glare, which the DEIR failed to address. The following mitigation measures would reduce the potential impacts if incorporated as conditions of approval of the proposed project.

MITIGATION MEASURE. The project must comply with City Resolution 9212 (or any successor or similar regulation adopted to reduce glare), which prohibits the use of highly reflective or mirrored glass in new construction.

MITIGATION MEASURE. The project will not use bright, decorative or security lighting.

3. The EIR's Statement of Project Objectives Is Unreasonably Narrow, and the DEIR is Inadequate Because It Lacks a Reasonable and Accurate Statement of Project Objectives.

12
 (PD-6)

The DEIR's statement of "Objectives" of the proposed project is unreasonably narrow, and biased toward the developer's proposed project concept, and inaccurately characterizes the proposed project/variant and its potential impacts on the environment. As a result, the DEIR fails to provide a reasonable or accurate statement of project objectives under CEQA standards.

The DEIR's allegation that the developer's proposal would redevelop an underutilized commercial site into a new mixed-use community is inaccurate. The 446,490 square-foot site is currently mixed-use commercial and retail (café) and is completely utilized for a 362,000 square foot commercial main structure which contains an 1,183 assignable square foot café and an 11,500 gsf childcare center (455,000 gsf office building minus 93,000 gsf of largely below grade parking garage), a 14,000 gsf service building, historically significant landscaping throughout the site and approximately 93,000 square feet of largely below grade parking. (DEIR p. 2.1; Ex. H, café permit; Ex. I, census data describing project site as "MIXED" land use with existing retail use) Under Resolution 4109/Stipulation as to Character of Improvements, the aggregate gross floor area is limited to the total area of the property (approximately 435,600 square feet, according to Dean Macris). (Ex. J, Dean Macris MEMO dated June 25, 1986.) According to the

13
 (PD-3)
 14
 (PP-1)

San Francisco Planning Department
January 8, 2019
Page 9

DEIR, the aggregate gross floor area of the existing buildings totals approximately 376,000 square feet, which is 84.2 percent of the size of the project site, so at present only 15.8 % of the site may be covered by additional buildings. In addition, since the site zoning changed to R-4 in 1960 and then to RM-1 in 1978, while the prior stipulations of Resolution 4109 continue to apply, the property became a nonconforming use under the Planning Code, so the “total floor area in commercial use may not be expanded.” (Ex. J, Macris MEMO and Ex. K, Passmore February 22, 1981 letter to John Cloudsley, Jr.) Under the current RM-1 zoning, office uses are generally not permitted, and retail uses are generally not permitted. (Ex. L, March 5, 2015 Letter of Determination; see also San Francisco Planning Code section 209.2 and Table 209.2, Zoning Control Table for RM Districts)

14
(PP-1)
cont'd

The DEIR is also inaccurate, because it does not acknowledge that the site is now highly walkable, with pathways throughout that lead out to Walnut, Mayfair, Laurel and Euclid/Masonic Streets. The EIR fails to acknowledge that there is currently a pathway that leads from the front of the existing office building, through the building to the Eckbo Terrace and out onto Masonic/Euclid streets.

15
(PD-4)

The City’s Preliminary Project Assessment specified that the proposed Walnut “walk” would not be an extension of a City street but would be an internal pathway. (See June 8, 2018 comments by Kathryn Devincenzi on Initial Study for 3333 California Street, Ex. M. p. 15, stating as to measurement of height “curb along the Walnut street extension may not be used as the base of measurement because the Walnut street extension is not a public right-of-way.”) The same analysis applies equally to the proposed Mayfair “extension.” Thus, the DEIR inaccurately described the project’s objectives as extending the “surrounding street grid into the site through a series of pedestrian and bicycle pathways and open spaces.”

Also, since the plans do not specify the size of the proposed new retail uses, it cannot be determined whether the type of retail provided would be of a size that is neighborhood-serving, and some portions of the proposed retail space are very large and could accommodate on-local retail uses. (See August 17, 2017 plan sheet A4.03, and compare with sheet A4.02). Also, by its nature, the proposed 54,000 square feet of retail uses are of a size that would attract customers from areas that are not in the neighborhood. Moreover, the proposed 9,826 square feet of composite food and beverage retail uses (DEIR p. 4.C.54) would attract substantial numbers of persons from outside the neighborhood and are one step up from fast food.

16
(PD-6)

The project’s objective to create complementary designs is inaccurate, because the design and architectural character of the proposed project/variant buildings would not be compatible with the scale or character of any of the neighborhoods surrounding the project site. Another objective acknowledges the incompatibility, acknowledging the “diverse surrounding context.” Also the Preliminary Project Assessment stated that the architectural design should be made high quality, but the plans have not been revised to do so.

↓

San Francisco Planning Department
January 8, 2019
Page 10

The description of the objective of creating a green, welcoming space that will encourage the use of the outdoors and community interaction is not applicable to the proposed project, which would create a concrete jungle with mostly strip planted beds constructed over underground concrete garage structures, in the place of natural, verdant expanses of lawns, shrubs, plants and trees planted into the ground. Also, the paved pathways proposed in the project fails to comply with the requirements of Planning Code section 135, which requires that “[u]sable open space shall be composed of an outdoor area or areas designed for outdoor living, recreation or landscaping.” Proposed concrete pathways are inaccurately designated as open space on August 19, 2017 plan sheet L0.01.

16
(PD-6
(cont'd)

The fact the proposed project/variant inaccurately characterized proposed paved pathways as open space is acknowledged by the objective to incorporate open space that would maximize pedestrian accessibility.

Also, the DEIR fails to acknowledge that the objective to integrate the existing office building into the development is inaccurate since the proposed project proposes to divide it in two and demolish its executive wing.

In addition, the DEIR and project plans do not specify the type and amount of affordable housing that might be constructed on site, and the San Francisco Planning Code allows a development agreement to increase or decrease the amount of affordable housing otherwise required by the Planning Code. Thus, the DEIR contains no evidence that the proposed project/variant would achieve the objective of providing on-site affordable units consistent with ABAG’s Regional Housing Needs Allocation for the City of San Francisco. The DEIR fails to specify how the proposed project/variant would achieve such ABAG allocation or evaluate the manner in which the proposed project/variant and alternatives would actually meet such ABAG allocation for all income levels.

In addition, the DEIR fails to identify the following conflicts between the developer’s proposed project/variant and the requirements of Resolution 4109/Stipulation as to Character of Improvements. Those requirements provide that: (a) no residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended, (b) no dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than 3300 square feet, nor shall any such dwelling cover more than fifty percent of the area of such parcel or be less than twelve feet from any other such dwelling, or be set back less than 10 feet from any presently existing or future public street, or have a height in excess of forty (40) feet, and (c) no residential building in other portions of the subject property shall have ground coverage in excess of 50% of the area allotted to such dwelling. The developer’s proposed Euclid Building and proposed Laurel duplexes violate these provisions, and the

17
(PP-1)

San Francisco Planning Department
January 8, 2019
Page 11

developer's proposed buildings on other portions of the site violate provision (c) because they have ground coverage in excess of 50% of the area allotted to such dwelling. Do you dispute that the developer's proposed project/variant would violate each of these provisions in the manner set forth above? The DEIR is inaccurate as to the proposed project's conflict with applicable laws

17
(PP-1)
cont'd

In addition, under Resolution 4109/Stipulation as to Character of Improvements, development of the property was required to include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building, a site plan was required to be submitted to the City Planning Commission showing the character and location of the proposed building or buildings and related parking spaces and landscaped areas upon the property, or upon each separate portion thereof as is allotted to such building or buildings. Such site plan was to be submitted to the City Planning Commission for approval as to conformity with these stipulations. The DEIR fails to discuss or provide for analysis the site plan that was approved by the City Planning Commission pursuant to this provision, and the EIR must be revised to provide this information.

It is also important to note that under Planning Code section 174, Stipulations as to Character of Improvements become portions of the Planning Code, so only the Board of Supervisors can modify the Stipulations as to Character of Improvements that are recorded against this site. Section 174 provides that:

“ Every condition, stipulation, special restriction and other limitation imposed by administrative actions pursuant to this Code, whether such actions are discretionary or ministerial, shall be complied with in the development and use of land and structures. All such conditions, stipulations, special restrictions and other limitations shall become requirements of this Code, and failure to comply with any such condition, stipulation, special restriction or other limitation shall constitute a violation of the provisions of this Code. Such conditions, stipulations, special restrictions and other limitations shall include but not be limited to the following:

(a) Conditions prescribed by the Zoning Administrator and the City Planning Commission, and by the Board of Permit Appeals and the Board of Supervisors on appeal, in actions on permits, licenses, conditional uses and variances, and in other actions pursuant to their authority under this Code;

(b) Stipulations upon which any reclassification of property prior to May 2, 1960, was made contingent by action of the City Planning Commission, where the property was developed as stipulated and the stipulations as to the character of improvements are more restrictive than the requirements of this Code that are otherwise applicable. Any such stipulations shall remain in full force and effect under this Code. (Planning Code section 174)

The DEIR inaccurately claims that a project objective would be to incorporate open space

San Francisco Planning Department
January 8, 2019
Page 12

in an amount equal to or greater than that required under the current zoning. DEIR 6.3. However the DEIR fails to acknowledge that this objective conflicts with the current zoning restrictions stated in Resolution 4109/Stipulation as to Character of Improvements require 100-foot landscaped set backs along the property's boundary with Euclid Avenue and along Laurel Street up to its intersection with Mayfair Drive. The EIR must be revised to state the amount of open space required under the current zoning applicable to the site (including Resolution 4109) and recirculated for public comment.

In addition, the Resolution 4109/Stipulation as to Character of Improvements requires one parking space for each 500 square feet of gross floor area in the commercial buildings on the site. The developer's proposed project/variant fail to comply with these provisions, and the DEIR fails to discuss this conflict.

4. The DEIR Inaccurately States the Characteristics and Impacts of Alternatives to the Proposed Project/Variant and Fails to Analyze Adequately a Reasonable Range of Alternatives.

The DEIR inaccurately compares alleged characteristics and impacts of the alternatives with those of the proposed project or project variant and inaccurately evaluates the comparative merits of the alternatives and the ability of each alternative to meet most of the basic project objectives. Due to these inaccuracies and the DEIR's failure to analyze a reasonable range of alternatives, the DEIR fails to foster informed decision making and public participation.

Contrary to the impression created in the DEIR, there was no *public* scoping process that considered various site plans, building retention programs, building heights, views of the character-defining features, land use programs, or feedback from the Architectural Review Committee of the San Francisco Historic Preservation Commission prior to publication of the DEIR. DEIR 6.9. The Planning Department failed to inform the public or the Laurel Heights Improvement Association, which nominated the site for listing on the National Register, of the Architectural Review Committee hearing that considered a range of alternatives on March 21, 2018. The Planning Department went out of its way to exclude the public and LHIA from the formulation of alternatives that would be evaluated in the DEIR.

After the DEIR was published, LHIA and members of the public advocated for a Community Preservation Alternative at a December 5, 2018 hearing of the San Francisco Historic Preservation Commission. The San Francisco Historic Preservation Commission's December 11, 2018 letter to the San Francisco Planning Department expressed interest in seeing the Community Preservation Alternative. (See Ex. 2 to LHIA's transmittal of Treanor SOIS evaluation) Also, the terms of the approved nomination of the site control the nature of the character-defining features of the resource, but the DEIR inaccurately characterizes them as expert opinion.

17
(PP-1)
cont'd

18
(AL-1)

San Francisco Planning Department
January 8, 2019
Page 13

The DEIR acknowledges that “alternatives with excavation and building construction programs scaled down from that of the proposed project or project variant and taking a shorter period of time to build would result in fewer overall occurrences of adverse construction noise impacts. Although a reduced development alternative would limit the ability to fully achieve some of the basic project objectives, it could reduce the duration of construction noise as well as the overall amount of development, and associated residential, employment, and parking rate increases that generate significant transportation impacts.” DEIR 6.9. However, the DEIR omits a reasonable explanation of the manner in which a reduced development alternative would limit the ability to fully achieve some of the basic project objectives, and in this respect presents an unsupported conclusion that is inadequate. A reduced development alternative could still achieve basic project objectives by providing a lesser amount of development on the site.

18
(AL-1)
cont'd

The DEIR claims that its analysis of alternatives is “qualitative relative to the identified impacts of the proposed project or project variant” but such a facile characterization does not justify the ambiguities and unsupported conclusions that are contained in the inadequate alternatives analysis. DEIR p. 6.10.

The DEIR claims that alterations that are not entirely in conformance with *The Secretary of Interior’s Standards for the Treatment of Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings* (Secretary’s Standards) may, or may not result in a significant impact under the “material impairment” significance standard of CEQA Guidelines Section 15064.5(b)(1). DEIR p.

19
(AL-3)

However, Rehabilitation Standard 6 states that “deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and where possible, materials. DEIR p. 6.11. The DEIR states that if there are character-defining features identified in the preservation alternatives that would be retained, they would be repaired or replaced in conformance with Standard 6. *Ibid.* However, this claim is inaccurate because Alternative C would not replace the glass curtain walls with new windows that match the old in design, color, texture and materials.

Alternative F: “Code Conforming” Alternative

20
(AL-1)

The DEIR inaccurately claims that its Code Conforming Alternative addresses neighborhood requests for an “all-residential” alternative. The neighborhood actually requested an alternative that would comply with the Existing Zoning ,which includes Resolution 4109, which bans retail on the site. However the Planning Department contorted this request into an alternative that does not reflect the zoning approvals that exist for the site. Instead, the Planning Department conceived of a non-existing zoning alternative that proposes uses that the applicant could apply for but have not been granted. ;Since application for conditional uses and other

San Francisco Planning Department
January 8, 2019
Page 14

permissions has not yet been considered by the Planning Commission or Board of Supervisors, it cannot be determined whether the Planning Commission or Board of Supervisors would grant the exceptions or approvals requested in the Code Conforming Alternative.

20
(AL-1)
cont'd

The City unreasonably configured the so-called Code Conforming Alternative to avoid analyzing the alternative of constructing all new residential buildings in accordance with the RM-1 zoning that applies to the site along with Resolution 4109. For example, the DEIR acknowledges that under Planning Code section 304(d)(5), planned unit developments within residential districts may include commercial uses only to the extent that such uses are necessary to serve residents of the immediate vicinity, subject to limitations for neighborhood commercial cluster (NC-21) districts. DEIR p. 6.10. The DEIR inaccurately claims that the Code Conforming Alternative includes limited ground-floor commercial uses because of the existence of this section, but the Planning Commission has not considered whether commercial uses are necessary to serve residents of the immediate vicinity, and a plan sheet shows a large proposed retail space that could be used for non-local retail. The project site is now amply served by retail uses, as it is immediately adjacent to the two-block Laurel Village Shopping Center (which contains two independent grocery stores and a wide range of commercial stores), one block from the Sacramento Street commercial corridor which contains many restaurants, one block from a Trader Joe's grocery store, and approximately one-two blocks from the City Center which includes a Target Store and other stores, and one-two blocks from the Geary Boulevard commercial corridor, and is within walking distance of the Clement Street commercial corridor. Thus, there is a reasonable possibility that, upon consideration of the facts, the Planning Commission would find that commercial uses on the project site are not necessary to serve residents of the immediate vicinity. Importantly, the DEIR lacks any land use or zoning studies discussing the types of commercial uses in the nearby established commercial centers that would support the DEIR's conclusion that any new commercial use is necessary to serve residents of the immediate vicinity.

Alternative A: No Project Alternative

The DEIR is inaccurate in claiming that Alternative A: No Project Alternative would not achieve any of the project objectives. The site currently includes office uses, a childcare center and a café (which is considered a type of retail use) Census data states that the site is mixed use. (Ex. I) Thus, Alternative A would meet the objective of having a mixed use development, although not to the same degree as the proposed project/variant.

Alternative B: Full Preservation - Office Alternative

Alternative B: Full Preservation - Office is unreasonably configured in the DEIR to include only 167 residential units and to construct a one-level vertical addition on the roof to expand the usable space for office uses. Given the City's housing needs, a reasonable alternative

San Francisco Planning Department
January 8, 2019
Page 15

would be configured to reuse the existing office building to provide residential uses. Also, in Alternative B, the Plaza B and Walnut buildings are set back to retain brick perimeter wall along California Street, which could be changed to provide more space for residential uses. DEIR pp. 6.28. Alternative B is also unreasonably configured to eliminate the existing childcare center and fails to mention the existing café in the main building. Also, the Annex could be re-purposed and expanded vertically to accommodate residential use, instead of being kept in its existing state in Alternative B.

THE DEIR inaccurately states that pedestrians would not be able to walk through the site to Presidio, Masonic, or Euclid Avenues under Alternative B. In fact, there is an existing passageway through the main office building that leads to the Eckbo Terrace and exits onto Euclid/Masonic. If reasonably configured, Alternative B could include signage would explain that pedestrians would be allowed to use this north/south throughway. In addition, pedestrians can now walk through the site and exit through the Mayfair or Laurel gate and walk from those points to Euclid Avenue.

Alternative B would excavate for a two-level California Street parking garage DEIR p. 6.29, 49. With a construction program limited to the northern portion of the site, and a shorter, single-phase construction schedule, the number of temporary construction-related noise events that could affect off-site sensitive receptor locations would be reduced from those under the proposed project or project variant. However, construction activities would be similar, e.g., the use of excavators with hoe rams to fracture and remove bedrock as part of the excavation for the California Street garage. Therefore, the potential to generate substantial temporary and periodic noise increases of at least 10 dBA or greater increase over ambient noise levels at off-site locations would remain. The DEIR admitted that under Alternative B, off-site sensitive receptors along the west side of Laurel Street would be exposed to similar, but slightly lower, noise levels due to less construction along Laurel Street and the south side of the project site, and that off-site sensitive receptors along the east side of Presidio Avenue and along the south side of Euclid Avenue would not be as directly exposed to the temporary, construction-related noise increases because of the greater distance from, and the more limited nature of, the construction activities. The DEIR concluded that as a result of the proximity of construction activities to off-site sensitive receptors along California and Laurel Streets, the nature of the construction activities and the potential for encountering bedrock, construction noise impacts under Alternative B (although more limited in terms of the number of noise events) would be significant and would require implementation of Mitigation Measure M-NO-1. DEIR p. 6.49.

Alternative C: Full Preservation - Residential Alternative

Alternative C demolishes the Annex building and concludes that the character-defining features of the existing building are “mostly retained.” DEIR p. 6.65. Site and landscape features contributing to the corporate campus setting are mostly retained. Most prominent views of the

20
(AL-1)
cont'd

21
(AL-3)

San Francisco Planning Department
January 8, 2019
Page 16

project site are retained with minimal change. *Ibid.*

The DEIR unreasonably configured Alternative C: Full Preservation - Residential Alternative to have 534 residential units and 44,306 square feet of ground-floor retail space. Alternative C would have 24 less residential units than the proposed project, but if reasonably configured would construct 24 residential units in some of the ground-floor space proposed for retail uses.

Alternative C is also unreasonably configured to have a new exit-only driveway onto Masonic Avenue near the intersection with Pine Street for the California Street Garage and the retained parking garage under the adaptively reused building (residential, retail, commercial, daycare, and car-share parking spaces). This exit near the intersection of Masonic with Pine Street would create a potential traffic hazard on a Major Arterial that serves substantial traffic in the P.M. peak hour. This Alternative unreasonably bars automobiles from exiting on Presidio Avenue, which is one of the principal means of egress from the existing underground garage, while Alternative C has three exits onto Laurel Street. DEIR p. 6.71. A reasonable configuration of Alternative C would allow automobile ingress and egress from all existing points of entry that are retained.

The DEIR inaccurately claims that under Alternative C, pedestrians would not be able to travel through the site to, or access the site from, Masonic and Euclid avenues. DEIR p. 6.73. As previously stated herein, there is an existing north/south passageway through the main building that leads from the northern entrance of the building, through the building, opens onto the Eckbo Terrace and leads to Masonic and Euclid avenues, which can be marked with signage as open to the public.

The DEIR states that under Alternative C, solid waste would be collected at the off-street refuse staging area adjacent to the off-street freight loading dock in the California Street Garage and compacted for offsite transport. DEIR 6.74. The DEIR's meaning is unclear. Please clarify whether the proposed off-street refuse and staging area and the adjacent off-street freight loading dock would both be located inside the proposed garage.

As to construction duration, how much time would it take to construct the first phase of Alternative C described at DEIR p. 6.75 (consisting of demolition of the circular garage ramp structures and the northerly extension of the east wing of the existing office building and alterations to the existing office building)?

How much time would it take to construct the second phase of Alternative C described at DEIR p. 6.75 (consisting of demolition of the existing annex building and the surface parking lots on the north and west portions of the site, excavation and site preparation for construction of the California Street buildings and the Mayfair Building and associated garages)?

21
(AL-3)
cont'd

The DEIR p. 6.75 states that as with the proposed project or project variant excavation under Alternative C would extend to a depth of approximately 40 feet below ground surface and would encounter bedrock, and site disturbance would occur in an area of know soil and groundwater contaminants from historic uses. Under the proposed project, project variant and Alternative C, please describe which portions of the site would be excavated to a depth of approximately 40 feet below ground surface, which portions of the site would be occupied by underground levels, and state the number of levels of underground garage or other underground structure that would be constructed in each location. It appears from the DEIR that excavation to a depth of approximately 40 feet below ground surface that would encounter bedrock would occur in locations other than under the proposed Walnut building. Also, how long do you expect that it would take to remediate the know soil and groundwater contaminants from historic uses and explain what is known to date about the potential methods of remediation and provide all writings describing the potential methods and duration of remediation and measures that would be taken to protect the public from exposure.

In addition, what is the estimated cost of demolishing the northerly extension of the east wing of the existing office building, repairing and/or supporting the remaining structure in this location, and the estimated duration of that demolition? Also, what is the estimated cost of dividing the existing main building and its southern wing (including any reinforcement needed)? What is the estimated cost of strengthening the existing main building to be able to support additional stories? Note that this information is relevant to the feasibility of alternatives.

Alternative C is also unreasonably configured because it would have 210 fewer residential units than the project variant. A variant of Alternative C could have been developed that constructed residential units in some of the space that Alternative C proposes to use for retail uses.

Please explain why Alternative C would allegedly provide fewer activated neighborhood-friendly spaces along the adjacent streets than the proposed project or project variant. DEIR p. 6.75. Please explain how Alternative C would provide a high quality and varied architectural and landscape design, utilizing the site's topography and other unique characteristics. DEIR p. 6.75. The information provided in the DEIR does not explain this statement. Please explain how Alternative C would construct some open spaces such as the plazas and Mayfair Walk that would be usable to project residents and the public, but not as many as the proposed project or project variant. DEIR p. 6.75. Please explain how Alternative C would partially meet Objective C by providing code-required open space and how each component of such space could be used for recreational purposes.

The DEIR fails to acknowledge at p. 6.76 that Alternative C would retain the views of prominent character-defining features of the property. Alternative C would retain public vistas from the landscaped green spaces along Euclid Avenue and Laurel Street to the integrated

San Francisco Planning Department
January 8, 2019
Page 18

window-walled building and to the Downtown and other areas of the City, which are also prominent character-defining features of the property. So are views of large trees and other landscaping visible from the public ways.

Please explain exactly what the EIR means by replacing the existing glass curtain wall system with “compatible residential window wall system,” how the new system would be different, and whether the system would retain the geometric patterns which the existing window walls have. DEIR p. 6.76. The DEIR only states that the replacement windows would have “small panes divided by a mullion and muntins.”

Also, please explain the nature of the materials proposed for the vertical addition in Alternative C that would appear visually subordinate to the historic portion of the building. DEIR. pp. 6.77-78. Please explain the nature of the contemporary design that would distinguish the proposed rooftop addition from the original building.

The DEIR states at p. 6.77 that under Alternative C, the rooftop mechanical penthouse would be removed. Please explain the location at which such equipment would be relocated including whether it would be on the exterior of the building and the nature of the equipment. DEIR p. 6.78 states that the existing mechanical penthouse would be replaced, and if replacement on the rooftop is intended, please explain the proposed location of the replacement and the location, height and materials proposed to be used in any proposed screening.

The DEIR inaccurately neglects to mention that under Alternative C, the existing green spaces and lawns used by the public that run along Laurel Street and the landscaped beds along Laurel Street would be retained in addition to such areas along Euclid Avenue, although the drawing on DEIR p. 6.72 shows that these areas would be retained except for the area at which the new proposed Mayfair Building would be constructed.

At page 6.77, the DEIR states that under Alternative C, the proposed addition would increase the height of the existing building (by approximately 12 feet for a total height of approximately 67 feet), but at page 6.78, it describes the addition as a “**two-story, stepped vertical addition.**” (Emphasis added) Please clarify this discrepancy and confirm that under Alternative C, the proposed addition would be one-story and state the amount of additional height that it would have.

The DEIR inaccurately claims that the best examples of the integration of the character-defining features of the site occur on the southern and eastern portions of the site, whereas elsewhere, it identifies the concrete pergola and landscaped beds along Laurel Street as character-defining features. DEIR p. 6.80. The DEIR fails to acknowledge that the landscaping along Laurel Street is also integrated with the main building.

21
(AL-3)
cont'd

San Francisco Planning Department
January 8, 2019
Page 19

Alternative C is unreasonably configured because the DEIR lacks any explanation or justification for the conclusion that Alternative C would provide retail parking at a higher rate per square footage of retail space than the proposed project and project variant, respectively. DEIR p. 6.82. The proposed project would provide 54,117 square feet of retail uses, but Alternative C would provide only 44,306 gsf of retail space. Please explain why Alternative C could not provide retail parking at the same rate per square footage of retail as the proposed project and project variant, respectively.

Also, the DEIR inaccurately claims at page 6.85 that pedestrians would not be able to travel through the site to Masonic and Euclid Avenues because the southern half of the north-south Walnut Walk would not be developed. As previously explained, there is an existing pathway that runs through the office building and opens onto the Eckbo Terrace and runs therefrom to Masonic and Euclid avenues through a gate. Signage could identify this passageway as a public thoroughway. Also, pedestrians can travel through the Walnut gate and through the site and exit onto Mayfair or Laurel streets. The same comments apply to bicycle access under Alternative C.

DEIR p. 6.97 states that all new construction would be subject to the "Historical Building codes." Please explain exactly what codes are meant by this statement and please provide citations to all such applicable codes.

5. The DEIR is Inaccurate or Incomplete in Numerous Respects.

The DEIR states that centralized trash rooms "with combined chutes or bins for recyclable, compostable and trash would be located within each residential building on every floor. The combined chutes would terminate into separate recyclable, compostable, and trash bins using tri-waste sorters and would be held within trash collection rooms." DEIR p. 2.78. Please state the amount of noise expected to be generated by the tri-waste sorters, the times of day during which such noise would be generated; also, please state whether such noise was included in the DEIR's analysis of operational noise and describe the details of the analysis that took into account such noise. Please also describe in detail the amount of space that would be occupied by the proposed tri-waste sorters and the trash collection rooms in each proposed location in the proposed project.

The DEIR indicates that the Transportation Demand Program measures supplied for the proposed project/variant, subject to refinement during the planning review process for project entitlements, would include delivery supportive amenities. TDM Measure Delivery-1 states that an area for the receipt and temporary storage of package deliveries would be provided in the off-street loading areas or other locations on the project site. DEIR p. 2.79. Please describe in detail the potential other locations on the project site that could be provided for these delivery supportive amenities and how they would operate.

23
(TR-10)

San Francisco Planning Department
January 8, 2019
Page 20

The DEIR states that a proposed 4,000 square-foot open space called a corner plaza would be constructed near the intersection of Masonic and Euclid avenues and this open space would be activated by the proposed retail use in the adjacent Euclid Building, and the residential lobby and amenity spaces in the adjacent Masonic and Euclid buildings. DEIR p. 2.80. Please describe in detail the nature of the potential amenity spaces that could be placed in the adjacent Masonic and Euclid buildings.

THE DEIR claims that the proposed project would retain approximately 53 percent of the overall lot area (approximately 236,000 square feet, excluding green roofs) as open area with portions to be developed with a combination of common and private open space. DEIR p. 2.83. Please provide the calculation of this proposed open space, including without limitation the amount of open space that could be provided in each component of the open space and state whether each component of the open space would be paved or planted into soils that drain toward groundwater. In this calculation, please specify the location and square footage of such open space that would consist of paved pathways or other paved areas and state how each component of such proposed "open space" meets the requirements of the Planning Code as to usable open space. The DEIR indicates that the proposed Cypress Stairs and Walnut Walk (excluding the Walnut Street "extension," roundabout and walkway between Center Building A and Center Building B) would constitute open space; please explain in detail why the walkway between Center Building A and Center Building B would not constitute open space, including without limitation under the San Francisco Planning Code. (DEIR pp. 2.83)

The DEIR states that access to the proposed Euclid Green would be developed at the corner of Laurel Street and Euclid Avenue. These spaces would be designed to be compliant with the Americans with Disabilities Act. DEIR pp. 2-76-2.77. The DEIR and plan sheets do not explain the changes proposed to the Euclid Green. The DEIR acknowledges that the existing green lawns at the corner of Euclid Avenue and Laurel Street (23,600 square feet) and along Presidio Avenue (10,700 square feet) are accessible to the general public. DEIR p. 2.9. Please describe in detail each and every change that the developer proposes to make to the existing green spaces that currently exist along Euclid Avenue and Laurel Street. The City's Urban Design Team review notes state that "Euclid Park seems to show retaining walls and other interruptions. It seems strongest as a single zone of lawn." (Ex. M, November 16, 2017 UDAT Notes) Please describe in detail what was meant by this statement and what document(s) the Planning Department reviewed before it made this comment. The DEIR and plan sheets submitted to the City do not show any such proposed modifications to the existing lawn and landscaped spaces along Euclid Avenue or Laurel Street.

In addition, if there is a possibility of any portion of the site being used for a community garden, please explain the proposed location and size of the proposed community garden and which existing site features would be changed to install it. If there is a possibility of any portion of the site being used for a farmer's market at any time, please explain the proposed location and

Narrative Description

(Describe the historic and current physical appearance and condition of the property. Describe contributing and noncontributing resources if applicable. Begin with a **summary paragraph** that briefly describes the general characteristics of the property, such as its location, type, style, method of construction, setting, size, and significant features. Indicate whether the property has historic integrity.)

Summary Paragraph

The Fireman's Fund Insurance Company Home Office is a 10.2-acre property in a central, predominantly residential area of San Francisco called Laurel Heights. From the property there are views in various directions to distant parts of San Francisco. The property consists of two buildings and a landscape that were designed to function as a single entity. The main building, referred to in this nomination as the Office Building, is a large three- to seven-story building

Fireman's Fund Insurance Company
Name of Property

San Francisco, CA
County and State

located in the center of the property. There is also a much smaller, one-story Service Building in the northwest corner of the property. The two buildings were designed to complement each other in character and materials. The Office Building is a glass walled building with an open character. The Service Building is a brick building with a closed character. The Office Building is an International Style building which despite its size is built into its sloping hillside site in such a way as to minimize its presence. Its four wings, each built for different functions, range from three floors to seven floors. It is characterized by its horizontality, its bands of windows separated by the thin edges of projecting concrete floors, and brick trim. The wings of the building frame outdoor spaces whose landscape design connects the outdoors with the indoors both functionally and conceptually. The landscape design includes outdoor spaces for use by employees, parking lots, circulation paths, and vegetation. The principal outdoor spaces are the Entrance Court, the Terrace, and small areas around the Auditorium.

SETTING

The Fireman’s Fund Home Office property is located in a central area of the north half of the City of San Francisco near the intersection of two principal streets, California and Presidio. The property occupies almost all of a large irregular block bound by California Street on the north, (continuing clockwise) Presidio Avenue on the east, Masonic Avenue on the southeast, Euclid Avenue on the south, and Laurel Street (in straight and curved sections) on the west. Fireman’s Fund occupies about 10.2 acres—the entire block except for a small triangular parcel at the corner of California and Presidio. (See Map 1 and Map 4)

The site itself slopes down from about 300 feet in elevation in the southwest corner to about 225 feet in the northeast corner. It is part of a cluster of low hills associated with Lone Mountain whose several high points were developed as cemeteries in the nineteenth century. The Fireman’s Fund site was previously a portion of the Laurel Hill Cemetery, and was long recognized for its views. Today there are distant views from the property to the southeast and downtown, to the northwest and a partial view of the Golden Gate Bridge, and to the west into the Richmond District.

The property is surrounded on all sides by thoroughly developed parts of the City of San Francisco. The site itself is at a junction of several different historical developments. To the east and north, the streets are laid out in a modified extension of the original grid of the city. Across Presidio Avenue on the east the neighborhood is called the Western Addition, characterized by a mix of middle-class homes built in the nineteenth century, and by flats and apartments built in

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

the years after the earthquake and fire of 1906. To the north, Presidio Avenue is the dividing line between two of San Francisco's wealthiest late-nineteenth- and early twentieth-century neighborhoods, Pacific Heights to the east and Presidio Heights to the west. To the west along California Street is Laurel Village, a post-World War II strip shopping center. To the west and south is Laurel Heights, a post-World War II residential development of houses and apartments. To the southeast across Masonic Avenue is Station 10 of the San Francisco Fire Department.

BUILDINGS

There are two buildings on the Fireman's Fund property. The Office Building, which is by far the larger of the two and is sometimes referred to as the main building, is located in the center of the property and is surrounded by lawns, gardens, and landscaped parking lots. The Service Building, referred to as the Annex since 1985, is a relatively small building located at the northwest corner of the property. Although different in size and function, the two buildings were designed to relate to each other as part of the overall design of the property. The materials and character of the two buildings express these relationships which are simultaneously contrasting and complementary. The character of the Office Building is dominated by its extensive exterior use of glass for walls, which form long bands between the thin exposed edges of its reinforced concrete floors. Brick is used as a secondary material in the building, but also as a visual connector to features of the landscaped grounds and to the Service Building. The Office Building, clad in glass, provides views of the city for its occupants and presents a transparent character to the outside. The almost windowless Service Building encloses its machinery and utilitarian work space.

Office Building

The Office Building as it exists today is the product of two principal periods of construction. The original building was completed in 1957 with the design of its siting, plan, and structure intended to accommodate future expansion. Between 1963 and 1967, a major expansion was undertaken in three phases. Other than these, during the period of ownership of the property by Fireman's Fund, there were many alterations made to the configuration of interior spaces, as was intended in a building with a flexible office plan. All of these changes were designed by the original architect or his successor firm and built by the original general contractor. (See Map 2)

Since Fireman's Fund sold the building in 1983, there have been extensive changes to interiors but only two important changes to the exterior—a new main entry and a darkening of the windows.

Plan

Today, the 354,000 square foot office building occupies a footprint consisting of four rectangular wings. Three of these wings are at right angles to each other and to the principal surrounding

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

streets—to California Street, Presidio Avenue, and the grid plans of the Western Addition, Pacific Heights, and Presidio Heights. The fourth wing is at an angle to the others but is parallel to Euclid Avenue.

These four wings have been named in various ways but for the purposes of this nomination are named as follows. The Office Wing (north), parallel to California Street, and the Office Wing (east), parallel to Presidio Avenue, together described as the Office Wing, were designed to house the principal employee work areas and associated functions. With levels of parking partially below ground (referred to as sub-levels), the Office Wing (east) is sometimes called the Garage Wing. The Executive Wing, parallel to Euclid Avenue, was designed for executive offices (and sometimes has been called the Administrative Wing). The Cafeteria Wing, parallel to Laurel Street, which connected the Office Wing and the Executive Wing, was designed to house the cafeteria and other employee services.

Considerations in the arrangement of the four wings of the building included the relation to their functions, the topography of the site, views to and from the building, relationships to the surrounding neighborhoods, access to the site, relationships to outdoor spaces framed by the wings of the building, and parking.

The largest and tallest part of the building—the combination of the Office Wing (north) and the Office Wing (east)—is situated on the lowest elevation, an arrangement that minimizes its visual presence on the surrounding streets and from afar. The lowest part of the building, the Executive Wing, is on the highest ground, which is a way of being the least conspicuous in the most visible location. As much as feasible for a very large building, the Fireman's Fund Home Office blends into its site and its largely residential setting. The horizontality of its design intentionally emphasizes its connection to its site.

The principal entrances to the building are on California Street and Laurel Street. From California Street, the Employee Entrance was designed primarily to provide access for workers in the Office Wing, and the Auditorium entrance was for workers and visitors to the Auditorium and nearby offices. From Laurel Street, the Executive and Visitor Entrance, near the north end of the Cafeteria Wing, was originally the principal entrance both for executives and visitors to the building. Secondary entrances along the east side of the Cafeteria Wing, provide access to the Terrace Garden from the Cafeteria and the employee's lounge.

The Office Wing (east) and the Garage on which it sits altogether is seven stories in height. It consists of three sublevels for parking and four office floors above. The parking garage extends further to the north and west than the office floors but because of the topography and landscaping is not highly visible. The most visible feature of the garage is its pair of circular entrance and exit ramps north of the rest of the structure. On the south side of this wing is a rectangular auditorium

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

that extends beyond the volume of the main structure. The north end of the office floors of this wing is raised above the top of the parking garage on concrete piers so that there is a covered driving and parking area. Inside, this wing was designed as open office space with scattered enclosed offices for departmental managers.

The Office Wing (north) is a four-story building. Both California Street entrances are in this wing, one leading back to the Auditorium and the other, which is generally on axis with the entrance gate on California Street. This entrance was altered in 1984–1985 with a remodeled interior lobby and a new entranceway structure on the outside (described below under alterations). Inside, this wing was designed with a central circulation and service core surrounded by generally open office areas on each floor. Scattered on the periphery of the open office areas were a few enclosed offices for departmental managers.

The Cafeteria Wing is a three-story building—the lower story is built into the hillside so that it is exposed only on the east side adjacent to the Terrace. Employee service functions are on the Terrace level where there is access to outdoor gardens and there are distant views to the east. The Executive and Visitor Entrance is on the second level adjacent to the Entrance Court on the west side.

The Executive Wing is a three-story building with its lower story partially built into the hillside. Inside, central corridors originally opened onto private offices for executives on each side. At the east end, offices at the junction with the Cafeteria Wing were originally for the president and the chairman of the Board of Directors of the company; nearby were board rooms, secretaries' offices, and service spaces. Upstairs above the president's office an original penthouse with a lounge, dining room, and outdoor deck was replaced by the 1963–4 addition.

Structure, Materials, and Mechanical Systems

At the most general level, the structure and materials of the building consist of concrete pile foundations, a mix of steel and reinforced concrete columns, concrete floors and roof, and exterior curtain walls of glass except for limited areas where walls are brick.

Because of the original 1957 plan of the Office Wing (north), special steel columns were designed for this section. The Office Wing was designed with a central reinforced concrete service core surrounded by open office space. To create an office space with a minimum of columns, the concrete roof spanned fifty-five feet from the core to the perimeter. Forty feet from the core were steel columns, beyond which the concrete roof was cantilevered. Ordinary steel columns could not practically be made to support these loads, so special columns were designed with steel channels fastened together as columns. This method produced slimmer columns than other approaches, minimizing their visual presence in the open office areas. When the Office

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

Wing (east) was added in 1966–1967, this same structural system was employed to provide a similar interior arrangement.

To produce concrete floors with narrow cantilevered outer edges, which would enhance the appearance of the building as a glass box, floor structures are built of one-way concrete girders and joists. Beyond the line of the windows, the concrete floor structures serve as platforms for washing windows.

Between the concrete floor structures interior spaces are enclosed by continuous horizontal bands of windows. The windows themselves are in regular vertical rectangular units. Extruded aluminum frames hold large middle panels of clear glass above bottom panels of ceramic coated glass, originally blue in color. In alternate window units, there are two types of operable panels at the junction of the top and bottom panels.

Red brick laid in running bond is used in scattered locations for a mix of both functional and aesthetic reasons. It is used at the principal entrances on California and Laurel Streets to make their locations clear. It is used at the west end of the Executive Wing to present a more domestic face to the houses that are near-by on Laurel Street—this brick wall also blocks the afternoon sun from overheating the interior and prevents glare seen from the west. Brick is used for the auditorium extension on the south side of the Office Wing. And, brick is used at the east end of the building on the exposed level of the mostly underground parking garage to screen the parking area from view.

The principal structural features of the auditorium are grouted brick walls and two deep reinforced concrete roof beams. The walls are formed of brick inner and outer surfaces with rebar and grout in between. The angled brick bays of the walls and the plaster over some interior surfaces were used for acoustical reasons.¹

Architecture

The design of the building is associated with the International Style and the idea that form follows function. The simple structural concept is clearly evident in the appearance of the building. By virtue of its consistent design and use of materials, the building reads visually as a single structure. At the same time, the functions of its different wings are expressed in their size, context, and relationships to the gardens, lawns, and parking areas around the building and to the views to and from the building. The four-story Office Wing accommodates the largest number of workers, originally in open offices. From its open-office floors, there are wide views of the city of San Francisco. The smaller Executive Wing accommodates a relatively small number of

¹ N. C. Stone, "In the News: Fireman's Fund Building Has Unique Acoustic," *Architect and Engineer* 210, No. 3 (September 1957): 43. Robert Cosby, Telephone conversation with Michael Corbett, 3 February 2018.

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

workers, originally in private offices. The smaller scale of this wing is oriented to the Entrance Court on the north and a wide lawn on the south.

Service Building

The Service Building, described on original 1955 plans as a Garage and Service Building, has had two substantial additions within the period of significance. Both were designed by the original architect and built by the original general contractor. The brick exterior of the additions matches that of the original building and that used on the Office Building.

As originally designed, the Service Building had an L-shaped footprint of two slightly overlapping rectangles enclosing 10,500 square feet. The larger rectangle was occupied as a garage and the smaller as a maintenance shop. As altered, the footprint is now an irregular cluster of attached rectangles enclosing 13,000 square feet for mechanical and maintenance functions.

The Service Building is a steel frame and reinforced concrete structure enclosed in brick. Its openings are limited to glass and aluminum doors, a few window openings, and ventilating louvers in the boiler room.

LANDSCAPE

Landscape Features Associated with the Mid-1950s Design

The landscape was an integral part of the original design for the new corporate headquarters commissioned by Fireman's Fund in the mid-1950s. The San Francisco-based firm of Eckbo, Royston, and Williams (ERW) was the landscape architect for the original landscape design, completed in 1957, and its successor firm Eckbo, Dean, Austin, and Williams (EDAW) designed the landscape associated with the mid-1960s additions. The landscape setting around the modernist Office Building integrates functional needs (such as parking lots and internal circulation) with large areas of lawns and structured outdoor spaces (the Terrace, Entrance Court, and the Auditorium's outdoor spaces). The landscape is designed to promote the integration between architecture and landscape and uses forms and materials that are characteristic of modernist designs from the mid-twentieth century. (See Map 2 and Map 3)

Brick Wall

A brick wall, which takes different forms, provides a continuous and unifying element around the edges of the site. It exists as a retaining wall along the perimeter of the property's northeast, north, and west sides. Three gated entrances—one for the employees on California Street and the service and executive/visitor entrances on Laurel Street—are integrated into these sections of the wall. Each of these three entrances has a separate vehicular and pedestrian opening framed by brick pillars and secured by a double-leaf, metal rail gate when the property is closed. On the south side of the Executive/Visitor Gate, the perimeter wall is transformed into low retaining

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

walls that define a series of planting beds along the west end and south side of the Executive Wing. The wall continues along the outer edge of the Terrace garden, along the bank that parallels Masonic Avenue, and then reconnects to the southeast corner of the Office Wing (east). Here rectangular brick planting beds have been incorporated into the wall, creating a zig-zag alignment similar to that found in other locations (i.e., on the bank along Laurel Street in the vicinity of the Entrance Court, on the southwest side of the Terrace, and in the bench wall that frames the eastern side of the Terrace).

Parking Lots and Internal Circulation

Two parking lots occupy the land in front (north) of the Office Building. The East Parking Lot and the West Parking Lot sit on either side of the entry drive, which aligns with the Employee Gate and an employee entrance (E2) into the Office Building.

The entry drive from California Street branches near the front of the Office Building; it continues to the east to provide access into the East Parking Lot and the circular ramps to the Garage. The western branch provides access to the West Parking Lot, and exits at the Laurel Street Service Gate. A short service road connects this branch of the entry drive to the Entrance Court parking lot and provides access to a service area at the west end of the Office Wing.

Topography in Relationship to the Spatial Organization and Function of the Site

The site slopes downward from its southwest corner, at the intersection of Euclid and Laurel streets. Grading has modified the topography so that the main outdoor spaces are located at different levels of the Office Building, as appropriate to their functions. Although the East and West Parking Lots are at a slightly lower elevation than the Office Building, the design of the landscape links these directly to its first floor. The Terrace garden, framed by the Office and Cafeteria Wings and originally intended to provide employees an outdoor setting for lunch and breaks, provides a direct connection into the Cafeteria Wing. And the Entrance Court, which originally provided parking for the executives and visitors, is at the same grade as the Executive/Visitor Entrance.

Major Vegetation Features

Lawns create the setting for the Office Building along the west and south sides of the property (and create a compatible connection between the property and the surrounding residential neighborhood) and slope downward toward California and Masonic Streets, respectively.

Some of the large trees which were part of the Laurel Hill cemetery vegetation were saved and ERW incorporated these into planting islands in the East and West Parking Lots in their mid-1950s design. Two Monterey cypress trees on a low mound in the East Parking Lot and a blue gum eucalyptus and several Monterey cypress in the West Parking Lot are remnants of this design feature. Monterey cypress, which were planted at some point after the addition of the

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

Garage in the mid-1960s, occupy the land between the East Parking Lot and California Street. These trees, and the brick perimeter wall, buffer views of the parking lots from the street and lessen the apparent size of the Office Building.

Landscaped banks along the west and southeast sides of the site provide a transition between different elevations of the land within the property and the surrounding streets. The presence of these landscaped banks (planted mainly with grass, some larger shrubs, and several trees) help to reduce the need for tall retaining walls and also increase the amount of green space around the edges of the property.

Entrance Court

The Entrance Court on the west side of the Office Building—in the outdoor space between the Office, Cafeteria, and Executive Wings—provides parking and access to the building's Executive/Visitor Entrance and was one of the two structured outdoor spaces in ERW's mid-1950s design. A narrow, rectangular planting bed (10' x 55') at the center of the asphalt paving creates a U-shaped drive, which connects to the Executive/Visitor Gate on Laurel Street. Sidewalks (exposed aggregate concrete) and narrow planting beds (with Japanese maple trees, azaleas, rhododendron, New Zealand flax, and decorative rocks) line the sides of the Entrance Court's parking lot.

Terrace

In ERW's mid-1950s design, the principal structured outdoor space was the Terrace, which was intended as a place for employees to sit outside during lunch and at breaks. The Terrace is framed by the south side of the Office Wing and the east side of the Cafeteria Wing, where it is protected from the prevailing west wind and provides views to the east and south of San Francisco. This garden area has two levels. The lower level contains a biomorphic-shaped lawn and a paved patio, which wraps around the lawn's north and east sides. Steps along the east side of the upper-level terrace connect down to the lower level of the garden. Both the terrace and patio are paved with exposed aggregate concrete which is divided into rectangular panels by inlaid rows of red brick aligned with the window frames of the building. A brick retaining wall runs along the east and north sides of the lower-level patio. A raised planting bed, to the east of this wall, provides a visual boundary along the Terrace garden's east side. Three raised, circular beds (one on the upper-level terrace, one at the western edge of the lawn, and one at the north end of the lawn) each contain a tree; the sides of these circular beds are constructed of modular sections of pre-cast concrete. (See Map 3)

The plan for the Terrace provides a classic modernist composition. The biomorphic-shaped lawn contrasts with the rectilinear pattern of the pavement and the geometric form of the three, circular tree beds, the zig-zag alignment of the wall along its eastern edge, and the curved arch of

Fireman's Fund Insurance Company

San Francisco, CA
County and State

hedge in the raised planting bed along its eastern edge. The triangular relationship between the three circular tree beds adds yet another level to the geometry of the composition.

Benches, which appear to have been custom-built for the mid-1950s design, are attached to the interior face of the wall along the Terrace's east side. The wooden boards for the seat and back are attached by metal bolts to a metal frame, which is attached to the wall; both the wood and metal are painted black. Benches of a similar design (three wood boards mounted on a bent metal frame) are mounted onto the patio at various places along its inner edge.

Landscape Features Associated with the Mid-1960s Design

EDAW, the successor firm to the ERW partnership which was dissolved in 1958, prepared the landscape design that accompanied the mid-1960s additions to the Office Building. Just as the mid-1960s architectural additions were intended to be compatible with the original Office Building's design vocabulary, EDAW's design was intended to compliment and reference the original, mid-1950s ERW design. The key parts of the mid-1960s landscape design included the addition of paved features around the east, south, and west sides of the new Auditorium—to create outdoor sitting areas and to facilitate pedestrian circulation—and rebuilding a portion of the brick perimeter wall along Masonic Avenue. These two outdoor sitting areas—one on the east side of the Auditorium and one on its west side—connect to entrances into the Auditorium. (See Map 3)

The Auditorium is located below and to the east of the Terrace. A ramp begins on the south side of the Terrace and leads down to the Auditorium. The ramp bisects the landscaped bank that extends from the Terrace down to Masonic Avenue. The ramp, a part of the original mid-1950s design, is paved in the same exposed aggregate concrete as the Terrace, but lacks the inlaid rows of brick.

The outdoor area on the Auditorium's west side is paved with exposed aggregate concrete divided into panels by a double row of inlaid brick that references, but is not identical to, the pavement in the mid-1950s Terrace. Black metal benches are mounted along the eastern and western sides of the pavement. A raised circular tree bed (with concrete walls identical to the three circular tree beds at the Terrace) is located on its western side.

The outdoor area on the Auditorium's east side is paved with concrete divided into rectangular panels by wood inserts. The east and south sides of this area are enclosed by rectangular brick planting beds which are incorporated into the Masonic Avenue brick perimeter wall. The arrangement of these beds creates a zig-zag alignment for the wall, which is similar to that found in other locations (i.e., the brick perimeter wall along Laurel Street below/west of the Entrance Court, in the retaining wall at the southwest corner of the Terrace, and along the bench wall that frames the east side of the Terrace).

The landscape along the east side of the property—which is at the same grade as Presidio Avenue—consists of a row of redwood trees planted across the eastern façade of the building, a level lawn between the building and street, and the Presidio Avenue Service Drive which provides access to the sub-level three of the Garage.

CHRONOLOGY OF DEVELOPMENT

Overview

The Fireman's Fund Home Office was built in five principal phases. The first four phases were under the ownership of the Fireman's Fund Insurance Company, and the buildings in these first four phases were designed by the same architect and structural engineer and were built by the same general contractor. The grounds were designed within these first four phases by the same landscape architectural firm and its successor firm. The fifth phase was carried out under a new owner—3333 Investors—who purchased the property from Fireman's Fund.

In addition, there have been many interior alterations throughout the life of the building, many within the period of significance and many outside of the period of significance. These are addressed in a general way after the five phases of construction below.

Buildings

Phase I: Original Construction 1955–1957

The Fireman's Fund Insurance Company bought the site of its future headquarters in March 1953 for \$650,000 from the San Francisco Unified School District.

Among many stated reasons that Fireman's Fund chose the site were access to public transportation, room on the site to expand, the cost of the site and the cost to build a low structure rather than a tall building downtown. An interview with the architect noted that the site "lent itself to a low-level building, which studies proved was preferable for efficient operation of the company's business."² In 1953–1954, in-depth preliminary studies of operations and work flow were undertaken by the architect, Edward B. Page, working with Nicholas Begovich, head of Management Services for Fireman's Fund. In April 1954, Page showed plans of the building to the Laurel Heights Improvement Association which was pleased with "a most attractive building and landscaping."³

In mid-June 1955, Edward B. Page submitted applications for building permits for both the Office Building and the Service Building. Plans submitted with the applications were dated 1

June 1955. For both buildings, the designers working with the architect were, the structural engineering firm of John J. Gould and H. J. Degenkolb; R. Rolleston West, mechanical engineer; Clyde E. Bentley, electrical engineer; Maurice Sands, interior decorator; and Eckbo, Royston, & Williams, landscape architects. The general contractor for the buildings was MacDonald, Young, & Nelson. The landscape contractor was Watkin & Sibbald.

According to an article in the *San Francisco Chronicle*, the company began moving into the Office Building on 17 June 1957. The dedication of the building on 9 July 1957 was attended by San Francisco Mayor George Christopher and many local business dignitaries. The final cost of the buildings was \$4.5 million, including \$80,000 for the Service Building, plus \$600,000 for the furniture and \$300,000 for the landscaping.

The company stressed that the buildings were designed both for efficient operation and to provide a pleasant working environment, recognizing that insurance companies were noted for high employee turnover and hoping that comfortable and attractive surroundings would help retain employees. Some of the means of establishing these conditions were providing good light and air, views, access to outdoor gardens, recreation facilities, a cafeteria, comfortable furniture, thoughtful choice of colors, and plentiful parking.

While there is no evidence of a master plan, the company and its designers anticipated the future need to expand. According to the general contractor at the time the building was first built, "The Building has been planned for an expansion factor of thirty percent. Future needs will be satisfied by adding a complete floor above the present floors or by adding a wing."⁴ Guided by City Planning Commission Resolution 4109, the expansions, which occurred in several phases between 1963 and 1967, were made in a way that would not change the character of the main building or harm the attractive environment created by the landscaped grounds and the relationships between the landscaping and the buildings.

The Fireman's Fund Home Office was the subject of wide popular and professional press coverage when it was first completed. In addition to numerous articles in the San Francisco press, *Business Week* ran an article on the company to coincide with the completion of the building.⁵ The principal west coast architectural periodical, the *Architect and Engineer*, ran a long cover story on the building.⁶ And, the prominent French journal, *Architecture d'aujourd'hui*, devoted two pages to the architecture and landscape design of the property in a special issue

on office buildings around the world.⁷ Fireman's Fund was the only American building featured among forty-three buildings in sixteen countries on three continents.

Phase II: One-story Addition 1963–1964

On 15 November 1963, Fireman's Fund applied for a building permit to add one story to a portion of the original building at a cost of \$800,000. This would add a floor to the Executive Wing, the Cafeteria Wing, and a portion of the west end of the Office Wing (north) with a total of 27,000 square feet. Construction began on 2 March 1964 and was completed in December 1964. The addition matched the original building in its design, materials, and details visible on the exterior.

The architect for this addition was the same as for Phase I and the structural engineer was H.J. Degenkolb & Associates, the successor to the original firm following the death of John Gould. The mechanical engineer was K.T. Belotelkin & Associates and the electrical engineer was Charles M. Krieger & Associates.

Phase III: Parking Garage, Auditorium, and Office Addition 1965

In the first half of 1965, Fireman's Fund initiated work on two related additions carried out under separate building permits, one for work that was much larger than the other. On 19 February 1965, the company applied for a permit for an addition on the east side of the Service Building and to build a new underground service tunnel between the Service Building and the main building. The addition was a rectangular block with a flat roof, the same size as the existing Service Building and clad in matching brick on the exterior.

The company applied for a second permit on 24 June 1965, for a large, partially underground, three-level addition whose primary purpose was a parking garage, but which also included more office space and an auditorium. The permit was issued on 24 August 1965 for work to cost \$1,500,000. The footprint of this new 120,000 square foot building was irregular, but the main part of it could be enclosed by a rectangle parallel to Presidio Avenue and at a right angle to the existing California Wing of the Main Building. At the north end of this building were two cylindrical ramps for access to the parking levels from the roof at the level of the previous parking area. The garage provided parking for 271 vehicles. At the south end of the structure was the auditorium which had seating for 300 people. The auditorium was entered at the first sub-level of the structure, one level below the ground floor of the original office building.

This addition was of reinforced concrete construction. The exposed north end of the garage was undisguised concrete. The exposed east side of the first and second sub-levels of the structure

County and State

was clad in brick with glass clerestories on the second sub-level and in the same aluminum frame and glass window wall as in the original building on the first sub-level. The auditorium was enclosed in brick.

The architect and engineers for this phase were all the same as in Phase II.

Phase IV: Parking Garage Superstructure and Fourth Floor Additions 1966–1967

On 14 February 1966, Fireman's Fund notified the Laurel Heights Improvement Association that it was seeking approval for the completion of the fourth floor addition from Phase II and the construction of a three-story office building on the roof of the parking garage built in Phase III. The permit for this work, to cost \$2,000,000, was issued 24 March 1966 and the work was completed in 1967. These changes were in the same materials and details as the original so that the character of the 1957 building remained intact.

Another addition was made under this permit to the Service Building. This was small rectangular building to serve as a new boiler room. Like the previous addition, this was clad in the same brick as on the original.

The architect and engineers for this work were the same as in Phases II and III.

Interior Alterations 1958–1982

Building permits were issued for many interior alterations to the building during its ownership by Fireman's Fund. Until the last couple of years, most of these were small jobs involving office spaces, sprinklers, and service features. In 1968–1969 and in 1975–1976, office areas throughout the building were renovated. The flexibility of the large open office areas of the original design anticipated reorganizations and remodelings of these spaces.

Until 1968, the architect for all of this work was Edward B. Page. Beginning in 1968, the work was done by his successor firm of Page, Cloudsley, & Baleix. Until 1970, the general contractor for the work was always MacDonald, Young, & Nelson and its successor firm of MacDonald & Nelson. Beginning in 1971, the contractor for many interior alterations was Herrero Brothers.

Overcrowding

By 1970, the building was running out of space. A new three-story office building was proposed about a half block away on Masonic Avenue near Geary, but was never built. Subsequently, planning began for a large new office building and data center on Lucas Valley Road in Marin County for 800 "technical and clerical" employees and for the company's large IBM computers.

Fireman's Fund Insurance Company
Name of Property

County and State

According to the San Francisco Chronicle, this move was necessary because, "Height limitations prevented adding to the existing building."⁸

Beginning in 1977, the corporate owner of Fireman's Fund since 1968, American Express, occupied space in the building and sometimes hired different contractors. By 1982, when portions of the building were leased to outside tenants, interior spaces were remodeled by different teams of designers and builders.

Landscape

The site was previously a portion of the Laurel Hill Cemetery, which closed in the late 1930s. Prior to construction of the Fireman's Fund Home Office, debris from the cemetery was cleared, taking care to leave several large trees which were incorporated into the landscape design.

Phase I: 1955–1957

The firm of Eckbo, Royston, and Williams (ERW) prepared the landscape design and worked with the architects on the site plan that determined the location of the building and the arrangement of the parking, internal roads, and outdoor spaces.⁹ Garrett Eckbo's description of the challenges of the design process for a building and site, found in his book *Urban Landscape Design*, provide insights into the resolution of the design for the Fireman's Fund property.

[T]he site is a piece of real estate, variable in size, form, and topography, produced by land subdivision . . . Thus the landscape design problem is to achieve the best possible development of a space or series of spaces determined by the relationship between the building and the site boundaries. Within these, the specific demands of the program must be satisfied. Problems of orientation and climate control—sun, wind, heat, glare, reflection—must be resolved. Visual demands created by the form and height of the building and the size and position of glass areas must be satisfied. The exterior landscape, beyond the site

⁸ *San Francisco Chronicle*, "Massive New Data Center," 30 May 1975.

⁹ Typically, one of the ERW partners would take the lead on a specific project and then oversee all phases of the work. The plans for the ERW design were not located during the research for this nomination, and the lead ERW partner for the Fireman's Fund landscape design could not be determined. A caption for a photograph, in a 1969 article in the *San Francisco Sunday Examiner and Chronicle* (Adams 1969), attributed the design to Ed Williams. This attribution seems reasonable for several reasons. Logistically, the Fireman's Fund project would have been handled by the San Francisco office under the direction of one of the two San Francisco-based partners—Ed Williams and Robert Royston; Garrett Eckbo operated out of their southern California office. Second, Eckbo attributed the Fireman's Fund design to Eckbo, Dean, Austin, and Williams (EDAW), the successor firm to ERW, in his 1964 book *Urban Landscape Design*. In other places in this book, he attributed designs prepared by Royston while an ERW partner (Krasi Park [1954] and Mitchell Park [1956]) to Royston's firm (Royston, Hanamoto, and Mayes) and would have done so with Fireman's Fund if Royston had been the lead designer. Finally, the landscape design for the mid-1960s additions to the Fireman's Fund office building were undertaken by EDAW, which supports the assumption that one of the partners who remained with EDAW being the designer for the original, mid-1950s plan.

*boundaries, must be analyzed and included or excluded by judicious screening or framing elements. Finally yard spaces which do not relate to building or specific function must be developed in meaningful forms. All of this will be more difficult if the building has been conceived as a self-sufficient unit, and less difficult if the organization of building and site spaces is conceived as one coherent pattern at one time.*¹⁰

Eckbo considered the Fireman's Fund site to be an example of this approach for the design process between a building and its site and included a description, site plan, and nine photographs of Fireman's Fund as one of the five projects he used to illustrate the "Building and Site" chapter of the book.

The connections between the Fireman's Fund office building and its landscape were a critical part of the image that the company was promoting with its new headquarters. Descriptions of the property in contemporary articles emphasized the "park-like setting" for the building and parking, which together occupied less than half of the site's 10.2 acres. The description in the *Architect and Engineer* in April 1956, noted that "the structure, which will overlook San Francisco, has been designed to relate to its park-like setting."¹¹ An extensive article on the new headquarters, in the *Architect and Engineer* in September 1957, explained that "The building itself occupies 1.74 acres, and there are 2.75 acres of off-street parking for more than 250 cars. On the rest of the land area, a truly superb job of landscaping has been done. This includes 110 varieties of trees, plants and ground cover that give the area surrounding the building a park-like aspect."¹² Eckbo made a similar point ("... leaving the major portion of the site for gardens") in his description in *Urban Landscape Design*.¹³

The size (10.2 acres), topography and location of the site (sloping downward from the southwest corner and with a panoramic vista of downtown), and the location of existing large trees influenced arrangement of the site features. Garrett Eckbo, describing the design process for the landscape, in *Urban Landscape Design*, wrote that "considerable care was taken in the arrangement of the building, parking areas, and levels [grading] to save all the existing trees."¹⁴ These mature trees, which were mainly in the large parking lots to the north of the Office Building, helped to frame the building in views from California Street and provided vegetation that was proportional to the three original stories of the building's north façade.

The Office Building was conceived as a series of wings set at right angles to each other, which, in turn, divided the land next to the building into outdoor spaces designed to provide connections between the architecture and the landscape. Additionally, the horizontality of the architecture both in its long, low wings, and in the specific design features of the wings—the division of floors by continuous thin edges of concrete and the walls of the floors consisting of long repetitions of similar window units—helped to balance the massing of the Office Building with the surrounding landscape. The exterior glass walls provided views into the landscape of the outdoor spaces and at certain times of day reflected landscape features (trees, lawn, walls, patterned pavement, etc.), adding yet another level of integration between interior and exterior spaces.

The principal outdoor space—the Terrace—was set on the east side of the building, framed by the Office and Cafeteria Wings, where it was “protected from the prevailing west wind” and on a portion of the site that had been graded to provide “a good view of a large part of San Francisco.”¹⁵ Here a biomorphic-shaped lawn was framed on its west, north, and east sides by a patio, whose exposed aggregate pavement was divided by rows of brick that aligned with the window frames of the building. Benches attached to the niches of the zig-zag of the seat wall, which enclosed the eastern side of the Terrace, provided places for employees “to relax in the sun during lunch or coffee breaks.”¹⁶

The Entrance Court on the west side of the Office Building—framed by the Office, Cafeteria, and Executive Wings—provided access to the Executive/Visitor Entrance into the building. A narrow, 80-foot-long, rectangular reflection pool at the center of the paving (asphalt divided by rows of red brick inset into the pavement) created a U-shaped drive. Arbor-covered sidewalks lined the outer edges of the pavement, with parallel parking next to the sidewalks.

A brick wall, which took several different forms, provided a continuous and unifying element around the edges of the site. It created a boundary wall along the property's northeast, north, and west sides, and the three gated entrances—one for the employees on California Street and the service and executive/visitor entrances on Laurel Street—were integrated into these sections of the wall. It was transformed into low retaining walls that defined a series of planting beds along the west end and south side of the Executive Wing, and continued—again as a boundary wall—along the outer edge of the Terrace and the parking lot to the east of the building. The brick in the various sections of this wall and in the pavement patterns of the Terrace and Entrance Court was the same as that used in the Office Building and Service Building and helped to integrate the architecture and landscape.

Lawns, the iconic symbol of the landscape in post-World II suburban design, created the setting for the Office Building along the west and south sides of the property and provided an appropriate interface with the surrounding residential neighborhood. In *Urban Landscape Design*, Eckbo noted that plant materials were chosen based on the existing trees on the site and the climatic conditions. Live oak and red-flowering eucalyptus were the primary species planted, with "secondary themes . . . carried by the Monterey cypress, olives, redwoods, and Bishop pines" that were planted.¹⁷ Shrubs and groundcovers were chosen to add color, fragrance, and "to provide interesting combinations of foliage, color, and texture, so that at all times of the year there will be something of special interest for the passerby to see."¹⁸

Phase II: 1963–1964

There were no additions or major changes to the ERW landscape design during Phase II.

Phases III and IV: 1965–1967

EDAW, the successor firm to the ERW partnership which had been amicably dissolved in 1958, prepared the landscape design that accompanied the mid-1960s additions to the Office Building. Just as the architectural additions were intended to be compatible with original Office Building's design vocabulary, EDAW's design was intended to compliment and reference the original, mid-1950s ERW design. The portion of the parking lot that wrapped around northeast corner of the site and a portion of the original brick perimeter wall along the eastern edge of this lot were removed when the office wing extension, garage, and auditorium were built. The planting islands within the remaining portion of the east parking lot were rearranged to accommodate a new parking pattern. A service drive was added from Presidio Avenue to the ground floor of the Garage. The brick wall, along Masonic Avenue, was rebuilt to accommodate the additions to the building and new service drive. A row of redwood trees were planted across the new eastern façade of the newly extended office wing, and the level land between the building and the street was planted with grass. Paving was added around the east, south, and west sides of the new Auditorium to create outdoor sitting areas and to facilitate pedestrian circulation.

EDAW designed an entrance terrace on the west side of the Auditorium, paved with exposed aggregate concrete divided by rows of inlaid brick that referenced the paving found in the original, mid-1950s Terrace. The new concrete-paved landing on the east side of the Auditorium provided a second, but smaller, outdoor sitting area; this area was enclosed on its east side by rectangular brick planting beds which were incorporated into a new section of the brick wall. The brick in the new planting beds and the new wall section was similar to that of the original wall.

3333 Investors

Phase V: Presidio Corporate Center 1984–1985

About 1983, Fireman's Fund sold the property to a new owner called 3333 Investors. In 1984 and 1985, 3333 Investors took steps to transform the property into the Presidio Corporate Center, an office building open to leasing by multiple tenants. Apart from numerous relatively minor interior office alterations, this owner made two distinctive changes visible on the exterior of the building.

In the spring of 1984, the aluminum window frames throughout the building were painted a dark color and the glass in the windows including the blue bottom panels of each window unit was darkened. The tinting of these windows was said to have a fifteen year life expectancy.¹⁹

In permits dated 6 October 1984 and 8 January 1985, the original entrance lobby on California Street was remodeled and a new exterior entrance gateway structure was built. Apart from serving to mark the entrance and to represent a new owner and a new use, it is not clear that this structure had any function. The architect for the new entrance structure was CRS Sirrine of Houston in association with EPR of San Francisco.

University of California

In February 1985, 3333 Investors sold the property to the Regents of the University of California to be used as the Laurel Heights Campus of the University of California, San Francisco. Since it has owned the property, the university has made minor exterior alterations and extensive interior alterations. The principal exterior alterations have been a project begun in 1986 that added a loading dock on Presidio Avenue and another that added rooftop screens to hide added mechanical equipment.

During the ownership of the University of California, space in the building has been occupied by the California Department of Transportation as well as by the University of California, San Francisco.

In preparation for a move to the new Mission Bay Campus and elsewhere, in 2012 the university began investigating options for the site. On 13 March 2015, the university signed a ground lease with Laurel Heights Partners, a development firm with plans to make extensive changes to the site. In April 2018, Laurel Heights Partners stated that they recently became the fee owner of the property.

INTEGRITY

For the period of significance 1957–1967, alterations to the property are addressed below for the buildings and the landscape separately, followed by an evaluation of integrity of the property as a whole.

Buildings

The two buildings of the Fireman's Fund Home Office have a high degree of integrity. Although the original 1957 buildings were altered with major additions in 1963–1967, the changes were all within the period of significance and all were carried out by the same primary team of the architect, the engineer, and the general contractor.

After the period of significance additions and alterations to the buildings have been relatively minor in the context of the whole. Altogether, these changes, which are described herein, have had a limited effect on the character of the buildings.

The principal changes after the period of significance to the Office Building were the addition of two service entrances, a gateway in front of the Employees Entrance on California Street, the darkening of the glass walls, and the addition of rooftop screens to hide mechanical equipment. The most significant of these are the darkening of the windows and the addition of the entrance gateway.

The entrance gateway was built in 1984–1985. It is a two-story structure that frames the path of entry from the street and also the existing walkway along the front of the North Wing. The ground level of this structure is clad in the same brick that is used elsewhere in the building. The second level, which spans brick supports on both sides, is glazed. The use of glass here is compatible with the glass windows that dominate the exterior surface of the original building in the Fireman's Fund era, but is different in its details and character. At present, the gateway is partially hidden by trees, lessening its impact.

Also in 1984–1985, the windows were darkened. This change involved tinting of the glass itself, the aluminum frames of the units of the windows, and the blue bottom panels of the window units. This change affects the character of the building as a whole but does not alter its essential features or design as a glass box open to its immediate landscape and to distant views.

Other alterations visible on the exterior are less important. A service entrance consisting of a roll-up door and loading area was added at either end of the Office Building, accessible from the service drive parallel to Laurel Street at the west end and from Presidio Avenue at the east end. The rooftop screens around mechanical equipment evoke the penthouses on the roofs of the Executive Wing and the Office Wing (north), which were removed in the additions of 1963–1967. They do not have a significant impact on the character of the building.

Fireman's Fund Insurance Company
Name of Property

San Francisco, CA
County and State

Interior changes since the Fireman's Fund era have altered the interior for new uses. As the headquarters of a national insurance company, the interior was designed to provide offices and support services for clerical workers, managers, executives, and others in a mix of open office areas, private offices, meeting rooms, public rooms, and rooms for office machines. For its current use by the University of California (for academic and administrative offices, office-based instruction, and social and behavioral research) open offices have been partitioned, old partitions have been removed or changed, and spaces have been created for specialized purposes. In 1987, a large MRI center was built on the ground floor of the California Street Wing. Along with these changes, for security reasons the building has been divided inside into sections that do not communicate and lobby areas have been remodeled as security checkpoints. These changes alter the visual relationship between the design of the building and its structure. These altered conditions are apparent to occupants and users of the building but cannot be seen from outside the building or by the general public.

The Service Building has been altered with three additions, each in the character of the original, each in the same brick as the original, and all within the period of significance.

Landscape

The landscape is an integral part of the design for the corporate headquarters commissioned by Fireman's Fund in the 1950s and to the additions to this facility from the 1960s. The ERW/EDAW design retains a high degree of integrity and continues to create a landscape setting around the International Style Office Building. The landscape design continues to promote the integration between interior and exterior space on the site, and the original forms and materials of its key features, which were characteristic of modernist designs from the mid-twentieth century, remain in place.

The Terrace, which was designed as the "centerpiece" of the landscape, continues to integrate the architecture of the building with the site and with the broader setting (through views of San Francisco). The Terrace retains its characteristic biomorphic-shaped lawn surrounded by a paved terrace and patio, and there have been only minor alterations since the end of the period of significance. One tree (likely an oak) at the south end of the lawn has been cut down, and new benches and tables have been added. Some of the original shrubs and flowering plants—described by Eckbo in his book *Urban Landscape Design*—are no longer present; however, the locations of the plants and their general character (trees in circular beds and flowering shrubs and groundcovers in planting beds) remain.

The Entrance Court was altered both during and after the period of significance. Sometime during the period of significance, the reflecting pool at the center of the parking lot was removed and converted into a planting bed; a review of aerial photographs indicates that this alteration occurred between 1961 and 1968. Several other changes occurred after the end of the period of

Fireman's Fund Insurance Company

County and State

significance. Between 1993 and 2001, the distinctive brick stripes in the parking lot pavement were paved over, and the arbors that covered the sidewalks on the north, east, and south sides of the parking lot were removed; the arbor on the west side was left in place. The exposed aggregate concrete paving for the sidewalks was also redone at this time. In the late 1990s, the configuration of the concrete pavement and the arrangement of the custom-built mid-1950s benches to the north of the parking lot were altered. However, the general design and function of the Entrance Court—as an outdoor connection between the Executive/Visitor Gate and the entrance to building on the west side of the Cafeteria Wing—are still evident, and the Entrance Court continues to contribute to the overall integrity of the landscape design.

The short service drive to the west of the Office Building was altered both during and after the period of significance. During the period of significance, the west side of the road was widened to provide additional parking; this change occurred between 1961 and 1968. After the period of significance, a portion of the east side was also widened for parking. However, the original alignment of this short road and its function within the overall landscape design remain. The service drive continues (1) to connect the entry drive and Entrance Court and (2) to provide access from a service area on the west side of the Office Building to the Laurel Street Service Gate. Additionally, the overall design of the internal circulation system (with the two parking lots in front of the Office Building and internal roads) remains intact.

A new feature was added in 2000–2001 (after the end of the period of significance) when a fenced outdoor child care/play area was built on the south side of the Office Building; this area had previously been planted with grass and was part of the large lawn along the south side of the property. As part of this change, a new pedestrian entrance was created for the Terrace's southwest corner by removing a part of the brick retaining wall along the outer, southern side of the Terrace and adding a metal gate. A new sidewalk and pedestrian ramp were added to provide access between Euclid Street and this new entrance. However, the overall design of the Terrace was not altered by the addition of this play area. Additionally, enough of the lawn remains to convey the original landscape setting along the south side of the property.

Some of the materials associated with the vegetation features have been changed. Specifically, most of the original shrubs, groundcovers, and smaller plants have been replaced. Most of these changes to materials likely occurred incrementally, after the end of the period of significance, when plants reached the end of their lifespan, when certain species did not thrive in a specific location, or when the popularity of species changed. However, the major vegetation features retain their original locations and functions within the landscape design and continue to contribute to the historic character of the landscaped setting of the Fireman's Fund property.

The key materials and workmanship of the landscape structures and site furnishings remain including the brick used in the walls throughout the landscape; the exposed aggregate concrete

Fireman's Fund Insurance Company

 County and State

for sidewalks; the exposed aggregate concrete divided into panels by rows of brick in the pavement at the Terrace and in the Auditorium's west-side sitting area; the metal for the entrance gates; the custom-designed wood benches found in the Terrace and at the Entrance Court's outdoor sitting area; and the circular tree beds constructed of modular sections of concrete found in the Terrace and in the Auditorium's west-side sitting area.

Combined Buildings and Landscape

Together the buildings and landscape of the Fireman's Fund Home Office constitute a single resource that possesses integrity as measured by the seven aspects of integrity, as follows:

- 1) Location: The property is in its original location. It has not been moved.
- 2) Design: The property retains the essential elements of its design and the relationship between the parts of the design. Alterations to the design since the period of significance are relatively minor. It retains integrity of design.
- 3) Setting: The setting of the property is the same in all major respects as at the time it was first built. It retains integrity of setting.
- 4) Materials: The materials used in the buildings and landscape during the period of significance are all present. The property retains integrity of materials.
- 5) Workmanship: Evidence of workmanship, both from craftsmanship (brick and landscape features) and industrial processes (glass manufacture, concrete finishing, extrusion of aluminum) are all present. The property retains integrity of workmanship.
- 6) Feeling: Because the property as a whole—its buildings and landscape—are little altered and have been well-maintained, it retains integrity of feeling from the period of significance.
- 7) Association: Apart from the lettering on the outside wall near two entrance gates with the name of the current occupant of the property, the property is almost indistinguishable from the time of its ownership by Fireman's Fund Insurance Company. Thus it retains integrity of association.

CHARACTER DEFINING FEATURES

8. Statement of Significance

Applicable National Register Criteria

(Mark "x" in one or more boxes for the criteria qualifying the property for National Register listing.)

- ☒ A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- ☐ B. Property is associated with the lives of persons significant in our past.
- ☒ C. Property embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components lack individual distinction.
- ☐ D. Property has yielded, or is likely to yield, information important in prehistory or history.

Criteria Considerations

(Mark "x" in all the boxes that apply.)

- ☐ A. Owned by a religious institution or used for religious purposes
- ☐ B. Removed from its original location
- ☐ C. A birthplace or grave
- ☐ D. A cemetery
- ☐ E. A reconstructed building, object, or structure
- ☐ F. A commemorative property
- ☐ G. Less than 50 years old or achieving significance within the past 50 years

Statement of Significance Summary Paragraph (Provide a summary paragraph that includes level of significance, applicable criteria, justification for the period of significance, and any applicable criteria considerations)

The Fireman's Fund Insurance Company Home Office is eligible for the National Register under Criteria A and C at the local level. Under Criterion A, it is significant in the area of Commerce for its association with the San Francisco insurance industry, an important industry in the history of the city from the Gold Rush to the present. In particular, it represents the postwar boom in San Francisco's insurance industry when many companies built new office buildings. At that time, Fireman's Fund was one of the largest insurance companies in the United States. It was the only major insurance company headquartered in San Francisco. It was a leader among all insurance companies in San Francisco in its embrace of new ideas, symbolized by its move away from downtown to an outlying location. Under Criterion A, the Fireman's Fund Home Office is significant in the area of Community Planning and Development as one of the principal embodiments of the postwar decentralization and suburbanization of San Francisco. Fireman's Fund was the first major office building to be built outside of downtown in a suburban setting and it was the first whose design was fully adapted to the automobile. Under Criterion C, the Fireman's Fund Home Office is significant as the work of three masters, the architect Edward B. Page, the engineering firm of John J. Gould & H.J. Degenkolb/Henry J. Degenkolb & Associates, and the landscape architectural firm of Eckbo, Royston, & Williams (ERW)/Eckbo, Austin, Dean, and Williams (EDAW). As a modernist, through his experiences in Paris in 1930, Edward Page had direct links to the birth of modern architecture and to its development in the United States. The Fireman's Fund Home Office is his best known and most important work. The Fireman's Fund Home Office—with its innovative structural design that provided open floors with minimal columns and exterior walls of glass—represents the beginning of the reputation of the Gould and Degenkolb engineering firms as among the leading structural engineers in San Francisco in the post-World War II period. ERW/EDAW was recognized as one of the country's leading landscape architectural firms during the period of significance, and their designs and writings contributed to the popularization of the modernist landscape design vocabulary and to modernism as an approach to creating outdoor spaces that addressed contemporary needs within a broad range of settings. The Fireman's Fund Home Office represents an example of the firm's mastery of modern design within a corporate landscape context. Additionally, the Fireman's Fund Insurance Company Home Office, a single property including both architectural and landscape architectural elements which were designed to complement each other, is significant under Criterion C as an example of a corporate headquarters in San Francisco that reflects mid-twentieth-century modernist design principles. The period of significance is 1957 to 1967, covering the period from the year when the first phase of the buildings and landscape were completed (1957) to the year the final phase of construction was undertaken (1967) by Fireman's Fund. The Fireman's Fund company continued

Fireman's Fund Insurance Company

on this site as a leading insurance company in San Francisco and nationally until it sold the property in 1983. Although there are numerous alterations, these alterations do not alter the essential character of the property and it retains a high level of integrity.

CRITERION A: COMMUNITY PLANNING AND DEVELOPMENT

For at least twenty-five years after World War II ended in 1945, there was an accelerated general movement of population and growth in the United States out of the central cities and into outlying areas. This regional decentralization and suburbanization took place in housing, retail, office, industrial, and institutional developments. In the San Francisco Bay Area, the two largest urban centers—San Francisco and Oakland—lost population as new housing and other

Fireman's Fund Insurance Company
Name of Property

San Francisco, CA
County and State

developments boomed on agricultural land and sparsely settled areas of Marin, San Mateo, Santa Clara, Alameda, and Contra Costa Counties. While there were many reasons for this movement, a primary factor was the growing use of motor vehicles. In contrast to the densely concentrated older cities, these new suburban areas were spread out, a development facilitated by construction of bridges across the bay in the 1930s to 1950s and the beginning of the construction of freeways.

San Francisco itself experienced its own internal version of this movement. While the City and County of San Francisco shared the same boundaries and much of its expanse was occupied by traditionally dense urban development, there were substantial areas outside the core—but within the city boundaries—that had never been developed or, because of changing conditions, were newly available for development.

Little new industry entered San Francisco in these years, but every other major land use was expanded. The spectrum of new developments of this period did not simply replicate old patterns of development. Instead, they were shaped by the forces that drove suburbanization elsewhere. In addition to motor vehicles, which were used for private transportation, for hauling goods for business and industry, and in competition with streetcars and other forms of transit, cheap energy and plentiful water played a fundamental role. Also, social forces such as a growing middle class, and “white flight” from perceived overcrowding and changing population demographics in central cities were major factors.

Between 1945 and the late 1960s, years that included the construction of the Fireman's Fund Home Office in Laurel Heights, many of the principal developments of the city itself were part of this movement. The developments of these years were different in fundamental ways from what had been built before. The cumulative effort of all these changes changed the character of the city as a whole. By the end of this period, San Francisco was not the dense pedestrian and streetcar city that grew up in the nineteenth and early twentieth centuries. It had become a mix of the earlier city and the “New City,” a term used by University of California scholar James Vance to describe these changes.²⁰ The co-existence of these two types of urban development in one city introduced new benefits and new problems. The city could better accommodate changing social and economic conditions, but it was plagued with traffic congestion, lack of parking, decreased support for mass transit, air pollution, proliferation of one-way streets, and construction of freeways.

Fireman's Fund was among several large and notable developments of San Francisco's postwar New City. Three of these developments were built on adjacent properties in the southwest corner

of the city. Park Merced, a residential development by the Metropolitan Life Insurance Company of New York consisting of garden apartments and thirteen-story towers on almost 200 acres, was begun just before the war but mostly was built after it, opening in 1950. Stonestown, a complex that included a shopping mall, ten-story towers and garden apartments, and a medical office building on 67 acres, was built in 1949–1952. San Francisco State College (now University), although planned before the war, was built in 1949–1954 on 140 acres. Across town in the southeast corner of the city, Candlestick Park, a 44,000 seat professional sports stadium, was built in 1958–1960. Residential tracts in the central and western parts of the city with hundreds of new homes and housing units, like Lakeshore Park, Laurel Heights, Anza Vista Heights, Midtown Terrace, and Country Club Acres, filled up most of the last open land in San Francisco in the 1940s and 1950s. Also in this period, planning began by the San Francisco Redevelopment Agency for Diamond Heights, a 300-acre site in the center of the city for retail, housing, schools, and other neighborhood functions.

In addition to these large projects, smaller new developments of every kind throughout the city were also shaped by the same conditions. Strip shopping districts (like Laurel Village), new branch libraries, churches, small office buildings, motels, drive-in restaurants, and other types of development were built on in-fill sites and in new areas. A common feature of all of these was the accommodation of automobiles including on-site parking garages and the placement of new buildings with parking lots around them.

As San Francisco was affected by decentralization and suburbanization, both within its borders and in nearby counties, traditional patterns of development persisted as well. One of the strongest traditional patterns was the location of large office buildings downtown. Between 1946 and 1967, twenty-one large office buildings were built in San Francisco. Nineteen of these were medium or high rise buildings on restricted lots downtown.

Despite the strength of the downtown, two major office buildings were built in central areas far from the traditional core of the city. The Fireman's Fund Insurance Company Home Office, originally a 194,000 square-foot building (equivalent to a twenty-story skyscraper on a downtown lot), was a sprawling low-rise building on a 10.2-acre site surrounded by landscaping and parking; it was built in a predominantly domestic-scale residential area. The Jack Tar Hotel and Office Building of 1960, including landscaped grounds, was built in a central location on Van Ness Avenue in a dense urban neighborhood of apartment buildings and multistory automobile dealerships; this large complex included an eight-story hotel and a twelve-story office building of 214,422 square feet.

While Fireman's Fund and the Jack Tar were the only major office developments in this period to locate outside of the traditional downtown but still within the city of San Francisco, they were

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

also part of a larger movement that saw new corporate office buildings and other large developments located in suburban areas outside of the city.

Evaluation

The Fireman's Fund Insurance Company Home Office is eligible for the National Register under Criterion A as one of the principal embodiments of the post World War II decentralization and suburbanization of San Francisco. Fireman's Fund was the first major office building to be built outside of downtown in a suburban setting and it was the first whose design was fully adapted to the automobile.

CRITERION A: COMMERCE

Two conditions of San Francisco's early history and growth, namely its reliance on maritime commerce and its frequent large and destructive fires, quickly gave rise to an insurance industry. This industry would play an important role in the local economy as an employer and as a source of investment money in the region. Because insurance companies had a significant presence in San Francisco from the beginning, the city became a center for the insurance industry on the west coast that has diminished since the 1980s but still continues to the present day.

The first of the two conditions was the isolation of San Francisco and its overwhelming dependence on maritime transportation. For the first twenty years of the American period, the most important means for the delivery of goods and people to California was by ship. While the completion of the transcontinental railroad in 1869 introduced another means of transport, San Francisco Bay remained a major world port until after World War II and still remains a significant port today. Ships owned by people and companies in other places came from all over the world to San Francisco. The owners of these ships and their cargos purchased insurance against loss from companies in the eastern United States and Europe. Very early in the period of American control of California, in 1849, insurance companies headquartered in distant places opened offices in San Francisco. In the next ten years, numerous companies from New York, London, Germany, and elsewhere opened San Francisco offices initially for the sale of marine insurance.

The second early condition that gave rise to the San Francisco insurance industry was an outcome of the rapid growth of the city, the haphazard construction of its buildings in flammable materials; these resulted in the destruction by fire six times in the 1850s of large parts of the city.

In response to both of these conditions insurance was provided at first only by distant companies and fire insurance was available only at exorbitant rates if it was available at all. High insurance rates were a primary factor in the improvement of building practices. Under the influence of insurance companies, building laws were enacted and continually strengthened and new buildings in the central commercial district were required to be built in fire-resistant materials.

Fireman's Fund Insurance Company

Name of Property

San Francisco, CA

County and State

Within a few years, local companies emerged in competition with outside companies primarily to sell two primary forms of insurance—marine insurance and fire insurance. Among more than thirty local insurance companies formed in San Francisco in the 1850s–1860s, Fireman's Fund Insurance Company was formed in 1863. Many of these lasted only briefly before they were bought by rivals or went out of business. Fireman's Fund was among the few San Francisco companies that became well-established and among these it was the only one left in business by 1895.²¹

Fireman's Fund succeeded where other local companies failed for a number of reasons. Among these, the company quickly established branch agencies in distant places and sold insurance throughout the United States and abroad, it paid its claims in a number of high risk and high profile situations which gave it a reputation for honesty and reliability, it had wealthy owners who could provide enough capital to survive in more than one case, and it made key innovations on a number of occasions that proved to be influential within the industry.

When the company was founded by local businessmen in 1863, its initial plan was to pay volunteer fire companies ten percent of the company profits for a charity associated with the Fire Department, and came up with the name "Fireman's Fund" for that reason. The idea of the company founders was that firemen would be more conscientious in putting out fires at buildings insured by Fireman's Fund, Fireman's Fund would prosper, and the charity would prosper. The idea didn't work, but the company kept the name.

Within five years of its founding, the company had branch agencies all over California and in New York and Chicago. By the time of the disastrous Chicago fire of 1871, which wiped out much of the central business district, Fireman's Fund covered many buildings there. The company might have gone under like many others did, but by collecting assessments from its stockholders, raised enough money to pay all claims and stay in business. With this action Fireman's Fund became the leading locally based insurance company in San Francisco, a position that it never relinquished.

In 1867, the company built an imposing headquarters in a prestigious location at the southwest corner of California and Sansome Streets. Situated among the leading banks and financial institutions of San Francisco on the principal street of the financial district of that time, the location itself was a statement of the ambitions of the company for success.

For the rest of the nineteenth century, the company prospered while taking over other San Francisco insurance companies and expanding its operations. The company paid claims after big

 County and State

fires in Boston and Virginia City, solidifying its reputation. By 1895, it had branch offices for its four regional departments around the country. At the end of the century, the company insured ships and enterprises associated with the high-risk environment of the Klondike Gold Rush in Alaska and Canada. By 1905, the company had regional department offices in Chicago, Boston, New York, Macon, Georgia, and London and had expanded internationally, with "general agents" in Hong Kong, Manila, Singapore, and Honolulu.

Fireman's Fund was by far the leading local insurance company at the time of the 1906 earthquake and fire. Despite the loss of its building and all records, and claims far exceeding the assets of the company, it paid all claims by again assessing its stockholders and by paying in installments. Within six years, the company had fully recovered and increased its assets from about \$3 million to \$9 million.

The importance of the various insurance companies, both home-grown and out-of-town, in San Francisco after the 1906 disaster was reflected in their buildings. Because of the nature of their business and the nature of the disaster, the location, design, and construction of buildings for the San Francisco insurance industry were particularly important. Like the most prestigious banks, San Francisco insurance companies preferred to locate on California Street near Montgomery, and as close as possible to that intersection on nearby streets. Fireman's Fund repaired and re-occupied its old building at the southwest corner of California and Sansome Streets; in 1915 the company completed a new building on the old site. The new building was in the form of a Roman temple. Located across California Street from another Roman temple, the oldest and most prestigious San Francisco bank, the Bank of California, the Fireman's Fund Building asserted the wealth, stability, and historic roots of the Fireman's Fund Insurance Company. The Liverpool & London & Globe Insurance Company, a British company in San Francisco since 1852, built a variation of a classical temple across California Street from Fireman's Fund in the same block in 1912. Another British company, The Royal Globe Insurance Company which was also in San Francisco since the 1850s, built an eleven-story office building at the corner of Sansome and Pine Streets, a block south of Fireman's Fund. Other insurance companies occupied other office buildings in this area.

As the insurance industry prospered, this area was strengthened as its center. In 1913, the Insurance Exchange, a centerpiece of the local insurance industry, opened a new eleven-story exchange and office building next door to Fireman's Fund's headquarters. Later, in 1924, Fireman's Fund built a new eight-story office building next door at 233 Sansome Street, enlarged with another five stories in 1929. In 1927, the sixteen-story Insurance Center Building was built at the northeast corner of Pine and Sansome Streets. All of these insurance company buildings from the years after 1906 were designed by prominent architects of the time. Collectively they asserted the importance of the industry and its associations with San Francisco history and finance.

Fireman's Fund Insurance Company
Name of Property

San Francisco, CA
County and State

Fireman's Fund's leading place in the competitive world of San Francisco insurance was partly due to various innovations and early adoptions of business ideas which gained advantages over rivals. In the nineteenth century, Fireman's Fund was a pioneer in the sale of insurance for grain, cotton, and other agricultural products. In the twentieth century, the company was early to sell automobile insurance. It made money with "war-risk" insurance during World War I. Among companies in San Francisco, it was early to enter new fields like life insurance and health and accident insurance. In the 1920s, Fireman's Fund grew substantially and was known as "the Tiffany" of the insurance world."²²

The insurance industry throughout the country was fundamentally changed by a United States Supreme Court decision in 1943 that for the first time defined insurance as interstate commerce. This changed the structure of most insurance companies, including Fireman's Fund. This reorganization coincided with the general postwar economic boom, which for some companies including Fireman's Fund, was accompanied by large and rapid growth.

From 1946 to 1954, Fireman's Fund's income from the premiums of policy holders increased from \$67 million to \$191 million. The company benefitted from the introduction of a Special Home Owners policy in 1951 that was a prototype for the standard "all risk" home insurance that became universal within a few years. A historian of the company described 1954 as "one of the most interesting and successful years in the Company's history" during which "an unusual number of aggressive steps [were] initiated... to expand operations and introduce new forms of insurance." In that year the company bought the National Surety Corporation in "one of the largest transactions of its kind ever made."²³

By the time of World War II, Fireman's Fund was spread out among several buildings in downtown San Francisco. The growth of the postwar years resulted in even more employees and produced a great need to consolidate in one location. Thus, in the booming years after the war the company bought the site for its new headquarters in Laurel Heights in 1953 and built the building that was completed in 1957. A factor in the company's interest in the site was its address on California Street. Although twenty-six blocks west of its traditionally prestigious downtown location, it still had a coveted California Street address.

This was a period of growth for San Francisco's insurance industry in general. Between 1950 and 1960, seven major insurance companies built new office buildings in San Francisco: Home Insurance Company (1950), Pacific Mutual Life (1954), Equitable Life (1955), America Fore (1956), California Union Insurance (1957), John Hancock (1959), and Occidental Life (1960). All of these were tall buildings downtown and none were as large as Fireman's Fund. Other

San Francisco, CA
County and State

slightly later insurance company buildings were Hartford Insurance (1964), the Pacific Insurance Company (1971), and Aetna Life & Casualty Company (1969); the Hartford and Aetna buildings were about the same size as Fireman's Fund after its expansions of the mid 1960s. The best-known and largest building of this period associated with the insurance industry was the Transamerica Pyramid, completed in 1971 two blocks from the heart of the traditional downtown center of San Francisco's insurance industry for the Transamerica Corporation, a holding company for insurance companies and other kinds of financial businesses.

The opening of Fireman's Fund's new building was not accompanied by a slowing of the company's growth. An important and newsworthy source of new business was in the category of inland marine insurance which "will insure any insurable interest against all perils anywhere in the world."²⁴ This covered motion pictures and their casts, rodeo performers, professional athletes, and other types of activity. Fireman's Fund was second internationally to Lloyd's of London in providing this type of insurance and was often in the news for this line of work.

In 1963, Fireman's Fund combined with the American Insurance Company of Newark, New Jersey, with Fireman's Fund becoming a holding company and changing its name to Fireman's Fund American Insurance Companies. In 1964, a company advertisement stated that "Today, Fireman's Fund American is the largest property and casualty insurance company headquartered in the West. It offers every basic line of insurance for both personal and commercial coverage... through more than 25,000 agents and brokers..."²⁵ In this period, substantial additions to the Laurel Heights building were made. In 1968, Fireman's Fund and American Express were combined, with American Express moving many employees to Laurel Heights.

Evaluation

The Fireman's Fund Insurance Company Building is eligible for the National Register under Criterion A for its association with the growth and development of the San Francisco insurance industry, an important industry in the history of the city from the Gold Rush to the present. In particular, it represents the post World War II boom in San Francisco's insurance industry when many companies built new office buildings. At that time, Fireman's Fund was one of the largest insurance companies in the United States. It was the only major insurance company headquartered in San Francisco. It was a leader among all insurance companies in San Francisco in its embrace of new ideas, symbolized by its move away from downtown to an outlying location.

CRITERION C: DESIGNERS

The Fireman's Fund Insurance Company Home Office was designed by a team under the leadership of the architect, Edward B. Page. The members of the design team including the architect, structural engineer, and landscape architect are presented below, followed by an evaluation.

Architect: Edward B. Page

Edward B. Page (1905–1994) was an architect who fit the description of many identified by Pierluigi Serraino in his book, *NorCalMod: Icons of Northern California Modernism*, as largely forgotten but important players in a vital period of architectural practice after World War II.²⁶ Like many in that period, Page was trained in the Beaux-Arts method and exposed to traditional ideas about planning and style. But in his own work Page was a modernist. He is remembered today largely for his design of one building, the Fireman's Fund Home Office in San Francisco, but in his day was well-recognized for his expertise and for the designs of a number of buildings.

Edward Bradford Page was born in Alameda, a member of the fourth generation of his family in the Bay Area. His great grandfather was a physician from Philadelphia who practiced medicine in Chile, acquired Rancho Cotati in Sonoma County in 1850, and designed a utopian plan for the town of Cotati. Edward Page was one of five brothers and the son of Charles R. Page who became president of the Fireman's Fund Insurance Company in 1937 and served as Chairman of the Board of Directors from 1943 to 1962.

Edward Page studied engineering at the Sheffield Scientific School at Yale and upon graduation in 1928 started another undergraduate course of study in architecture at the Yale School of Fine Arts. He was critical of the program and was encouraged to take a leave of absence. He spent the year 1930 traveling and studying architecture in Europe. Living mostly in Paris, his inclinations toward architectural modernism were confirmed by a brief disillusioning experience working on a competition entry for the Grand Prix de Rome for Jean Labatut at the Ecole des Beaux Arts. He also studied at the Ecole Americaine at Fontainebleau.

Describing himself in later years, as recorded in an interview at the Environmental Design Archives of the University of California at Berkeley, he rejected the traditions of the Beaux Arts and learned as much as he could about modernism. He said that the most valuable part of his education at that time was in Paris cafes, particularly Les Deux Magots which was renowned as a center for artists, writers, and other cultural figures and had an "architects' table"—"you sat there long enough and every architect in the world who came to Paris would come by." In this way he

County and State

met prominent and experienced architects from all over, people who as a young student he would have had no opportunity to talk with otherwise. "We were all rebels," he said, "well into the Modern world of architecture, sneering at the Beaux Arts."²⁷

After a year he returned to Yale and, in 1932, received a degree in architecture. He returned to San Francisco at the worst part of the Depression. There was no work in architecture but he got a job as a laborer building the Bohemian Club, an experience that gave him a ground level view of construction and corresponded to one of the essential elements of an education at the Bauhaus.

From 1934 to 1936, Page worked as a junior draftsman for Arthur Brown, Jr., San Francisco's pre-eminent Beaux-Arts architect. In that job, he prepared full size details of pediments, cornices, and other decorative features used in the Department of Labor-Interstate Commerce Commission complex in Washington, D.C. Contrary to his expectations, he came to admire Brown and his work. Without giving up his Modernist ideals, he later modeled his own practice in part on the observation that Brown "did things with pride, never turned out anything second class," and never let considerations of money affect the level of his efforts.²⁸

In 1936, Page moved across the hall on the eighth floor of 251 Kearny Street to the office of Bakewell & Weihe. John Bakewell, Jr. was a distinguished Beaux-Arts architect and had been Arthur Brown's partner, and Ernest Weihe was also educated in Paris in the Beaux-Arts method. When business was slow in the office, Page was allowed to work there on his own projects and in 1937-1938 was a draftsman for the Golden Gate International Exposition (G.G.I.E.). Later in life he remembered his design for the Island Club (demolished) at the G.G.I.E. with particular pride. In that job he met John J. Gould and Henry J. Degenkolb with whom he formed a close friendship.²⁹ Later, Gould and Degenkolb's postwar firm would be the structural engineers for the Fireman's Fund Home Office and Page and Degenkolb worked on several projects together in the course of their careers.

After receiving his architectural license in 1938, Page worked for himself and for others on small projects from 1939 to 1942. On one of these projects, for Lewis Hobart, another prominent Beaux-Arts architect, he worked on drawings for the floor of Grace Cathedral. From 1942-1947, he worked as the Chief of Architecture and Engineering for San Francisco architect Wilbur D. Peugh supervising wartime projects for U.S. Naval Operations.

In 1947, Page opened his own office in San Francisco. Many of his early projects were in association with others, including the Glen Crags Housing Project with Wilbur D. Peugh in 1951 and two schools with Cantin & Cantin in 1952. His design for the 1954 Mason B. Wells house in Belvedere won an Award of Merit from the Northern California Chapter of the American Institute of Architects.

As Serraino observed, many Modernist architects of the postwar generation in the Bay Area, did not seek publicity and, despite the quality and success of their work were not well recognized and have not been remembered. Edward Page's approach to his practice fit this profile. He did not seek publicity, he intentionally kept his office small so he would have control over his own projects, and he obtained work largely through referrals. "I operated by selling trust," he said, which was gained by "achieving competence" in dealing with client's needs from listening and responding.³⁰

When Page was hired in 1954 to design the Fireman's Fund Home Office, his father was Chairman of the Board of Directors. He insisted however, that he earned the job over many competitors through a series of small projects for the company. One lead to another over a period of time and when the big job came up, he had gained the trust and respect of company managers. On the Fireman's Fund project, Page coordinated the contributions of all. He was described as "the master" by Loring Wylie, an engineer in the Degenkolb office who had a major role working on the additions of the 1960s. Wylie remembered Page's deep involvement with and lead in solving issues with expansion joints as representative of his high level of competence and control.³¹ On another technical matter, he designed an innovative system of dispersed lighting for Fireman's Fund in an effort to provide better working conditions.³²

Following the success of the first phase of the Home Office in 1957, Page designed three subsequent additions in 1963–1967, and branch offices in Fresno, Riverside, San Jose, and Los Angeles. He also consulted on the designs of branches outside of California including those in New York, New Orleans, and Atlanta, where he advised primarily on matters related to the way the insurance business works. Apart from Fireman's Fund, his later projects included his own residence in Sausalito, a garage at the San Francisco airport, and the Faculty Club at Stanford University.³³

³⁰ Page, interview.

³¹ Wylie, telephone conversation.

³² Cosby, telephone conversation.

³³ Page's interests extended to history and preservation. With three others including the engineer John J. Gould, he founded the Fort Point Museum Association in 1959. The association initiated efforts to preserve Fort Point, now a part of the Golden Gate National Recreation Area.

In the work of Edward Page, the Fireman's Fund building was the high point of his career in several ways. It was his largest and best-known building. Its success led to work on at least seven other buildings for Fireman's Fund over the next fifteen years – Fireman's Fund would be the most important client in the history of the firm. Page's success with Fireman's Fund also opened the door to work for other corporate clients.

The International Style design of the Fireman's Fund building represented Page's personal experience of the formative period of modernism in Europe before the Bauhaus was closed by the Nazis and its leaders scattered to the United States and elsewhere. Modernism in America was initially shaped largely by immigrant architects from Europe and by Americans who studied in the United States with European immigrants like Walter Gropius, Mies van der Rohe, and Le Corbusier. Page was among a small number of Americans whose travels and encounters with modernist architects in Europe directly shaped his ideas about architecture. As his largest and best-known building, the Fireman's Fund building is the foremost example in Page's work of this experience.

The core of Bauhaus teachings was about more than the appearance and style of buildings. It was also about the process of design, the relationship of architecture and engineering, the fundamental role of engineering in architecture, and the role of the architect as the master of a collaborative effort. The Fireman's Fund building represents these things in the work of Edward Page. Working with a team that included distinguished engineers, designers, and contractors, Page was recognized and admired as the master in charge whose vision and principles were realized under his leadership.

In 1968, Edward Page took on two partners, John U. Cloudsley, Jr. and John Baleix, long-time employees who had both been hired when the work on the Fireman's Fund Home Office began. The firm of Page, Cloudsley & Baleix continued as the architects for all work on the Home Office, all of which was for interior remodelings, as long as Fireman's Fund owned the property. The principal work of the firm was for Fireman's Fund and remodeling downtown office buildings.³⁴

Engineers: John J. Gould & H. J. Degenkolb, Structural Engineers

The structural engineer for the original 1957 phase of the Fireman's Fund Home Office was the firm of John J. Gould & H. J. Degenkolb. Henry J. Degenkolb had been an employee of Gould until he became a partner in 1956. Fireman's Fund was the first big project of the new

³⁴ John U. Cloudsley, Jr. (1926–2013), grew up in Stockton, the son of an architect. John Baleix (1928–2014) grew up in Oakland. Both studied architecture at the University of California at Berkeley. Both spent their entire careers with Edward B. Page and Page, Cloudsley & Baleix except for three months in 1959 when Baleix worked for Reid, Rockwell, Banwell & Tarics.

partnership. After Gould died in 1961, the firm continued as Henry J. Degenkolb & Associates. The Degenkolb firm designed the principal additions to the Fireman's Fund Home Office in the period 1963–1967.

John J. Gould (1898–1961) was born in Switzerland and studied at the Engineering School in Zurich. He worked in Switzerland, Germany, France, the Middle East, and New York City before coming to San Francisco in 1925. From 1933 to 1935 he worked for the State Division of Architecture where he was involved with issues of seismic safety for schools. In 1935 he became the Chief Structural Engineer for the Golden Gate International Exposition. In 1940 he started his own firm. He was active in professional organizations and served as president of the Structural Engineers Association of Northern California. He had a particular interest in the effects of seismic forces on buildings and in designing safely in relation to those forces.

Henry J. Degenkolb (1913–1989) received a B.S. degree in civil engineering from the University of California in 1936. In 1937–1938 he worked for John J. Gould at the San Francisco Bay Exposition Company designing facilities for the Golden Gate International Exposition. During World War II he worked in various industries and in 1946 he was hired by John J. Gould as the firm's chief engineer. Looking back on his career in 1986 he said, "John [Gould] ran the office—that is, the business, the contracts, the management—and I was the center of the back room. I ran the drafting and the design and everything like that."³⁵ From this, it appears that Degenkolb was the principal structural designer of the Fireman's Fund Home Office in all its phases.

The Firm designed many of San Francisco's major structures of the 1940s–1960s including Park Merced, the International Building, the Bank of California tower, expansion of the San Francisco airport, parking garages at St. Mary's Square and the Civic Center, and many branches of the Bank of America and Pacific Telephone. The Fireman's Fund Home Office was the first large project of the firm after Degenkolb became a partner. According to the National Academy of Engineering, Henry J. Degenkolb "was responsible for the structural design of some of the most distinctive structures in California."³⁶

Henry J. Degenkolb was a man of enormous energy and accomplishment. He was an "earthquake chaser" who traveled to earthquake sites around the world to better understand the effects of seismic forces on buildings. He was active in many professional groups, especially those concerned with seismic issues and building codes. At the time of the completion of the Fireman's

Fund Home Office in 1957 he was president of the Structural Engineers Association of Northern California. He was also a lecturer in engineering at the University of California from 1946 to 1961.

The Fireman's Fund building was the first major project of the firm of John J. Gould and H.J. Degenkolb, which later became Henry J. Degenkolb & Associate. The firm is noted for its innovative designs in a long-lived practice that has included many of San Francisco's major structures during the initial design and subsequent expansions of the Fireman's Fund building and continuing up to the present day. The Fireman's Fund building—with its innovative structural design that provided open floors with minimal columns and exterior walls of glass—was a successful debut for the partnership of John J. Gould and Henry J. Degenkolb and for Degenkolb's role as principal designer of the partnership and his subsequent practice after Gould's death. Fireman's Fund represents the beginning of the reputation of Gould and Degenkolb as among the leading structural engineers in San Francisco in the post-World War II period.

Landscape Architects: Eckbo, Royston, and Williams (ERW)/Eckbo, Dean, Austin, and Williams (EDAW)

In 1945, Garrett Eckbo, Robert Royston, and Ed Williams—three of the pioneers of modern landscape architecture—formed the partnership of Eckbo, Royston, and Williams (ERW). The firm was responsible for the original mid-1950s landscape design for the Fireman's Fund site, which embodied the characteristics of the modern movement in landscape architecture after World War II. The firm's projects (1945–1958) helped to expand the profession of landscape architecture beyond the scale of the individual residential garden and contributed to the popularization of the modernist landscape design vocabulary and to modernism as an approach to creating outdoor spaces that addressed contemporary needs. The American Society of Landscape Architects (ASLA), in a history that accompanied an award presented to EDAW (its successor firm), noted that ERW “established a compelling portfolio of modernist landscapes.”³⁷ The partnership soon became “one of the leading firms in the country, highly regarded for its advanced planning, innovative modern vocabulary, and its quality of execution,”³⁸ and in 1950, ERW was awarded the Gold Medal in Landscape Architecture by the New York Architectural League.³⁹

ERW actively promoted its work and was regularly written about in popular magazines, professional journals, and newspapers of the era; examples include *Sunset*, *House Beautiful*, *House & Garden*, *Architectural Review*, *Progressive Architecture*, and *Architectural Record*. Additionally, ERW designs were regularly used to illustrate a reoccurring feature on modern residential landscape design that ran in the *Los Angeles Times* during the 1950s. The firm gained additional exposure in the early 1950s after Eckbo's book *Landscape for Living*, which was illustrated with examples of ERW's work, was published. The book defined "the modern discipline of landscape architecture for his professional peers and a broader readership"⁴⁰ and placed these ideas within the context of the post-World War II society.

As was true of all landscape architectural practices during the early years after the war, ERW was heavily involved in creating residential gardens. By the early 1950s, ERW had "hundreds of completed gardens in four states," with more than 50 located in Marin County alone and others in virtually all of the developing suburban communities in the Bay Area.⁴¹ The firm was a pioneer in expanding the practice of landscape architecture into the scale of neighborhood and community design.⁴² The Standard Oil Rod and Gun Club in Richmond (1949) was Royston's (and the firm's) first major park commission. "The facility was an immediate success and attracted the attention of Bay Area planners representing several municipalities."⁴³ Other park and playground projects soon followed, "many of which gained attention in the national media."⁴⁴ The firm worked on numerous new housing projects in both northern and southern California. The 258-acre cooperative housing project of Ladera on the San Francisco peninsula featured an innovation design with "a linear park which tied together the residential clusters and separated automobile and pedestrian circulation."⁴⁵ This was an early application of Royston's concept for the "landscape matrix," which was his term for the use of connective or continuous open space around which the balance of the design was oriented.⁴⁶ The implementation of this concept into community planning was a major innovation within the profession.⁴⁷

In addition to Fireman's Fund, ERW worked on a range of public outdoor spaces in San Francisco in the post-World War II era including the Venetian Room Roof Garden at the

Fairmont Hotel (1946), the entrance court to the Palace of the Legion of Honor (1950), Portsmouth Square (1954), and St. Mary's Park (1957). St. Mary's was one of the earliest large-scale roof-top gardens in the city and sat atop a parking garage in the Chinatown neighborhood. ERW was the landscape architect for Stonestown, a retail, residential, and office complex in the suburban western part of San Francisco (built between 1949 and 1952).

In 1946, Eckbo moved to Los Angeles and opened a second office. This move "expanded the firm's opportunities and gave each partner more breathing space."⁴⁸ Royston and Williams, both of whom lived in Marin County, remained in the San Francisco office. Although each partner typically took the lead on a specific project and then oversaw all phases of the work, the designs were generally a combination of individual and collaborative input. Williams, describing the partners working methods in a 1952 profile in the *Marin Independent*, stated that "although we work as individuals—there is a complete exchange of ideas."⁴⁹ Another profile of the firm, in the September 1946 issue of the *Architect and Engineer*, explained that the three met as needed in Paso Robles, which was the halfway point between their two offices, "to continue and extend the original ideal of their association which is based upon the premise that three minds are better than one if the best each one has to offer is brought to the fore."⁵⁰

In their history of this pioneering firm in the book *Invisible Gardens: The Search for Modernism in the American Landscape*, Peter Walker and Melanie Simo noted that "although each [partner] was unquestionably capable of running his own firm . . . the three achieved greater strength and flexibility in partnership. Eckbo, the preeminent theorist and reformer, not only led the firm intellectually but also had a broad vision of the potentialities of the field—perhaps broader than any other practitioner at the beginning of the postwar era in the United States. Royston, a gifted designer with a fascination for formal exploration, remained deeply committed to the social purposes of his built work, particularly the private gardens, neighborhood parks, and playgrounds."⁵¹ Williams was "an open space enthusiast who, long before the environmental movement, saw the importance of managing urban growth and conserving natural environments."⁵²

In 1958, the ERW partnership was amicably dissolved. Robert Royston formed a new firm with Asa Hanamoto and David Mayes, two associates at ERW. Eckbo and Williams along with Francis Dean, who had become an ERW partner in 1953, formed Eckbo, Dean, and Williams.

With the addition of Don Austin, in 1964, the partnership became Eckbo, Dean, Austin, and Williams (EDAW). The firm officially became known as EDAW in 1973.

During the 1960s, landscape architectural firms became involved in planning and analysis for entire regions not just individual communities. EDAW, "guided by a progressive vision of the leadership role of landscape architecture,"⁵³ took on these larger scale projects and was at the forefront of this expansion of the profession. The firm prepared California's first state-wide open space study and followed this with a similar plan for the State of Hawaii.⁵⁴ During this period, EDAW began to work on international projects, and as a result of this work, EDAW is recognized as having made a significant contribution to opening the door for western design and planning firms to work in Asia. As it expanded the scale and complexity of its work, EDAW added new professional skills to its capabilities and became recognized for its environmental resources planning and management and its visual analysis capabilities.⁵⁵

By the 1990s, EDAW had grown into a 400-person firm with sixteen offices, including ones in London, Sydney, and Hong Kong that accommodated the needs of its growing international presence. Its expertise ranged from "urban planning and urban regeneration to environmental management and resort design."⁵⁶ Examples of three projects that illustrate the scope of the firm's work include a plan for the restoration of the Everglades, Washington, D. C.'s Monumental Core Framework Plan, and the Jinji Lake Waterfront, a masterplan for a new 600,000-person community, in Suzhou, China.⁵⁷

In 2005, EDAW, was acquired by AECOM Technology Corporation, "an expanding family of companies offering integrated services in engineering, transportation, planning and environmental expertise."⁵⁸ The firm continued to operate as a distinct entity, as EDAW AECOM, until 2009. At that time, the EDAW name was retired as AECOM fully merged the identities of all its subsidiary firms under the AECOM logo.⁵⁹ In recognition of the firm's contributions to the profession of landscape architecture ASLA awarded EDAW the Landscape Architecture Firm Award in 2009.⁶⁰

Garrett Eckbo

Garrett Eckbo (1910–2000) was born in New York but moved with his family to Alameda, California in 1912, where he spent the remainder of his childhood. He studied landscape architecture at the University of California, Berkeley and graduated in 1935. After a one year stint designing residential landscapes for a nursery business in Los Angeles, Eckbo placed first in a nationwide design competition and received a scholarship to Harvard's Graduate School of Design; he graduated with a Masters in Landscape Architecture in 1938. While at Harvard, Eckbo chafed at the restrictive Beaux Arts education that dominated the landscape design department. He found more in common with the idea that "architecture and design had a social role and could help improve the quality of life," which was being put forth by Bauhaus founder Walter Gropius and architect/designer Marcel Breuer, both of whom came to Harvard after fleeing Nazi Germany.⁶¹ It was during this period that Eckbo began his life-long practice of writing about his ideas and pushing to expand the boundaries of the landscape architecture profession. In 1938–39, he published, with Harvard classmates Dan Kiley and James Rose, three articles in *Pencil Points* (a leading architectural journal) that described their modernist design ideals and laid out how society, ecology, and landscape architecture were interrelated; these essays became known as the "Harvard Revolution" and helped to usher in the modern era of landscape design.⁶²

Eckbo directly influenced several generations of practitioners through his teaching—first at the University of Southern California (1946–58) and then at the University of California, Berkeley (1963–1969) where he was chair of the Department of Landscape Architecture—and through his writing. His book *Landscape for Living*, first published in 1950 and illustrated with examples of work by ERW, defined "the modern discipline of landscape architecture for his professional peers and a broader readership"⁶³ and put these ideas into the context of the post-World War II society. Eckbo went on to write additional books, each of which continued the themes of his first book within different contexts. He devoted the last ten years of his life to "theoretical study and publication."⁶⁴ His last book, *People in a Landscape*, was published in 1998 and continued reoccurring themes of his professional life that landscape design can be an agent of societal change⁶⁵ and that "landscapes can link society and nature."⁶⁶

County and State

In his numerous residential designs of the 1950s, Eckbo developed a “contemporary vocabulary drawn from the arts of painting and sculpture” that resulted in “spaces and forms that viewers read immediately as modern.”⁶⁷ A sampling of his other major design contributions—which illustrate the breadth of his work—include his collaboration (1939–1942) with architects Vernon DeMars and Burton Cairns and landscape architect Francis Violic in applying modernist ideas to the design of approximately 50 migrant worker’s camps for the Farm Security Administration; the widely-publicized ALCOA Forecast Garden (1952–1966) where Eckbo demonstrated the multiple uses for aluminum in the landscape; the Fulton Mall (completed in 1964) which redesigned Fresno’s central business district into a pedestrian mall in an effort to retain its viability as a regional retail center; and the Union Bank Square in Los Angeles (1968), a three-acre plaza next to the 40-story Union Bank headquarters where the design’s “biomorphic and organic forms recall paintings by Joan Miro.”⁶⁸

In their book *Garrett Eckbo: Modern Landscapes for Living*, that accompanied an exhibition on his life, work, and influences on the profession at the University Art Museum in Berkeley in the late 1990s, Marc Treib and Dorothy Imbert wrote that Eckbo “played a central role in the formation and practice of modern landscape architecture”⁶⁹ and is considered “. . . one of the most influential landscape architects of this century, fitting design to the needs and desires of contemporary life. His contribution [was] distinct for addressing in equal measure society, the natural landscape, art, and technique.”⁷⁰ He was awarded the American Society of Landscape Architects (ASLA) Medal (1975), the highest honor bestowed on an individual by the society. In 1998, he became the first person to be named a Distinguished Alumnus at the University of California, Berkeley’s College of Environmental Design.

Robert Royston

A California native, Royston (1918–2008) was raised on his family’s walnut ranch in the Santa Clara Valley and received his degree in landscape architecture from the University of California, Berkeley in 1940. After serving in the United States Navy during World War II, Royston returned to the Bay Area and joined Eckbo and Williams to form ERW in 1945. In 1958, Royston separated from ERW and formed Royston, Hanamoto, and Mayes (RHM). The Royston firm had a number of different partnership structures and names through the years before becoming Royston, Hanamoto, Alley, and Abey (RHAA) in 1979. RHAA continues to exist today and maintains offices in San Francisco and Mill Valley.

Royston played a major role in the development of the post-World War II landscape in the Bay Area, and, as noted in a profile in the *San Francisco Chronicle* in 2006, “it’s hard to spend a day in the Bay Area without seeing a landscape designed by the firm.”⁷¹ Royston’s firm designed the landscapes associated with civic buildings, numerous education campuses and planned communities, and over sixty parks.⁷² His early suburban park projects—undertaken between 1946 and 1965—are considered among the most important achievements of his career. In their book *Modern Public Parks: Robert Royston and the Suburban Park*, Reuben Rainey and J. C. Miller made the following assessment of this contribution: “During this twenty year period Royston and his professional partners created a series of suburban parks of varying scale that pioneered new directions in American park design. These projects were innovative in their spatial organization, design details, and materials, creatively reshaping American park design traditions to meet the unprecedented needs of postwar suburban expansions. They attracted national attention in design periodicals and earned a number of design awards from the American Society of Landscape Architects.”⁷³

By the time he retired in 1998, Royston was widely recognized as one of the pioneers in modern landscape architecture. He influenced the profession through his design innovations in the 1950s and 1960s, the collaborative work of his firm, and his impact on future landscape architects as an educator at his alma mater and other institutions. Royston was awarded numerous awards during his career including ASLA Fellow (1975), the AIA Medal (1978), and the ASLA Medal (1989), the highest honor awarded by the organization.⁷⁴ In 2000, he was named a Distinguished Alumnus at the University of California, Berkeley’s College of Environmental Design.

Ed Williams

Ed Williams (1914–1984) was born in Pittsburg, Pennsylvania in 1914 but moved with his family to Berkeley in 1929. He was a classmate and friend of Eckbo’s at UC Berkeley and graduated with his degree in landscape architecture 1935. The range of his work, cited in a profile of ERW in the *Architect and Engineer* in 1946, highlighted both William’s interests and the expanding breadth of the profession of landscape architecture; the article stated that he had designed parks and playgrounds, had worked on preparing a post war program of public works for San Mateo County that “served as a model for other counties and communities,” and had experience in zoning, transit surveys, master planning, subdivision design, private gardens, and

estates. During World War II, he became the head of the mechanical engineering section at Western Pipe and Steel.⁷⁵

In 1940, he and Eckbo founded their first partnership. Williams went on to be a founding partner in the two important twentieth century landscape architecture firms—ERW and EDAW—that evolved from this initial partnership. Williams remained in the EDAW partnership through the rest of his career. In a profile on the ERW in *Invisible Gardens: The Search for Modernism in the American Landscape*, Peter Walker and Melanie Simo noted that Williams was a “skillful designer” who had “placed second in the national competition that sent Eckbo to Harvard.”⁷⁶ However his real impacts on the profession were in his work in environmental planning and his management abilities that nurtured the growth of EDAW from a small firm to a large corporation with offices around the globe. Walker and Simo noted that “as the firm grew, Williams assumed more responsibilities in management and planning. For his partners and younger associates, he remained a stabilizing influence—a rock of integrity in a fluid, changing world.”⁷⁷ In the 1960s, Williams became the partner in charge of EDAW’s large-scale planning efforts and was at the forefront of expanding the profession into environmental planning. He directed EDAW’s efforts for California’s first state-wide open space study in the mid-1960s and a similar plan for the State of Hawaii.⁷⁸ Williams was made a Fellow of ASLA for his designs and for his service to the profession.⁷⁹

Evaluation

The Fireman’s Fund Insurance Company Home Office is significant under Criterion C as the work of three masters, the architect Edward B. Page, the engineering firm of John J. Gould & H.J. Degenkolb/Henry J. Degenkolb & Associates, and the landscape architectural firm of Eckbo, Royston, & Williams (ERW)/Eckbo, Austin, Dean, and Williams (EDAW).

Edward B. Page was a member of the postwar generation of architects in the Bay Area who introduced modernism on a large scale to the area. He was also a direct link through his experience as a young man, to the architectural ferment over modernism in Europe. The Fireman’s Fund Insurance Company Home Office was his largest and best-known project and is the best representative of his career and work.

John J. Gould & H.J. Degenkolb/Henry J. Degenkolb & Associates and its successor Degenkolb Engineers has been one of the leading structural engineering firms in California from its

founding to the present day. The Fireman's Fund building—with its innovative structural design that provided open floors with minimal columns and exterior walls of glass—represents the beginning of the reputation of Gould and Degenkolb as among the leading structural engineers in San Francisco in the post-World War II period.

ERW was established in 1945 by three of the pioneers of modern landscape architecture—Garrett Eckbo, Robert Royston, and Ed Williams. ERW was responsible for the original mid-1950s landscape design for the Fireman's Fund site, and its successor firm EDAW designed the landscape features associated with the mid-1960s additions. During the period of significance, ERW /EDAW was recognized as one of the country's leading landscape architectural firms. Their designs and writings contributed to the popularization of the modernist landscape design vocabulary and to modernism as an approach to creating outdoor spaces that addressed contemporary needs within a broad range of settings. The Fireman's Fund site is significant as an example of the firm's mastery of modern design within the corporate landscape context.

CRITERION C: ARCHITECTURE/LANDSCAPE ARCHITECTURE

The Fireman's Fund Insurance Company Home Office is a single property that has significant components of architecture and landscape architecture, each of which has a specific context. These contexts are presented below followed by an evaluation of the property as a whole.

Modern Architecture

The design of the Fireman's Fund Home Office Building drew on the main stream of the history of Modern Architecture, beginning with its European origins: the Bauhaus and the International Style. At the same time, it was influenced by the forces that translated European modernism for the United States.

The Bauhaus, founded by Walter Gropius in 1919, was a school of the arts that sought to heal the division that many saw between the arts and craftsmanship, a division that was an outgrowth of capitalism and the industrialization of western society. The school taught a great variety of crafts and building construction along with theory of art. All of these things could be brought together in architecture, unofficially the first among equals. Unlike the Arts and Crafts Movement, the Bauhaus taught that good design, which was the product of this education, should be applied to mass production and that this was necessary in a modern highly technological society. The mass production of well-designed products including building parts and buildings was an important means of addressing the need for housing and other social issues. The creation of beautiful and useful products in a technological society required collaborative efforts that combined art, craftsmanship, and engineering.

As an emblem of its ideals, in 1926 the Bauhaus moved from Weimar to a new building in Dessau. The building was a composition of rectangular wings, all but one of them two to four

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

stories in height, at right angles to each other. Each wing was functionally differentiated from the others and they were arranged so that they framed outdoor spaces. In this way the building and its outdoor spaces functioned together as one. The building was a modern structure of reinforced concrete with steel sash windows. No ornament was applied to the building apart from the lettering of its name.

The idea of the International Style was based in large part on the example of the Bauhaus and the work of its teachers and students. The style was named in a 1932 book, *The International Style* by Henry-Russell Hitchcock and Philip Johnson, who wrote it as a follow-up to an exhibition they curated at the Museum of Modern Art in New York. In 1964, Hitchcock said that the term, “defines a type of architectural design which came into existence in the early 1920s, developed at the hands of a few leaders to classic expression by 1930, and from that time on found wider and wider acceptance throughout the world.” Its three principal elements, he said, were “[1] a new conception of architecture as volume rather than as mass, ... [2] regularity rather than axial symmetry ... as the chief means of ordering design,” and [3] a proscription against “arbitrary applied decoration.”⁸⁰ The idea was not that the International Style was a single style but that it was a way of responding to technology that should be the same in any country and that it represented a viable way of addressing the needs for housing and other social problems.

Politics in Germany closed the Bauhaus in 1933 and many of its leaders came to the United States. Walter Gropius went to Harvard, Mies van der Rohe, the head of the Bauhaus at the time it closed, went to the Illinois Institute of Technology, and others went to various parts of the country. Other European modern architects not connected to the Bauhaus—Richard Neutra, Rudolph Schindler, Erich Mendelsohn, and Serge Chermayeff—went to California. These architects and Americans who were influenced by their work brought the International Style to the United States. Before World War II, the number of International Style buildings in the United States was extremely limited.

After World War II as it took hold in the United States, the International Style was embraced in varying degrees for different types of buildings and clients, perhaps most of all for corporate office buildings. In the process of its popularization, the designers and builders of the style omitted the social goals that were part of its original rationale. The style came to represent the values of modern corporations including faith in technology and solving problems based on reason and science. The design of International Style buildings depended on physical features like new technologies and materials. It also depended on a deep understanding of the purpose of buildings and on research on how they are to be used.

⁸⁰ Gerd Hatje, ed., “International Style,” *Encyclopedia of Modern Architecture* (New York: Harry N. Abrams, 1964), 151-155.

Fireman's Fund Insurance Company
 Name of Property

San Francisco, CA
 County and State

In San Francisco, the best-known early examples of the International Style were a few houses designed by Richard Neutra in the 1930s. After the war, Erich Mendelsohn designed the Maimonides Health Center in 1950. The office of Skidmore, Owings, & Merrill opened in San Francisco in 1945 and designed International Style buildings like Mount Zion Hospital in 1950, the Greyhound Maintenance Facility (now California College of the Arts) in 1951, and the Naval Post Graduate School in Monterey in 1954.

The most concentrated area of new corporate office buildings was in downtown San Francisco where the principal builder of these buildings was the insurance industry. Most but not all of these buildings were in the International Style. Of fifteen corporate office buildings downtown built between 1946 and 1965, thirteen were in some version of the International Style, one was in the Moderne Style, and one was based on Independence Hall in Philadelphia, an eighteenth-century Georgian Style brick building. Nine of the fifteen buildings including the Georgian Style building were for the insurance industry.

Modern Architecture had to do with more than the look of buildings. It had to do with the process of the design of buildings, with the adoption of new technologies and materials, and with the relationship of buildings to their surroundings, both their immediate surroundings and their greater surroundings—with their own site and with the city. It also had to do with the expression of the relationship between structure and technology, represented by Louis Sullivan's statement that "form follows function."

The architect of the Fireman's Fund Home Office Building, Edward Page, absorbed ideas about modernism from architectural journals, conversations with architects from many countries in Paris cafes, travel around Europe in 1930 to see early buildings of the Modern Movement, and from fellow architects of his generation. His experience, and that of the architectural profession in the United States in general during World War II reinforced many elements of the Modern Movement—the role of engineers, the use of new technologies and materials, designing without ornament, an economy of means, and the primacy of function as a generator of design.

According to Serraino, writing about San Francisco's modern architects in the 1940s–1960s, "Each took a stance on what being modern meant, and each practiced accordingly."⁸¹ Edward Page's approach to modernism put a premium on technology and sophisticated accommodation of function. Among the best-known figures of Modern Architecture, Page admired Eero Saarinen above all others because "he was the only one who understood that sixty percent of a modern

⁸¹ Pierluigi Serraino, *NorCalMod: Icons of Northern California Modernism* (San Francisco: Chronicle Books, 2006), 8.

Fireman's Fund Insurance Company

Name of Property

San Francisco, CA

County and State

building was mechanical equipment, electrical, and air-conditioning." Frank Lloyd Wright, Mies van der Rohe, and Le Corbusier did not understand this, he said.⁸²

While there is no known evidence of any direct connection, the Fireman's Fund Home Office echoes the design of several of the most influential International Style buildings. Its basic organizational concept is like that of the Bauhaus itself, an arrangement of low-rise perpendicular wings with separate functions and with the wings framing outdoor areas that function with the building. Like the famous property of Philip Johnson, one of the authors of *The International Style*, with its Glass House and its Brick House that were completed in 1949, one of the buildings of the Fireman's Fund Home Office is glass and the other is brick. Like the General Motors Technical Center in Warren, Michigan, designed by Eero Saarinen and built 1953–1955, the Fireman's Fund Home Office represents a radical departure from most contemporary corporate offices as a low-rise building on landscaped grounds in a suburban location.

Modernism in the Landscape

American landscape design during the late nineteenth and early twentieth centuries was based on ideals of the Ecole des Beaux-Arts. Books, such as *An Introduction to the Study of Landscape Design* by Henry Hubbard and Theodora Kimball (first published in 1917), codified an appropriate spatial organization, style, and features for various types of landscapes and emphasized that the designer's skill or creative input should be focused on how to adapt these standards or patterns to a particular site. Until the latter part of the Great Depression, all university landscape architecture programs in the country taught within this Beaux-Arts framework, and landscape designers absorbed this viewpoint during their training and put it into practice when they graduated. They typically selected or adapted structures, planting arrangements, and details, such as site furnishings, from multiple eras and European traditions to create a formal organization of landscape space with an eclectic mix of historical references.⁸³

By the late 1930s, a Modernist sensibility to landscape design had just begun to evolve. In 1938, Harvard professor and designer Christopher Tunnard published *Gardens in the Modern Landscape* in which he asserted that "the old values and the old forms . . . could no longer satisfy contemporary artistic and planning needs."⁸⁴ He believed that the right style for the twentieth century was no style at all but rather a new conception of planning the human environment.⁸⁵ Tunnard was reacting against the lack of connection between landscape design within the

San Francisco, CA
 County and State

predominant Beaux Arts tradition and the realities of modern life. Through his writing and teaching at Harvard, Tunnard championed a modern landscape commensurate in its conceptual and aesthetic authority to the best of modern architecture.⁸⁶

Modernism in the landscape first appeared in residential garden design⁸⁷, and during the 1940s, California designer Thomas Church became one of the leading interpreters of modernist tenets within this setting. The importance of California to the development of the modern landscape design movement continued after World War II. The explosion of residential landscape commissions that accompanied the postwar suburban housing boom provided landscape architects with increased opportunities to apply the tenets of modernism to gardens. *Sunset Magazine*, headquartered in Menlo Park, played a major role in popularizing a version of modernism suited to the California climate and lifestyle through its ongoing articles that showed the general public what a modern garden (and house) could look like and how it could function. Dianne Harris, in her article "Writing a Modern Landscape: Thomas Church as Author," noted that historians and theoreticians have recognized the essential role played by the popular press in publicizing modern design and in helping to promote a new way of seeing "that became essential to the formation of Modernism in design."⁸⁸ Modern design became an accepted expression of California's "age of abundance," historian Kevin Starr's characterization of the state's post World War II economic boom.⁸⁹

Garrett Eckbo, one of the principal theorists of modern landscape design, wrote that the "modernist approach to landscape architecture was concerned with the relationship of the landscape to modern architecture and the relationship within the site between space, materials, and people."⁹⁰ Modernism in landscape architecture reflected a concern for the specific site or space rather than an adherence to established patterns based on historical forms, which emphasized the Beaux-Arts principles of balance, symmetry, proportionality, and axiality. Designers rejected the axis and symmetry and instead used geometric and biomorphic forms for arrangements of hardscape, circulation, and planting which together often created abstract spatial compositions. In the residential designs where modernism was first expressed, there was a strong functional and visual relationship between interior and exterior space, as expressed in buildings featuring large expanses of windows, courtyards being framed by the buildings, and patios that

extended living spaces into the outdoors. Additionally, the same materials used for buildings were often used in the landscape's structures (such as walls or arbors) and paving. Rather than merely being a decorative element, plants were used to define outdoor space. The lawn became a symbol of the landscape in post-World II suburban communities and was used in small and large settings—individual homes, parks, commercial and educational campuses, and civic spaces—as an organizing element of space.⁹¹

Modern landscapes were intended for people to use and were adapted to the real lives and needs of the times. For example given the supremacy of the automobile in the post-World War II suburban environment, parking lots were incorporated as a conscious part of designs. The expanding post-World War II economy provided landscape architects with a multitude of opportunities to adapt the modernist vocabulary for gardens to the new parks, educational and commercial campuses, and civic spaces being developed in the post war economic boom. This expansion in the profession of landscape architecture was led by a new generation of landscape architects, which included at its forefront Garrett Eckbo, Robert Royston, and Ed Williams—the three partners in the firm responsible for the landscape design of the Fireman's Fund site.

Landscape of the Corporate Headquarters

A new type of cultural landscape, created by a synthesis of modernist buildings and landscape design, developed during the post-World War II era as corporate headquarters moved out of the central city. Louise A. Mazingo, professor of landscape architecture at the University of California, Berkeley and the author of several articles and a book on this development, has noted that corporations moved out of the urban core for a number of reasons. First and foremost, the larger sites available in the suburbs allowed corporations to construct new buildings that fit their current management structure and operational needs. "Efficient office organization now required flexible, expandable offices with movable partitions rather than fixed walls. The dense, constricted downtown became untenable."⁹²

By the early 1950s, insurance companies had spearheaded this exodus from the central business district to the peripheral residential areas of the city or to suburban sites. An article in *Business Week* in 1951, quoted by Mazingo in her article "The Corporate Estate in the USA, 1954–1964," noted that there were not enough downtown spaces "in the right places" to meet companies' needs for expansion. The management of these insurance companies believed that it was hard to "hire first class personnel" to work in downtowns that were viewed as undesirable environments. ("Management thinks workers will be happier looking at trees instead of grimy buildings and

San Francisco, CA
County and State

listening to birds instead of honking taxis.”⁹³) The integration of the architecture and landscape typically featured a low-rise, centrally-sited, modernist building(s), an entry drive and large parking lots which were a reflection of the domination of the automobile as the preferred means of transportation for employees and visitors, and an enveloping landscape setting or “green surround” which was often designed to resemble an idealized suburban space.⁹⁴ The buildings and parking lots occupied only a fraction of a site’s acreage and the landscaped lawns and outdoor spaces contributed to the “seamlessness between the interior and exterior space, which was a common goal of the modernist architectural aesthetic.”⁹⁵ Mozingo noted that corporations “considered the designed landscape essential to the functioning of their management facilities.”⁹⁶ This new type of corporate headquarters—with its modernist architecture and landscape—became a part of the effort to “reconceive the white-collar workplace, retain targeted employee groups, and signal eminent corporate standing,”⁹⁷ and resulted in what became an “identifiable place, creating a tangible symbol of the corporate persona.”⁹⁸

During the 1950s, landscape architects incorporated these new corporate headquarters in their practices. They became partners—with architects—in the creation of these new corporate environments and developed designs that established connections between the building, the site, and the surrounding landscape.⁹⁹ The site planning, automobile approaches, different hierarchies of entrances, parking lots, and lawns used to create an interface between the building and the surrounding landscape, and the outdoor spaces of the post-World War II corporate landscapes all exemplified the functionalism of mid-20th century modernism.¹⁰⁰

The development and design of the Fireman’s Fund Home Office, located on a 10-acre site on California Street outside of the traditional urban core of the city, was an example of this new corporate environment in San Francisco that exhibited all of these characteristics. An article in the *San Francisco Chronicle*, published to coincide with the official dedication on 9 July 1957, noted that architect Edward B. Page designed the Fireman’s Fund building “from inside out” to meet the specific nature of the insurance company’s work flow within and between departments. The article emphasized the building’s modern sensibility as expressed through the design and materials of the architecture, the company’s concern for the working environment, and an

identification with a suburban—rather than urban—landscape setting. This article noted that the new headquarters was “designed to provide efficient business operation and a maximum of light, air, and good morale.”¹⁰¹ The article described the contemporary nature of the building (its “glass, steel, and aluminum structure; the “ceiling to floor windows that permit sweeping vistas of the city’s skyline”; a “feeling of spaciousness”) while noting a range of amenities that acknowledged the needs of the employees including ample parking, a large cafeteria, and “lounges, reading rooms, guest rooms, and a sheltered outdoor terrace”—all of which were set within “extensive lawns and gardens.”¹⁰² Fireman’s Fund came to be recognized as a local expression of the modern suburban corporate headquarters.¹⁰³ It appeared in a 1969 article in the *San Francisco Sunday Examiner-Chronicle* that provided local examples of corporate plazas and landscapes that contributed to the common good while creating an identifiable image for the company. This article noted that “whereas insurance companies suffer chronically from a high rate of employee turnover, that problem has been minimal since Fireman’s Fund’s 1200 workers began enjoying the company park.”¹⁰⁴

Evaluation

The Fireman’s Fund Insurance Company Home Office, a single property including both architectural and landscape elements which were designed to complement each other, is significant under National Register Criterion C as an example of a corporate headquarters in San Francisco which reflects mid-twentieth-century modernist design principles. The property is a synthesis of International Style buildings and mid-twentieth century modernist landscape features which reflect key characteristics of a post-World War II suburban corporate headquarters. As an example of the International Style, the building itself expresses the use of new technologies and materials, designing without ornament, an economy of means, a focus on function, an orientation to the landscape, and a process of design that resulted in a characteristic expression in glass and concrete. Key characteristics of a post-World War II suburban corporate headquarters are expressed in the design’s centrally-sited modernist building within a park-like setting that accommodates the automobile as the primary form of transportation and through the arrangement of the office building’s low-rise perpendicular wings which frame outdoor spaces designed to function with the building. The design expresses mid-twentieth century modernist landscape forms and materials including the combination of geometric and biomorphic forms in the design of the Terrace, the use of brick and concrete materials in landscape structures and paving to promote the integration between architecture and landscape, and the presence of a

broad lawn—an iconic feature in suburban corporate landscapes during the post-World War II era—along the west side and south sides of the property.

BACKGROUND HISTORY OF THE PROPERTY

Laurel Hill Cemetery

The Fireman's Fund Insurance Company Home Office is located on the southeast corner of the site of the Laurel Hill Cemetery. The entire cemetery was in a multi-block area bound by Parker Avenue, California Street, Presidio Avenue, and a diagonal line from a point on Presidio Avenue between Sutter and Post Streets to a point near the intersection of Parker and Euclid Avenues.

Laurel Hill Cemetery was begun in 1854 as Lone Mountain Cemetery, one of four cemeteries established in the 1850s and 1860s in central San Francisco as Yerba Buena Cemetery and others further downtown filled up. The name was changed to Laurel Hill Cemetery in 1867. It was referred to as the "Pioneer Cemetery" and was the most prestigious San Francisco burial place for several decades.¹⁰⁵ The design of the cemetery followed the example of parklike cemeteries first built in the eastern United States in the 1830s-1840s with winding paths and landscaped grounds.

Among notable people buried there were Andrew Hallidie, inventor of the cable car; Charles Crocker, one of the Big Four builders of the transcontinental railroad; William Ralston and William Sharon of the Bank of California; and eleven U.S. senators. In addition to these and many other prominent people, there were 107 people in the Japanese Cemetery and an unknown number in the Serbian Cemetery. Altogether there were about 47,000 burials in Laurel Hill Cemetery.

A long effort to move all cemeteries out of San Francisco included banning of future burials in the city beginning 1 August 1901; a law requiring removal of cemeteries from San Francisco that was signed 17 January 1914; an eviction order from the City of San Francisco in November 1937; and removal of burials beginning 26 February 1940.

Laurel Heights

The cemetery land was purchased from the cemetery association by a real estate developer, Heyman Brothers, who announced in April 1941 plans to develop "an exclusive \$10,000,000 home district, including some 600 residential sites, as well as a million dollar business district"¹⁰⁶ on the site. The original intention was to offer five acres to the city for a park or playground. The residential neighborhood would be called Mayfair Terrace and the business district would be

 County and State

called Mayfair Village. Development of the property was delayed by World War II. When work resumed in 1947-1948, the residential area was called Laurel Heights and the business district was called Laurel Village. According to the builder, 75% of the home lots were developed by October 1949.¹⁰⁷ By April 1951, a citizen's group called the Laurel Heights Improvement Association had been formed to address neighborhood issues.

San Francisco Unified School District Proposed Site of Lowell High School

Around the time of the end of the war, on 27 June 1945, when the cemetery was gone and the revived development of the neighborhood was imminent, the San Francisco Board of Education initiated action to purchase a portion of the Heyman Brothers property as the site for a new Lowell High School campus. On 28 June 1946, the school district bought about twelve acres, about one fifth of the total area of the cemetery, in the northeast corner of the property for \$194,690. The site of the school property was shown on a November 1947 map called "Map of Resubdivision of a Part of Laurel Heights, San Francisco, Calif." By mid-1950, however, the Board of Education had selected another site for Lowell High School and announced its intention to sell the Laurel Heights property.

The school district offered the site to the San Francisco Department of Parks and Recreation as it was required to do, but preferred to sell it at the highest price possible, with the understanding that it could get \$450,000 for residential development and \$650,000 for commercial development. Zoned for residential use, prolonged and complicated negotiations were necessary to win approval from the City Planning Commission for a rezoning of the site for commercial use.

Taking an active role in the controversy, the Laurel Heights Improvement Association expressed concern that commercial use of the property would diminish property values and the quality of the neighborhood. Referring to the official map that was a reference for those who purchased residential lots, and the designation of the "Future Location of Lowell High School" on the map, the association stated to the City Planning Commission: "Purchasers had every right to believe that in the construction of this school the architecture would be of modern and attractive design, with proper setback lines, well landscaped grounds, open recreation fields, and off-street parking."¹⁰⁸ On 21 June 1951, the City Planning Commission granted the request of San

Francisco's Director of Property to withdraw the application which the City had filed on 27 April 1951 for reclassification of the property from First Residential District to Commercial District.¹⁰⁹

During a two-year period reports and rumors in the press, in newspapers, and in public documents and meetings indicated that interested parties in the property included unnamed potential builders of a tall office building, the federal government, and Fireman's Fund Insurance Company. In October 1952, San Francisco's Director of Property "asked for a speedy rezoning to escape Federal condemnation of the land."¹¹⁰ Also during this period, the city took approximately two acres from the southeast corner of the twelve-acre property for streets and a fire station.

Ultimately, after presentation of the drawings of an unnamed architect to interested neighbors, an agreement was reached for rezoning of the property for commercial use. This agreement, City Planning Commission Resolution No. 4109 of 13 November 1952, included six stipulations for any development of the site. These are, briefly: 1) that only professional, institutional, or office buildings and associated service buildings were allowed; 2) the total floor area of buildings was limited; 3) off-street parking was required in relation to the number of employees and visitors; 4) setbacks were required on the west and south except for minor service buildings; 5) any development for residential use was subject to planning guidelines; and 6) there must be "appropriate and reasonable landscaping of the required open spaces." Because of this rezoning agreement, all development plans for the property have had to be approved by the City Planning Commission to insure compliance with these requirements.¹¹¹

Verbal Boundary Description (Describe the boundaries of the property.)

The Fireman's Fund Insurance Company Home Office occupies Block 1032 Lot 3 as shown on the Assessor's Parcel Map (Map 4 and Map 5). The property occupies most of its block, a total of approximately 447,361 square feet or 10.2 acres. Its irregular shape can be described, clockwise, by California Street on the north, the boundary with an adjacent property (Block 1032 Lot 2) measuring 232.859 feet in length, Presidio Avenue, Masonic Avenue, Euclid Avenue, and Laurel Street.

Boundary Justification (Explain why the boundaries were selected.)

The property includes the entire parcel that was purchased by Fireman's Fund Insurance Company in 1953, all of which was developed by the company for its use.

Photographs

Submit clear and descriptive photographs. The size of each image must be 1600x1200 pixels (minimum), 3000x2000 preferred, at 300 ppi (pixels per inch) or larger. Key all photographs to the sketch map. Each photograph must be numbered and that number must correspond to the photograph number on the photo log. For simplicity, the name of the photographer, photo date, etc. may be listed once on the photograph log and doesn't need to be labeled on every photograph.

RE: 3333 California St. Development

23

Dear Ms. Woods:

(PD-5)

I am writing regarding the development of the 3333 California Street development, currently the UCSF Laurel Heights Campus (the "Site"). It is my understanding that the San Francisco Planning Department is working with the developer of the Site regarding the initial project plans for the proposed development. The owner of the fee interest and the developer of the Site are limited in their joint ability to develop the Site because the owner of the Site does not have free and clear title; rather the general public holds a permanent recreational interest in all of the open space at the Site. Therefore, any development plans at the Site may not impinge upon this open space.

The general public holds a **permanent** right of recreational use on all of the open space at 3333 California and such rights were obtained by implied dedication. Dedication is a common law principle that enables a private landowner to donate his land for public use. Implied dedication is also a common law principle and is established when the public uses private land for a long period of time, which period of time is five (5) years in California. In 1972, the California legislature enacted Civil Code Section 1009 to modify the common law doctrine of implied dedication and to limit the ability of the public to secure **permanent** adverse rights in private property. Here, however, the existing open space at the Site was well established and well used as a park by the general public long before the completion of the construction of the full footprint of the improvements at the Site in 1966. Therefore, the general public has permanent recreational rights to the open space at the Site; the rights were obtained by implied dedication prior to the enactment of Cal. Civil Code Sec. 1009 in 1972.

Even if the general public had not secured permanent rights to recreational use through implied dedication prior to 1972, the public and countless individuals have acquired a prescriptive easement over the recreational open space. The recreational use has been continuous, uninterrupted for decades, open and notorious and hostile (in this context, hostile means without permission). Every day, individuals and their dogs use the green space along Laurel, Euclid and along the back of the Site at Presidio. Individuals ignore the brick wall along Laurel and regularly use the green space behind the wall as a park for people and for their dogs. The use of the Site has not been permissive. For example, the owner of the Site has not posted permission to pass signs in accordance with Cal. Civil Code Sec. 1008. If such signs ever were posted, they have not been reposted at least once per year. Although it is counterintuitive, an owner typically posts such signs to protect against the public securing adverse rights. One might assume the owner of the Site has not posted such signs, as the owner is aware of the pre-existing and permanent recreational rights the general public has secured to the open space. Because the

public's rights to the open space were secured decades ago through implied dedication, it is not necessary for the general public to rely upon its prescriptive easement rights outlined in this paragraph; rather it is another means to the same end.

It is important that the Planning Department understand these legal issues as any project plan (or any future project description in an Environmental Impact Report ("EIR") for the Site) cannot include development of the open land over which the public has a secured permanent rights of recreational use. It would not be a concession by the owner/developer to leave the open space undeveloped and allow public recreational use as the general public holds permanent recreational rights to this space. It is important to note that even the open space behind the walls that has been used as park space is also included in this dedication to the public. According to well-established case law, a wall or fence is not effective in preventing the development of adverse property rights if individuals go around the wall, as is the case here.

In sum, the open space at the Site cannot be developed as the public secured such rights through implied dedication prior to 1972 (or, alternatively, by prescriptive easement). In reviewing the development plans for the Site, the City cannot decide to allow development of any of the open space as the recreational rights to the space are held by the public at large. Any project description in the future EIR for the Site that contemplates development of any of the open space would be an inadequate project description and would eviscerate any lower impact alternative presented in the EIR. One only need to look to the seminal land use case decided by the California Supreme Court regarding this very Site¹ to see that an EIR will not be upheld if the project alternatives are legally inadequate. It would be misleading to the public to suggest that a lesser impact alternative is one that allows the public to use the space to which it already has permanent recreational use rights.

In sum, please be advised of the public's permanent recreational rights to all of the existing open space at the Site and please ensure that a copy of this letter is placed in the project file.

Sincerely,

Meg Fitzgerald

IMPACTS

Significance Thresholds

The proposed Housing Elements would normally have a significant effect on the environment if they would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment which contribute to a scenic public setting;
- Substantially degrade the existing visual character or quality of the site and its surroundings; or
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area or which would substantially impact other people or properties.

Impact Evaluation

As discussed previously, the 2004 Housing Element and 2009 Housing Elements would not change the land use objectives and policies in the City's area and redevelopment plans. According to Part I of the 2009 Housing Element (Data and Needs Analysis), the City has available capacity to meet the RHNA. Therefore, the rezoning of land uses is not required. To meet the City's share of the RHNA, the proposed Housing Elements aim to do the following: 1) preserve and upgrade existing housing units to ensure they do not become dilapidated, abandoned, or unsound, and 2) provide direction for how new housing development in the City should occur. With respect to the latter, the 2004 Housing Element encourages new housing in Downtown and in underutilized commercial and industrial areas. The 2004 Housing Element also encourages increased housing in neighborhood commercial districts and mixed-use districts near Downtown. The 2009 Housing Element encourages housing in new commercial or institutional projects and accommodating housing through existing community planning processes.

Impact AE-1: The proposed Housing Elements would not have a substantial adverse effect on a scenic vista. (Less than Significant)

New residential housing could result in an impact related to scenic vistas if it would be developed in a manner that obstructs views from a scenic vista from a public area or introduces a visual element that would dominate or upset the quality of a view. The proposed Housing Elements do not change the allowable development in the City. However, the Housing Elements may promote increased density (as described below) which could result in greater bulk and mass of buildings thereby potentially affecting scenic vistas.

As shown in Figure V.C-2, important vistas are primarily viewed from public parks or open space, which would not be at risk for conversion to housing uses. New housing could also encroach into a scenic vista and alter the appearance of the vista. As discussed previously, Telegraph Hill, Russian Hill, Pacific Heights, Buena Vista, and Dolores Heights are areas with outstanding visual features that are unique to

Generally, allowable height and bulks, as established in the San Francisco Planning Code are intended to reflect the City's topography and take advantage of the City's scenic vistas. However, individual development projects could have the potential to affect scenic vistas; this issue is appropriately considered in the project-specific environmental review of proposed new development. Additionally, in some circumstances, modified controls such as increased height limits could result in reductions to building bulk and preservation of views that might otherwise be blocked by a more massive structure. For example, the EIRs for Transbay Terminal⁸ and Rincon Hill⁹ areas identified this relative difference in the effect of building heights and massing and the respective EIRs for these projects appropriately evaluated increases in building heights. However, it is possible that changes in density standards and encouraging development to maximum allowable heights could indirectly result in taller and bulkier buildings that may potentially affect a scenic vista.

The following 2004 Housing Element policies could counteract the 2004 Housing Element's potential to result in an adverse effect on a scenic vista by preserving existing housing, which would reduce the need for new construction, and the potential for the construction of taller or bulkier buildings. Additionally, policies that promote the preservation of housing within the existing neighborhood scale could be expected to reduce the potential for new development that could affect a scenic vista.

Impact	2004 Housing Element	Corresponding 1990 Residence Element Policy
Retain existing housing, which could reduce demand for construction of new housing, potentially avoiding adverse impacts on scenic vistas.	Policy 2.1: Discourage the demolition of sound existing housing.	3.1: Discourage the demolition of sound existing housing.
	Policy 2.4: Retain sound existing housing in commercial and industrial areas.	3.6: Restrict the conversion of housing in commercial and industrial areas.
Retain existing neighborhood scale	Policy 1.1: Encourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of units that are affordable to lower income households. Set allowable densities in established	Policy 2.1: Set allowable densities in established residential areas at levels which will promote compatibility with prevailing neighborhood character.

⁸ As discussed in Section 5.15 (Visual and Aesthetics) of the Transbay Terminal/Caltrain Downtown Extension/Redevelopment Project Final EIS/EIR, March 2004.

⁹ As discussed in Section III.B (Visual Quality) of the Rincon Hill Plan Final EIR, Certified May 5, 2005.

Impact AE-2: The proposed Housing Elements would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and other features of the built or natural environment which contribute to a scenic public setting. (Less than Significant)

New construction could result in impacts related to damaging scenic resources if new housing would directly affect environmental features, such as topographic features, landscaping, or a built landmark that contributes to a scenic public setting. Figure V.K-1 in section V.K (Recreation) depicts San Francisco's open spaces. These open spaces contain the majority of the City's natural scenic resources. As shown in this map, much of San Francisco's larger tracts of open spaces are located on the west side of the City, with some larger open spaces also located along the southern edges of the City. San Francisco's landmark buildings are shown on Figure V.E-1 in section V.E (Cultural and Paleontological Resources). The majority of San Francisco's landmarks are confined to the northeastern portion of the City. The following addresses the potential for the 2004 and 2009 Housing Element policies to substantially damage scenic resources.

2004 Housing Element Analysis

The 2004 Housing Element includes policies that promote development of vacant and/or underutilized lands (2004 Housing Element Implementation Measure 4.1.4) to a similar degree as the 1990 Residence Element (Policy 1.1). Additionally, as discussed under Impact V.AE-1, the 2004 Housing Element promotes increased residential density more so when compared to the 1990 Residence Element policies. Promoting increased residential densities in tandem with the development or redevelopment of vacant and underutilized lands could result in potential impacts related to scenic resources. For example, new development that could occur on vacant or undeveloped parcels or redevelopment of underutilized parcels could affect existing natural features that would have otherwise remained without the emphasis to develop/redevelop a particular site. Although some 2004 Housing Element policies could increase the potential for development of underutilized and/or vacant lands that may potentially contain scenic resources, 2004 Housing Element Policies 2.1 and 2.4 could reduce the potential for this impact by promoting housing retention and discouraging demolition. Discouraging demolition of existing structures and retaining existing housing units would help ensure that redevelopment of sites would not result in substantial changes to the overall building footprint, thereby reducing the potential to affect any existing scenic resources. Regardless, development of sites with scenic resources could occur, however any impacts to scenic resources under such circumstances would be development specific and appropriately addressed during the environmental analysis prepared for the specific project.

New development would be required to comply with the previously discussed regulations, including the Residential Design Guidelines, Section 311 of the San Francisco Planning Code and the Urban Design Element of the San Francisco General Plan. Additionally, street trees (and other trees including Landmark trees) that may be considered a scenic resource are protected under the City's tree ordinance (as described above), and therefore the 2004 Housing Element policies would not be anticipated to substantially affect the City's street trees. Furthermore, the majority of the City's scenic resources are confined to open spaces designated as public land and under the jurisdiction of the Recreation and Parks Department and other state and federal agencies and therefore are not expected to be converted to residential uses. Therefore, the 2004 Housing Element would not directly or indirectly damage scenic resources, and the

2004 Housing Element would have a *less than significant* impact with respect to substantially damaging scenic resources.

2009 Housing Element Analysis

As discussed under Impact AE-1, the 1990 Residence Element promotes increased density on a broader, citywide, scale to a greater extent than the 2009 Housing Element. Some policies in the 2009 Housing Element could promote density for affordable housing projects and as a strategy to be pursued during community planning processes. The 2009 Housing Element also promotes development of underused and surplus public lands (Implementation Measure 4). As discussed in the analysis for the 2004 Housing Element policies that promote increased residential densities in tandem with the redevelopment of underutilized lands could result in potential impacts related to scenic resources by increasing the development potential of the site, thereby incentivizing the redevelopment of underused sites. Nonetheless, the 2009 Housing Element, when compared to the 1990 Residence Element, does not aggressively promote density more so than the 1990 Residence Element. When taken as a whole, the 2009 Housing Element would promote density to a lesser extent than the 1990 Residence Element, which could potentially result less development incentive for underused sites. Regardless, development of sites with scenic resources could occur, however any impacts to scenic resources under such circumstances would be development specific and appropriately addressed during the environmental analysis prepared for the specific project. New development would be required to comply with the previously discussed regulations, including the Residential Design Guidelines, Section 311 of the San Francisco Planning Code, the Urban Design Element of the San Francisco General Plan, and the City's tree protection ordinance.

Furthermore, 2009 Housing Element Policies 2.2 through 2.5 and Implementation Measure 37 could reduce this impact for similar reasons as discussed above under the 2004 Housing Element analysis. In addition, 2009 Housing Element Policy 11.6 preserves landmark buildings, some of which could be considered a scenic resource of the built environment. Additionally, the majority of the City's scenic resources are confined to open spaces designated as public land and under the jurisdiction of the Recreation and Parks Department and other state and federal agencies and therefore are not expected to be converted to residential uses. Also, as discussed above, the policies noted would not directly result in new residential development and would, thus, not directly or indirectly damage scenic resources. Therefore, the 2009 Housing Element would not directly or indirectly damage scenic resources, and the 2009 Housing Element would have a *less than significant* impact with respect to substantially damaging scenic resources.

Impact AE-3: The proposed Housing Elements would not substantially degrade the existing visual character or quality of the site and its surroundings. (Less than Significant)

New construction could result in impacts related to visual character if new housing would be developed with greater densities or heights than surrounding land uses or introduce incompatible uses in such a way as to substantially degrade the character or quality of the site. The existing visual characteristics throughout the City, similar to the land uses, are varied and reflect the change in the development patterns, land uses, and architectural styles in the City. Telegraph Hill, Russian Hill, Pacific Heights,

character because the 2009 Housing Element would not change allowable land uses or increase allowable building height and bulk. Similarly, as the 2009 Housing Element would not result in changes to the physical land use controls or to allowable uses, the 2009 Housing Element would not be expected to result in substantial changes to the City's existing visual character. Additionally, the following 2009 Housing Element policy would further consider neighborhood character when developing new housing, thereby reducing the potential for new development to degrade the existing visual character.

Impact	2009 Housing Element	Corresponding 1990 Residence Element Policy
Respect existing neighborhood character.	Policy 11.1: Promote the construction and rehabilitation of well-designed housing that emphasizes beauty, flexibility, and innovative design, and respects existing neighborhood character.	Policy 12.4: Promote construction of well designed housing that conserves existing neighborhood character.

As shown above, the differences between 2009 Housing Element Policy 11.1 and 1990 Residence Element Policy 12.4 are not significant and would not represent a shift in policy. 1990 Residence Element Policy 12.4 provides guidelines for development that are intended to preserve neighborhood character. The 2009 Housing Element recognizes the diversity in architectural styles throughout the City. 2009 Housing Element Policy 11.1 would ensure that future development would be consistent with existing neighborhood character. Moreover, as with the 2004 Housing Element, there would be no direct or indirect substantial adverse change to visual character attributable to the 2009 Housing Element policies.

Overall, the 2009 Housing Element would promote measures that would increase the housing supply in a manner that does not present conflicts with existing visual character. Development associated with new residential units would be required to comply with the previously discussed regulations and requirements. Therefore, the 2009 Housing Element would have a *less than significant* impact with respect to degradation of existing visual character.

Impact AE-4: The proposed Housing Elements would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area or which would substantially impact other people or properties. (Less than Significant)

Implementation of the 2004 Housing Element and 2009 Housing Element could result in impacts related to light and glare if new housing would introduce new sources of light or glare that are unusual for an urban area. New housing could introduce new sources of light and glare if reflective glass or if bright, decorative or security lighting is used. However, for infill development that would replace open parking lots or yards, softer lighting that generates less glare than the present security lighting would typically be used. Additionally, residential exterior lighting tends to be focused on specific areas, rather than lighting a wide area such as a surface parking lot or undeveloped parcels. City Resolution 9212 prohibits the use of highly reflective or mirrored glass in new construction. New development would be required to comply

Restaurant ^{790.91}: A retail eating and/or drinking use which serves prepared, ready-to-eat cooked foods to customers for consumption on or off the premises and which has seating. It may have a Take-Out Food ^{790.122} as a minor and incidental use. It may provide on-site alcohol sales for drinking on the premises (ABC Types 41, 47, 49, 59, or 75); however, if it does it is required to operate as a Bona Fide Eating Place ^{790.142}. It is not required to operate within an enclosed building per Section 703.2(b)(1) so long as it is also a Mobile Food Facility ^{102.34}. Any outdoor seating and/or dining area is subject to regulation as an Outdoor Activity Area.

Limited Restaurant ^{790.90}: A retail eating and/or drinking use which serves ready-to-eat foods and/or drinks to customers for consumption on or off the premises, that may or may not have seating. It may provide off-site beer and/or wine sales for consumption off the premises with an ABC Type 20 license within the accessory use limits of Section 703.2(b)(1)(C)(vi).

Bar ^{790.22}: A retail use which provides on-site alcoholic beverage sales for drinking on the premises. ABC License Types include: 42, 48, or 61 (no minors permitted on premises) and 42 or 60 (minors permitted on premises).

General Grocery ^{790.102(a)}: A retail food establishment that offers a diverse variety of unrelated, non-complementary food and non-food commodities. May provide beer, wine, and/or liquor sales for consumption off the premises with ABC Type 20 or 21 within the accessory use limits of Section 703.2(b)(1)(C)(vi). May prepare minor amounts or no food on-site for immediate consumption.

Specialty Grocery ^{790.102(b)}: A retail food establishment that offers specialty food products, such as baked goods, pasta, cheese, confections, coffee, meat, seafood, produce, artisanal goods and other specialty food products, and may also offer additional complementary food and non-food commodities. May provide beer, wine, and/or liquor sales for consumption off the premises with ABC Type 20 or 21 within the accessory use limits of Section 703.2(b)(1)(C)(vi). May prepare minor amounts or no food on-site for immediate consumption.

Other may include: **Massage Establishment** ^{790.60}, **Tobacco Paraphernalia Establishment** ^{790.123},

Medical Cannabis Dispensary ^{790.141}, **Service, Personal** ^{790.116}, **Take-out Food** ^{790.122}

UCSF - Laurel Heights
3333 California St.

TO: Supervisor John Molinari
FROM: Dean L. Macris
RE: UCSF-Laurel Heights
3333 California Street (at Presidio)
(formerly Fireman's Fund office building)

As a result of recent inquiries about the proposed UCSF-Laurel Heights campus, we have compiled the following background information about the property. Because the University of California is not subject to local zoning regulations, no permits have been filed with the City for the proposed use. Nevertheless, the University has prepared a draft EIR, which we have reviewed. A copy of our comments on the EIR is attached for your information.

Project Description

Two buildings were constructed in three phases (1955-1966) on the 10-acre site as corporate headquarters of Fireman's Fund Insurance Company, which occupied the building through 1982. The building was purchased in 1982 by Presidio Corporate Center and renovation was begun for use as an office building. It was subsequently purchased by the Regents of University of California in February 1985. Current development on the site is as follows:

354,000 square feet of gross building area in main building
13,000 square feet of gross building area in annex building
97,500 square feet of parking area (549 spaces)

Building Use

Existing use in 1982	Fireman's Fund	1260 employees
Proposed use in 1988	UCSF School of Pharmacy	400 persons
	CalTrans, approximately	840 persons
	Private lessees	<u>20 persons</u>
		1260 persons
Proposed use in 1995	UCSF School of Pharmacy	860 persons
	(CalTrans will vacate when lease expires)	

3333 California St.

Zoning History

- 1921 Original zoning was "First Residential". Site was formerly a portion of the Laurel Hill Cemetery.
- 1952 Zoning changed to "Commercial" in order to permit development of Fireman's Fund Corporate Headquarters. CPC Resolution 4109 approves zoning change and establishes conditions for use of property (copy attached). Conditions include:
1. Use limited to professional, institutional, or office buildings.
 2. Aggregate gross floor area limited to total area of property (approximately 435,600 square feet).
 3. Parking to be 1 space for each 500 square feet of gross floor area.
 4. No buildings within 100 feet of Euclid Avenue or Laurel Street and Mayfair Drive.
 5. Conditions for residential development if such should occur in future.
 6. Landscaping requirements.

1960 Zoning changed to "R-4" (as part of citywide rezoning program), which permits office/institutional use as "transitional". Prior stipulations of Resolution 4109 continue to apply.

1978 Zoning changed to "RM-1" (as part of citywide rezoning program), which does not permit office/institutional uses.

However, because use was established in conformity with zoning at time of development, status becomes Non-Conforming Use (NCU) with a 50 year termination date (Section 185(b)). Use also qualifies as a Limited Commercial Use (LCU) (Section 186(a)2) which allows continuation without termination date. Prior stipulations of Resolution 4109 continue to apply.

Compliance provisions permit continuation as office use or conversion to institutional or hospital use without termination date.

Extent of Local Control

The University of California is not subject to local zoning review.

If local zoning did apply, building permit applications for remodeling or conversions to institutional use would not require conditional use or other special use review by Department of City Planning. However, City Planning Commission could elect to review building permit applications and establish conditions for approval under powers of Discretionary Review.

RE: Fireman's Fund Office Site,
3333 California Street
Lot 3 in Assessor's Block 1032;
Use of Existing Property by
more than one firm.

Dear Mr. Cloudsley:

This is to confirm the above-described property is considered a nonconforming use under the City Planning Code. Provisions of the Code applicable to nonconforming uses and this RM-1 zoned site will permit the property to be converted from its present use by a single firm to use by more than one firm. The total floor area in commercial use may not be expanded, however.

Sincerely,

Robert W. Passmore
Assistant Director of
Planning-Implementation
(Zoning Administrator)

Planning
Information:
415.558.6377

Dear Mr. Miller:

This letter is in response to your request for a Letter of Determination regarding the property at 3333 California Street. This parcel is located in the RM-1 (Residential, Mixed, Low-Density) District and a 40-X Height and Bulk District. The request includes two main components: (1) confirmation of the current office use and its continuation as a legal, non-conforming use, not subject to Planning Code Section 321 with respect to the Office Development Annual Limit Program; and (2) confirmation that certain deferred maintenance work, property upgrades, and tenant improvements would not be considered an intensification or expansion of the legal, nonconforming office use, pursuant to Planning Code Section 186.

In your letter, dated February 10, 2015, you stated that there are two existing buildings at the site: a "main building" and an "annex building." The main building contains approximately 348,800 gross square feet of office use, and the annex building contains approximately 14,000 gross square feet of office use. The site also contains 541 off-street parking spaces, of which 212 are located in the main building's three levels of below-grade parking. The remaining 329 parking spaces are located in surface lots.

The site was part of the Laurel Hill Cemetery from the mid-1850s until the early 1940s. The San Francisco Unified School District (SFUSD) owned the property until the early 1950s. The Fireman's Fund Insurance Company (Fireman's) purchased the property from SFUSD in April, 1953. It then developed the site in phases between 1955 and 1966 as its corporate headquarters. Fireman's occupied the site from 1957 to 1982 (when it relocated to Novato, California). The property was then sold to a private party in 1982, during which time it underwent office renovations and was occupied with office tenants. In January, 1985, the Regents of the University of California (UC Regents) purchased the property subject to then-existing office leases. UC Regents has occupied and used the site for office uses and ancillary uses since 1985.

J. Gregg Miller, Jr.
One Ferry Building, Suite 200
San Francisco, CA 94111-4213

March 5, 2015
Letter of Determination
3333 California Street

In your February 10, 2015 letter, you indicated that, currently, the Prado Group, Inc./SKS Partner LLC and the UC Regents have entered into an exclusive negotiating agreement with respect to the future of the property. With that in mind, you are seeking a determination with respect to the current uses, the continuation of those uses, change in tenancy, and associated maintenance work and upgrades. The upgrades may include: replacing the HVAC systems, upgrading the mechanical, electrical and plumbing systems, replacing the glazing system, and improving the landscaping and hardscape.

The site is currently zoned RM-1. Under the RM-1 zoning, office uses are generally not permitted. However, Section 186 of the Planning Code allows for the continuation of legal, non-conforming uses, despite limitations on the duration of such non-conforming uses set forth in Section 185 of the Planning Code. Because the two existing buildings were lawfully constructed and occupied as offices prior to the enactment of the RM-1 zoning in 1978, they have legal, non-conforming use status under Section 186 and, therefore, are not subject to the limitations set forth in Section 185.

Your letter also referenced past letters of determination by the Zoning Administrator in 1981 and 1983, which discussed issues related to multi-tenancy and continuation of the nonconforming office use. In the February 22, 1981 letter, the Zoning Administrator stated that the "...property is considered a nonconforming use...and this RM-1 zoned site will permit the property to be converted from its present use by a single firm to use by more than one firm." In the August 4, 1983 letter, the Zoning Administrator confirmed the continuation of the nonconforming business office use allowing "...business office use of the property at all levels, without expansion, and with activities, signs and hours limited by Section 186(b) of the Code. There is no termination date for continued business office use within these controls."

With regard to Section 321 of the Planning Code, the Office Development Annual Limit Program and associated development impact fees would not apply to the property since they were enacted after the existing office uses were lawfully established in 1957.

With respect to maintenance work, upgrades, and tenant improvements, Section 181 of the Planning Code allows certain maintenance and repair work, and minor alterations to be made to nonconforming uses, as long as such work continues to be consistent with the applicable restrictions of Section 181.

Determination

Based on City records of the property's continued occupancy as office spaces, and current zoning provisions, it is my determination that the existing office use may continue indefinitely as a legal, nonconforming use, and that the maintenance work, property upgrades and tenant improvements constitute permissible alterations under Section 181 of the Planning Code. In the event that the nonconforming use is abandoned or discontinued for three years or more, Section 183 of the Planning Code shall apply.

APPEAL: If you believe this determination represents an error in interpretation of the Planning Code or abuse in discretion by the Zoning Administrator, an appeal may be filed with the Board of Appeals within 15 days of the date of this letter. For information regarding the appeals process, please contact the Board of Appeals located at 1650 Mission Street, Room 304, San Francisco, or call (415) 575-6880.

UDAT NOTES

Project: 3333 California

Planner: Brittany Bendix

Date: November 16, 2017

Attendees: David Winslow, Glenn Cabrereros, Maia Small, Brittany Bendix, Jeff Joslin

The sloped site occupies a transition zone between several neighborhoods and proposes partial retention and adaptive re-use of an existing non-complying building with respect to height, and non-conforming office use. The site is in an RM -1 / 40-X district. The project is organized around a plaza, a hill top green space, and several public accessible ways. The site is bounded by five street frontages: California, Presidio, Masonic, Euclid, and Laurel.

Site Design and Open Space

Walnut extension

UDAT recommend continued effort to reinforce the sense of Walnut as a street rather than a garage access lane. The width of the parking entrances should be no greater than a single lane (12'). Garage doors should be brought close to the face of buildings rather than deeply recessed. Sidewalks should span driveways on Walnut Street. Driveways on Walnut should have curb aprons as opposed to the curb returns shown, allowing for a contiguous public sidewalk into the site.

UDAT recommends the pick-up and drop-off area at the southeastern end of Walnut extension be designed to act and feel primarily as a pedestrian plaza. Consider amenities and design treatments that enhance that use.

Euclid Park seems to show retaining walls and other interruptions. It seems strongest as a single zone of lawn.

Parking

The current proposal shows 558 dwelling units with 885 parking spaces, which translates to 1.6 parking spaces per dwelling unit. The quantity of parking proposed will likely trigger several measures to offset automobile usage through the Transportation Demand Management program (TDM) which is designed to incentivize transit and active transportation modes like walking and biking and depress demand for single occupancy vehicle use by residents of and visitors to the site. Since the project site is within quarter mile (5 minute walk) of numerous transit lines several of which fall on the Muni Rapid network, SDAT strongly encourages the project sponsor to reduce the off-street parking ratio within the project.

Masonic Parking Entrance: Design so as to minimize the cavernous gap in the street wall: explore angling entrance perpendicular to Masonic and reducing the width of the throat. Explore maximizing the slope of the ramp to allow a door and roof covering to come closer to the street.

Laurel parking Entrance:

To diminish the scale of the garage entrance, please consider dividing into two doors 10' wide and setback slightly (2'-3') from face of building wall.

Architecture

California Building east (office Bldg):

Though proposed as an office building, this should be compatible with the overall context, which is dependent on detailing and materiality that provides a neighborhood sense of scale and character.

California and Laurel (Plaza 'A' Building):

While the use of balconies is encouraged to support an active interface between buildings and public realm, the open, continuous wrap-around balconies appear to remove too much building frontage from the street wall, do not reinforce a sense of individual use, and tend to overemphasize the horizontality of the buildings. Balance the transparency of the balconies to vertically modulate the building façade, and balance the open ness with more solid guardrail.

Laurel Townhomes:

The ground floor frontage reads as mostly garage doors. Explore alternative means for aggregating or minimizing the single car parking function to better express the townhouses with landscaped front yards and entries with porches.

Mayfair Building Elevation:

Please explore materials and detailing compatible with the block face. Minimize the use of metal panels and open balconies.

Bridge: Consider how the bridge across the north-south walnut lane should be invitational and frame and the space at an appropriate scale for pedestrians. There is an opportunity to design this as a visible public serving amenity / celebratory focal element.

As the design of individual buildings continues to develop, please provide larger scale drawings and details.

Re: 3333 California Street, Mixed-Use Project
Initial Study: Case No. 2015-014028ENV

CITY & COUNTY OF S.F.
DEPT. OF CITY PLANNING
RECEPTION

These preliminary comments are submitted as to the Initial Study but are not required by June 8, 2018, because the Planning Department has confirmed that the City will not issue a negative declaration after the public comment period on the Initial Study and the City will prepare an Environmental Impact Report (EIR) under the California Environmental Quality Act, Public Resources Code sections 21000 *et seq.* (CEQA) as to this proposed project. The EIR on the project has not yet been released, and under applicable law, comments on the potentially significant environmental impacts and other analyses required by CEQA are not due until the end of the public review period on the draft EIR or hearing held by the decisionmaker on the proposed project. Ex. A, e-mails dated March 22 and 28, 2018 with Planning Department.

1
(CEQA-5)

Also, the Initial Study ("IS") does not provide the complete CEQA analyses of significant impacts on traffic, air quality, noise and historical resources, and those analyses may contain information pertinent to the IS's evaluations of impacts the City proposes to treat as not significant under CEQA. Based on the additional information provided in the Draft EIR, comments as to significant impacts and nonsignificant impacts may be provided after the Draft EIR is released.

In addition, pertinent information is missing from the Initial Study, and complete copies of all the reference materials cited in the Initial Study were not provided as of June 4, 2018. Further, the Initial Study is incomplete, inaccurate and/or inadequate to support determinations that certain impacts of the proposed project would not be significant. Under CEQA Guidelines section 15063(d)(3), an Initial Study must include sufficient information to support its conclusions, but the IS does not include such sufficient information.

Governing Principles

It is important to recognize that a significant effect on the environment is defined in CEQA as a substantial or potentially substantial adverse change in the environment. Public Resources Code

City and County of San Francisco
 June 8, 2018
 Page 2

sections 21068, 21100(d). 14 California Code of Regulations (“CCR”) section 15382 defines a “significant effect on the environment” as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.” Under 14 CCR section 15064(a)(1), if there is substantial evidence in light of the whole record before an agency that a project may have a significant effect on the environment, the agency must prepare a draft EIR.

1
 (CEQA-5)
 cont'd

In preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project irrespective of whether an established threshold of significance has been met with respect to any given effect. *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1106-07.

As used in this submission, “project” will mean the proposed project as well as the proposed project variant, unless otherwise indicated.

1. The Proposed Project Would Have a Significant Adverse Impact on Geology and Soils.

Under Appendix G of the CEQA Guidelines and the Initial Study (p. 205) a project would have a significant impact on the environment if it would:

- a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - i. Seismic-related ground failure, including liquefaction
 - ii. Landslides
- b. Result in substantial soil erosion or loss of topsoil, or
- c. Be located on a geologic unit or soil that is unstable, or would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. Ex. B, 14 California Code of Regulations (“CFR”) section 15000 *et seq.* (“CEQA Guidelines”), Appendix G.

Also, under the Initial Study (p. 205) a project would have a potentially significant impact on geology and soils if it would:

- d. Directly or indirectly destroy a unique paleontological resource or site or unique geological feature.

Under the standards identified in the San Francisco 2004 and 2009 Housing Element EIR (“Housing Element EIR”), a project would normally have a significant effect if it would:

 June 8, 2018
 Page 3

“Change substantially the topography or any unique geologic or physical features of the site.” Ex. C, San Francisco 2004 and 2009 Housing Element EIR (“Housing Element EIR”), p. V.O-25.

In addition, according to the EIR for the Pier 70 Mixed-Use District Project, a project would have a significant impact if it would “substantially change the topography or any unique geologic or physical features of the site.” Ex. D, excerpt of EIR for Pier 70 Mixed-Use District Project, p. 4.N.32. “Unique geologic or physical features” include those which “embody distinctive characteristics of any regional or local geologic principles.” *Ibid.*

A. The Proposed Project Would Result in Substantial Soil Erosion or Loss of Topsoil.

Construction of the proposed project or project variant would require earthwork activities across the entire project site. According to the Initial Study, the depths of excavation would range from 7 to 40 feet below the existing grade, with a total of approximately 241,300 net cubic yards of excavated soils generated during the approximately 7 to 15-year construction period. Only approximately 3,700 cubic yards of excavated soils would be reused on the project site as fill. IS p. 207. Evidence of the method used to calculate the amounts of excavated soils was not included in the IS and must be provided in the Draft EIR to afford an opportunity for public comment on the accuracy of the calculation and severity of resulting impacts.

Many areas to be excavated are now covered by topsoil and extensively planted with grasses, shrubs, and various vegetation. The project’s geotechnical consultant Langan Treadwell Rollo recommended that “all areas to receive improvements should be stripped of vegetation and organic topsoil.” (LTR p. 14)

As explained in the EIR for the 2009 Housing Element:

“New construction could result in impacts related to soil erosion and the loss of topsoil if new housing.... would result in grading activities, or if new development would require much more extensive grading. This exposure could result in erosion or loss of topsoil. The 2004 and 2009 Housing Element policies that promote increased density could result in heavier buildings on soil types or in proximity to slopes that are susceptible to erosion. Heavier buildings would require stronger and deeper foundations, involving more excavation than lighter buildings. Ex. C, San Francisco 2004 and 2009 Housing Element EIR. p. V.O-46.

As evidenced by the Langan Treadwell Rollo report and the Initial Study, substantial amounts of existing topsoil would be removed to construct underground parking garages in the Masonic Building, Mayfair Building, Plaza A and B Buildings and Walnut Building and new multi-unit

2
 (GEO-2)

City and County of San Francisco

June 8, 2018

Page 4

buildings. Paved pathways and stairways would be constructed on areas which are now planted with vegetation and grasses. 37 percent of the site is now landscaping or landscaped open space. IS p. 210.

2
(GEO-2)
cont'd

The Initial Study fails to analyze the impact of project excavation and construction on the substantial loss of topsoil and erroneously bases its determination that the impact would not be significant on operational conditions existing after the topsoil has been excavated. The Initial Study states that at buildout, the project site would be more intensely developed and landscaped with limited to no open areas susceptible to erosion or loss of topsoil. IS. p. 211. Since substantial existing topsoil will have been lost as a result of construction of the project, it is irrelevant to the loss of existing topsoil from construction and excavation that later operation on the paved and built areas would not expose the minimal topsoil that may be reused or replaced to erosion or loss. *Ibid.* An EIR must analyze the changes which the project would have to the existing environment.

The EIR must analyze the substantial loss of existing topsoil as a significant impact of the proposed project and analyze alternatives and mitigation measures that would avoid or reduce the impact.

B. The Proposed Project Would Substantially Alter the Existing Topography and Unique Geologic or Physical Features of the Site.

3
(GEO-3)

The proposed project would have a significant impact because it would directly or indirectly destroy substantial portions of Laurel Hill, which is a unique geological or physical feature and embodies distinctive characteristics of local geologic principles. As explained in the Laurel Heights Improvement Association's nomination of the site for listing on the National Register of Historic Places, which was granted by the State of California Historic Resource Commission on May 17, 2018:

"the site is part of a cluster of low hills associated with Lone Mountain whose several high points were developed as cemeteries in the nineteenth century. The Fireman's Fund site was previously a portion of the Laurel Hill Cemetery, and was long recognized for its views. Today there are distant views from the property to the southeast and downtown, to the northwest and a partial view of the Golden Gate Bridge, and to the west into the Richmond District." (Ex. E, excerpts from Nomination of Laurel Heights Improvement Association for listing of Fireman's Fund Insurance Company Home Office in the National Register of Historic Places, p. 6) [Note that the copy of the nomination included in the City's reference materials was a draft version; although the final version of the nomination was provided to the San Francisco Planning Department, that Department has not included the final version of the nomination in the reference materials provided with

Page 5

the Initial Study.]

The plaque previously placed on the site to commemorate the former site of Laurel Hill Cemetery 1854-1946, California Historical Landmark #760, recognized the site as “the most revered of San Francisco’s hills.” (Ex. F, excerpts from State Office of Historic Preservation file on California Historical Landmark #760) The remarks of Gardiner Johnson of the California Historical Society recognized that when the new cemetery grounds were located on Laurel Hill:

“From the summit of this beautifully-shaped hill it was then possible to obtain one of the finest and most extensive views of both land and water.” (*Id.* p. 1-2)

The existing Terrace on the 3333 California Street site, “as the ‘centerpiece’ of the landscape, designed to integrate the architecture of the building with the site and with the broader setting (through views of San Francisco)” currently exists on the site and overlooks views of San Francisco. (Ex. E, Nomination p. 28)

The proposed project would have a significant impact on the environment because it would result in excavation of substantial portions of Laurel Hill and alter existing slopes, including the areas known for its views of the City. (See Ex. G, photographs of areas of Laurel Hill proposed for excavation)

The Initial Study recognizes that the topography exhibits a generally southwest-to-northeast downslope, with a grade change of approximately 65 feet. (IS p. 206) On the south and east portions of the site, bedrock is relatively shallow, at 7 to 17 feet below ground surface. IS p. 206.

The Masonic Building would be a four- to six-story, 40 foot-tall building. Due to the site’s slope, the Masonic Building’s first level would be a partially below-grade parking garage with a residential lobby at the northeast corner of the floor adjacent to the proposed garage entry. IS pp. 41-43. The Euclid Building would be a four- to six-story, 40-foot-tall building. Due to the site’s slope, the Euclid Building would have a partially below-grade floor. IS pp. 44-45.

Construction of the Masonic and Euclid Buildings would excavate the existing slope of Laurel Hill along Masonic and Euclid. As a result of the proposed excavation and construction, the existing slopes of Laurel Hill along Masonic and Euclid would be substantially altered and their distinctive characteristics of providing views of San Francisco substantially degraded by the structures erected in these slopes. On the south and east portions of the site, bedrock is relatively shallow, at 7 to 17 feet below ground surface. IS p. 206. The excavations on the south and central portions of the project site would encounter bedrock. IS p. 207. The Mayfair building on Laurel Street would also have a below-grade garage with access from Laurel Street. IS p. 47.

The EIR must analyze the substantial alteration of the south, east and western slopes of Laurel

Hill as a result of construction of the Euclid, Masonic and Mayfair buildings and underground garages as a significant impact and analyze alternatives and mitigation measures that would avoid or reduce the impact.

3
(GEO-3)
cont'd

C. The Proposed Project Would Expose People or Structures to Potential Substantial Adverse Effects Including the Risk of Loss, and/or Would Be Located on a Geologic Unit or Soil That is Unstable or Would Become Unstable as a Result of the Project and Potentially Result in On-Site or Off-Site Landslide, Lateral Spreading, Subsidence, Liquefaction or Collapse.

4
(GEO-1)

The Langan Treadwell Rollo Preliminary Geotechnical Investigation dated 3 December 2014 (Ex. H "LTR") constitutes expert evidence supported by fact that all of the aforementioned potentially significant impacts could occur as a result of the proposed project. The Initial Study violates the requirements of CEQA because it fails to analyze these impacts a significant impacts and fails to require binding and enforceable mitigation measures to reduce or avoid these significant effects as a condition of approval of the project.

The Revised Environmental Evaluation explains that massive excavation would occur on the project site for below-grade parking garages, the basement levels of buildings and site terracing, as the project would excavate approximately 61 percent of the surface of the site (274,000/446,479 square feet) at depths of 7 to 40 feet. Revised Environmental Evaluation p. 28. The Initial Study estimates that 241,300 net cubic yards of soils would be excavated (which is 2,171,700 square feet of soils). IS p. 207. Approximately 288,300 cubic yards of demolition debris and excavated soils would be removed from the project site, and approximately 3700 cubic yards of soil would be reused on the project site as fill. IS p. 78.

LTR advises that adverse effects could occur onsite that could result in damage from the following conditions that could result from project activities:

- the presence of fill and loose sand will affect foundation support and excavation support (p. 9).
- the new building to be constructed adjacent to the parking garage may impose surcharge on the basement wall of the parking garage; to avoid surcharging the wall, the western perimeter wall of the new building may need to be supported on drilled piers that gain support in the bedrock below the elevation of the bottom of the parking garage. (LTR, p. 10).
- the proposed single basement will require an excavation of approximately 12 feet below the ground surface; the primary considerations related to the selection of the shoring system are the presence of fill and loose to medium-dense sand and the potential settlement of adjacent structures and improvements caused by movement of temporary shoring (LTR, p. 10).

City and County of San Francisco
June 8, 2018
Page 7

- to retain the excavation sides for the multi-level basements, a retaining system with tiebacks may have been used; therefore, tiebacks may be encountered during basement excavation for new structure located east of the parking garage (LTR, p. 10).

- drilling of shafts for the soldier piles will likely require casing and/or use of drilling mud (slurry) to prevent caving; to prevent settlement of adjacent improvements, soldier piles should not be installed by driving or vibratory methods; a monitoring program should be established to evaluate the effects of the construction on the adjacent buildings and surrounding ground (LTR, p. 10-11).

- sand with low fines content was encountered within the zone of excavation.; to reduce caving, lagging boards should be placed with every foot of excavation to limit caving; voids that result from caving soil behind wood lagging should be grouted before proceeding to the next row of lagging (LTR, p. 11).

- the bottom of the excavation should be above the groundwater level; during drilling of the soldier-pile holes, groundwater or perched water may be encountered; to keep the holes from caving, casing and/or drilling slurry may be needed; alternatively, the soldier piles may be installed using auger-case method (LTR, p. 11).

- generally, soldier piles can be installed under the City's sidewalk provided that the top 3 feet of the soldier piles are removed after the permanent basement wall is cast; if tiebacks are needed, it has been our experience that using hollow-stem augers to install tiebacks in sand will result in loss of ground; therefore, tiebacks, if required, should be installed using smooth-cased method (such as a Klemm rig) to reduce loss of ground (LTR, p. 11).

- the soil at subgrade should consist of stiff to very stiff clay, medium dense sand, and bedrock; therefore, the slabs may be supported on grade; if weak soil is present at subgrade level, the weak soil should be removed and replaced as engineered fill (LTR, p. 11).

- the near surface soil was determined to be moderately corrosive; the corrosive soil will adversely affect below grade improvements, such as foundations and utilities; recommendations for protection of buried structures presented in Appendix D are that all steel, iron, etc, should be properly protected against corrosion depending upon the critical nature of the structure; all buried metallic pressure piping should be protected against corrosion (LTR, p. 11).

- if the site grading is scheduled for the rainy season, the near-surface soil may be too wet to achieve adequate compaction during site preparation and fill placement and may deflect significantly under the weight of construction equipment; for these conditions, moisture conditioning of the material and the use of lightweight equipment may be required to lower the soil to a moisture level that will promote proper compaction; methods of moisture conditioning

4
(GEO-1)
cont'd

City and County of San Francisco

June 8, 2018

Page 8

include mixing and turning (aerating) the soil to naturally dry the soil and lower the moisture content to an acceptable level; aeration typically requires at least a few days of warm, dry weather to effectively dry the material (LTR, p. 12).

4
(GEO-1)
cont'd

- if localized soft or wet areas are encountered, it may be necessary to over-excavate to a depth of 18 to 24 inches, place a layer of stabilizing geo-synthetic, and backfill with granular material to stabilize the subgrade and bridge the soft material (LTR, p. 12)

- bedrock encountered in the borings consists of serpentinite and sandstone; serpentinite contains naturally occurring asbestos; therefore a Site Mitigation Plan may be needed to be prepared prior to construction; bedrock handling and disposal should be performed in accordance with the Site Mitigation Plan. (LTR, p. 12)

- inclinations of temporary slopes should not exceed those specified in local, state or federal safety regulations; at a minimum the requirements of the current OSHA Health and Safety Standards for Excavations (29 CFR Part 1926) should be followed; temporary slopes less than 10 feet high should be inclined no steeper than 1.5: 1 (horizontal to vertical); in addition, all vehicles and other surcharge loads should be kept at least 10 feet away from the tops of temporary slopes (LTR, p. 13).

- all areas to receive improvements should be stripped of vegetation and organic topsoil; voids resulting from the demolition activities should be properly backfilled with lean concrete or engineered fill as described in the LTR recommendations (LTR, p. 14).

- prior to placement of any engineered fill, the onsite soil exposed by stripping should be scarified to a depth of at least 12 inches, moisture-conditioned to at least three percent above optimum moisture content, and compacted to at least 95 and 90 percent relative compaction for sand and clay, respectively; the soil subgrade should be kept moist until it is covered by select fill (LTR, p. 14).

- if soft areas are encountered during site preparation and grading, the soft material should be removed and replaced with engineered fill; if the soft material is deeper than 24 inches, LTR recommends over-excavating to a depth of 18 to 24 inches, placing a geotextile fabric at the bottom of the excavation, and backfilling with granular material (LTR, p. 14).

- fill should consist of onsite or imported soil that is non-corrosive, free of organic matter or other deleterious material, contains no rocks or lumps larger than four inches in greatest dimension, has a liquid limit of less than 25 and a plasticity index lower than 8, and is approved by the geotechnical engineer (LTR, p. 14).

- fill should be placed in horizontal lifts not exceeding eight inches before compacted,

City and County of San Francisco

June 8, 2018

Page 9

moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction; fill thicker than five feet and-or consisting of clean sand or gravel should be compacted to at least 95 percent relative compaction (LTR, p. 14).

4
(GEO-1)
cont'd

- LTR should be provided with samples of proposed fill at least three days before use at the site; the grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site; a bulk sample of approved fill should be provided to LTR at least three working days before use at the site so a compaction curve can be prepared (LTR, p. 14-15)

- where necessary, trench excavations should be shored and braced to prevent cave-ins and/or in accordance with safety regulations; if trenches extend below the groundwater level, it will be necessary to temporarily dewater them to allow for placement of the pipe and/or conduits and backfill (LTR, p. 15).

- if fill with less than 10 percent fines is used, the entire depth of the fill should be compacted to at least 95 percent relative compaction; jetting of trench backfill should not be permitted; special care should be taken when backfilling utility trenches in pavement areas; poor compaction may cause excessive settlements resulting in damage to the pavement section (LTR, p. 15).

- to reduce the potential for water to become trapped in trenches beneath the building or pavements, which trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements, an impermeable plug consisting of either native clay or lean concrete, at least five feet in length, should be installed where the trenches enter the building or cross planter areas and pass below asphalt or concrete pavements (LTR, p. 15).

- to reduce the potential for differential movement and cracking, exterior concrete slabs should be underlain by at least 4 inches of Class 2 aggregate base, and the upper 12 inches of the soil subgrade should be compacted to at least 95 and 90 percent relative compaction for sand and clay, respectively (LTR, p. 15).

- the foundation subgrade should be free of standing water, debris, and disturbed materials prior to placing concrete; if fill, soft, or loose soil is present at the foundation subgrade, it should be removed to expose competent material and be replaced by lean concrete (LTR, p. 17).

- to avoid surcharging the basement wall of the parking garage, the western perimeter wall of the new building may need to be supported on drilled piers that gain support in the bedrock below the elevation of the parking garage (LTR, p. 17).

City and County of San Francisco

June 8, 2018

Page 10

- drilled piers should be installed by a qualified contractor with demonstrated experience in this type of foundation; loose material may potentially cave during drilling, thus casing and/or drilling fluid may be required (LTR, p.18).

- where space does not permit a sloped excavation, shoring will be required, and a cantilever soldier pile and lagging shoring system is the most appropriate for the depth of the excavation planned and types of soil present; penetration of soldier piles should be sufficient to provide lateral stability (LTR, p. 18).

- a soldier pile and lagging system is relatively flexible, and movement should be anticipated; if the shoring system is properly designed and installed, movements at the top of the shoring should not exceed one inch (LTR, p. 19).

- because the site is in a seismically active region, the wall design should be checked for seismic condition; seismic design parameters recommended for areas in the northwest portion of the site where bedrock is relatively deep or in the eastern and southern portions of the site where bedrock is relatively shallow, should be followed (LTR, p. 21-22).

Significantly, LTR concludes by recommending in-person observation of various operations to check that the contractor's work conforms to the geotechnical aspects of the plans and specifications:

“Prior to construction, we should review the project plans and specifications to check their conformance to the intent of our recommendations. During construction, we should observe excavation, temporary shoring and foundation installation, subgrade preparation and compaction of backfill. These observations will allow us to compare the actual with the anticipated subsurface conditions and check that the contractor's work conforms to the geotechnical aspects of the plans and specifications...Actual subsurface conditions may vary. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that described in this report, Langan Treadwell Rollo should be notified to make supplemental recommendations, as necessary.” (LTR, p. 22)

This recommendation is evidence that the existence of various Building Code provisions, the preparation of plans by a qualified geotechnical engineer, and the review of construction plans by the Department of Building Inspection cannot be relied upon as providing adequate or effective mitigation for the hazards described above, given the reality that the project proponent and/or contractor will focus on minimizing costs of construction and the fact that regulatory standards are subject to interpretation. LTR did not rely upon an expectation of regulatory compliance as mitigation for these potentially significant adverse effects of the project. Rather, LTR

4
(GEO-1)
cont'd

City and County of San Francisco

June 8, 2018

Page 11

recommended that on-site monitoring of various excavation and construction activities by a licensed geotechnical professional would be required to mitigate the potential adverse impacts of this project. While LTR recommended that such on-site monitoring be performed, the project does not incorporate it as an enforceable, binding mitigation measure imposed as a condition of approval of the project.

In addition, the Initial Study recognizes that in the event of an earthquake that exhibits strong to very strong seismic ground shaking, "considerable damage could occur to buildings on the project site, potentially injuring building occupants and neighbors." IS p. 209.

In order to reduce the severity of the aforementioned significant impacts, the following mitigation measures should be imposed in the EIR as conditions of approval of the project:

"MITIGATION MEASURE. Prior to construction, Langton Treadwell Rollo (or an equivalently qualified geotechnical professional licensed in the State of California, herein "LTR")) should review the project plans and specifications to check their conformance to the intent of LTR's recommendations in its Preliminary Geotechnical Investigation, 3333 California Street dated December 3, 2014. At all times during construction, LTR should observe excavation, temporary shoring and foundation installation, subgrade preparation and compaction of backfill. These observations will allow LTR to compare the actual with the anticipated subsurface conditions and check that the contractor's work conforms to the geotechnical aspects of the plans and specifications...Actual subsurface conditions may vary. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that described in this report, LTR should be notified to make supplemental recommendations, as necessary."

MITIGATION MEASURE. Since bedrock encountered in the borings consists of serpentinite and sandstone and serpentinite contains naturally occurring asbestos, a Site Mitigation Plan to reduce or eliminate any exposures of workers or nearby residents to asbestos will be prepared prior to excavation by a qualified, licensed professional and reviewed by LTR prior to excavation; such Site Mitigation Plan will be included in the Draft EIR and will be released for public comment; bedrock handling and disposal must be performed in accordance with the Site Mitigation Plan.

MITIGATION MEASURE. Since up to 15 feet of loose to medium dense sand was encountered above the water table, and loose and medium dense sand may densify during an earthquake (IS p. 210), most of the soil susceptible to seismic densification must be removed during excavation; at the conclusion of excavation, LTR will perform any necessary or advisable investigation of the site and verify in writing that most of the soil subject to seismic densification has been removed from the site.

4
(GEO-1)
cont'd

City and County of San Francisco
 June 8, 2018
 Page 12

MITIGATION MEASURE. Project sponsor will be required to maintain a water truck on site during all excavation, demolition, filling and other activities that could cause dust and will wet down dust sufficiently to prevent its blowing onto residences across the street from the site on Laurel, Euclid, Presidio and California streets.

4
 (GEO-1)
 cont'd

Residents are very concerned that the 7-10 year proposed duration of construction would be too impactful for this residential area, especially since there would be substantial excavation from 7 to 40 feet below grade to accommodate underground garages and foundations. Residents recently learned of this proposed duration, and the developers stated that they would seek a development agreement that would permit them to construct the project over a 15 year period so that “if conditions do not exist to build out the entire project, we can phase construction in order to align with market conditions and financing availability.” (See Ex. I, October 12, 2017 email from Dan Safier) Since the Initial Study indicates that the developers would seek the right to apply for additional zoning changes after a certain period, the developers could seek approval for increases in the project from the Board of Supervisors, so the project could become more impactful. *Ibid.* The EIR must address all phases of the project, including foreseeable future expansion that could increase impacts of the project.

2. The Proposed Project Would Have a Potentially Significant Impact on Biological Resources and Would Conflict With Local Policies or Ordinances Protecting Biological Resources.

5
 (BR-1)

The proposed project would have a significant adverse impact on the environment because it would remove 185 onsite trees to allow for demolition, excavation and site preparation, including 19 onsite Significant Trees (i.e. trees within 10 feet of the public right-of-way that meet specific height, trunk, diameter, and canopy width requirements) and 15 protected street trees along California Street, and adequate mitigation is not included as a condition of approval of the proposed project. (IS p. 69)

The Initial Study failed to evaluate impacts of the proposed project against the applicable significance standards. Both CEQA Appendix G and the Housing Element EIR acknowledge that a proposed project would normally have a significant effect on the environment if it would:

“Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;

City and County of San Francisco
 June 8, 2018
 Page 13

Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.” (Ex. B, excerpts from CEQA Appendix G; and Ex. C, excerpts from Housing Element EIR, p. V.N-29.

The Initial Study fails to analyze whether the proposed project would conflict with any local policies and only analyzes select provisions of one local ordinance, the San Francisco Urban Forestry Ordinance (SFUFO), which it misinterprets.

The Initial Study fails to analyze the proposed project’s conflict with the stated purposes of the San Francisco Urban Forestry Ordinance, article 16, sections 801 *et seq.*, of the San Francisco Public Works Code (“SF UFO”) to “realize the optimum public benefits of trees on the City’s streets and public places, abatement of air and noise pollution, enhancement of the visual environment and others;” to integrate street planting and maintenance with other urban elements and amenities, including but not limited to utilities, and enhancement of views and solar access; to recognize that “the removal of important trees should be addressed through appropriate public participation and dialogue, including the California Environmental Quality Act (Public Resources Code Sections 21000 *et seq.*)”, to “recognize that green spaces are vital to San Francisco’s quality of life as they provide a range of environmental benefits, protect public safety, and limit conflicts with infrastructure.” SF UFO section 801.

Under SF UFO section 807, removal of significant trees “shall be subject to the the applicable rules and procedures for removal set forth in Sections 806, 810, or 810A” of the SF UFO. Also, protection of such trees during construction shall be required in accordance with Section 808(c) of the SF UFO.

Under SF UFO section 810A (b), removal of a significant tree(s) on privately-owned property shall be subject to the rules and procedures governing permits for removal of street trees as set forth in Section 806(b). Under those rules, the Department must give all Interested San

5
 (BR-1)
 cont'd

City and County of San Francisco
 June 8, 2018
 Page 14

Francisco organizations and, to the extent practical, all owners and occupants of properties that are on or across the from the block face where the affected Tree is located, 30 days notice of the proposed removal and also post a notice on the affected Tree 30 days before the proposed removal. SF UFO section 806 (a) (2). If during that notice period, any person files with the Department written objections to the Removal, the Director shall hold a hearing to consider public testimony concerning the proposed Tree Removal. Under SF UFO section 806(a)(3)(A), seven days notice must be given of the hearing date in the manner provided in SF UFO section 806(a)(3)(A). Under SFO section 806(a)(3)(C), the Director's decision is appealable to the Board of Appeals.

5
 (BR-1)
 cont'd

Also under SF UFO section 810A, as “part of the Director’s determination to authorize removal of a significant tree, the Director shall consider the following factors related to the tree:

- (1) Size, age, and species;
- (2) Visual and aesthetic characteristics, including the tree’s form and whether it is a prominent landscape feature or part of a streetscape;
- (3) Cultural or historic characteristics, including whether the tree has significant ethnic appreciation or historical association or whether the tree was part of a historic planting program that defines neighborhood character;
- (4) Ecological characteristics, including whether the tree provides important wildlife habitat, is part of a group of interdependent trees, provides erosion control, or acts as a wind or sound barrier;
- (5) Locational characteristics, including whether the tree is in a high traffic area or low tree density area, or provides shade or other public benefits;
- (6) Whether the tree constitutes a hazard tree as set forth in Section 802(o); and
- (7) Whether the tree has been maintained as set forth in Section 802(1).”

The standards for new street trees require, among other things, that the new street trees “be of a species suitable for the site conditions,” and the Director may “waive or modify the number of and/or standards for Street Trees” if other pre-existing surface, sub-surface, or above-grade features render installation of the required Street Tree(s) in the required fashion impossible, impractical, and/or unsafe.” SF UFO section 806 (d). For each required street tree that the Director waives, the applicant shall pay an in-lieu fee or provide alternative landscaping, including sidewalk landscaping.

Thus, decision to remove a tree is a discretionary one which is to be made with consideration of the policies and factors stated in the SF UFO. The Initial Study and Arborist Report (p. 4) prepared by SBCA Tree Consulting, amended 10-19-15, erroneously portray the decision to remove significant trees as automatically granted whenever they would be in the way of construction as long as some kind of replacement trees would be provided.

However, some of the onsite significant trees are prominent landscape features and others have

City and County of San Francisco
 June 8, 2018
 Page 15

significant historical association because they were present while the historically significant Laurel Hill cemetery was located on the site, so removal of the onsite significant trees would conflict with the policies stated above. The EIR should identify the trees which were present on the Laurel Hill cemetery. Due to this conflict, the proposed removal of Significant Trees is a significant impact that must be evaluated in the EIR.

5
 (BR-1)
 cont'd

In addition, the San Francisco Urban Forest Plan (SF UFP) recognizes that “trees and other vegetation clean our air and water, create greener neighborhoods, calm traffic, improve public health, provide wildlife habitat and absorb greenhouse gases.” Ex. J, SF UFP p. 1. Among the strategies required to achieve the SF UFP, Strategy 2.2.2 to “Encourage developers to incorporate existing trees into building and site designs” provides that “[c]onsideration should be given during review of building plans to the existing trees on the site, especially ‘significant’ trees (20 feet or more in height, 15 feet or greater canopy width, and/or 12 inches or greater in trunk diameter.” SF UFP pp. 39, 47. Also, Strategy 2.2.4 to “[r]equire contractors to carry Tree Protection Bonds during construction projects” recognizes that “[c]onstruction activities frequently result in accidental damage or loss of trees - including street trees. Development projects with the potential to disturb existing trees should be required to carry Tree Protection Bonds as insurance. Such bonds would allow recourse in the event that significant damage to trees occurs during the development process through fines, tree replacement or other measures.” SF UFP pp. 47. Strategy 2.2.5 to “[i]mprove process for approving Tree Protection Plans for construction projects” states that “[c]urrently Tree Protection Plans are collected by the Planning Department. Review of these plans should take place with appropriate urban forestry staff. The inspection and enforcement of plans should be carried out. These plans include important provisions to protect trees such as protective barriers, construction exclusion zones, and the restriction of material and equipment storage within tree drip zones.” *Ibid.*

The SF UFP also recognizes that Public Works Code section 810A “describes trees that are automatically protected under Significant Tree designation and “additional consideration that will be taken into account for tree removal applications.” SF UFP p. 73.

The proposed project would have a significant impact on the environment because it would require the removal of Significant Trees and would conflict with the above-described policies of the SF Urban Forestry Plan, including policies that support preserving significant trees on construction sites and require specific mitigation measures such as Tree Protection Bonds and improved process for approving Tree Protection Plans for construction projects by including appropriate urban forestry staff in the approval, inspection and enforcement of plans. In addition, the proposed project would conflict with the policies stated in the SF Urban Forestry Ordinance for consideration of the historical association, size, age, species and visual and aesthetic characteristics, including the tree’s form and whether it is a prominent landscape feature or part of the streetscape. The EIR should analyze whether the project as proposed could be built without the removal of each of the Significant Trees.

City and County of San Francisco
 June 8, 2018
 Page 16

The IS's reliance on regulatory compliance to prevent significant adverse impacts to these resources was not sufficient because it was not based on a project specific analysis of potential impacts and the specific effect of regulatory compliance. Such project specific analysis of potential impacts and the specific effect of regulatory compliance was not included in the Initial Study. The effect of regulatory compliance on these resources cannot be determined because the decision to remove a Significant Tree is discretionary. Also, the environmental evaluation did not commit the project sponsor to implementation of specific performance criteria as mitigation measures agreed as a condition of approval of the project or objective performance criteria for measuring whether the goals related to these resources would be achieved. Such specific measures were not provided or agreed to as mitigation measures adopted as a condition of approval of the proposed project.

5
 (BR-1)
 cont'd

Absent a binding agreement or approval decision which implements specific mitigation measures that contain objective performance criteria that would measure whether the policy goals for protection of these resources would be achieved, the substantial adverse impact from removal of 185 onsite trees, including 19 onsite Significant Trees and 15 protected street trees remains significant and must be analyzed as a significant impact in the EIR.

Mitigation measures imposed as a condition of approval of the proposed project should include the following:

MITIGATION MEASURE. Project sponsor will be required to employ a contractor who maintains in effect during all excavation and/or construction performed while trees are present on the site Tree Protection Bonds which would allow recourse in the event that significant damage to trees occurs during the development process through fines, tree replacement or other measures." Ex. J, SF UFP pp. 47.

MITIGATION MEASURE. Prior to their approval, all Tree Protection Plans will be reviewed by appropriate urban forestry staff, and urban forestry staff will be required to perform onsite inspection and enforcement of the Tree Protection plans.

3. The Proposed Project Would Have a Potentially Significant Adverse Effect, Either Directly or Through Habitat Modifications, on Resident or Migratory Birds.

6
 (BR-2)

The proposed project would remove 185 onsite trees to allow for demolition, excavation and site preparation, including 19 onsite Significant Trees (i.e. trees within 10 feet of the public right-of-way that meet specific height, trunk, diameter, and canopy width requirements) and 15 protected street trees along California Street. (IS p. 69)

In addition to the significance standards stated in the preceding section, the Housing Element EIR acknowledges that "new construction could result in impacts related to biological resources

City and County of San Francisco
 June 8, 2018
 Page 17

if new housing would result in disturbance from construction activities, tree removal...interference with migration, construction of tall buildings with glass walls that could increase bird strikes and possibly interrupt a migration corridor...". (Ex. C, p. V.N-30, 46)

6
 (BR-2)
 cont'd

The Initial Study acknowledges that the proposed project "would result in the temporary loss of nesting and foraging habitat through the removal of onsite trees and vegetation during construction" and states that "after the approximately 7- to 15-year construction period and incorporation of site landscaping (including the planting of up to 250 new trees on the project site) birds would be expected to inhabit the project site." IS p. 199. The IS does not state how soon after the incorporation of site landscaping bird habitation would be expected to occur on site. The Initial Study also discloses that tree removal and construction-related activities associated with the proposed project could adversely affect bird breeding "at the project site and in the immediate vicinity." IS 199. "Construction activities that may cause visual disturbance or alter the ambient noise environment include vegetation removal, demolition of existing buildings, and construction of foundations and new buildings." IS p. 199-200. The Initial Study also acknowledges that "landscaped areas within the project site may provide suitable habitat for resident and migratory birds covered under the Migratory Bird Treaty Act (MBTA) of 1918 (16 U.S.C. 703-711) and the California Fish and Game Code (sections 3503 and 3503.5). IS p. 199.

The information set forth above supports a fair argument that the proposed project could have a substantial adverse effect, either directly or through habitat modifications, on a species identified as a candidate, sensitive, or special-status species by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service. The information set forth above also provides a fair argument that the proposed project would interfere substantially with the movement of native resident or migratory wildlife species or impede the use of native wildlife nursery sites. This impact would be significant under the standards of Appendix G of the CEQA Guidelines and the Housing Element EIR set forth above. The impact on habitat interference would be substantial since it would last at least 7 years and possibly more than 15 years, given the need for the newly planted, unestablished trees to grow to sufficient size to support bird habitat. The Initial Study provides no mitigation for this potentially significant impact on biological resources, so the impact is significant and must be evaluated as a significant impact in the EIR, along with mitigation measures and alternatives that could reduce or avoid the impact. The Initial Study provides potential mitigation only for interference with onsite bird nests.

In addition, the Initial Study admits that the proposed project "would increase the number of new buildings at the project site and the heights of existing buildings, which could create potential obstacles for resident or migratory birds. This could result in an increase in bird injury or mortality in the event of a collision. The existing office building at the center of the site would be partially demolished and separated into two buildings connected by a bridge at the fourth floor. The separated buildings (i.e. Center Buildings A and B) would be adaptively reused as residential buildings and would include two- to three-story vertical additions, increasing the

City and County of San Francisco

June 8, 2018

Page 18

height from approximately 55.5 feet tall to up to 92 feet tall, and a connecting bridge at the fourth floor. In addition, the proposed project includes the construction of 3 new structures at the site ranging from 37 to 45 feet in height (37 to 67 feet for the project variant), some of which would include balconies. San Francisco Planning Code section 139 addresses 'feature-related hazards', which are defined as 'free-standing glass walls, wind barriers, skywalks, balconies, and greenhouses on rooftops that have unbroken glazed segments 24 square feet and larger in size.' The proposed project or project variant would comply with the feature-related standards of planning code section 139 by using bird-safe glazing treatment on 100 percent of any feature-related hazards (e.g. balconies, free-standing glass walls, or skywalks). With planning code section 139 compliance and implementation of Mitigation Measure M-B1-1, the proposed project or project variant would not interfere substantially with the movement of any native resident or migratory wildlife species or with established native resident or migratory wildlife corridors. This impact therefore, would be less than significant with mitigation." IS p. 201-202.

6
(BR-2)
cont'd

However Mitigation Measure M-B1-1 pertains only to interference with onsite bird nests. The remainder of the discussion amounts only to an argument that regulatory compliance would be sufficient to mitigate significant impacts. However, Planning Code section 139 allows the Zoning Administrator to waive the requirements contained within Section 139(c)(2) or modify such requirements to allow equivalent Bird-Safe Glazing Treatments upon the recommendation of a qualified biologist. Also, Planning Code section 139(c)(2)(B) allows general exceptions for historic buildings and, pursuant to the Secretary of Interior Standards for Rehabilitation of Historic Properties, requires treatment methods such as netting, glass films, grates, and screens. Thus, compliance with Planning Code section 139 may not result in use of bird-safe glazing treatment on 100% of the feature-related hazards. Since regulators are allowed to use discretion in applying the subject regulations, the specific effect of the application of the regulations cannot be determined.

The IS's determination that regulatory compliance will be sufficient to prevent significant adverse impacts was not based on a project specific analysis of potential impacts and the specific effect of regulatory compliance. Such project specific analysis of potential impacts and the effect of regulatory compliance was not included in the Initial Study. Also, the environmental evaluation did not commit the project sponsor to implementation of specific performance criteria as objective criteria for measuring whether the goal would be achieved. Such specific measures were not provided and adopted as a condition of approval of the proposed project. Further, under Planning Code section 139(a), structures that create a feature-related hazard "are required to treat all of the feature-related hazard." Mitigation Measure M-B1-1 does not incorporate this measure. Absent an agreement to implement specific mitigation measures that contain specific performance criteria and objective criteria for measuring whether the goal would be achieved, the substantial adverse impact of interference with the movement of native resident or migratory birds remains significant and must be analyzed in the EIR as a significant impact.

↓

City and County of San Francisco

June 8, 2018

Page 19

In addition, the Initial Study's assertion that "the proposed project or project variant would comply with the feature-related standards of planning code section 139 by using bird-safe glazing treatment on 100 percent of any feature-related standards of planning code section 139 (e.g., balconies, free-standing glass walls, or skywalks)" conflicts with the standards of Planning Commission Resolution 9212, which states that "clear, untinted glass should be used at and near the street level." Ex. C, excerpts from Housing Element EIR, p. V.A-35. The EIR should also analyze any and all conflicts between the bird-safe glazing treatment and the Planning Commission Resolution 9212 standards for clear, untinted glass at and near street level, because conflicts between applicable plans indicate that the impact may not be insignificant as a result of regulatory compliance.

6
(BR-2)
cont'd

Renderings of the proposed project show clear glass walls and do not depict frosted glass, permanent stencils, or the like. The EIR should identify specific mitigation measures that would be used to provide bird-safe glazing treatment and incorporate them as a condition of approval of the proposed project.

4. The Proposed Project Would Have a Significant Impact on the Environment Because the Project Would Conflict With Applicable Land Use Plans or Regulations and Would Have a Substantial Impact Upon the Existing Character of the Vicinity.

7
(PP-1)

A. Urban Design Element of San Francisco General Plan and Residential Design Guidelines

The proposed project would conflict with the following policies of the Urban Design Element, among others:

Policy 1.1: Recognize and protect major views in the city, with particular attention to those of open space and water.

Visibility of open spaces, especially those on hilltops, should be maintained and improved, in order to enhance the overall form of the city, contribute to the distinctiveness of districts and permit easy identification of recreational resources. The landscaping at such locations also provides a pleasant focus for views along streets.

Objective 3: Moderation of major new development to complement the City pattern, the resources to be conserved and the neighborhood environment.

Policy 3.3: Promote efforts to achieve high quality design for buildings to be constructed at prominent locations.

City and County of San Francisco
 June 8, 2018
 Page 20

Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.

7
 (PP-1)
 cont'd

Policy 3.5: Relate the height of buildings to important attributes of the city patterns and to the height and character of existing development.

Policy 3.6: Relate the bulk of the buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction....

When buildings reach extreme bulk, by exceeding the prevailing height and prevailing horizontal dimensions of existing buildings in the area, especially at prominent and exposed locations, they can overwhelm other buildings, open spaces and the natural land forms, block views and disrupt the city's character. Such extremes in bulk should be avoided by establishment of maximum horizontal dimensions for new construction above the prevailing height of development in each area of the city...

Policy 3.7: Recognize the special urban design problems posed in development of large properties.

Policy 3.8: Discourage accumulation and development of large properties, unless such development is carefully designed with respect to its impact upon the surrounding area and upon the City.

Policy 3.9: Encourage a continuing awareness of the long-term effects of growth upon the physical form of the city.

Policy 4.1: Protect residential areas from the noise, pollution and physical danger of excessive traffic.

Policy 4.2: Provide buffering for residential properties when heavy traffic cannot be avoided. Ex. V, Urban Design Element of San Francisco General Plan.

The proposed project would also conflict with the following provisions of the Residential Design Guidelines:

DESIGN PRINCIPLE: Design buildings to be responsive to the overall neighborhood context, in order to preserve the existing visual character.

Many neighborhoods have defining characteristics such as street trees, buildings with common scales and architectural elements, and residential and commercial uses that make

City and County of San Francisco

June 8, 2018

Page 21

the neighborhood identifiable and an enriching place to be. The neighborhood is generally considered as that area around a home that can easily be traversed by foot....

7
(PP-1)
cont'd

Though each building will have its own unique features, proposed projects must be responsive to the overall neighborhood context. A sudden change in the building pattern can be visually disruptive. Development must build on the common rhythms and elements of architectural expression found in a neighborhood. In evaluating a project's compatibility with neighborhood character, the buildings on the same block face are analyzed. However, depending on the issues relevant to a particular project, it may be appropriate to consider a larger context.

Broader Neighborhood Context: When considering the broader context of a project, the concern is how the proposed project relates to the visual character and scale created by other buildings in the general vicinity.

Defined Visual Character

GUIDELINE: In areas with a defined visual character, design buildings to be compatible with the patterns and architectural features of surrounding buildings.

On some block faces, there is a strong visual character defined by buildings with compatible siting, form, proportions, texture and architectural details. On other blocks, building forms and architectural character are more varied, yet the buildings still have a unified character. In these situations, buildings must be designed to be compatible with the scale, patterns and architectural features of surrounding buildings, drawing from elements that are common to the block.

III. Site Design

DESIGN PRINCIPLE: Place the building on its site so it responds to the topography of the site, its position on the block, and to the placement of surrounding buildings.

TOPOGRAPHY

Guideline: Respect the topography of the site and the surrounding area.

New buildings and additions to existing buildings cannot disregard or significantly alter the existing topography of the site. The surrounding context guides the manner in which new structures fit into the streetscape, particularly along slopes and hills. This can be achieved by designing the building so it follows the topography in a manner similar to surrounding buildings.

City and County of San Francisco

June 8, 2018

Page 22

Similarly, a proposed project may be located next to a historic or architecturally significant building that is set back from the street or is on a wider lot with front and side gardens. The front setback of the proposed project must respect the historic building's setbacks and open space. Additionally, the front setback must serve to protect historic features of the adjacent historic building.

7
(PP-1)
cont'd

SIDE SPACING BETWEEN BUILDINGS

GUIDELINE: Respect the existing pattern of side spacing.

Side spacing is the distance between adjacent buildings...Projects must respect the existing pattern of side spacing.

VIEWS

GUIDELINE: Protect major public views from public spaces.

The Urban Design Element of the General Plan calls for protection of major public views in the City, with particular attention to those of open space and water. Protect major views of the City as seen from public spaces such as streets and parks by adjusting the massing of proposed development projects to reduce or eliminate adverse impact on public view sheds.

IV. Building Scale and Form

DESIGN PRINCIPLE: Design the building's scale and form to be compatible with that of surrounding buildings, in order to preserve neighborhood character.

BUILDING SCALE

GUIDELINE: Design the scale of the building to be compatible with the height and depth of surrounding buildings.

The building scale is established primarily by its height and depth. It is essential for a building's scale to be compatible with that of surrounding buildings, in order to preserve the neighborhood character.

Building Scale at the Street

GUIDELINE: Design the height and depth of the building to be compatible with the existing building scale at the street.

If a proposed building is taller than surrounding buildings, or a new floor is being added to an existing building, it may be necessary to modify the building height or depth to maintain the existing scale at the street. By making these modifications, the visibility of the upper floor is limited from the street, and the upper floor appears subordinate to the primary facade.

7
 (PP-1)
 cont'd

In modifying the height and depth of the building, consider the following measures; other measures may also be appropriate depending on the circumstances of a particular project:

- Set back the upper story. The recommended setback for additions is 15 feet from the front building wall.
- Eliminate the building parapet by using a fire-rated roof with a 6-inch curb.
- Provide a sloping roofline whenever appropriate.
- Eliminate the upper story.

Building Scale at the Mid-Block Open Space

GUIDELINE: Design the height and depth of the building to be compatible with the existing building scale at the mid-block open space.

BUILDING FORM

GUIDELINE: Design the building's form to be compatible with that of surrounding buildings.

Though the Planning Code establishes the maximum building envelope by dictating setbacks and heights, the building must also be compatible with the form of surrounding buildings.

GUIDELINE: Design the building's facade width to be compatible with those found on surrounding buildings.

Proportions

GUIDELINE: Design the building's proportions to be compatible with those found on surrounding buildings.

Proportions are the dimensional relationships among the building's features, and typically involve the relationship between the height and width of building features....Building features must be proportional not only to other features on the building, but also to the features found on surrounding buildings.

City and County of San Francisco
June 8, 2018
Page 24

Rooflines

GUIDELINE: Design rooflines to be compatible with those found on surrounding buildings.

7
(PP-1)
cont'd

V. Architectural Features

DESIGN PRINCIPLE: Design the building's architectural features to enhance the visual and architectural character of the neighborhood.

In designing architectural features, it is important to consider the type, placement and size of architectural features on surrounding buildings, and to use features that enhance the visual and architectural character of the neighborhood. Architectural features that are not compatible with those commonly found in the neighborhood are discouraged.

VI. Building Details

DESIGN PRINCIPLE: Use architectural details to establish and define a building's character and to visually unify a neighborhood.

The use of compatible details visually unifies a neighborhood's buildings, providing continuity and establishing the architectural character of the area.

WINDOWS

GUIDELINE: Use windows that contribute to the architectural character of the building and the neighborhood.

Windows are one of the most important decorative features, establishing the architectural character of the building and the neighborhood.

EXTERIOR MATERIALS

GUIDELINE: The type, finish, and quality of a building's materials must be compatible with those used in the surrounding area.

When choosing building materials, look at the types of materials that are used in the neighborhood, and how those materials are applied and detailed. Ensure that the type and finish of these materials complement those used in the surrounding area, and that the quality is comparable to that of surrounding buildings. Ex. K, Residential Design Guidelines, excerpts.

City and County of San Francisco
 June 8, 2018
 Page 25

Defining characteristics of the single-family residential buildings on Laurel Street across the street from the site include one-story in height at the front, with a second set-back story, sloped roofs, consistent entrance and front setback patterns and compatible stucco materials. Defining characteristics on Euclid Avenue across the street from the site are two-unit flats or multiple-unit apartment buildings with rear yards sloping toward the site. Defining characteristics of the residences on California Street and Presidio Avenue are approximately four-story buildings designed with traditional architectural forms. The proposed project conflicts with the prevailing character of the surrounding areas and neighborhood in these and other respects, including the existing pattern of mid-block open space, as can be seen in the plans showing the incongruent scale and building forms of the proposed project. Also, the new buildings and additions to existing buildings proposed in the project would disregard or significantly alter the existing topography of the site.

7
 (PP-1)
 cont'd

B. The Proposed Project Would Have a Significant Impact on the Environment Because the Project Would Conflict With Applicable Land Use Plans or Regulations and Would Have a Substantial Impact Upon the Existing Character of the Vicinity.

The Housing Element EIR state that a proposed project would normally have a significant effect on the environment if it would:

“Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or

Have a substantial impact upon the existing character of the vicinity.” Ex. C, p. V.B-27-28.

On the Figure IV-3 of the Housing Element EIR, the Generalized Citywide Zoning Map, the project site is shown in a “Residential” area. Ex. C, 2014 Housing Element EIR, p. IV-14-15 and Figure IV-3.

“Figure IV-4 shows a generalized height map of the City.” Ex. C, 2014 Housing Element EIR, p. IV-14 and Figure IV-4. This map shows that the project site is in a height district of “40 ft” or less.

Map 06 of the 2014 Housing Element shows average generalized permitted housing densities by Zoning Districts as 54 average units per acre in medium density areas. Ex. L, 2014 Housing Element p. I.70. Policy 11.4 of the 2014 Housing Element refers to this map and states the policy to:

City and County of San Francisco
 June 8, 2018
 Page 26

7
 (PP-1)
 cont'd

“Continue to utilize zoning districts which conform to a generalized residential land use and density plan and the General Plan.” Ex. L, p. 37

Policy 11.4 text provides that:

“The parameters contained in the Planning Code under each zoning districts [sic] can help ensure that new housing does not overcrowd or adversely affect the prevailing character of existing neighborhoods. The City’s current zoning districts conform to this map and provide clarity on land use and density throughout the city. When proposed zoning map amendments are considered as part of the Department’s community planning efforts, they should conform generally to these [sic] this map, although minor variations consistent with the general land use and density policies may be appropriate. They should also conform to the other objectives and policies of the General Plan. Ex. L, p. 37.

Housing Element policies do not provide for zoning changes to allow retail or commercial office uses. 2014 Housing Element Policy 1.6 provides:

“Consider greater flexibility in number and size of units within established building envelopes in community based planning processes, especially if it can increase the number of affordable units in multi-family structures.

However, in some areas which consist mostly of taller apartments and which are well served by transit, the volume of the building rather than number of units might more appropriately control the density.

Within a community based planning process, the City may consider using the building envelope, as established by height, bulk, set back, parking and other Code requirements, to regulate the maximum residential square footage, rather than density controls that are not consistent with existing patterns. In setting allowable residential densities in established neighborhoods, consideration should be given to the prevailing building type in the surrounding area so that new development does not detract from existing character.” Ex. L, p. 10.

In addition, Housing Element Policy 7.5 supports process and zoning accommodation for affordable housing, as it provides that:

“Encourage the production of affordable housing through process and zoning accommodations, and prioritize affordable housing in the review and approval process....

Local planning, zoning, and building codes should be applied to all new development, however when quality of life and life safety standards can be maintained zoning

City and County of San Francisco

June 8, 2018

Page 27

accommodations should be made for permanently affordable housing. For example, exceptions to specific requirements, including open space requirements, exposure requirements or density limits, where they do not affect neighborhood quality and meet with applicable design standards, including neighborhood specific design guideline, can facilitate the development of affordable housing. Current City policy allows affordable housing developers to pursue these zoning accommodations through rezoning and application of a Special Use District (SUD).” Ex. L, p. 29.

7
(PP-1)
cont'd

Thus, the proposed project would conflict with the Housing Element of the General Plan because the proposed project would seek to use a Special Use District to change the permitted uses to allow retail uses, new commercial office uses and public parking uses and to increase height and/or bulk limits, which would not be zoning accommodations “for permanently affordable housing.” Also, the proposed project would be inconsistent with the prevailing building type in the surrounding area and/or detract from existing character, detract from neighborhood quality and/or conflict with provisions of the Residential Design Guidelines and Urban Design Element, for the reasons stated herein.

For these reasons, the proposed project would also conflict with the following other policies of the 2014 Housing Element:

Policy 11.3 Ensure growth is accommodated without substantially and adversely impacting existing residential neighborhood character.

Accommodation of growth should be achieved without damaging existing residential neighborhood character. ...In existing residential neighborhoods, this means development projects should defer to the prevailing height and bulk of the area.

Policy 11.5 Ensure densities in established residential areas promote compatibility with prevailing neighborhood character.” Ex. L, p. 37.

The Housing Element EIR explains that:

“The San Francisco Planning Code, which incorporates by reference the City’s Zoning maps, governs permitted uses, densities and the configuration of buildings in San Francisco. Permits to construct new buildings (or to alter or demolish existing ones) cannot be issued unless either the proposed action conforms to the Planning Code, or an exception is granted pursuant to provisions of the Planning Code, or a reclassification of the site occurs....

Section 263 of the Planning Code contains special exceptions to the height limits for certain uses within certain areas. Buildings and structures exceeding the prescribed

City and County of San Francisco
 June 8, 2018
 Page 28

height may be approved by the Planning Commission according to the procedures for conditional use approval in Section 303 of the Planning Code; provided, however, that such exceptions may be permitted only in the areas specified and only to the extent stated in each section.” Ex. C, p. V-A-32-33.

7
 (PP-1)
 cont'd

The City’s Preliminary Project Assessment (“PPA”) states that:

“various aspects of the project conflict with both the current RM-1 Zoning of the site, as well as City Planning Commission Resolution No. 4109. The Preliminary Project Assessment application indicates the intent of the property owner to pursue a rezoning, potentially to an NC District. Additionally, as noted in the comments below, a special Use District overlay to the current RM-1 District may also be a potential path for rezoning. In either case, rezoning of the property requires approval by the Board of Supervisors....various components of the project exceed the current 40 foot height limit. Accordingly, a height district reclassification of the property must be sought. This also requires approval by the Board of Supervisors.” Ex. M, PPA, p. 10.

As further explained in the City’s Preliminary Project Assessment:

“The project proposes a combination of residential, office, commercial parking, retail and entertainment uses. Of these proposed land use categories, only residential uses are currently permitted in the existing RM-1 District. Accordingly, pursuing the project as proposed would require a rezoning of the subject property. The project description provided in the Preliminary Project Assessment application indicates the owner’s interest in pursuing a rezoning of the property to an NC (Neighborhood commercial) district, but does not specify which type of NC District...

The project proposed retail uses throughout the property.

The demolition of existing structures or conversion of floor area dedicated to the site’s 363,218 square feet of existing nonconforming office use is an abandonment of that nonconforming use per Planning Code Section 183. Therefore, to re-establish office uses in the proposed new structures, the uses must comply with any applicable zoning controls.

The project includes 60 off-street parking spaces as part of a ‘Public Parking Garage’ defined in Planning Code Section 102. The existing RM-1 district does not permit public parking garages and, at this time, it is unclear if the described 60 ‘paid public parking spaces for community use’ are legally noncomplying with regard to the Planning Code. Additional information is needed regarding the existing and proposed location of these

spaces and the date of their establishment to make that determination...

The site has subsequently undergone additional rezoning, as it is now within an RM-1 District. However, the stipulations of future development as outlined in Resolution 4109 continue to apply, absent modification by the Board of Supervisors per Planning Code Section 174....In the project comments that follow, when there is an inconsistency, the more restrictive is noted as the guiding control. As indicated in the Preliminary Project Assessment application, the project may result in the rezoning of the property which requires review and approval by the Board of Supervisors. Amending Resolution 4109 would also require review and approval by the Board of Supervisors....

In general, the RM-1 District controls are more restrictive than the Stipulations of Resolution 4109. However, the stipulations are more restrictive when defining the density and buildable area requirements as applicable to a portion of the subject property fronting on Laurel and Euclid Avenues. At present, the project does not comply with these restrictions and would require amending the Resolution...

The subject property is within an RM-1 District which permits a residential density of up to one unit per 800 square feet of lot area. However, as a Planned Unit Development the proposal may seek approval for a density equal to one less unit than what is permitted by the district with the next greater density (RM-2)...While additional information is necessary to calculate the exact maximum density for the area subject to Resolution 4109, initial calculations estimate approximately 508 units are allowed pursuant to the current RM-1 zoning and Resolution an upon seeking the additional density allowed as a Planned Unit Development, the estimated maximum is 660 dwelling units. If the Resolution did not apply, these respective amounts become 558 and 743...

The subject property is within a 40-X Height and Bulk District, restricting the maximum height of buildings to 40 feet above grade, as measured generally from curb at the center of each existing and proposed building. The upper measurement of the height limit changes depending on the grade at that location per Planning Code Section 260(a)(1). Additionally, the upper measurement of the height of a building varies based on the roof form per Planning Code Section 260(a)(2). While in general the proposal accurately applies these methodologies, curbs along the Walnut Street extension may not be used as the base of measurements because the Walnut Street extension is not a public right-of-way...The additional stories proposed for the altered structures will require that the project seek a Height District reclassification which is reviewed and approved by the Board of Supervisors...

The existing office building is 66.5 feet tall from the existing grade to the finished roof...

7
(PP-1)

City and County of San Francisco

June 8, 2018

Page 30

The project proposed a lot line adjustment that would extend the property's Masonic Avenue Boundary into the public right-of-way. This adjustment requires a General Plan Referral because it includes the vacation of a public way and transportation route owned by the City and County. This adjustment will also require review by the Department of Public Works as a partial street vacation request...

Open Space. Additional information is needed to determine how the project complies with this requirement for each individual unit and to confirm that the spaces comply with the dimensional requirements for either private or common spaces... (Ex. M, PPA. pp. 12-17.

Planning Code section 209.2 provides that in an RM-1 district, the "Residential Density, Dwelling Units" is [u]p to one unit per 800 square feet of lot area." Retail uses and commercial uses are not permitted.

As acknowledged in the Housing Element EIR, a proposed project "could result in impacts related to conflicts with existing land use policy, plans, or regulations" if it "resulted in housing development that was not consistent with zoning and land use designations as outlined in the governing land use plans and/or the City's Planning Code to the extent those regulations help to avoid or mitigate potential environmental impacts." Ex. C, p. V.B-29. In addition, there could be "impacts related to land use character if new housing is substantially out of scale with development in an existing neighborhood, or if new development is so different than existing development that the new development would change the existing character of an area." Ex. 2, p. V.B-33. "Similarly, substantial increases in residential densities in traditionally low-density neighborhoods could result in changes to land use character." Ex. C, p. V.B-33.

The Initial Study admits that the "project as proposed is not consistent with the provisions set forth in the planning code for the RM-1 Zoning District and would not comply with development restrictions identified in Resolution 4109, described below. The existing office use within the project site, as well as the scale of the existing office building within the project site, does not conform to the low-density residential character described for the RM-1 Zoning District." IS p. 22. The Initial Study misinterprets Resolution 4109 and fails to mention that it contains a limitation on the aggregate gross floor area of all buildings on the property of a gross floor area that "shall not exceed the total area of the property allotted to such use," a limitation of 50% as to lot coverage of residential development, and a prohibition on any residential dwelling other than a one-family dwelling or a two-family dwelling occupying any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended, occupying a parcel of land having an area of less than 3300 square feet, and a requirement that such buildings be set back 12 feet from any other building and 10 feet from any street. The new buildings proposed on the site propose to violate these limitations, including the gross floor area

7
(PP-1)
cont'd

City and County of San Francisco

June 8, 2018

Page 31

limitations, and the Mayfair and Euclid Buildings propose to violate the prohibition on any residential dwelling other than a one-family dwelling or a two-family dwelling being erected at the locations of the proposed buildings and/or would also violate the use limitations which prohibit retail uses. The Initial Study failed to analyze these provisions of Resolution 4109, and retail uses are not allowed under that Resolution. Ex. N, Resolution 4109 and Stipulation as to Character of Improvements.

7
(PP-1)
cont'd

The Initial Study states that the “proposed project would include amendments to the planning code and zoning maps to rezone a portion of the site from the current RM-1 zoning and 40-X Height and Bulk Districts.” IS p. 22. First, the proposed planning code and zoning map amendments were not provided in the Initial Study, so the IS is incomplete and its description of the proposed project is inadequate and incomplete. Also, the Initial Study states that these:

“changes would be implemented through the creation of a Special Use District (SUD) that would establish land use zoning controls for the project site. An ordinance establishing the SUD would require a recommendation by the Planning Commission and approval by the Board of Supervisors. In addition, the project sponsor would seek approval of a Conditional Use authorization/Planned Unit Development to permit development of buildings in excess of 50 feet in height; to allow for more units than principally permitted in the RM-1 Zoning District, to allow certain planning code exceptions to open space requirements, dwelling unit exposure, and rear yard setback requirements mandated by the planning code in an RM-1 Zoning District; and to provide a waiver or modification of any applicable conditions of Resolution 4109.” IS p. 23.

As discussed above, the City’s Preliminary Project Assessment stated that amending Resolution 4109 would require review and approval of the Board of Supervisors.

Since the proposed project is within a 40-X Height and Bulk District, it does not meet the criteria required to allow the Planning Commission to increase the height limit pursuant to Planning Code section 253, which provides that “wherever a height limit of more than 40 feet in a RH District, or more than 50 feet in a RM or RC District, **is prescribed by the height and bulk district in which the property is located**, any building or structure exceeding 40 feet in height in a RH District, or 50 feet in height in a RM or RC District, shall be permitted only upon approval by the Planning Commission according to the procedures for conditional use approval in Section **303** of this Code.” Further, under Planning Code section 253:

“In reviewing any such proposal for a building or structure exceeding 40 feet in height in a RH District, 50 feet in height in a RM or RC District, or 40 feet in a RM or RC District where the street frontage of the building is more than 50 feet the Planning Commission shall consider the expressed purposes of this Code, of the RH, RM, or RC Districts, and of the height and bulk districts, set forth in Sections **101, 209.1, 209.2, 209.3,**

City and County of San Francisco
June 8, 2018
Page 32

and **251** hereof, as well as the criteria stated in Section **303(c)** of this Code and the objectives, policies and principles of the General Plan, and **may permit a height of such building or structure up to but not exceeding the height limit prescribed by the height and bulk district in which the property is located.** (Emphasis added.)

7
(PP-1)
cont'd

Since the property has a height limit of 40 feet in an RM-1 district, Planning Code section 253 does not authorize a height limit increase.

In addition, the proposed project would not meet the criteria applicable to conditional uses as stated in Section **303(c)** and elsewhere in the Planning Code and further would not meet the requirements of Planning Code section 304 for a Planned Unit Development, including that the requirements that the project shall:

- (1) Affirmatively promote applicable objectives and policies of the General Plan;
- (2) Provide off-street parking adequate for the occupancy proposed;
- (3) Provide open space usable by the occupants and, where appropriate, by the general public, at least equal to the open spaces required by this Code;
- (4) Be limited in dwelling unit density to less than the density that would be allowed by **Article 2** of this Code for a district permitting a greater density, so that the Planned Unit Development will not be substantially equivalent to a reclassification of property;
- (5) In R Districts, include Commercial Uses only to the extent that such uses are necessary to serve residents of the immediate vicinity, subject to the limitations for NC-1 Districts under this Code, and in RTO Districts include Commercial Uses only according to the provisions of **231** of this Code;
- (6) Under no circumstances be excepted from any height limit established by **Article 2.5** of this Code, unless such exception is explicitly authorized by the terms of this Code. In the absence of such an explicit authorization, exceptions from the provisions of this Code with respect to height shall be confined to minor deviations from the provisions for measurement of height in Sections **260** and **261** of this Code, and no such deviation shall depart from the purposes or intent of those sections.”

The IS has not explained the nature of the “minor deviations” from the provisions for measurement of height that would be sought, so the IS is incomplete, and the EIR must identify them so the nature of the project can be known, and comments can address inaccuracies and conflicts with land use policies.

The proposed project would fail to affirmatively promote applicable objectives and policies of the General Plan as to density and height.

Approval of a Planned Unit Development cannot be substantially equivalent to a reclassification of property, which it would if misused in this matter, because the 744 residential units in the

City and County of San Francisco
 June 8, 2018
 Page 33

project variant would exceed the additional density of 660 units allowed as a Planned Unit Development above existing density limits (which include Resolution 4109) and the 558 project units would exceed the approximately 508 units allowed under the applicable stipulations as to future development contained in Resolution 4109, which can only be changed by the Board of Supervisors. (See Ex. O, developer's calculation of permitted densities under alleged PUD boost)

7
 (PP-1)
 cont'd

Moreover, the proposed project, which is located in an R District, would not "include Commercial Uses **only to the extent that such uses are necessary to serve residents of the immediate vicinity**, subject to the limitations for NC-1 Districts under this Code." The Initial Study does not state that a rezoning from the RM-1 District would be sought. The project site is directly adjacent to the Laurel Village neighborhood commercial area, and one block away from the Sacramento Street neighborhood commercial area and one block away from Trader Joe's. Residents of the immediate vicinity are adequately served by retail uses.

Thus, the project may under no circumstances be excepted from any height limit established by **Article 2.5** of this Code under the Planned Unit Development provisions, because no exception is explicitly authorized by the terms of the Planning Code in a 40-foot Height and Bulk District. The Initial Study fails to substantiate the nature of the proposed deviations from the provisions for the measurement of height as being minor and fails to establish that such deviation shall not depart from the purposes or intent of Planning Code sections 260 and 261. The Preliminary Project Assessment already warned the project proponent not to attempt to measure heights from the Walnut Street extension because it is a walkway and not a public right-of-way.

Further, the project would not provide open space usable by the occupants and, where appropriate, by the general public, at least equal to the open spaces required by this Code.

Since plan sheet G3.03 shows that the project proponent counted the paved Lower Walnut walkway and the approximately 16 foot front set back in front of proposed retail uses on California Street (described as California Plaza) as open space, the project does not comply with the open space requirements of Planning Code section 135 that "[u]sable open space shall be composed of an outdoor area or areas designed for outdoor living, recreation or landscaping, including such areas on the ground and on decks, balconies, porches and roofs, which are safe and suitably surfaced and screened, and which conform to the other requirements of this Section." Moreover, the Initial Study admits that "the network of proposed new common open spaces, walkways, and plazas within the project site" "would be shaded mostly by proposed new buildings for much of the day and year." IS p. 161. For this reason, as well, such network of new common open spaces does not qualify as open space under Planning Code section 135 because it is not "designed for outdoor living, recreation or landscaping."

The Housing Element EIR further explains that:

City and County of San Francisco

June 8, 2018

Page 34

“For construction of new residential buildings and alteration of existing residential buildings in R Districts, Section 311 of the Planning Code requires consistency with the design policies and guidelines of the General Plan and with the Residential Design Guidelines that are adopted for specific areas. ...The guidelines apply to development in all RH and RM districts, and are intended to maintain cohesive neighborhood identity, preserve historic resources, and enhance the unique setting and character of the City and its residential neighborhoods.

7
(PP-1)
cont'd

The guidelines are based on the following design principles, which are also used to determine compliance with the guidelines:

- Ensure that the building’s scale is compatible with surrounding buildings.
- Ensure that the building respects the mid-block open space.
- Maintain light to adjacent properties by providing adequate setbacks.
- Provide architectural features that enhance the neighborhood’s character.
- Choose building materials that provide visual interest and texture to a building.
- Ensure that the character-defining features of an historic building are maintained.” Ex. C, p. V.A-34.

The Housing Element EIR also explains that Proposition M, codified in Planning Code section 101.1, established eight Priority Policies including “protection of neighborhood character,” “landmark and historic building preservation,” “protection of open space,” and “preservation and enhancement of neighborhood-serving retail uses.” Ex. C, p. V.A-41-42.

The Housing Element EIR explains that “[s]ection 263 of the Planning Code contains special exceptions to the height limits for certain uses within certain areas. Buildings and structures exceeding the prescribed height limit may be approved by the Planning Commission according to the procedures for conditional use approval in Section 303 of the Planning Code; provided, however, that such exceptions may be permitted only in the areas specified and only to the extent stated in each section.” Ex. C, p. V.B-2. None of these exceptions apply to the proposed project.

The Initial Study uses an erroneous legal standard in determining that the project’s potential conflicts with land use plans (and other impacts analyzed in the IS) need not be studied as a significant impact in the EIR. As explained in the Initial Study for the 1629 Market Street Project :

“The Initial Study evaluates the proposed 1629 Market Street Mixed Use Project to determine whether it would result in significant environmental impacts. The designation of topics as ‘Potentially Significant’ in the Initial Study means that the EIR will consider the topic in greater depth and determine whether the impact would be significant.” Ex. P,

↓

City and County of San Francisco
 June 8, 2018
 Page 35

p. 4.

The Initial Study for the 3333 California Street project acknowledges that the proposed project “would not conform to the existing RM-1 zoning and 40-X Height and Bulk District, and amendments to the planning code would be required as part of the proposed project or project variant.” The Initial Study then puts forth the erroneous conclusion that if “the Board of Supervisors finds that amendments to the planning code are warranted to allow for implementation of the proposed project or project variant, the Board of Supervisors would adopt amendments to establish the Special Use District, which would resolve any conflicts between the planning code and the proposed project or project variant. To approve the proposed project or project variant, the city would be required to make findings of project consistency with the planning code. The proposed project or project variant, as approved, would thus be consistent with relevant plans and policies once amended.” IS. p. 110-111. The project’s proposed misuse of Special Use District procedures and other procedures was explained above.

The Initial Study errs in claiming that to approve the proposed project, the city would be required to make findings of project consistency with the planning code. In certain circumstances, the city is required to find that a proposed project is consistent with provisions of the General Plan. Planning Code section 101.1. The proposed project would be inconsistent with provisions of the Urban Design Element and Housing Element of the General Plan for the reasons set forth above, including that the bulk of the buildings does not relate to the prevailing scale of development and would have an overwhelming or dominating appearance, and that the height of buildings does not relate to important attributes of the city patterns and the height and character of existing development. Urban Design Element Policies 3.5 and 3.6. Policy 3.6 explains that it was intended to avoid disruption to the city’s character from buildings that reach extreme bulk, by exceeding the prevailing height and prevailing horizontal dimensions of existing buildings in the area which “can overwhelm other buildings, open spaces and the natural land forms, block views.” Thus, these provisions of the general plan were adopted for the purpose of mitigating or avoiding an environmental effect. At the project site, the proposed new buildings would block public views from the open green spaces and significantly shadow open spaces and overwhelm other buildings.

Also, application of a Special Use District is authorized by the Housing Element to encourage production of affordable housing, not to authorize deviations from residential use district classifications for retail or commercial uses. The Housing Element EIR identified “Policy 7.5: Encourage the production of affordable housing through process and zoning accommodations and prioritize affordable housing in the review and approval processes” as one of the “Policies With Potential for Physical Environmental Impacts.” Ex. C, p. IV-35. The Housing Element EIR acknowledged that “[i]mplementation of the 2009 Housing Element could result in impacts related to existing character if new housing is out of scale with development in an existing neighborhood or if new development is so different it would change the existing character of an

7
 (PP-1)
 cont'd

City and County of San Francisco
 June 8, 2018
 Page 36

area.” Such impacts would occur if a Special Use District or other deviations were used for the purposes proposed by the project proponent, especially for the improper purposes set forth above. The new buildings would still be out of scale with surrounding development and disrupt the area’s character through their dominating appearance, so the significant adverse physical impacts would remain despite approval of an Special Use District under the circumstances requested by the project proponent. The project approval would not result in consistency with the policies of the Urban Design Element or Housing Element, because the IS does not identify those elements of the General Plan as proposed to be amended in connection with approval of the proposed project. IS p. 86.

7
 (PP-1)
 cont'd

The Initial Study also improperly asserted that the impact on land use plans and policies would be less than significant because that the proposed project “would adhere to applicable environmental regulations, and therefore, would not conflict with policies or regulations adopted for the purpose of avoiding or mitigating an environmental effect such that a substantial adverse physical change in the environment related would result.” IS p. 111. This is an unsupported conclusion which is inadequate under CEQA and is contradicted by the evidence discussed herein. No explanation is provided as to the nature of the environmental regulations that would be complied with, the performance standards that would result in compliance or the specific expected management actions that would be taken. The IS’s determination that regulatory compliance will be sufficient to prevent significant adverse impacts was not based on a project specific analysis of potential impacts and the specific effect of regulatory compliance.

Thus, the EIR must analyze the potentially significant impacts which the proposed project would have on conflicts with numerous applicable land use plans, policies and regulations, including those discussed herein, and the substantial impact that the proposed project would have upon the existing character of the vicinity. In the cumulative impact discussion, the Initial Study acknowledges that to some extent conflicts with land use plans and policies under the proposed project “could be embodied in a considerable contribution to a cumulative physical environmental impact” and “such cumulative physical impacts are addressed and analyzed under the specific environmental topics section in the initial study and will also be addressed in Chapter 4, Environmental Setting and Impacts, of the EIR.” This statement constituted recognition that plans and policies with which the project would conflict were adopted for the purpose of avoiding or mitigating an environmental effect.

In addition, the Housing Element EIR recognized that :

“Implementation of the 2004 Housing Element and 2009 Housing Element could result in impacts related to conflicts with existing land use policy, plans, or regulations if the Housing Elements resulted in housing development that was not consistent with zoning and land use designations as outlined in governing land use plans and/or the City’s Planning Code to the extent those regulations help to avoid or mitigate potential

City and County of San Francisco
 June 8, 2018
 Page 37

environmental impacts. For example, if a height limit in a particular area was designed to avoid impacting a view from a public vantage point, there could be an impact from a policy that increased the height limits.” Ex. C, p. V.B-29.

7
 (PP-1)
 cont'd

The proposed project’s increased heights and bulk would conflict with existing public views from the publicly accessible open space that currently exists on the project site, including on Euclid, Laurel and Presidio avenues and the Terrace.

5. The Project Could Have Significant Shadow Impacts on Existing Open Spaces that Have Been Used by the Public for Recreational Purposes, on Sidewalks on the East Side of Laurel Street, and on Publicly Accessible Open Space Proposed by the Project.

8
 (WS-2)

The City’s Shadow Analysis Procedures and Scope Requirements state that the proposed project is subject to review under CEQA if it “would potentially cast new shadow on a park or open space such that the use and enjoyment of that park or open space could be adversely affected,” and such procedures describe potentially affected properties as including “parks, publicly-accessible open spaces, and community gardens.” (Ex. Q) Also, the 2017 Notice of Preparation of an EIR for a mixed use project states that “the topic of shadow will include an evaluation of the potential for the proposed project to result in shadow impacts on nearby sidewalks.” (Ex. P, Initial Study for 1629 Market Street Project, p. 19)

The Initial Study states that the “threshold for determining the significance of shadow impacts under CEQA is whether the proposed project or project variant would create new shadow in a manner that substantially affects the use and enjoyment of outdoor recreational facilities or other public areas.” IS p. 156.

The San Francisco Planning Department Shadow Analysis Procedures and Scope Requirements provide that a shadow analysis would be required:

“If the proposed project is subject to review under the California Environmental quality Act (CEQA) and would potentially cast new shadow on a park or open space such that the use of enjoyment of that park or open space could be adversely affected.” Ex. Q, p. 1.

Those procedures further provide that:

“Potentially Affected Properties. Potentially affected properties including: parks, publicly-accessible open spaces, and community gardens identified in the graphical depictions should be listed and described. The description of these properties should include the physical features and uses of the affected property, including but not limited to: topography, vegetation,

City and County of San Francisco
 June 8, 2018
 Page 38

structures, activities, and programming. Each identified use should be characterized as ‘active’ or passive.’ Aerial photographs should be included, along with other supporting photos or graphics. The programming for each property should be verified with the overseeing entity, such as the Port of San Francisco, the Recreation and Parks Department, etc. Any planned improvements should also be noted.” Ex. Q, p. 2.

8
 (WS-2)
 cont'd

The Initial Study failed to analyze the significance of the shadow impact upon the entire open green spaces used by the public for recreational purposes on the project site.

The Initial Study inaccurately stated that “UCSF currently grants public access” to two existing open green spaces at the perimeter of the project site. In fact, these areas have been used by the public without the permission of the property owner for many years. At the time of issuance of the Initial Study, there were no signs posted indicating that use of the open space was under the permission of the property owner. As explained in the attached letter from attorney Fitzgerald, the public has acquired permanent recreational rights to the open space at the site; the rights were obtained by implied dedication prior to the enactment of Cal. Civil Code section 1009 in 1972. Ex. R) The public has also “acquired a prescriptive easement over the recreational open space. The recreational use has been continuous, uninterrupted for decades, open and notorious and hostile (in this context, hostile means without permission.) Every day, individuals and their dogs use the green space along Laurel, Euclid and along the back of the Site at Presidio. Individuals ignore the brick wall along Laurel and regularly use the green space behind the wall as a park for people and for their dogs. The use of the Site has not been permissive.” *Ibid*.

The Initial Study failed to analyze the impact of shadows on the entire open green space along Laurel, and excluded the open green space along Presidio, because the project proponent seeks permission to build upon, or alter, some of those areas. This is not an of-right project. As explained by the City’s Preliminary Project Assessment, the proposed project fails to comply with numerous requirements of the Planning Code, and rezonings and discretionary approvals would be required to be granted by the Planning Commission and Board of Supervisors. Under applicable discretionary review procedures, the Planning Commission could scale the project back to avoid construction on, or alteration of, the currently publicly-accessible open spaces, and/or make other modifications.

Under Public Resources Code section 21068, a “Significant effect on the environment” means a substantial, or potentially substantial, adverse change in the environment.

Under the CEQA Guidelines, 14 Cal. Code of Regulations section 15382, “Significant effect on the environment” means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the

City and County of San Francisco
 June 8, 2018
 Page 39

environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.” To assess the changes to the environment that will result from the project, the agency treats existing conditions as the environmental baseline against which the project’s changes to the environment are measured. 14 Cal. Code of Regulations section 15152.

8
 (WS-2)
 cont'd

As established by the nomination of the property to the National Register of Historic Places, the “landscape design connects the outdoors with the indoors both functionally and conceptually.” Ex. E, Nomination, p. 5. Among the character defining features of this historically significant resource, the nomination listed “Vegetation features that helps to integrate the character of the Fireman’s Fund site with that of the surrounding residential neighborhoods including (1) the large trees in and around the East and West parking Lots, (2) the lawns on the west, south and east sides of the property, and (3) the planted banks along laurel and masonic streets.” The subject lawn areas and the Terrace are currently used as publicly-accessible open spaces, and it is possible that the approving agencies will retain them as open spaces. These areas would be significantly shaded by the proposed project, with the 2-3 floors proposed to be added to the top of the building. Thus, significantly shading these areas should be treated as a potentially significant impact on the environment in the EIR.

However, the Initial Study failed to analyze the significance of the shadow impact on the entire open green areas and merely analyzed the potential impact upon the portions of these areas that the project proponent proposes not to build upon. However, Figure 37, Extent of Net New Project Shadow Throughout the Day and Year, shows the entire open green spaces along Laurel Street and Presidio Avenue as in the “frequent shadow” zone. IS p. 158. The area in which the Terrace is located would also be frequently shadowed, and the project as proposed would remove the Terrace. The Initial Study shows that there would be a significant adverse shadow impact upon the areas along Laurel Street, Presidio Avenue and the Terrace which the project proponent proposes to build upon or alter, and the Initial Study failed to analyze the potentially significant impact of shadows on these publicly-accessible areas and failed to make a determination that impacts on these areas would not be significant. Thus, the EIR should analyze the potential shadow impacts on these areas as potentially significant impacts under CEQA. Approving authorities may retain some or all of these open spaces. The Initial Study failed to use the correct significance standard, which required it to analyze whether impacts on these areas could be “potentially significant.” The Initial Study’s exclusion of these areas because they would possibly be within part of the built project was erroneous. The Initial Study acknowledges that the decision-makers could modify the project to continue the usability of these spaces. IS p. 160.

Since the evidence shows that new shadows would be frequent on the publicly-accessible open spaces, the EIR should evaluate these shadows as a potentially significant impact on the environment. As acknowledged in the Initial Study for 1629 Market Street Project, the “designation of topics as ‘Potentially Significant’ in the Initial Study means that the EIR will

City and County of San Francisco
 June 8, 2018
 Page 40

consider the topic in greater depth and determine whether the impact would be significant.” Ex. P, p. 4.

8
 (WS-2)
 cont'd

Similarly, the Initial Study shows that the proposed project would cause frequent shadows on the sidewalks on the east side of Laurel Street. The Initial Study failed to specifically determine that the proposed project would not create new shadow on the sidewalks on the east side of Laurel Street in a manner that substantially affects public areas. Instead, it determined that impact would not be significant by using a lesser standard, stating that “[o]verall, the proposed project or project variant would not increase the amount of shadow on the sidewalks above levels that are common and generally expected in developed urban environments.” IS p. 160. Since the evidence shows that the new shadow would be frequent on sidewalks on the east side of Laurel Street, the EIR must evaluate this shadow as a potentially significant impact on the environment and make a determination of whether the impact would be significant under the correct significance standard.

As acknowledged in the Initial Study for 1629 Market Street Project, to determine the impact insignificant, a determination must be made under CEQA that the proposed project’s net new shadows would not be anticipated to substantially affect the use of “any publicly-accessible areas, including nearby streets and sidewalks.” Ex. P, p. 66.

In addition, the Initial Study shows that the proposed project would cause new shadows on the open space proposed to be used in the project, which would be open to the public. ” The Initial Study admits that “the network of proposed new common open spaces, walkways, and plazas within the project site” “would be shaded mostly by proposed new buildings for much of the day and year.” IS p. 161. Thus, the EIR must analyze shadow impacts on these publicly-accessible areas as significant impacts, but the IS improperly excluded them from analysis as significant impacts. Many of these areas are not now significantly shaded as part of the existing environment, but would be a result of the proposed project.

The EIR should follow the City’s shadow analysis procedures and identify and describe all the potentially newly shadowed areas discussed above in graphic depictions together with aerial photographs and provide a quantitative analysis of the impacts that would result from the project. Ex. Q, p. 4.

In addition, it is inaccurate to state that under the proposed project, the Euclid Green “would be developed as common open space that would be open to the public.” IS p. 160. That green open space is currently used as recreational open space by the public, as I have observed.

It should be noted that shadows are physical impacts, not aesthetic impacts exempt from CEQA in certain transit-served areas. The EIR on the Housing Element of the San Francisco General Plan clearly treats shadows as a physical effect along with wind impacts and analyzes aesthetic

City and County of San Francisco
 June 8, 2018
 Page 41

impacts in a separate section. Ex. C - Final EIR 2004 and 2009 Housing Element p. V.J-3, V.C-1. As further explained in that EIR:

“Shadow is an important environmental issue because the users or occupants of certain land uses, such as residential, recreational/parks, churches, schools, outdoor restaurants, and pedestrian areas have some reasonable expectations for direct sunlight and warmth from the sun. These land uses are termed ‘shadow sensitive.’ (Ex. C - Final EIR 2004 and 2009 Housing Element p. V.J-3)

Thus, shadows are a physical impact and are not an aesthetic impact.

6. The Proposed Project Could Have a Significant Hazard and Hazardous Materials Impact.

The Initial Study states that hazards or hazardous material would be significant if the project would:

Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials,

Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Be located on a site which is included on a list of hazardous materials sites complied pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment. IS p. 227-228.

The Initial Study acknowledges that during construction, particularly excavation and grading, construction workers would be exposed to chemicals in the soil and groundwater through skin contact, ingestion or inhalation of airborne dust or vapors, and the “public, including nearby offsite residents and future site occupants, could be exposed to these chemicals through inhalation of airborne dust or vapors or contact with accumulated dust if proper precautions were not implemented.” IS p. 232.

Langan Treadwell Rollo evaluated the additional samples collected in August 2014 from the location of the former onsite USTs following removal of the waste oil UST against the environmental screening levels for commercial uses, but the San Francisco Health Department

8
 (WS-2)
 cont'd

9
 (HZ-1)

City and County of San Francisco
 June 8, 2018
 Page 42

requested that the soil gas results for the site be compared to current environmental screening levels for residential uses. IS p. 229-230. Volatile organic compounds were detected in soil gas at concentrations exceeding residential environmental screening levels, at two of seven sampling locations. IS p. 230. "The health department also requested that a site mitigation plan and a demolition and construction dust control plan be prepared for the site. The site mitigation plan would include soil and groundwater handling procedures, designs for minimization measures that control human exposure to remaining hazardous substances, an environmental contingency plan, and a health and safety plan....All compliance documentation would be reviewed and approved by the health department." IS p. 230.

9
 (HZ-1)
 cont'd

However, the Housing Element EIR states that "redevelopment of former commercial and industrial sites to residential uses would be required to undergo remediation and cleanup under DTSC and the SFBWQCB before construction activities could begin. If contamination at any specific project were to exceed regulatory action levels, the project proponent would be required to undertake remediation procedures prior to grading and development under the supervision of the City's SFDPH, HMUPA, or the SFBWQCB (depending on the nature of any identified contamination). Ex. C, p. V.Q-42.

The Initial Study does not disclose the mitigation measures that the site mitigation plan would provide, including soil and groundwater handling procedures, designs for minimization measures that control human exposure to remaining hazardous substances, an environmental contingency plan, and a health and safety plan. An agency may not rely upon a corrective action plan to mitigate potential impacts of site contamination when the plan's mitigation measures are not disclosed in the record. *Citizens for Responsible Equitable Environmental Development v. City of Chula Vista* (2011) 197 Cal.App.4th 327, 332. Since the Initial Study has not disclosed the mitigation measures that would be used, the EIR must analyze the project's impact from hazardous materials as a significant impact, and analyze mitigation measures. The Initial Study has not disclosed the soil and groundwater handling procedures, designs for minimization measures that control human exposure to remaining hazardous substances, an environmental contingency plan, or a health and safety plan, which the public health department would require.

Since specific mitigation measures have not been developed, disclosed and adopted as a condition of approval of the project, the potentially significant impacts from hazards and hazardous materials has not been mitigated to a level of insignificance. The IS's determination that regulatory compliance will prevent significant adverse impacts was not based on a project specific analysis of potential impacts, potential mitigation measures and the specific effect of regulatory compliance. The Initial Study has not explained the effect of regulatory compliance, identified methods the agencies will consider for mitigating the impact or indicated the expected outcome. By relying on a hope of compliance with regulations that apply to transitory conditions, such as excavation or construction activities that could release hazardous substances, and do not require onsite monitoring to determine compliance, the IS failed to perform a careful

City and County of San Francisco
 June 8, 2018
 Page 43

analysis that would be sufficient to find the impact not significant. Thus, the impact remains significant and must be fully analyzed in the EIR, with review and mitigation approved by all agencies with jurisdiction over the nature of any identified contaminants.

9
 (HZ-1)
 cont'd

Since LTR compares soil gas results to the Environmental Screening levels published by the San Francisco Regional Water Quality Control Board, review and approval of mitigation plans by DTSC and the SFBRWQCB may be required in addition to review and approval by the San Francisco Department of Public Health. The EIR should analyze whether the soil gas detections are under the jurisdiction of DTSC and the SFBRWQCB or other agencies besides the San Francisco Department of Public Health and whether the mitigation plan conforms with the supplemental vapor intrusion guidance document for conducting uniform vapor intrusion evaluations in California expected to be released in mid-2018 by the State Water Resources Control Board, the San Francisco Bay Regional Water Quality Control Board, and the Department of Toxic Substances Control. IS, FN302.

Moreover, the Initial Study evaluates only whether the low levels of volatile organic compounds which were detected in soil gas would pose a vapor intrusion concern for commercial or residential residents at the Plaza A building. However, the impact could be significant if a member of the public, such as a resident across the street from the project site, could be exposed to such soil gas released during construction. The EIR should analyze potential impacts on the public and nearby residents of release into the air of such soil gas and also analyze whether such emissions could be emitted within one-quarter mile of a school.

In addition to contamination from the USTs, the Initial Study discloses that “the site may contain onsite hazardous waste associated with medical uses, such as radioactive materials or other contaminants that may be contained within the existing onsite fume hoods, centrifuges, refrigerators, and waste storage containers. There is also the potential for contaminants, including minor radioactive contamination, in the facility plumbing system from disposal of secondary washes. Currently this hazardous waste is properly disposed of offsite under manifest.” IS p. 233.

While UCSF would remove much of the chemicals and radioactive materials as part of their relocation, the date of their relocation is uncertain, as is the manner of disposal of the remaining materials. What is the date on which UCSF employees would be relocated from the site? The Initial Study states that any remaining medical hazardous waste would be disposed of in an approved facility during building demolition or reuse and would not pose a significant hazard to the public or the environment if applicable federal, state and local regulations are followed. IS 233. The Initial Study does not indicate the identified methods the agencies will consider for mitigating the impact, adopt specific mitigation measures, explain the effect of regulatory compliance or indicate the expected outcome. Thus, the potentially significant impact from medical hazardous waste, including radioactive contamination in the plumbing system from

City and County of San Francisco
 June 8, 2018
 Page 44

disposal of secondary washes, must be analyzed as a potentially significant effect in the EIR, together with all appropriate mitigation measures. The EIR should include as a mitigation measure the preclusion of connection of the piping system used for disposal of secondary washes containing minor radioactive contamination with the proposed graywater recycling system proposed to be installed and used on the property. Without such mitigation, water containing radioactive waste contamination could be used for irrigation onsite and the radioactive materials could be spread onsite.

9
 (HZ-1)
 cont'd

MITIGATION MEASURE. No piping onsite which was used for medical uses, including disposal of secondary washes containing radioactive material, may be connected with any piping used in the graywater recycling system proposed to be installed on the property and used for onsite irrigation and other uses. The project proponent will be required to execute a binding agreement to implement such mitigation measure as a condition of approval of the project.

In addition, the Initial Study states that the building may contain hazardous building materials such as asbestos, lead-based paint, electrical transformers containing PCBs, fluorescent light ballasts containing PCBs or other contaminants, and fluorescent light tubes containing mercury vapors, which could escape in the environment and pose concerns for construction workers and the public if not properly handled or disposed of in accordance with applicable regulations. Again, the impact must be evaluated as a significant impact in the EIR because the Initial Study does not indicate the identified methods the agencies will consider for mitigating the impact, adopt specific mitigation measures, explain the effect of regulatory compliance or indicate the expected outcome. The project proponent proposes to expose substantial amounts of such materials, as it proposes to demolish substantial portions of the existing building and cut a large hole in the building for a passageway.

Also, the Initial Study states that bedrock which would be encountered during site excavation includes serpentinite, which contains naturally occurring asbestos, and during project excavation, naturally occurring asbestos minerals may present a human health hazard if they become airborne and are inhaled. IS p. 235. The Initial Study states that the construction contractor would be required to prepare an asbestos dust mitigation plan specifying measures that would be taken to ensure that no "visible" dust crosses the property boundary during construction. However, the Initial Study indicates that the 17 California Code of Regulations section 93105 requires the use of best available dust mitigation measures to prevent the offsite migration of asbestos-containing dust. Again, the impact must be evaluated as a significant impact in the EIR because the Initial Study does not indicate the identified methods the agencies will consider for mitigating the impact, adopt specific mitigation measures, explain the effect of regulatory compliance or indicate the expected outcome.

Also, under Appendix G of the CEQA Guidelines project hazards and hazardous materials would

City and County of San Francisco
 June 8, 2018
 Page 45

be significant impact if the project would:

“Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.” Ex. B.

The Housing Element EIR uses the same significance standard Ex. C, p. V.Q-40.

The Initial Study identifies several schools/daycare centers are located within a quarter mile of the project site, that states that demolition and construction activities would require handling and transport of hazardous wastes. However, the IS improperly relies upon unspecified future regulatory compliance as the basis for a conclusion that “there would be limited potential for such materials to affect the nearest school.” IS p. 237. The significance standard is triggered by a release within one-quarter mile of an existing school. For the reasons stated above, reliance upon unspecified future regulatory compliance is not sufficient to mitigate the adverse impact, and the potential that such materials could be emitted within one-quarter mile of a school requires the potentially significant impact to be analyzed in the EIR as a significant impact, together with specified mitigation measures that will be incorporated as conditions of approval of the proposed project.

The Initial Study admits that the project site is currently on the Leaking Underground Storage Tank Sites list maintained by the State Water Resources Control Board and “is included on other lists of hazardous materials sites compiled pursuant to Government Code section 65962.5. The listings are related to public notice requirements for permitted activities such as air emissions reporting for onsite activities, small quantity generation of hazardous waste in the medical laboratories, and the former USTs discussed in Impact HZ-2.” IS p. 238. However, the Initial Study is incomplete and inadequate because it does not identify the other lists of hazardous materials sites compiled pursuant to Government Code section 65962.5 on which the project site is included. The EIR must disclose each such site which lists the project site and the nature of the listing so that potential impacts from hazards and hazardous materials can be evaluated.

Thus, the City has failed to comply with the procedures required by CEQA, because Public Resources Code section 21092.6 requires the agency to include in the draft EIR any information derived from consultation of Government Code section 65962.5 (the Cortese list), but the Initial Study states that it will not further address the issue of hazardous materials or waste. Ex. S, CEB, *Practice Under CEQA*, section 13.65 p. 13-74. The City has failed to include in the IS the information “on other lists of hazardous materials sites compiled pursuant to Government Code section 65962.5. The listings are related to public notice requirements for permitted activities such as air emissions reporting for onsite activities, small quantity generation of hazardous waste in the medical laboratories, and the former USTs discussed in Impact HZ-2.” IS p. 238. The City must state all information contained in the listings on such other sites in the Draft EIR.

 Page 46

7. The Proposed Project Could Have a Significant Adverse Impact on Greenhouse Gas Emissions.

10
 (GHG-1)

The Initial Study states that the project's impact on greenhouse gas emissions ("GHG") would be significant if it would:

"Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment" or

"Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." IS p. 146.

New CEQA Guideline section 15064.4, on the determination of significance of GHG emissions, reflects the existing CEQA principle that there is no iron-clad definition of "significance." CEQA Guidelines section 15064(b). Accordingly, lead agencies must use their best efforts to investigate and disclose all that they reasonably can regarding a project's potential adverse impacts. *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comm.* (2001) 91 Cal.App.4th 1344, 1380-81; Ex. T, California Natural Resources Agency, *Final Statement of Reasons for Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*, December 2009. Section 15064.4 is designed to assist lead agencies in performing that required investigation. *Id.*, p. 20; In particular, it provides that lead agencies should quantify GHG emissions where quantification is possible and will assist in the determination of significance, or perform a qualitative analysis, or both as appropriate in the context of the particular project, in order to determine the amount, types and sources of GHG emissions resulting from the project. *Ibid.* Regardless of the type of analysis performed, the analysis must be based "to the extent possible on scientific and factual data." *Ibid.* In addition, lead agencies should also consider several factors. *Ibid.*

As further explained in *Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*, December 2009, pp. 21-22:

"With the foregoing principles in mind, the quantification called for in proposed section 15064.4(a)(1) is reasonably necessary to ensure an adequate analysis of GHG emissions using available data and tools, in accordance with Public Resources Code Section 21083.05. Even where a lead agency finds that no numeric threshold of significance applies to a proposed project, the holdings in the *Berkeley Jets and Protect the Historic Amador Waterways cases*, described above, require quantification of emissions if such quantification will assist in determining the significance of those emissions. OPR and the Resources Agency find that quantification will, in many cases, assist in the determination of significance, as explained below. (State CEQA Guidelines, § 15142 ("An EIR shall be prepared using an interdisciplinary approach which will ensure the integrated use of the

City and County of San Francisco
 June 8, 2018
 Page 47

natural and social sciences and the consideration of qualitative as well as quantitative factors.”).)

10
 (GHG-1)
 cont'd

First, quantification of GHG emissions is possible for a wide range of projects using currently available tools. Modeling capabilities have improved to allow quantification of emissions from various sources and at various geographic scales. (Office of Planning and Research, *CEQA and Climate Change: Addressing Climate Change Through the California Environmental Quality Act Review*, Attachment 2: Technical Resources/Modeling Tools to Estimate GHG Emissions (June 2008); CAPCOA White Paper, at pp. 59-78. Moreover, one of the models that can be used in a GHG analysis, URBEMIS, is widely used in CEQA air quality analyses. (CAPCOA White Paper, at p. 59) Second, quantification informs the qualitative factors listed in proposed section 15064.4(b). Third, quantification indicates to the lead agency, and the public, whether emissions reductions are possible, and if so, from which sources. Thus, if quantification reveals that a substantial portion of a project’s emissions result from energy use, a lead agency may consider whether design changes could reduce the project’s energy demand.

Proposed section 15064.4(a)(1) also reflects existing case law that reserves for lead agencies the precise methodology to be used in a CEQA analysis. (See, e.g. *Eureka Citizens for Responsible Gov’t v. City of Eureka* (2007) 147 Cal.App.4th 357, 371-373.) As indicated above, a wide variety of models exist that could be used in a GHG analysis. (CAPCOA White Paper, at pp. 59-78.) Further, not every model will be appropriate for every project. For example, URBEMIS may be an appropriate tool to analyze a typical residential subdivision or commercial use project, but some public utilities projects, such as waste-water treatment plants, may require more specialized models to accurately estimate emissions. (*Id.* at pp. 60-65.) The requirement to disclose any limitations in the model or methodology chosen also reflects the standard for adequacy of EIRs in existing State CEQA Guidelines section 15151...

If the lead agency determines that quantification is not possible, would not yield information that would assist in analyzing the project’s impacts and determining the significance of the GHG emissions, or is not appropriate in the context of the particular project, section 15064.4(a) would allow the lead agency to consider qualitative factors or performance criteria...

The existing CEQA Guidelines state that the determination of significance requires a lead agency to use its judgment based on *all* relevant information. (State CEQA Guidelines, § 15064(b); see also *Id.* at §§ 15064.7 (thresholds may be qualitative), 15142 (analysis should be interdisciplinary and both qualitative and quantitative).)

Subdivision (a) would also allow a lead agency to rely on performance-based standards to

City and County of San Francisco
 June 8, 2018
 Page 48

assist in the determination of significance. Just as with quantification, the purpose of engaging in a qualitative or performance standard based analysis is to develop information relevant to a significance determination. Several examples exist of the types of performance standards that might appropriately be used in determining the significance of greenhouse gas emission. Proposed section 15183.5(b)(1)(D), for example, contemplates that a plan for the reduction of greenhouse gas emissions may contain performance based standards. Where such standards are developed as part of such a plan, a lead agency would have evidence indicating that compliance with such standards would indicate that the impact of greenhouse gas emissions would be less than significant. Further, in adopting SB375, the Legislature acknowledged that regional transportation plans, and the environmental impact reports prepared to analyze those plans, may contain performance standards that would apply to transit priority projects. (See, e.g., Public Resources Code, § 21155.2.) Other potential examples include the Bay Area Air Quality Management District's proposed Best Management Practices for Construction Greenhouse Gas Emissions (calling for use of alternative fuels, local building materials and recycling), and the California Public Utilities Commission's Performance Standard for Power Plans [sic] (requiring emissions no greater than a combined cycle gas turbine plant). Compliance with such standards may be relevant to the significance determination, when considered in conjunction with the project's total projected emissions...

Similar to use of a significance threshold, a lead agency must exercise care to ensure that performance standards do not replace a full analysis of all potential emissions. (*Protect the Historic Amador Waterways, supra*, 116 Cal.App.4th at 1109 ("in preparing and EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect.)) For example, while a Platinum LEED ® rating could assist a lead agency in determining whether emissions related to a building's energy use may be significant, that performance standard may not reveal sufficient information to evaluate transportation-related emissions associated with that proposed project.

As indicated above, even a qualitative analysis must be based to the extent possible on scientific and factual data. Further, the type of analysis that is required will depend on the context of a particular project....The following hypothetical examples may illustrate, however, how section 15064.4(a) could operate:

Project 2: a large commercial development is proposed in an suburban context. Heavy-duty machinery would be required in various construction phases spanning many months. Following construction, the development would rely on electricity, water and wastewater services from the local utilities. Natural gas burners would be used on site. The development would employ several hundred workers and

10
 (GHG-1)
 cont'd

City and County of San Francisco
 June 8, 2018
 Page 49

attract thousands of customers daily. A traffic study has been prepared for the project. The local air quality management district's guidance document recommends that projects of similar size and character should use URBEMIS, or another similar model, to estimate the air quality impacts of the development.

10
 (GHG-1)
 cont'd

In the context of Project 2 a quantitative analysis would likely be appropriate. The URBEMIS model, which would likely be used to analyze other emissions, could also be used to estimate emissions from both project-related transportation and on-site indirect emissions (landscaping, hot-water heaters, etc.) Modeling is typically done for projects of like size and character. Other models are readily available to estimate emissions associated with utility use. In the context of Project 2, a lead agency may find it difficult to demonstrate a good faith effort through a purely qualitative analysis. (See, e.g., *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comm.* (2001) 91 Cal.App.4th 1344, 1370...

Factors Potentially Indicating Significance

The qualitative factors listed in the proposed section 15064.4(b) are intended to assist lead agencies in collecting and considering information relevant to a project's incremental contribution of GHG emissions and the overall context of such emissions. Notably, while subdivision (b) provides a list of factors what should be considered by public agencies in determining the significance of a project's GHG emission, other factors can and should be considered as appropriate.

Determine Whether Emissions Will Increase or Decrease

The first factor in subdivision (b), for example, asks lead agencies to consider whether the project will result in an increase or decrease in different types of GHG emissions relative to the existing environmental setting. All project components, including construction and operation, equipment and energy use, and development phases must be considered in this analysis. (State CEQA Guidelines, § 15378 (Project includes "the whole of the action").)...

This section's reference to the 'existing environmental setting' reflects existing law requiring that impacts be compared to the environment as it currently exists. (State CEQA Guidelines, § 15125.) This clarification is necessary to avoid a comparison of the project against a 'business as usual' scenario as defined by ARB in the Scoping Plan. Such an approach would confuse 'business as usual' projections used in ARB's Scoping Plan with CEQA's separate requirement of analyzing project effects in comparison to the environmental baseline. (*Compare* Scoping Plan, at p. 9 ('The foundation of the Proposed Scoping Plan's strategy is a set of measures that will cut greenhouse gas

City and County of San Francisco
 June 8, 2018
 Page 50

emissions by nearly 30 percent by the year 2020 as compared to business as usual.’ *with Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278 (existing environmental conditions normally constitute the baseline for *environmental* analysis); see also *Center for Bio. Diversity v. City of Desert Hot Springs*, Riverside Sup. Ct. Case No. RIC464585 (August 6, 2008) (rejecting argument that a large subdivision project would have a ‘beneficial impact on CO2emissions’ because the homes would be more energy efficient and located near relatively uncongested freeways). Business as usual may be relevant, however, in the discussion of the ‘no project alternative’ in an EIR. (State CEQA Guidelines, § 15126(e)(2) (no project alternative should describe what would reasonably be expected to occur in the future in the absence of the project).)...

10
 (GHG-1)
 cont'd

Thresholds of Significance

The second factor in subdivision (b) asks whether a project exceeds a threshold of significance for GHG emissions...

Several agencies have developed, or are in the process of developing, thresholds of significance for GHG emissions. For example, thresholds are currently being developed, or have already been adopted by the Bay Area Air Quality Management District for operations and construction, the City of Davis for residential developments, and the South Coast Air Quality Management District for industrial projects. Regardless of the threshold chose, however, this section does not alter the pre-existing rule under CEQA that if substantial evidence supports a fair argument that a project may result in significant impacts, despite *compliance* with a threshold, an EIR must be prepared. (*Meija v. City of Los Angeles* (2005) 130 Cal. App.4th 322, 342.) Further, ‘in preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect.’ (*Protect the Historic Amado Waterways, supra*, 116 Cal.App.4th at 1109.)

Consistent with the above, if relying on a threshold developed by another agency, lead agencies must exercise caution in selecting a threshold to ensure that the threshold is appropriately applied...Some agencies have adopted ‘thresholds’ pursuant to other laws that may not be applicable in the CEQA context. ARB has adopted several thresholds pursuant to AB32, for example, to address specific purposes that are unrelated to CEQA. For example, the *de minimus* threshold governs the level at which emissions will be regulated by ARB’s AB 32 regulations. (Health & Safety Code, § 38561(e); Scoping Plan, at pp. 96-97.) CEQA does not permit use of a *de minimus* threshold, however...Additionally, the Reporting Threshold is the level at which emissions from large industrial sources are required to be reported.

City and County of San Francisco
 June 8, 2018
 Page 51

Consistency with a Plan or Regulation

10
 (GHG-1)
 cont'd

Finally, the third factor in subdivision (b) directs consideration of the extent to which a project complies with a plan or regulation to reduce GHG emissions. That section further states, however, that to be used for the purpose of determining significance, a plan must contain specific requirements that result in reductions of GHG emissions to a less than significant level. This clarification is necessary because of the wide variety of climate action plans and GHG reduction plans that are currently being adopted by public agencies. ARB, for example, recently adopted its statewide Scoping Plan. That plan may not be appropriate for use in determining the significance of individual projects, however, because it is conceptual at this state and relies on the future development of regulations to implement the strategies identified in the Scoping Plan. (Scoping Plan, at p. 9.) Regulations that will require actual reductions of GHG emissions may not be adopted until 2012. (*Ibid.*) Once those regulations are adopted and being implemented, they may, if appropriate, be used to assist in the determination of significance, similar to the current use of air quality, water quality and other similar environmental regulations. (*CBE, supra* 103 Cal.App.4th at 111...

In addition to the regulations that will be developed to implement the Scoping Plan, this factor would also allow lead agencies to consider plans that are developed to reduce GHG emissions on a regional or local level. (Scoping Plan, at p. 26.) The proposed section 15064.4(b)(3) is intended to be read in conjunction with the section 15064(h)(3), as proposed to be amended, and proposed section 15183.5. Those sections each indicate that local and regional plans may be developed to reduce GHG emissions. If such plans reduce community-wide emissions to a level that is less than significant, a later project that complies with the requirements in such a plan may be found to have a less than significant impact.

Notably, CEQA does not provide a specific definition of 'comply' in the context of determining a project's consistency with a particular plan. Some guidance may be gleaned, however, from case law interpreting the requirements that a local government's activities be consistent with its General Plan. In that context, a 'zoning ordinance [for example] is consistent with the city's general plan where, considering all of its aspects, the ordinance furthers the objectives and policies of the general plan and does not obstruct their attainment.' (*City of Irvine v. Irvine Citizens Against Overdevelopment* (1994) 25 Cal.App.4th 868, 879.) **Reading section 15064.4 together with 15064(h)(3), however, to demonstrate consistency with an existing GHG reduction plan, a lead agency would have to show that the plan actually addresses the emissions that would result from the project.** Thus, for example, a subdivision project could not demonstrate 'consistency' with the ARB's Early Action Measures because those measures do not address emissions resulting from a typical housing subdivision. (ARB,

City and County of San Francisco
 June 8, 2018
 Page 52

Expanded List of Early Action Measures for Reduce Greenhouse Gas Emissions in California Recommended for Board consideration, October 2007; see also State CEQA Guidelines, §§ 15063(d)(3) (initial study must be supported with information to support conclusions), 15128 (determination in an EIR that an impact is less than significant must be briefly explained).) (Emphasis added)

10
 (GHG-1)
 cont'd

SECTION 15064.7. THRESHOLDS OF SIGNIFICANCE

Specific Purposes of the Amendment

Proposed subdivision (c) of section 15064.7 would allow a lead agency to adopt a threshold developed by another agency, or recommended by experts, provided that such threshold is supported with substantial evidence...In adopting any threshold of significance, including one developed by an expert or agency with specialized expertise, the lead agency must support the threshold with substantial evidence in the administrative record. (State CEQA Guidelines, § 15064.7(b).)...Because any threshold must be supported with substantial evidence, and must be adopted through a public process, any threshold recommended by an expert that is ultimately adopted will undergo sufficient scrutiny to ensure its legitimacy. (State CEQA Guidelines, § 15064.7(b).)

SECTION 15126.4 CONSIDERATION AND DISCUSSION OF MITIGATION MEASURES PROPOSED TO MINIMIZE SIGNIFICANT EFFECTS.

Specific Purposes of the Amendment.

Section 21083.05 of the Public Resources Code expressly requires OPR and the Resources Agency to develop regulations on the ‘mitigation of greenhouse gas emissions.’ The goals of this legislative mandate are to (1) reduce GHG emissions and (2) to provide consistency in the development of GHG emissions reduction measures...

Existing section 15126.4 provides guidance on CEQA’s general mitigation requirements. To emphasize that mitigation of GHG emissions is subject to those existing CEQA requirements, OPR and the Natural Resources Agency added a new subdivision (c) to the existing section 15126.4. The Amendments identify five general methods of mitigation that may be tailored to the specific circumstances surrounding a specific project...

Mitigation of Greenhouse Gas Emissions

Comments submitted on the Amendments indicated general concerns that mitigation for GHG emissions may not be effective or reliable. To further clarify the existing mitigation requirements that would apply to measures to reduce greenhouse gas emissions, the

City and County of San Francisco
 June 8, 2018
 Page 53

Natural Resources Agency revised the lead-in sentences in subdivision (c). Specifically, the Natural Resources Agency added that all mitigation must be supported with substantial evidence and be capable of monitoring or reporting. This addition reflects the requirement in Public Resources Code that a lead agency's findings on mitigation be supported with substantial evidence and that it must adopt a mitigation monitoring and reporting program along with the project if mitigation measures are required. (Public Resources Code, §§ 21081(a)(1), 21081.6.)...

10
 (GHG-1)
 cont'd

Consistent with section 15126.4(a), a lead agency must support its choice of, and its determination of the effectiveness of, any reduction measures with substantial evidence. Substantial evidence in the record must demonstrate that any mitigation program or measure is [sic] will result in actual emissions reductions...

Measures to be Implemented on a Project-by-Project Basis

Finally, the fifth type of measure that could reduce GHG emissions at a planning level is the development of binding measures to be implemented on a project-specific basis. Proposed subdivision (c)(5) recognizes that, for a planning level decision, appropriate mitigation of GHG emissions may include the development of a program to be implemented on a project-by-project basis...

This type of mitigation is subject to the limits of existing law, however, Thus, proposed subdivision (c) (5) should not be interpreted to allow deferral of mitigation. Rather, it is subject to the rule in existing section 15126.4 (a) (1)(B) that such measures 'may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way.'

SECTION 15130. DISCUSSION OF CUMULATIVE IMPACTS

Specific Purposes of the Amendment

Section 15130(b)(1)(B)

Section 21083(b) of the Public Resources Code requires that an EIR be prepared if the 'possible effects of a project are individually limited but cumulatively considerable.' that section further defines 'cumulatively considerable' to mean that 'the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.'

In determining whether a project may have significant cumulative impacts, a lead agency

City and County of San Francisco
 June 8, 2018
 Page 54

must engage in a two-step process. First, it must determine the extent of the cumulative problem. To do so, a lead agency must examine the ‘effects of past projects, the effects of other current projects, and the effects of probably future projects.’ Once it does so, the lead agency then determines whether the project’s incremental contribution to that problem is cumulatively considerable...

10
 (GHG-1)
 cont'd

The existing Guideline section 15130(b) addresses the first step of the process. It offers two options for estimating the effects resulting from past, present and reasonably foreseeable projects. A lead agency may either rely on a list of such projects, or a summary of projections to estimate cumulative impacts. Existing section 15130(b)(1)(B) allows a lead agency to rely on projections in a land use document or certified environmental document that addresses the cumulative impact under consideration...

The proposed amendments would also allow a lead agency to rely on information provided in regional modeling programs. The best projections of the cumulative effect of GHG emissions may be available in up-to-date models such as the International Council for Local Environmental Initiative’s Local Government GHG Protocol and the California Climate Action Reserve’s Registry general, industry and project type protocols. (Ex. T, California Natural Resources Agency, *Final Statement of Reasons for Regulatory Action, Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB 97*, pp. 20-28, 30, 46, 49, 50, 53, 54)

The Initial Study failed to quantify GHG emissions that could result from the proposed project, and such quantification is reasonably necessary to ensure adequate analysis of GHG emissions using available data and tools, and such quantification would assist in determining the significance of those emissions. URBEMIS is one model that is widely used in CEQA air quality analyses and can also be used to analyze a project’s GHG emissions. In fact, the local air quality management district’s guidance document recommends that projects of a similar size and character to a large commercial development proposed in a suburban context “should use URBEMIS, or another similar model, to estimate the air quality impacts of the development...” Ex. T, p. 23.

In addition, in June 2010, the BAAQMD adopted recommended thresholds with two alternatives for determining significance for most nonindustrial development projects. One is a bright-line threshold of 1100 MT/year of carbon dioxide equivalent emissions. The other recommended threshold is a per capita threshold of 4.6 MT/yr of CO₂-equivalent emissions, based on the service population of the project. Ex. S, CEB, *Practice Under the California Environmental Quality Act*, § 20.81A, p. 20-100.

The Housing Element EIR states that BAAQMD has updated their CEQA air quality guidelines and “adopted significance standards for GHGs on June 2, 2010.” The updated CEQA Air

City and County of San Francisco

June 8, 2018

Page 55

Quality Guidelines includes significance thresholds, assessment methodologies, and mitigation strategies for GHG emissions. Ex. C, p. V.I-12. The recently adopted GHG thresholds of significance, as discussed in BAAQMD's May 2010 CEQA Air Quality Guidelines, includes two sets of GHG thresholds: one that would apply to specific development projects, and another threshold that would apply to plan-level CEQA analysis. *Ibid.*

10
(GHG-1)
cont'd

The California Resources Agency has identified "the Bay Area Air Quality Management District's proposed Best Management Practices for Construction Greenhouse Gas Emissions (calling for use of alternative fuels, local building materials and recycling" as performance-based standards that are appropriate to use in determining significance of GHG emissions. Ex. T, p. 22.

The Initial Study has not provided substantial evidence that the project's GHG emissions, and/or the project's percentage reduction from business as usual ("BAU") correlates with statewide, regional or local goals. The IS's claim that GHG impacts would not be significant was not supported by substantial evidence that the project's energy-efficiency goals, construction-related GHG emission goals, and transportation-related GHG emission goals would be reached.

Moreover, the IS failed to consider "whether the project will result in an increase or decrease in different types of GHG emissions relative to the existing environmental setting. All project components, including construction and operation, equipment and energy use, and development phases must be considered in this analysis." Ex. T, p. 24. Instead, the IS evaluated the project's consistency with applicable local and regional plans for GHG reduction rather than considering whether the project will "result in an increase or decrease in different types of GHG emissions relative to the existing environmental setting." Thus, the IS erroneously used existing plans as the baseline against which potential project effects were analyzed, instead of increases or decreases in different types of GHG emissions relative to the existing environment.

The IS's consistency evaluation was supported by the bald claim that the project would comply with various regulations and programs relating to energy efficiency, waste reduction, tree planting and landscaping, etc. This analysis was inadequate because it was not based on a project specific analysis of potential impacts and the specific effect of regulatory compliance. Also, the environmental evaluation did not commit the project sponsor to implementation of specific performance criteria as mitigation measures agreed as a condition of approval of the project or objective performance criteria for measuring whether the project would achieve the goals of such programs or regulations.

The Initial Study states that "construction-related emissions would still have the potential to conflict with or obstruct implementation of the applicable air quality plan...Both construction and long-term operational emissions have the potential to result in emissions that could conflict with or obstruct implementation of the applicable air quality plan. IS p. 144. "As described above, construction and operation of the proposed project or project variant would generate criteria air

City and County of San Francisco

June 8, 2018

Page 56

pollutant and ozone precursor emissions that would contribute to regional air emissions and affect regional air quality. It is possible that the levels of emissions generated during construction or operation could violate or contribute substantially to an existing or projected air quality violation.” IS pp. 144-145.

10
(GHG-1)
cont'd

The Initial Study’s claim that the project would comply with various plans or regulations to reduce GHG emissions is also deficient because the IS has failed to show that the plans or regulations contain specific requirements that would result the proposed project’s reducing GHG emissions to a less than significant level. Ex. T, p. 26. The IS has failed to show that the referenced plans or regulations actually address that emissions that would result from this proposed project or project variant. Ex. T, p. 27.

Thus, the IS has failed to comply with CEQA because it has failed to determine the extent to which the proposed project either increases or decreases GHG emissions, by comparing the project’s emissions to the current environment and whether the anticipated GHG emissions associated with the project exceed a threshold of significance set by the lead agency or another agency with jurisdiction over resources affected by the project.

Moreover, the IS’s GHG analysis is deficient under CEQA because it failed to provide substantial evidence that the proposed project’s percentage reduction in GHGs from business as usual would correlate with achieving AB 32’s statewide goal of reducing emissions by approximately 30 percent below BAU by 202, or other applicable goals of the City or other agencies. The IS lacks substantial evidence to show that the proposed project would reduce its GHG emissions to levels that would be consistent with achieving applicable state, regional, local or other agency GHG reduction goals.

The IS does not present substantial evidence demonstrating that project GHG emissions would be consistent with SB 32’s goal of reducing GHG emissions by 40% below 1990 levels by 2030 (IS p. 147, fn. 124), of the goals of Executive Order S-3-05 to reduce emissions to 1990 levels by 2020, and to reduce emissions to 80% below 1990 levels by 2050 (IS p. 147 fn. 121), or the targets of Executive Order B-30-15 of reducing GHG emissions to 40 percent below 1990 levels by 2030. (IS p. 147, fn. 122) Also, the IS inadequately relied on the claim that San Francisco has met the State and regional 2020 GHG reduction targets citywide, but this proposed project would have significant adverse air emissions from 7-15 years of construction and operations which would result for years after 2020, so the GHG analysis analysis should have been performed for a longer time-range.

In addition, the IS failed to implement mitigation measures requiring as a condition of approval that during operations and construction the project proponent implement enforceable measures that would ensure that targeted reductions in GHG emissions would be met, and that compliance with applicable programs and regulations would actually occur.

↓

City and County of San Francisco
 June 8, 2018
 Page 57

For the reasons stated above, the IS failed to follow CEQA procedures in determining the significance of the project's effect on GHG emissions, failed to support with substantial evidence in the record its determination that the project's and project variant's effect on GHG emissions would not be significant, and failed to provide substantial evidence in the record showing that the project and project variant's percentage reduction in GHGs in comparison with business as usual would correlate with achieving state, regional or local goals.

10
 (GHG-1)

8. The Determination that the Project Could Not Have Significant Growth-Inducing Impacts is Not Supported by Substantial Evidence.

11
 (PH-2)

As required by section 15126.2(d) of the CEQA Guidelines, an EIR must consider the ways in which the proposed project could directly or indirectly foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment.

Implementation of the proposed project would require numerous zoning changes to establish new land use controls for the project site. As previously discussed herein, retail and new office uses are not allowed by the existing zoning set forth in Resolution 4109, and the project would propose to construct housing units in excess of the approximately 508 housing units allowed under Resolution 4109. The zoning changes sought and resulting land uses would change the mix and types of land uses that could be developed on the project site, and would allow for increased building heights and density.

The EIR should analyze whether the proposed project and project variant would result in residential development at a greater average housing density per acre than currently exists on the project site or in the immediate project vicinity.

Also, implementation of the proposed project would include the expansion of infrastructure for the provision of new or expanded distribution lines for water, gas and electrical service and sewer system lines.

The proposed project could be growth inducing if it would extend water supply infrastructure and/or gas and electric distribution infrastructure or sewer service infrastructure beyond what is necessary to serve uses proposed under the project.

The IS states that the project would include construction of new natural gas and sewer lines to serve the project site. IS p. 119. However, the IS provides no support for its conclusion that this infrastructure would not indirectly induce substantial population growth in the project area because the project site is an infill site surrounded by existing development and "the proposed infrastructure improvements would be sized to meet only project needs and would not enable additional development." IS p. 119. The project description did not include specifications as to

City and County of San Francisco
 June 8, 2018
 Page 58

the sizing of new or expanded infrastructure or impose limitations on its size as an enforceable condition of approval of the project.

The following mitigation measure should be adopted as a condition of approval of the proposed project:

MITIGATION MEASURE. The EIR will set forth technical specifications that show without question that proposed infrastructure improvements installed in connection with the project would be sized to meet only the needs of the project or project variant as proposed in the project description in the EIR and would not enable additional development; a qualified professional engineer will review the proposed specifications and sign a report verifying that such specifications will allow such infrastructure to only meet the needs of the project or project variant as proposed in the project description in the EIR and would not enable additional development; such report will be included in the Draft EIR and submitted for public comment; and the project approval will incorporate as enforceable mitigation measures such technical specifications that specifically provide that infrastructure installed on and/or nearby the project site would be sized to meet only the needs of the project or project variant as proposed in the project description in the EIR and would not enable additional development.

Absent substantial evidence to support the conclusion that no indirect impacts related to population growth as a result of expansion of infrastructure would occur, the evidence contained in the IS supports a fair argument that the expansion of infrastructure could indirectly foster population growth. The EIR must analyze this impact as a potentially significant impact.

Also, CEQA Guidelines section 15126.2(d) recognizes that increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. The EIR should analyze in detail whether the project's demand for water, gas, electricity and sewer service could adversely affect the current supply of water, gas, electricity and sewer service to residences surrounding the site or in the immediate vicinity, so that new or expanded connections could be required.

9. The Project Description is Not Stable.

For purposes of CEQA, a "project" is defined as comprising "the whole of an action " that has the potential to result in a direct or reasonably foreseeable indirect physical change to the environment. 14 CCR section 15378(a).

The Initial Study lists approval of a subdivision map by San Francisco Public Works as an approval that would be required to implement the proposed project or project variant. IS p. 86.

11
 (PH-2)
 cont'd

12
 (PD-7)

City and County of San Francisco
 June 8, 2018
 Page 59

However the Initial Study fails to provide any information on the nature of the subdivision that would be sought, including whether spaces proposed to be used for retail or office uses would be subdivided. The EIR should disclose all information in the possession of the City as to the nature of the subdivision that would likely be sought.

12
 (PD-7)
 cont'd

In addition, the Initial Study indicates that the Walnut Street extension would be a pathway, and the EIR should clarify that approval would not be sought to make the Walnut Street extension a public street or public right of way. The EIR should also clarify that approval would not be sought to divide the project site into blocks, because the whole site is now one lot and block.

The project description and objectives are artificially narrow and preclude consideration of reasonable alternatives for achieving the project's underlying purpose. By describing the project as "mixed-use," the Initial Study seeks to prejudice the consideration of other adaptive reuse alternatives, such as all-residential development, which would conform with the existing zoning. The proposed project, however, would conflict with the existing land use controls, including controls prohibiting retail uses and new office uses at the site, heights in excess of 40-feet, violation of open space and rear yard requirements, and would seek other deviations. The project description and objectives would require numerous zoning changes, so is not an of-right project. The community has supported new residential construction, and the project objectives should be corrected to seek to achieve adaptive reuse of this historically significant resource in a manner which complies with applicable land use controls and avoids or substantially reduces significant impacts on the environment under CEQA standards. An all-residential alternative should be included in the EIR so as not to artificially limit alternatives considered by omitting information from the EIR that is highly relevant to the Board of Supervisors, which would have to approve zoning changes to permit the project as proposed to proceed.

13
 (AL-1)

Further, the report of the project sponsor's consultant as to preservation alternatives states that all new construction proposed in the preservation alternative has been designed to the greatest extent that is technically feasible "to be comparable in square footage to the proposed Project or Project Variant." Ex. U, Page & Turnbull, 3333 California Street, Preservation Alternatives Report, excerpts, p. 8. According to the IS, the proposed project would have a total of 1,372,270 gross square feet, whereas the existing uses on the site occupy a total of 469,000 gross square feet. IS pp. 9, 21. The project variant would occupy a total of 1,476,987 gsf. Ex. U, p. 82. The EIR must clarify the actual objectives of the proposed project so as not to preclude consideration of reasonable alternatives for achieving the project's underlying purpose. Considering this information, together with the other information in the IS, it is unclear whether the project objectives are to build mixed-use development, to rezone the site to allow retail and new office uses and increased height limits, to achieve an amount of square footage of development that is now sought by the proposed project or project variant, or to achieve feasible adaptive reuse of a historically significant resource.

City and County of San Francisco
 June 8, 2018
 Page 60

In addition, the project description is unstable in that the Initial Study indicates that the project proponent would seek a development agreement that would permit a 15-year period for construction and “limit the City’s ability to rezone the site for a set period of time.” IS p. 23. Thus, the development described in the Initial Study may not be the full extent of the contemplated development, especially in view of the proposed removal of the 4th floor of the existing office building and the strengthening of the building to accommodate additional floors.

14
 (PD-7)

The EIR must disclose all information as to the number of additional floors that the strengthening of the structure is being designed to accommodate and all other designs that are being prepared to accommodate expansion. Is the strengthening of the building being designed to accommodate more floors than three, and if so, how many such additional floors? The Initial Study discloses only that two to three stories are proposed to be added to the existing building. Also, are any of the new buildings being designed to accommodate expansion, and how many additional floors are they being designed to accommodate? An Initial Study must consider all phases of project planning, including phases planned for future implementation. 14 CCR section 15063(a)(1). The EIR must also disclose all available information as to the terms of the proposed development agreement that the project proponent and/or the City is considering.

Additional floors added to buildings would allow space for more residential units or other uses sought by the developer, and could increase the number of occupants or users of the site, and the consequent volumes of traffic, air emissions, noise and shadows. The impact of shadow would be greater if more than two to three additional stories were added to the existing building. Thus, the information sought is relevant to analysis of environmental impacts.

Very truly yours,

Kathryn Devincenzi

Ms. Moore,

Thank you. Please confirm that the City will not issue a negative declaration after the 30-day public comment period on the initial study, and the City will prepare an EIR for 3333 California.

Kathy Devincenzi

Wed, Mar 28, 2018 at 3:35 PM

Your understanding is correct. Regardless of whether a negative declaration is issued after the 30-day comment period, providing your specific comments about the adequacy of the CEQA environmental review for the project in a timely manner will enable the Department to fulfill our responsibility under CEQA to engage in a good faith effort to disclose significant effects of the proposed project on the physical environment. The sooner you are able to provide such comments, the more thorough this evaluation is likely to be.

Regards,

Julie Moore, Senior Planner

EXHIBIT B

**CEQA APPENDIX G:
ENVIRONMENTAL CHECKLIST FORM**

NOTE: The following is a sample form and may be tailored to satisfy individual agencies' needs and project circumstances. It may be used to meet the requirements for an initial study when the criteria set forth in CEQA Guidelines have been met. Substantial evidence of potential impacts that are not listed on this form must also be considered. The sample questions in this form are intended to encourage thoughtful assessment of impacts, and do not necessarily represent thresholds of significance.

1. Project title: _____
2. Lead agency name and address: _____

3. Contact person and phone number: _____
4. Project location: _____
5. Project sponsor's name and address: _____

6. General plan designation: _____ 7. Zoning: _____
8. Description of project: (Describe the whole action involved, including but not limited to later phases of the project, and any secondary, support, or off-site features necessary for its implementation. Attach additional sheets if necessary.)

9. Surrounding land uses and setting: Briefly describe the project's surroundings:

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement.)

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, has consultation begun? _____

Note: Conducting consultation early in the CEQA process allows tribal governments, lead agencies, and project proponents to discuss the level of environmental review, identify and address potential adverse impacts to tribal cultural resources, and reduce the potential for delay and conflict in the environmental review process. (See Public Resources Code section 21083.3.2.) Information may also be available from the California Native American Heritage Commission's Sacred Lands File per Public Resources Code section 5097.96 and the California Historical Resources Information System administered by the California Office of Historic Preservation. Please also note that Public Resources Code section 21082.3(c) contains provisions specific to confidentiality.

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Expose sensitive receptors to substantial pollutant concentrations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Create objectionable odors affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

IV. BIOLOGICAL RESOURCES:

Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

VII. GREENHOUSE GAS EMISSIONS.

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

VIII. HAZARDS AND HAZARDOUS MATERIALS. Would the project:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

IX. HYDROLOGY AND WATER QUALITY.

Would the project:

a) Violate any water quality standards or waste discharge requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
--------------------------------------	--	------------------------------------	--------------

XIII. POPULATION AND HOUSING. Would the project:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------

XIV. PUBLIC SERVICES.

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

Fire protection?

Policies With Potential for Physical Environmental Impacts¹

Corresponding 1990 Residence Element Policy	2004 Housing Element	2009 Housing Element
Policy 2.2: Encourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of units that are permanently affordable to lower income households.	Policy 1.6: Create incentives for the inclusion of housing, particularly permanently affordable housing, in new commercial development projects.	Policy 1.10: Support new housing projects where households can easily rely on public transportation, walking and bicycling for the majority of daily trips.
Policy 1.3: Create incentives for the inclusion of housing, particularly permanently affordable housing, in new commercial development projects.	Policy 1.7: Encourage and support the construction of quality, new family housing.	Policy 1.6: Consider greater flexibility in number and size of units within established building envelopes in community based planning processes, especially if it can increase the number of affordable units in multi-family structures.
Policy 1.5: Allow new secondary units in areas where their effects can be dealt with and there is neighborhood support, especially if that housing is made permanently affordable to lower income households.	Policy 1.8: Allow new secondary units in areas where their effects can be dealt with and there is neighborhood support, especially if that housing is made permanently affordable to lower income households.	Policy 7.5: Encourage the production of affordable housing through process and zoning accommodations, and prioritize affordable housing in the review and approval processes.
Policy 7.3: Grant density bonuses for construction of affordable or senior housing.	Policy 4.4: Consider granting density bonuses and parking requirement exemptions for the construction of affordable housing or senior housing.	Policy 11.5: Ensure densities in established residential areas promote compatibility with prevailing neighborhood character.
Policy 2.3: Allow flexibility in the number and size of units within permitted volumes of larger multi unit structures, especially if the flexibility results in creation of a significant number of dwelling units that are permanently affordable to lower income households.	Policy 4.5: Allow greater flexibility in the number and size of units within established building envelopes, potentially increasing the number of affordable units in multi-family structures.	
Policy 12.5: Relate land use controls to the appropriate scale for new and existing residential areas.	Policy 11.6: Employ flexible land use controls in residential areas that can regulate inappropriately sized development in new neighborhoods, in downtown areas, and in other areas through a Better Neighborhoods type planning process while maximizing the opportunity for housing near transit.	

increase the likelihood that those individuals would utilize available public transit, or other alternatives modes of transportation (bicycle and walking) to work, decreasing the overall number of vehicle trips or vehicle miles traveled (VMTs) citywide. It also follows that housing in proximity to neighborhood services (such as along neighborhood commercial districts, mixed-use districts, or commercial areas) could reduce vehicle trips by shifting a portion of those trips to transit, bicycle or pedestrian trips. Proximity to neighborhood services could also result in lower VMT. For example, 2004 Housing Element Policies 1.2 and 1.9 and their corresponding implementation measures direct housing to commercial and educational areas more strongly than the 1990 Residence Element, which would reduce vehicle trips by locating housing in proximity to job cores and services. 2009 Housing Element Policies 12.1, 13.1, and 13.3 encourage housing near transit lines and existing transit infrastructure to a greater extent than their corresponding 1990 Residence Element policies. Therefore, no inconsistencies between the proposed Housing Elements and the Transportation Element have been identified.

Urban Design Element

The Urban Design Element is concerned with the physical character and environment of the City with respect to development and preservation. The following Urban Design Element policies may be potentially inconsistent with the proposed Housing Elements.

- Objective 3: Moderation of major new development to complement the City pattern, the resources to be conserved and the neighborhood environment.
- Policy 3.3: Promote efforts to achieve high quality of design for buildings to be constructed at prominent locations.
- Policy 3.4: Promote building forms that will respect and improve the integrity of open spaces and other public areas.
- Policy 3.5: Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development.
- Policy 3.6: Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction.
- Policy 3.7: Recognize the special urban design problems posed in development of large properties.
- Policy 3.8: Discourage accumulation and development of large properties, unless such development is carefully designed with respect to its impact upon the surrounding area and upon the City.
- Policy 3.9: Encourage a continuing awareness of the long-term effects of growth upon the physical form of the city.
- Policy 4.1: Protect residential areas from the noise, pollution and physical danger of excessive traffic.

Policy 4.2: Provide buffering for residential properties when heavy traffic cannot be avoided.

The proposed Housing Elements would not adversely affect implementation of the above policies. Specifically, 2004 Housing Element Policies 11.1, 11.8, and 11.9 would use new housing to enhance neighborhood vitality and diversity and would ensure increased housing density would not conflict with existing neighborhood character. 2009 Housing Element Policies 11.1 and 11.7 encourage the preservation of neighborhood character. All of these policies would relate directly to the Urban Design Element policies. No inconsistencies between the proposed Housing Elements and the Urban Design Element have been identified.

Area Plans

The General Plan also includes several area (neighborhood) plans that serve to guide the nature of future development within specific districts of the City. The 2004 Housing Element and 2009 Housing Element do not include any changes to the land use objectives and policies in the City's Area Plans or Redevelopment Plans for certain areas in the City. However, the proposed Housing Elements promote specific neighborhood and area plans as part of the planning process. 2004 Housing Element Policy 11.6 calls for the completion of the Better Neighborhoods area plans and 2009 Housing Element Policy 1.1 calls for a community planning process to guide new housing growth. Applicable Area Plans or Redevelopment Plans would continue to guide future development in specific neighborhoods or districts. A number of other planning efforts are currently underway including, but not limited to the Transit Center District Plan, Treasure Island, and Western SoMa, which could result in increased residential development potential in those areas. The estimated new housing construction potential for each of these areas is provided in Table IV-6 in Section IV (Project Description).

The more general policies in the 2004 and 2009 Housing Elements are made more precise in the applicable area plans as they relate to certain parts of the City. 2004 Housing Element Policies 1.7, 4.4, 11.6, 11.7, and 11.8 and 2009 Housing Element Policies 2.1 and 7.5 would promote increased housing density by encouraging the construction of new housing and discouraging demolition of existing housing. 2004 Housing Element Policies 3.1, 3.3, 3.4, and 3.5 and 2009 Housing Element Policies 2.5 and 7.6 encourage the preservation of existing residential units through maintenance and upgrade activities. 2004 Housing Element Policy 11.3 and 2009 Housing Element Policies 8.1, 9.1, 9.2, 9.3 support the production, management, and preservation of affordable housing units in accordance with San Francisco's needs. 2004 Housing Element Policies 11.1, 11.8, and 11.9 and 2009 Housing Element Policies 11.1 and 11.7 would ensure new housing does not conflict with existing neighborhood character. 2004 Housing Element Policies 1.7 and 4.5 and 2009 Housing Element Policy 2.2 encourage family housing. Implementation of the policies in the proposed Housing Elements could also serve to increase energy efficiency of San Francisco's housing stock by directing housing to locations where residents could have reduced reliance on automobiles, such as mixed use neighborhoods and areas surrounding existing transportation infrastructure. The proposed Housing Element policies discussed above further the intent related to housing of the Area Plans discussed below. No inconsistencies between the proposed Housing Elements and specific area plans have been identified.

Other Development Agreements

Executive Park

Executive Park is a 71-acre area located in southeastern San Francisco. It is bounded on the west by U.S. 101, on the east by the Candlestick Point Special Use District, on the north by Bayview Hill, and on the south by Candlestick State Park and the San Francisco Bay. Adjacent neighborhoods include the Bayview Hunters Point neighborhood to the north, and the Little Hollywood and Visitacion Valley neighborhoods to the northwest. Primary access to Executive Park is from Harney Way, Alana Way, Thomas Mellon Drive and Executive Park East Boulevard. Secondary access is provided via Blanken Avenue to the west, which connects Bayshore Boulevard with Executive Park West Boulevard, and Jamestown Avenue/Hunters Point Expressway to the east. Executive Park is now an office park with some housing on the far eastern end. The office buildings are surrounded by surface parking and the housing is internally focused and gated. The plan envisions a new San Francisco neighborhood: a mixed-used residential neighborhood with attractive public streets and open space connectivity.¹⁷ The Executive Park Area Plan is an ongoing effort that could provide approximately 1,600 additional housing units.

Park Merced

Park Merced is residential neighborhood on approximately 152 acres of land in the southwest portion of San Francisco adjacent to Lake Merced and generally bounded by Vidal Drive, Font Boulevard, Pinto Avenue, and Serrano Drive to the north, 19th Avenue and Junipero Serra Boulevard to the east, Brotherhood Way to the south, and Lake Merced Boulevard to the west. The Plan would increase residential density, provide a neighborhood core with new commercial and retail services, modify transit facilities, and improve utilities within the development site. The principal land use goals are to reduce automobile use by concentrating housing close to employment, increasing the supply of housing, and providing better integrated residential and neighborhood serving retail and office uses; to maximize opportunities to use pedestrian and bicycle pathways; to establish pedestrian-oriented nodes for the location of neighborhood services and amenities, open space, and community services; and to incorporate environmental factors such as sun, shade, and wind into the design and housing materials.¹⁸ The Parkmerced Area Plan is an ongoing effort that could provide approximately 5,600 additional housing units.

San Francisco Planning Code

The San Francisco Planning Code, which incorporates by reference the City's Zoning Maps, governs permitted uses, densities and the configuration of buildings in San Francisco. Permits to construct new buildings (or to alter or demolish existing ones) cannot be issued unless either the proposed action conforms to the Planning Code, or an exception is granted pursuant to provisions of the Planning Code, or

¹⁷ Executive Park Area Plan, revised draft, March 19, 2009, website: <http://www.sfplanning.org/Modules/ShowDocument.aspx?documentid=1545>, accessed June 22, 2010.

¹⁸ Park Merced EIR, Part 1 website: http://www.sf-planning.org/ftp/files/MEA/2008.0021E_Parkmerced_DEIR_V1-01.pdf, accessed June 22, 2010.

a reclassification of the site occurs. The following is a summary of Planning Code provisions related to controls on housing.

Existing Zoning (San Francisco Planning Code)

San Francisco utilizes a zoning system with two separate sets of districts: one that regulates land uses, and another that regulates the height and bulk of buildings. The existing use districts and height limits in the City are described below.

There are a total of 13 residential zoning districts in the City, reflecting a mix of land use. A summary of the planning code provisions for residential uses is provided in the San Francisco Planning Code Zoning Districts, Residential Districts Controls Summary, on the Planning Department's website.¹⁹ Residential zoning designations in the City range in density from RH-1 (D) (House-One Family, Detached Dwellings) to RTO (Residential Transit Oriented Development).

The City contains 25 separate height and bulk districts that range in height from 40 feet to 550 feet. The City is divided into classes of height and bulk districts as indicated on the zoning maps. Additional height limits are imposed for certain use districts, such as areas located within narrow streets or alleys. Section 263 of the Planning Code contains special exceptions to the height limits for certain uses within certain areas. Buildings and structures exceeding the prescribed height may be approved by the Planning Commission according to the procedures for conditional use approval in Section 303 of the Planning Code; provided, however, that such exceptions may be permitted only in the areas specified and only to the extent stated in each section. Some of the areas eligible for exceptions to the height limits include north and south of the Ferry Building, east and west of Chinese Playground, Chinatown corners and parapets, and north of Market residential special use districts, among others.

Planning Code Section 295

Section 295 of the Planning Code, the Sunlight Ordinance, was adopted through voter approval of Proposition K in November 1994 to protect certain public open spaces from shadowing by new structures. Section 295 prohibits the issuance of building permits for new construction or additions that would result in structures greater than 40 feet in height that would shade property under the jurisdiction of, or designated to be acquired by, the Recreation and Park Commission, during the period from one hour after sunrise to one hour before sunset on any day of the year. An exception is permitted if the Planning Commission, upon advice from the Recreation and Park Department general manager and the Recreation and Park Commission, determines that the shadow would have an insignificant impact on the use of such property. In practice, therefore, Section 295 acts as a kind of overlay that further limits heights and/or shapes of certain buildings around protected parks; the Section 295 limit is in addition to the height limits in the Height and Bulk districts.

¹⁹ San Francisco Planning Department, Zoning Districts, Residential Districts Controls Summary, website: http://www.sfgov.org/site/uploadedfiles/planning/projects_reports/Residential%20Standards%20Summary%20Table.pdf, accessed April 9, 2009.

All of the open spaces within the City that are under Recreation and Park Department control are protected by Section 295. Privately-owned open spaces, including any open spaces that are required under the Planning Code as part of an individual development proposal, are not subject to Section 295. Section 295 is applicable to the analysis of shadow impacts in Section V.I (Wind and Shade) of this EIR.

Planning Code Section 147

Planning Code Section 147, applicable to the C-3, RSD, SLR, SLI, or SSO zoning districts, states that new buildings and additions to existing buildings where height limits are greater than 50 feet must be shaped to minimize shadow on public plazas or other publicly accessible open spaces other than those protected by Section 295, “in accordance with the guidelines of good design and without unduly restricting the development potential of the property.” The following factors must be taken into account in determining compliance with this criterion: the amount of area shadowed, the duration of the shadow, and the importance of sunlight to the type of open space being shadowed. Various areas within the City are zoned RSD, SLR, SLI, or SSO and hence subject to Section 147. Section 147 is applicable to the analysis of shadow impacts in Section IV.I (Wind and Shade) of this EIR.

Planning Code Section 311 and Residential Design Guidelines

For construction of new residential buildings and alteration of existing residential buildings in R Districts, Section 311 of the Planning Code requires consistency with the design policies and guidelines of the General Plan and with the Residential Design Guidelines that are adopted for specific areas. Section 311 also states that the Director of Planning may require modifications to the exterior of a proposed residential building—including, but not limited to changes in siting, building envelope, scale, texture, detailing, openings, and landscaping—in order to bring it into conformity with the Residential Design Guidelines and the General Plan. The most recent set of Residential Design Guidelines was adopted in 2003. The guidelines apply to development in all RH and RM districts, and are intended to maintain cohesive neighborhood identity, preserve historic resources, and enhance the unique setting and character of the City and its residential neighborhoods.

The guidelines are based on the following design principles, which are also used to determine compliance with the guidelines:

- Ensure that the building’s scale is compatible with surrounding buildings.
- Ensure that the building respects the mid-block open space.
- Maintain light to adjacent properties by providing adequate setbacks.
- Provide architectural features that enhance the neighborhood’s character.
- Choose building materials that provide visual interest and texture to a building.
- Ensure that the character-defining features of an historic building are maintained.

Various areas within the City are zoned R and hence subject to Section 311 and the Residential Design Guidelines. Section 311 is applicable to the analysis of visual quality in Section V.C (Aesthetics) of this EIR.

Other Controls

Reflective Glass (Planning Commission Resolution 9212)

Planning Commission Resolution No. 9212 (1981) established a pair of guidelines for reviewing and acting on proposed building projects. The first guideline states that clear, untinted glass should be used at and near the street level. The second guideline states that mirrored, highly reflective, or densely tinted glass should not be used except as an architectural or decorative element. By prohibiting mirrored or reflective glass, this resolution serves to limit glare. Resolution 9212 is applicable to the analysis of visual quality in Section V.C (Aesthetics) of this EIR.

San Francisco Green Building Ordinance (SFGBO)

In 2008, the City adopted Chapter 13C (Green Building Requirements) into San Francisco Building Code. The purpose of the requirements is to promote the health, safety, and welfare of San Francisco residents, workers, and visitors by minimizing the use and waste of energy, water and other resources in the construction and operation of the buildings within the City and by providing a healthy indoor environment. The requirements are based on LEED®²⁰ or GreenPoints²¹ rating systems. Upon full implementation of the SFGBO in 2012, residential development will be required to achieve the following minimum standards:

1. Small residential (four or fewer units) – 75 GreenPoints;
2. Mid-sized residential (five or more units less than 75 feet in height) – 75 GreenPoints; or
3. High-rise large residential – 75 GreenPoints or LEED® Silver.

The ordinance requires compliance with the applicable LEED® performance standards or GreenPoint Rated checklists (which applies mostly to residential buildings) for New Construction, Version 2.2, LEED® criteria sustainable Sites (SS) 6.1 and SS6.2 for stormwater management, as well as the best management practices (BMPs) and Stormwater Design Guidelines of the SFPUC (1304C.0.3). Additionally, for high-rise residential buildings (1304C.1.3), new group B (Business) and M (Mercantile) occupancy buildings (1304C.2), and new large commercial buildings (1304C.2.2), water efficient landscaping (LEED® credit WE1.1) and water conservation are required (LEED® credit WE3.2).

²⁰ U.S. Green Building Council - LEED Rating Systems information website: <http://www.usgbc.org/DisplayPage.aspx?CMSPageID=222> accessed June 17, 2010.

²¹ Build It Green - GreenPoint ratings information website: <http://www.builditgreen.org/greenpoint-rated/> accessed June 17, 2010.

- consider the impacts of ozone control measures on particulate matter (PM), air toxics, and greenhouse gases in a single, integrated plan;
- review progress in improving air quality in recent years; and
- establish emission control measures to be adopted or implemented in the 2009-2012 timeframe

Overall, the intent of the CAP, as described above, would not conflict with the proposed Housing Elements. No inconsistencies between the proposed Housing Elements and the CAP have been identified

The San Francisco Bay Plan

The San Francisco Bay Plan was completed and adopted by the San Francisco Bay Conservation and Development Commission in 1968 and submitted to the California Legislature and Governor in January 1969. The Bay Plan was prepared by the Commission over a three-year period pursuant to the McAteer-Petris Act of 1965 which established the Commission as a temporary agency to prepare an enforceable plan to guide the future protection and use of San Francisco Bay and its shoreline. In 1969, the Legislature acted upon the Commission's recommendations in the Bay Plan and revised the McAteer-Petris Act by designating the Commission as the agency responsible for maintaining and carrying out the provisions of the Act and the Bay Plan for the protection of the Bay and its great natural resources and the development of the Bay and shoreline to their highest potential with a minimum of Bay fill. The Bay Plan is in the process of being updated. No inconsistencies between the proposed Housing Elements and this Plan have been identified.

Urban Forest Plan

Pursuant to Chapter 12 of the San Francisco Environment Code, the Urban Forestry Council advises City departments, including the Board of Supervisors and the mayor. Its tasks are to develop a comprehensive urban forest plan; educate the public; develop tree-care standards; identify funding needs, staffing needs, and opportunities for urban forest programs; secure adequate resources for urban forest programs; facilitate coordination of tree-management responsibilities among agencies; and report on the state of the urban forest. The Council's scope of authority is completely advisory and educational in nature. The Council has prepared an Urban Forest Plan, which reviews the creation of San Francisco's urban forest, analyzes the structure and functional benefits of the forests, and identifies the challenges that threaten its future, which could include impacts resulting from housing development. Designed to provide a road map for policy-makers and implementers, the Plan identifies goals that are critical to maximizing the value of the forest. Underlying these goals is the understanding that the urban forest is a living and evolving resource that is adapted to the unique and often challenging conditions of the urban environment. These goals are directed at the owners and managers of the trees that comprise the urban forest. No inconsistencies between the proposed Housing Elements and this Plan have been identified.

Proposition M

In November 1986, the voters of San Francisco approved Proposition M, the Accountable Planning Initiative, which added Section 101.1 to the City Planning Code to establish eight Priority Policies. These

policies, and the sections of this Environmental Evaluation addressing the environmental issues associated with the policies are (1) preservation and enhancement of neighborhood-serving retail uses (Section V.B); (2) protection of neighborhood character (Section V.B); (3) preservation and enhancement of affordable housing (Section V.D with regard to housing supply and displacement issues); (4) discouragement of commuter automobiles (Section V.F); (5) protection of industrial and service land uses from commercial office development and enhancement of resident employment and business ownership (Section V.B); (6) maximization of earthquake preparedness (Section V.O [Geology and Soils]); (7) landmark and historic building preservation (Section III.E [Cultural Resources and Paleontological Resources]); and (8) protection of open space (Section V.J [Shadows] and Section V.N).

Prior to issuing a permit for any project that requires an Initial Study under CEQA, and prior to issuing a permit for any demolition, conversion, or change of use, and prior to taking any action that requires a finding of consistency with the General Plan, Section 101.1 requires that the City find that the proposed project or legislation would be consistent with the Priority Policies. As noted above, the consistency of the Project with the environmental topics associated with the Priority Policies is discussed in Chapter V (Environmental Setting, Impacts, and Mitigation Measures) of this EIR. The case report and approval motions for the Project would contain the Planning Department's comprehensive Project analysis and findings regarding consistency of the Project with the Priority Policies.

CONCLUSION

Overall, the proposed Housing Elements would not conflict with any of the goals of the plans and policies listed in this section. The potential of the proposed Housing Elements to conflict with applicable plans, policies, or regulations is discussed in detail under Impact LU-1 in Section V.B (Land Use and Land Use Planning).

- Mixed Uses (Non-residential);
- Residential;
- Visitor-Serving Retail; and
- Parks and Open Space.

Existing Zoning

There are a total of 13 residential zoning districts in the City, reflecting a mix of land use. A summary of the planning code provisions for residential uses is provided in the San Francisco Planning Code Zoning Districts, Residential Districts Controls Summary, on the Planning Department's website.¹ The Summary of the Planning Code Standards for Residential Districts provides the name of the zoning district and maximum dwelling unit density, as well as other land use controls. Residential zoning designations in the City include, but are not limited to RH-1 (D) (House-One Family, Detached Dwellings), RH-2 (House-Two Family), RM-1 (Mixed [Apartments and Houses], Low Density) to RM-4 (Mixed [Apartments and Houses], High Density), RC-3 (Residential-Commercial Combined, Medium Density), RED (Residential Enclave District) and RTO (Residential Transit Oriented Development). Generally, RH-1 zoning districts allow for one dwelling unit per lot. RH-1(S) zoning districts allow for an additional minor second unit. RH-2 zoning districts generally allow for two units per lot, with RH-3 zoning districts allowing three units per lot. Residential Mixed zoning districts can allow up to three dwelling units per lot (RM-1), or up to one unit per 200 square feet (sf) of lot area (RM-4). RC-3 districts allow up to three units per lot or one unit per 400 sf of lot area and RC-4 districts allow up to one unit per 200 sf of lot area. RED districts have similar density standards as RC-3 and RM-3 zoning districts, in that, RED districts allow for one dwelling unit per 400 sf of lot area. RTO zoning districts generally allow one dwelling unit per 600 sf of lot area, although these density limits may be exceeded for providing additional affordable housing units and other special uses.

Existing Height and Bulk Districts

The City contains 25 separate height and bulk districts that range in height from 40 feet to 400 feet. The different classes of height and bulk districts are indicated on the zoning maps. Additional height limits are imposed for certain use districts, such as areas located within narrow streets or alleys. Section 263 of the Planning Code contains special exceptions to the height limits for certain uses within certain areas. Buildings and structures exceeding the prescribed height may be approved by the Planning Commission according to the procedures for conditional use approval in Section 303 of the Planning Code; provided, however, that such exceptions may be permitted only in the areas specified and only to the extent stated in each section. Some of the areas eligible for exceptions to the height limits include north and south of the Ferry Building, east and west of Chinese Playground, Chinatown corners and parapets, and north of

¹ San Francisco Planning Department, Zoning Districts, Residential Districts Controls Summary, website: <http://www.sf-planning.org/Modules/ShowDocument.aspx?documentid=5358>, accessed April 9, 2009.

Market residential special use districts, among others. Figure IV-4, Generalized Citywide Height Map, shows that generally the western half of the City is dominated by 40-foot height limits. Moving east, towards the Downtown, heights increase along Van Ness Avenue and continue into the Downtown. Additional information on existing height limits is included in the following discussion of individual planning districts.

San Francisco Planning Districts

For purposes of this section of the EIR, the City is discusses with respect to each Planning District, as depicted in Figure V.A-1. The City is comprised of 18 Planning Districts. The following discussion provides a general overview of the existing land use character within each of the 18 Planning Districts. The existing land use character is described in terms of general land uses, height limits, preservation districts, and other characteristics that may pertain to a given planning district, including details of various planning efforts. Over the years, the San Francisco Planning Department has undergone a number of focused planning efforts, initiated by either the Planning Department or the Redevelopment Agency, to guide the development of various areas or neighborhoods within the City. These efforts have resulted in the preparation of Area Plans or Redevelopment Plans. Within each Planning District, applicable Area and Redevelopment plans are also discussed with respect to land use character. These Area and Redevelopment Plans are also discussed in Section V.A (Plans and Policies).

South Bayshore

The South Bayshore area of the City is bordered to the north by the South of Market and Mission Planning Districts, to the west by the Bernal Heights and South Central Planning Districts, and to the south by San Mateo County and the San Francisco Bay. The entire eastern border of this district fronts along the San Francisco Bay. Existing height limits north of Islas Creek are 40 feet, increasing to 80 and 85 foot height limits along Third Street. West of Third Street heights decrease to 65 feet. Heights south of Islas Creek are 40 feet along Pier 90 and 90, increasing to 85 feet along Third Street and 80 feet for parcels near Pier 88. Land uses north and south of Islas Creek are designated M-2 (Heavy Industrial), and further east, land uses are primarily PDR (Production, Distribution and Repair) zoning districts. PDR zoning districts allow for a variety on non-residential activities and are an important reservoir of space for San Francisco's new and evolving industry and unforeseen activity types. Business and activities allowed in PDR Districts generally share a need for flexible operating space that features large open interior spaces, high ceilings, freight loading docks and elevators, floors capable of bearing heavy loads, and large (often uncovered exterior) storage areas. These uses are often not ideally compatible with housing for operational reasons, including the need for significant trucking and delivery activities, 24-hour operation, and emission of noise, odors and vibrations. North and south of Islas Creek, a variety of PDR-related special use districts exists.

Industrial zoning districts (M-1 and M2 [Light Industrial]) extend south of Islas Creek, along the San Francisco shoreline, with 40 foot height limits. To the east of Hunter's Point Boulevard lies the India Basin shoreline park, which is designated as Open Space. RM-1 zoning districts are located southeast of Innes Avenue and abut the Hunter's Point Naval Shipyard. The Hunter's Point Naval Shipyard generally

Chapter 35 of the San Francisco Administrative Code

Chapter 35 of the San Francisco Administrative Code "Residential and Industrial Compatibility and Protection" is designed to protect existing and future industrial businesses from potentially incompatible adjacent and nearby development. The City encourages the use of best available control technologies and best management practices whenever possible to further reduce the potential for incompatibility with other uses, including residential. Another goal of this ordinance is to protect the future residents of industrial and mixed-use neighborhoods by providing a notification process so that residents are made aware of some of the possible consequences of moving to an industrial or mixed-use neighborhood and by encouraging and, if possible, requiring, features in any new residential construction designed to promote the compatibility of residential and adjacent or nearby industrial uses.

San Francisco Redevelopment Agency Plans

The San Francisco Redevelopment Agency, formed in 1948, was established for the purpose of improving the environment of San Francisco and creating better urban living conditions through the removal of blight. Authorized and organized under the provisions of the California Community Redevelopment Law, the Agency is an entity legally separate from the City and County of San Francisco, but existing solely to perform certain functions exclusively for and by authorization of the City and County of San Francisco. The Agency operates primarily in redevelopment project areas designated by the Board of Supervisors. Redevelopment Plans within the City are discussed above.

San Francisco County Countywide Transportation Plan

Pursuant to state law, in 1990, the San Francisco County Transportation Authority was designated the Congestion Management Agency for San Francisco. The Transportation Authority is responsible for setting transportation investment priorities for the city, developing and maintaining a computerized travel demand forecasting model and related databases, and programming state and federal funds for local transportation projects. The Authority is also responsible for preparing a long-range Countywide Transportation Plan. The Countywide Transportation Plan is the City's blueprint to guide transportation system development and investment over the next thirty years. The Plan is consistent with the broader policy framework of San Francisco's General Plan and particularly its Transportation Element. The Countywide Transportation Plan further develops and implements General Plan principles by identifying needed transportation system improvements.

IMPACTS***Significance Thresholds***

The proposed Housing Elements would normally have a significant effect on the environment if they would:

- Physically divide an established community;

- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect; or
- Have a substantial impact upon the existing character of the vicinity.

Impact Evaluation

Section V.A (Plans and Policies) of this EIR describes the Area Plans of the General Plan and Redevelopment Plan Areas adopted by the San Francisco Redevelopment Agency that serve to guide the nature of future development in specific neighborhoods or districts in the City. The City's General Plan includes adopted Area Plans for the following areas: Bayview Hunters Point, Central Waterfront, Chinatown, Civic Center, Downtown, East SoMa, Market & Octavia, Mission, Northeastern Waterfront, Showplace Square/Potrero, Rincon Hill, South of Market, Van Ness Avenue, and Western Shoreline. The San Francisco Redevelopment Agency maintains redevelopment plans for the following areas: Bayview Hunters Point, Federal Office Building, Golden Gateway, Hunters Point Shipyard, Mission Bay, Rincon Point - South Beach, South of Market, Transbay, Visitacion Valley, Western Addition A-1, and Yerba Buena Center. Redevelopment Areas also serve to guide the nature of future development in specific areas, and either contain special zoning and land use controls or specify that the controls of the San Francisco Planning Code apply.

Implementation of the proposed Housing Elements would not directly result in changes to applicable height and bulk zoning districts or to allowable uses under the Planning Code. Additionally, the 2004 Housing Element and 2009 Housing Element do not include any changes to any of the land use objectives and policies in the City's Area Plans or Redevelopment Plans. While implementation of the proposed Housing Elements would not directly affect existing Area Plans or Redevelopment Plans, it would encourage new Area Plans with similar planning-related strategies that may be designed to accommodate growth. Applicable Area Plans or Redevelopment Plans would continue to guide future development in specific neighborhoods or districts.

As noted before, ABAG, in coordination with the State Department of Housing and Community Development (HCD), uses population and job growth projections from the State Department of Finance to determine the regional housing needs for the Bay Area and allocates housing to cities and counties within the Bay Area through the Regional Housing Needs Allocation (RHNA). In providing direction for meeting regional housing needs, ABAG's RHNA number focuses on both the amount of housing and the affordability of housing. Currently, the City is generally meeting ABAG's most recent household projections and is slightly exceeding ABAG's latest population estimates. A variety of local factors support growth projections for San Francisco. The desirability of San Francisco, with its wealth of natural and urban amenities, has always appealed strongly to consumers. This desirability has resulted in continued high demand for housing, as evidenced by high property values and a growing population. Therefore, it is expected that residential development in the City would occur regardless of the proposed Housing Elements, and housing element law ensures that local agencies, including San Francisco, plan for

the development of, and make land available for, new housing. To meet the City's share of the RHNA, including its income requirements, the proposed Housing Elements aim to do the following: 1) preserve and upgrade existing housing units to ensure they do not become dilapidated, abandoned, or unsound, and 2) provide direction for how and where new housing development in the City should occur. With respect to the latter, the 2004 Housing Element encourages new housing in Downtown and in underutilized commercial and industrial areas. The 2004 Housing Element also encourages increased housing in neighborhood commercial districts and mixed use districts near Downtown. The 2009 Housing Element encourages housing in new commercial or institutional projects, housing projects near major transit lines, and accommodating housing in appropriate locations and densities through community planning efforts.

Impacts related to land use could occur if the proposed Housing Elements resulted in new development, including infrastructure, which would divide an established community. The 2004 and 2009 Housing Elements encourage future housing development in infill areas or on individual parcels, and future housing development would be expected to take place in established neighborhoods as shown in Figure IV-5 in Section IV (Project Description). The proposed 2004 and 2009 Housing Elements would not change allowable land uses already permitted by the City's Planning Code, therefore the proposed Housing Elements would not physically divide an established community. Furthermore, none of the policies in the 2004 or 2009 Housing Elements would encourage the division of a community. In fact, most policies would encourage residential growth in established areas within an established land use plan. For example, Policies 1.1, 1.2, 1.3, 1.4, and 1.5 of the 2004 Housing Element encourage housing in appropriate geographic locations as well as encouraging higher density and in-fill development. Therefore, implementation of these policies would not result in the division of an established community. Similarly, Policies 1.1, 4.6, 12.1, 12.3, 13.1, and 13.3 of the 2009 Housing Element encourage the development of strategically located housing near existing infrastructure or transit. Therefore, implementation of these policies would not result in the division of an established community. In addition, the 2004 and 2009 Housing Elements do not include any extensions of roadways or other development features through a currently developed area that could physically divide an established community. Therefore, implementation of either of the 2004 or 2009 Housing Elements would have *no impact* resulting from the division of an established community.

Impact LU-1: The proposed Housing Elements would not conflict with applicable land use plans, policy, or regulations. (Less than Significant)

Implementation of the 2004 Housing Element and 2009 Housing Element could result in impacts related to conflicts with existing land use policy, plans, or regulations if the Housing Elements resulted in housing development that was not consistent with zoning and land use designations as outlined in governing land use plans and/or the City's Planning Code to the extent those regulations help to avoid or mitigate potential environmental impacts. For example, if a height limit in a particular area was designed to avoid impacting a view from a public vantage point, there could be an impact from a policy that increased the height limits. However, as discussed throughout this document, the proposed Housing Elements would not result in changes to allowable land uses or height and bulk designations.

The following includes a general consistency discussion between City land use and planning policy documents and both the 2004 Housing Element and 2009 Housing Element. As stated in the analysis

Impact LU-2: The proposed Housing Elements would not have a substantial impact upon the existing character of the vicinity. (Less than Significant)

The City includes a mix of land uses, including residential, neighborhood retail, institutional and cultural, commercial, industrial, and open space areas. This mix of land uses varies throughout the City: some areas are predominately residential in nature, some predominately commercial, and other areas contain a variety of mixed uses (commercial strips surrounded by residential uses or commercial and industrial areas with small amounts of residential). These various types and mixtures of land uses contribute to the existing land use character throughout the City. The proximity of housing to these various land uses has shaped the development of San Francisco. As discussed throughout this EIR, varied land uses exist within relatively close proximity to residential uses, providing needed services as well as housing in proximity to job cores.

Figures V.B-1 and V.B-2 show the available housing unit capacity and pipeline units that are anticipated to be developed, or have the potential for residential development, outside existing Commercial Districts and within Downtown and Mixed-Use Districts, respectively. As shown in Figure V.B-1, approximately 17,587 units in the City's pipeline occur outside the service area of one of the City's Commercial Districts (calculated as more than 1/4 mile from a commercial district), with capacity for additional 498 units. The areas of the City with the most pipeline or capacity units not served by a Commercial District include Park Merced, Hunters Point Shipyard, and Candlestick neighborhoods. Planning efforts are underway in these areas, and the intent of these efforts is to develop commercial uses to support the new residential development. As shown in Figure V.B-2, approximately 3,134 units in the City's pipeline occur within Downtown and Mixed Use Districts, with capacity for another 8,692 units in these areas. According to the land use inventory prepared by the City, the areas with the greatest potential for development near Downtown and Mixed Use Districts include Rincon Hill, East SoMa, and Mission. These figures reflect the trends that much of San Francisco's residential neighborhoods are located in relatively close proximity to a variety of land uses. The following discusses the potential for the 2004 and 2009 Housing Element policies to affect land use character.

2004 Housing Element Analysis

Implementation of the 2004 Housing Element could result in impacts related to land use character if new housing is substantially out of scale with development in an existing neighborhood, or if new development is so different than existing development that the new development would change the existing character of an area. The following 2004 Housing Element policies promote residential development in certain areas of the City and promote increased residential densities. A substantial increase of residential uses in an area that has been traditionally dominated by non-residential uses could result in changes to land use character. Similarly, substantial increases in residential densities in traditionally low-density neighborhoods could result in changes to land use character. The potential for the 2004 Housing Element policies to affect land use character is addressed below.

Overall, the 2004 Housing Element includes policies that would maintain consistency with existing neighborhood and land use character though the encouragement of in-fill development in a manner that does not present conflicts with the existing character of the vicinity. Furthermore, the 2004 Housing Element would not directly result in changes to zoning or height and bulk designations. New housing would be required to comply with the previously discussed regulations, the governing land use plan, the City's Residential Design Guidelines, and the Urban Design Element of the General Plan, which is concerned with the physical character and environment of the City with respect to development and preservation. Finally, Chapter 35 of the City's Administrative Code further reduces incompatibilities between residential and industrial uses. Therefore, the 2004 Housing Element would have a *less than significant* impact with respect to conflicts with existing land use character.

2009 Housing Element Analysis

Implementation of the 2009 Housing Element could result in impacts related to existing character if new housing is out of scale with development in an existing neighborhood or if new development is so different it would change the existing character of an area. The following 2009 Housing Element policies promote residential development in certain areas of the City and promote increased residential densities. The potential for these policies to affect land use character is addressed below.

Impact	2009 Housing Element	Corresponding 1990 Residence Element Policy
Direct growth to certain areas of the City.	Policy 1.1: Focus housing growth- and the infrastructure necessary to support that growth- according to community plans. Complete planning underway in key opportunity areas such as Treasure Island, Candlestick Park and Hunters Point Shipyard.	Implementation Measure 1.1.2: Pursuit of housing development opportunities in neighborhood and area plans.
	Policy 1.3: Work proactively to identify and secure opportunity sites for permanently affordable housing.	Policy 1.1: Promote development of permanently affordable housing on surplus, underused and vacant public lands.
	Policy 1.6: Consider greater flexibility in the number and size of units within established building envelopes in community based planning processes, especially if it can increase the number of affordable units in multi-family structures.	Policy 2.5: Allow flexibility in the number and size of units within permitted volumes of larger multi-unit structures, especially if the flexibility results in creation of a significant number of dwelling units that are permanently affordable to lower income households.

Impact	2009 Housing Element	Corresponding 1990 Residence Element Policy
Promote housing that fits within existing neighborhood character.	Policy 11.1: Promote the construction and rehabilitation of well-designed housing that emphasizes beauty, flexibility, and innovative design, respects existing neighborhood character.	Policy 12.4: Promote construction of well designed housing that conserves existing neighborhood character.
	Policy 11.3: Ensure growth is accommodated without substantially and adversely impacting existing residential neighborhood character.	Policy 12.4: Promote construction of well designed housing that conserves neighborhood character.
	Policy 11.5: Ensure densities in established residential areas promote compatibility with prevailing neighborhood character.	Policy 12.5: Relate land use controls to the appropriate scale for new and existing residential areas.
	Policy 11.7: Consider a neighborhood's character with integrating new uses, and minimize disruption caused by expansion of institutions into residential areas.	Policy 12.3: Minimize disruption caused by expansion of institutions into residential areas.
Reduce land use conflicts through support of the long-range planning process.	Implementation Measure 8: Planning, Redevelopment and MOWED should complete long range planning processes already underway: Japantown, Glen Park, the Northeast Embarcadero Study, the Bayview Hunter's Point Plan, Candlestick/Hunters Point, India Basin Shoreline Community Planning Process, Treasure Island and Hunter's Point.	

The 2009 Housing Element recognizes the diversity in architectural structures throughout the City. 2009 Housing Element Policy 11.1 would ensure that future development would be consistent with existing neighborhood character. The 2009 Housing Element advocates for housing to be incorporated into new commercial and institutional development, but notes that housing development in areas of commercial and institutional development should be determined based through a community planning process. Additionally, Implementation Measure 8 calls for the City to complete long range planning processes already underway for many areas of the City. These planning processes have identified locations where the City has determined that new residential development would be appropriate, and where the City has engaged the surrounding communities in a community planning process. The specific environmental

review conducted for those planning efforts will address the compatibility of those plans with the existing land use character.

As discussed previously, the 2009 Housing Element does not, overall citywide, promote increased residential densities more so than the 1990 Residence Element. The 2009 Housing Element promotes increased densities mostly as a strategy to be pursued during community planning processes. Any such community planning process would be required to undergo a separate environmental review pursuant to CEQA, and would be required to address the potential for the proposed land use controls of that community planning effort affect land use character. Furthermore, incremental increases in residential density in those areas that permit residential uses would not substantially change the existing land use character. Additionally, new residential uses would be required to be developed in accordance with the residential design guidelines or other applicable design guidelines, as well as Planning Code density requirements.

Although the 2009 Housing Element promotes housing in certain areas of the City, including within commercial developments and near transit, the proposed 2009 Housing Element would not change allowable land uses. As shown in Figures V.B-1 and V.B-2, much of the City is located in proximity to a variety of land uses including commercial districts and mixed use districts. Therefore, policies that promote additional residential development within mixed-use areas would not result in substantial changes to land use character.

Furthermore, new housing would need to comply with the previously discussed regulations, the governing land use plan, and the Urban Design Element of the General Plan. Finally, compliance with Chapter 35 of the City's Administrative Code further reduces any potential incompatibilities between residential and industrial uses. In addition, the following 2009 Housing Element policies could reduce any potential impacts to character by directly or indirectly encouraging the preservation of neighborhood character.

Similar to the 2004 Housing Element discussed above, overall, the 2009 Housing Element contains policies and measures that would increase the City's housing supply in a manner that does not present conflicts with existing land use character. The 2009 Housing Element would not result in changes to allowable land uses or height and bulk designations and future development would be required to comply with the previously discussed land use regulations. Therefore, the 2009 Housing Element would have a ***less than significant*** impact with respect to conflicts with existing land use character.

Cumulative Impacts

The geographic context for the cumulative impacts associated with land use issues is the City and County of San Francisco. Cumulative impacts occur when impacts from a proposed project that are significant or less than significant combine with similar impacts from other past, present, or reasonably foreseeable projects in a similar geographic area. Changes to the existing land use environment in the area could occur through the conversion of vacant land and low density uses to higher density uses, or through conversion of existing land use (e.g., from commercial to residential). However, it is assumed that future development would be consistent with policies in the adopted General Plan as well as zoning

requirements. Any new development is also anticipated to require CEQA review and design review, as well as other state and local regulations such as San Francisco Administrative Code Chapter 35, which would reduce potential land use conflicts. For this reason, cumulative impacts to land uses as a result of incompatible uses and changes to land use character would be *less than significant*. The contribution of the Housing Elements to such cumulative land use impacts is less than significant and is thus not cumulatively considerable because overall the Housing Elements promote compatibility with the surrounding land uses. This cumulative impact would be *less than significant*.

It is also anticipated that any new development will be reviewed for consistency with adopted land use plans and policies by the City, such as CEQA, the Planning Code, and the California Subdivision Map Act, all of which require findings of plan and policy consistency prior to approval of entitlements for development. For this reason, cumulative impacts associated with inconsistencies of future development with adopted plans and policies would be *less than significant*. In addition, the contribution of the Housing Elements to such cumulative impacts would be *less than significant*. As a result, the proposed Housing Elements would not contribute to any impacts associated with plan or policy inconsistency. This is considered to be a *less than significant* cumulative impact.

MITIGATION AND IMPROVEMENT MEASURES

Mitigation Measures

No mitigation measures are warranted by the proposed Housing Elements.

Improvement Measures

No improvement measures are warranted by the proposed Housing Elements.

V. ENVIRONMENTAL SETTING AND IMPACTS

C. AESTHETICS

INTRODUCTION

This section addresses the potential impacts of the 2004 Housing Element and 2009 Housing Element policies related to scenic vistas, scenic resources, visual character or quality of surrounding area, and potential new sources of light and glare.

ENVIRONMENTAL SETTING

Visual Character

The visual setting of the City is varied, reflecting the unique visual characteristics of the City's topography, street grids, public open spaces, and distinct neighborhoods. San Francisco's skyline may be characterized by a general pattern of densely clustered high-rise commercial development in the downtown core that tapers off to low-rise development at its periphery. This compact urban form signifies the downtown as the center of commerce and activity and produces a downtown "mound," distinctive from the City's numerous hills. Although distinctive, this form is neither smooth nor uniform. A range of building heights in the downtown creates gaps, peaks, dips and inconsistencies within this pattern, allowing taller buildings and building tops to stand out in profile against the sky. The tension between conformity and variety in the skyline results in a readable and recognizable image for San Francisco, with notable landmarks such as the Transamerica Pyramid, sitting apart from the "mound."

Outside of the highly commercial and built-up downtown area, much of the City is characterized by unique residential neighborhoods, which each exhibit their own distinctive visual character. Neighborhoods within the City can vary greatly in terms of density, scale, architectural style, and general design pattern. Most neighborhoods have a traditional neighborhood commercial district with a main street which provides goods and services to residents in the vicinity. Commercial storefront buildings usually contain businesses on the first floor and residential units above. This type of development creates a village-like appearance, common throughout much of San Francisco's neighborhoods and districts.

Section V.B (Land Use and Land Use Planning) discusses the land use character of the 18 Planning Districts within the City, as depicted on Figure V.A-1, and describes existing height limits and land uses within each of the Planning Districts, including descriptions of neighborhood commercial areas.

Open Space

Public open spaces often give a neighborhood its identity, a visual focus, a center for activity and provide a counterpoint to often dense mixed-use residential and commercial neighborhoods by providing visual relief from the built environment. Open spaces in the City include playgrounds, civic spaces, regional parks, and neighborhood parks. Refer to Section V.J (Recreation) for more information about parks and open spaces.

- Executive Order S-01-07 establishing the Low Carbon Fuel Standard (LCFS) requires a 10% or greater reduction in the average carbon intensity for transportation fuels in California regulated by ARB (also a discrete early action measure).
- AB 1493 (Pavley Standard) requires ARB to adopt regulations to reduce GHG emissions for noncommercial passenger vehicles and light-duty trucks of model year 2009 and thereafter.
- Under Senate Bill 107, California's Renewable Portfolio Standard (RPS) requires retail suppliers of electric services to increase procurement from eligible renewable energy resources to 20% by 2010.
- California Executive Order S-14-08 mandates retail suppliers of electric services to increase procurement from eligible renewable energy resources to 33% by 2020.
- Senate Bill (SB) 1368 requires the California Public Utilities Commission (PUC) and CEC to establish GHG emission performance standards for the generation of electricity.

Regional

The BAAQMD is the primary agency responsible for comprehensive air pollution control in the entire San Francisco Bay Area Air Basin. As such, the BAAQMD works directly with the Association of Bay Area Governments, the Metropolitan Transportation Commission, and local governments and cooperates actively with all federal and state government agencies. The BAAQMD develops rules and regulations, establishes permitting requirements for stationary sources, inspects emissions sources, and enforces such measures through educational programs or fines, when necessary.

BAAQMD has published a document titled *BAAQMD CEQA Guidelines, Assessing the Air Quality Impacts of Projects and Plans* (BAAQMD CEQA Guidelines, December 1999). In that document BAAQMD provides guidance and recommendations on the methodologies of analysis and suggested thresholds of significance that Lead Agencies can use when analyzing air quality impacts during CEQA review of projects. This document does not address climate change or GHG emissions.

The BAAQMD recently updated their 1999 CEQA Air Quality Guidelines (referenced above) and adopted significance thresholds for GHGs on June 2, 2010. The updated CEQA Air Quality Guidelines includes significance thresholds, assessment methodologies, and mitigation strategies for GHG emissions. The recently adopted GHG thresholds of significance, as discussed in BAAQMD's May 2010 CEQA Air Quality Guidelines, includes two sets of GHG thresholds: one that would apply to specific development projects, and another threshold that would apply to plan-level CEQA analyses. The proposed 2004 and 2009 Housing Elements are an update to the City's General Plan and therefore, the plan-level threshold would be the applicable threshold for the proposed Housing Elements. However, as discussed in Section V.H (Air Quality), according to the BAAQMD, the recently adopted thresholds of significance for GHGs are intended to apply to environmental analyses that have begun on or after adoption of the revised CEQA thresholds (June 2, 2010). Therefore, the proposed project would not be subject to BAAQMD's recently

V. ENVIRONMENTAL SETTING AND IMPACTS

J. WIND AND SHADOW

INTRODUCTION

This section addresses the potential impacts of the 2004 Housing Element and 2009 Housing Element policies related to wind and shadow. The San Francisco Planning Code contains provisions pertaining to wind and shadow minimization. Because wind and shadow contribute substantially to the San Francisco environment and can be highly susceptible to an impact from development, these issues are analyzed as part of CEQA review in San Francisco.

ENVIRONMENTAL SETTING

Wind

Wind impacts are generally caused by large building masses extending substantially above neighboring buildings, and by buildings oriented such that a new large wall catches a prevailing wind, particularly if such a wall includes little or no articulation.

Long-term wind data in San Francisco is available from historical wind records from the U.S. Weather Bureau weather station located above the old Federal Building at 50 United Nations Plaza. Table V.J-1 shows that average wind speeds are greatest in the summer and least in the fall. Winds also exhibit a diurnal variation with the strongest winds occurring in the afternoon, and lightest winds occurring in the early morning.

Table V.J-1
Seasonal Wind Direction Frequency and Average Speed in Knots (%)

Prevailing Wind Direction	January		April		July		October		Annual	
	Freq	Speed	Freq	Speed	Freq	Speed	Freq	Speed	Freq	Speed
North	12.5	7.9	2.2	11.0	0.3	6.0	3.3	6.6	5.0	7.2
North-northeast	1.3	5.6	0.7	6.1	0.3	6.8	0.7	6.6	0.8	6.0
Northeast	4.5	5.3	1.3	4.7	1.1	7.4	2.2	5.8	1.9	5.6
East-northeast	1.4	6.3	0.6	4.8	0.2	5.1	0.8	5.1	0.8	5.6
East	11.9	4.8	2.6	4.5	0.1	3.9	4.8	4.5	4.8	5.0
East-southeast	2.1	6.4	0.3	5.2	0.1	2.5	0.6	5.8	0.8	5.8

Shadow

Shading is an important environmental issue because the users or occupants of certain land uses, such as residential, recreational/parks, churches, schools, outdoor restaurants, and pedestrian areas have some reasonable expectations for direct sunlight and warmth from the sun. These land uses are termed "shadow-sensitive". For a discussion of parks and open space in San Francisco, refer to Section V.K (Recreation).

Shadow lengths are dependent on the height and size of the building or object from which they are cast and the angle of the sun. The angle of the sun varies with respect to the rotation of the earth (i.e., time of day) and elliptical orbit (i.e., change in seasons). The longest shadows are cast during the winter months and the shortest shadows are cast during the summer months.

In the City, the presence of the sun's warming rays is essential to enjoying open space. This is because climatic factors, including ambient temperature, humidity, and wind, often combine to create a comfortable climate only when direct sunlight is present. Therefore, the shadows created by new development nearby can critically diminish the utility of the open space. This is particularly a problem in the Downtown area and in adjacent neighborhoods, where there is a limited amount of open space, pressure for new development, and zoning controls that allow tall buildings. Neighborhoods that experience shading issues include the Downtown area and many of the adjacent areas, including Civic Center, Nob Hill, Financial District, Mission Bay, and South of Market. Together these areas could accommodate approximately 12 percent of the City's pipeline housing units and approximately five percent of the overall capacity for new housing within the City.⁴ Refer to Figure IV-4 in Section IV. Project Description, which shows the Citywide Height Map.

The City of San Francisco is densely developed with urban uses. As discussed in Section V.K (Recreation), the City is served by over 200 neighborhood park, recreation, and open space facilities. These facilities are considered "shadow-sensitive".

In general, all applications for new construction or additions to existing buildings above 40 feet in height must be reviewed to determine whether a project would cast additional shadows on properties under the jurisdiction of, or designated to be acquired by the Recreation and Park Department. The Planning Department staff develops a "shadow fan" diagram that shows the maximum extent of the shadows cast by a proposed building throughout the year, between one hour after sunrise and one hour before sunset. If the shadow fan indicates a project shadow does not reach any property protected by Planning Code Section 295 (the sunlight ordinance), no further review is required. If the shadow fan shows that a project has potential to shade such properties, further analysis is required.

⁴ This calculation used the entire Downtown District to represent the Civic Center, Nob Hill, and Financial District areas. The aforementioned areas do not encompass the entire Downtown District. Therefore, the percentage of pipeline housing units and overall capacity that are in areas with shading issues are likely overstated.

and are dominated by either coast live oak (*Quercus agrifolia*) or California wax myrtle (*Myrica californica*). Small stands of California wax myrtle forest occur in the eastern portion of Golden Gate Park, but these may be planted trees. However, stands of coast live oak forest within Golden Gate Park are thought to be remnants of the historic vegetation. Stands of coast live oak forest occur at several other natural areas, and those at Buena Vista Park and 15th Avenue Steps are also likely to be remnant stands of the historic San Francisco vegetation. Baker Beach and Fort Funston are also likely to include seabluﬀ scrub habitat, another sensitive community.⁵

In addition, an EIR is currently being prepared for the Significant Natural Resource Areas Management Plan (SNRAMP)⁶ Areas on Department of Recreation and Parks property in the City, which are different than the natural areas previous discussed. The SNRAMP will be used by the resource managers over the next 20 years. The 31 Natural Areas located within the City are scattered mostly throughout the central and southern portions of the City and constitute approximately four percent of the total City area. They range in size from less than one acre (i.e., 15th Avenue Steps) to almost 400 acres (i.e., Lake Merced).

The movement and migration of wildlife in urban and suburban areas has been substantially altered due to habitat fragmentation over the past century. This fragmentation is most commonly caused by development, which can result in large patches of land becoming inaccessible and forming a virtual barrier between undeveloped areas, or resulting in additional roads which, although narrow, may result in barriers to smaller or less mobile wildlife species. Fragmented habitat corridors are located throughout the City. Habitat fragmentation results in isolated "islands" of habitat, which prevents the exchange of genetic material within species populations in different geographic areas necessary to maintain the genetic variability to withstand major environmental disturbances such as fire or climate change.⁷

Wetlands

Wetlands are generally considered to be areas that are periodically or permanently inundated by surface or groundwater, and support vegetation adapted to life in saturated soil. Wetlands are recognized as important features on a regional and national level due to their high inherent value to fish and wildlife, use as storage areas for storm and flood waters, and water recharge, filtration, and purification functions. Technical standards for delineating wetlands have been developed by the U.S. Army Corps of Engineers (ACE) and the U.S. Fish and Wildlife Service (USFWS), which generally define wetlands through consideration of three criteria: hydrology, soils, and vegetation. The ACE and the California Department of Fish and Game (CDFG) have jurisdiction over modifications to stream channels, rivers banks, lakes and other wetland features. Due to the extent of development and past filling within the City, jurisdictional wetlands and other water features are not prevalent within the City. However, wetlands are

⁵ These areas include rocky cliffs along the shoreline that are likely to support seabluﬀ scrub habitat.

⁶ The Notice of Preparation of an Environmental Impact Report for the Natural Areas Management Plan was released on April 22, 2009.

⁷ California Wilderness Coalition, et. al. Missing Linkages: Restoring Connectivity to the California Landscape. (<http://www.calwild.org/resources/pubs/linkages/index.htm>).

Sensitive vegetation communities are also identified by CDFG on its List of California Natural Communities Recognized by the CNDDDB. Impacts to sensitive natural communities and habitats identified in local or regional plans, policies, regulations or by federal or state agencies must be considered and evaluated under the CEQA (CCR: Title 14, Div. 6, Chap. 3, Appendix G).

Local

San Francisco General Plan

The San Francisco General Plan provides general policies and objectives to guide land use decisions and development throughout the City. General Plan objectives and policies relevant to biological resources are discussed in Section V.A (Plans and Policies) of this EIR.

Chapter 8 of the San Francisco Environmental Code

Chapter 8 of the San Francisco Environment Code bans the use of tropical hardwood and virgin redwood for reasons including atmospheric imbalance and global warming and that the destruction of rainforests is contributing currently to extinction of 30 species of plant and animal life each day. The City prohibits the use, acquisition or purchase, directly or indirectly, by any City or County department or agency, of any tropical hardwoods or tropical hardwood wood products as well as virgin redwood or virgin redwood wood products.

San Francisco Integrated Pest Management Ordinance

Chapter 3 of the San Francisco Environmental Code states that the City, in carrying out its operations, shall assume pesticides are potentially hazardous to human and environmental health. City departments shall give preference to reasonably available nonpesticide alternatives when considering the use of pesticides on City property. The Integrated Pest Management Ordinance provides an outline of the City's integrated pest management (IPM) approach.

Urban Forest Plan

Pursuant to Chapter 12 of the San Francisco Environment Code, the Urban Forestry Council advises city departments, including the Board of Supervisors and the mayor. Its tasks are to develop a comprehensive urban forest plan; educate the public; develop tree-care standards; identify funding needs, staffing needs, and opportunities for urban forest programs; secure adequate resources for urban forest programs; facilitate coordination of tree-management responsibilities among agencies; and report on the state of the urban forest. The Council's scope of authority is completely advisory and educational in nature. The Council has prepared an Urban Forest Plan, which reviews the creation of San Francisco's urban forest, analyzes the structure and functional benefits of the forests, and identifies the challenges that threaten its future. Designed to provide a road map for policy-makers and implementers, the Plan identifies goals that are critical to maximizing the value of the forest. Underlying these goals is the understanding that the urban forest is a living and evolving resource that is adapted to the unique and often challenging

conditions of the urban environment. These goals are directed at the owners and managers of the trees that comprise the urban forest.

Urban Forestry Ordinance

Section 804 of Article 16, "Urban Forestry Ordinance," in the San Francisco Public Works Code outlines the jurisdiction of the San Francisco Department of Public Works (DPW) over trees and landscaping. DPW has jurisdiction over planning, planting, protection, maintenance, and removal of trees or landscaping in the public right-of-way, as well as over certain trees on private property if they are deemed hazard, landmark, or significant trees. Pursuant to Article 16, the San Francisco Urban Forestry Ordinance's purposes include: realize the optimum public benefits of trees on the City's streets and public places; integrate street planting and maintenance with other urban elements and amenities; promote efficient, cost effective management of the City's urban forest; reduce the public hazard, nuisance, and expense occasioned by improper tree selection, planting, and maintenance; provide for the creation of an equitable, sustained, and reliable means of funding urban-forest management throughout the City; create and maintain a unified urban-forest resource; recognize that trees are an essential part of the City's aesthetic environment; recognize that green spaces are vital to San Francisco's quality of life; and ensure that landscaping in sidewalk areas is properly constructed and maintained in order to maximize environmental benefits, protect public safety, and limit conflicts with infrastructure. Directions are provided for planting and removal of street trees by the DPW and persons outside the DPW.

Significant Trees

Significant trees are defined by City ordinance as trees in, or within 10 feet of, a public right-of-way that are greater than 20 feet tall, have a canopy greater than 15 feet in diameter, or have a trunk greater than 12 inches in diameter at 4.5 feet above grade.⁹ Removal of significant trees requires the authorization of the DPW director or the director's designee, and is subject to the rules and procedures governing permits and disclosures as above.

Landmark Trees

In 2007, the San Francisco Board of Supervisors adopted legislation for designation and protection of landmark trees. Landmark trees can be anywhere within San Francisco, including private property. They are designated as such by the Board of Supervisors, based on criteria such as age, location, species, or visual quality. Once the tree has been designated, a notice indicating this designation is recorded for the property on which the tree is located. The City Zoning Administrator is required to identify landmark trees on proposed development or construction sites, and to notify the Urban Forestry Council and DPW. Special permits are required if the property is later proposed for development.¹⁰ The City Zoning

⁹ San Francisco Public Works Code, Article 16, Urban Forestry Ordinance, Available at: <http://www.municode.com/Resources/gateway.asp?pid=14142&sid=5>, Section 810A.

¹⁰ San Francisco Public Works Code, Article 16, Urban Forestry Ordinance, Available at:

Administrator or other City agency must impose measures to protect landmark trees on a construction site.

IMPACTS

Significance Thresholds

The proposed Housing Elements would normally have a significant effect on the environment if they would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Impact Evaluation

As discussed previously, the 2004 Housing Element and 2009 Housing Elements would not change the land use objectives and policies in the City's area and redevelopment plans. According to Part I of the 2009 Housing Element (Data and Needs Analysis), the City has available capacity to meet the Regional Housing Needs Assessment (RHNA) as determined by the Association of Bay Area Governments (ABAG). Therefore, the rezoning of land uses is not required. To meet the City's share of the RHNA, the proposed Housing Elements aim to do the following: 1) preserve and upgrade existing housing units to ensure they do not become dilapidated, abandoned, or unsound, and 2) provide direction for how new

<http://www.municode.com/Resources/gateway.asp?pid=14142&sid=5>, Section 810.

housing development in the City should occur. With respect to the latter, the 2004 Housing Element encourages new housing in Downtown and in underutilized commercial and industrial areas. The 2004 Housing Element also encourages increased housing in neighborhood commercial districts and mixed-use districts near Downtown. The 2009 Housing Element encourages housing in new commercial or institutional projects and accommodating housing through existing community planning processes.

Impact BI-1: The proposed Housing Elements would not have a substantial adverse effect on any candidate, sensitive, or special-status species; riparian habitat or other sensitive natural communities; federally protected wetlands; or interfere with the movement of species. (Less than Significant)

New construction could result in impacts related to biological resources if new housing would result in disturbance from construction activities, tree removal, construction on or near wetlands or sensitive habitats or riparian areas, interference with migration, take of special status-species (e.g. development/redevelopment of abandoned buildings that provide habitat for bats could impact those species), application of pesticides and herbicides, construction of tall buildings with glass walls that could increase bird strikes and possibly interrupt a migration corridor, and conflict with provisions of an adopted habitat conservation plan. As shown in Figure IV-4 in Section IV (Project Description), the City's height districts allow the tallest buildings (121 to 550 feet) in the Downtown and SoMa areas, with a few exceptions in other areas of the City. Generally, lower heights in the western and southern portions of the City would not affect bird migration. Increases in density could be accomplished by promoting development to full height limits in the Downtown area, which could affect bird migration. On the other hand, increasing density could accommodate more of the City's fair share of the RHNA in fewer buildings, necessitating less new construction and less potential for disturbance or interference to biological resources.

2004 Housing Element Analysis

The 2004 Housing Element does not propose policies that would directly or indirectly encourage development of areas with sensitive habitat or species. However, the following 2004 Housing Element policies could affect bird migrations by encouraging increased density in Downtown areas.

Impact	2004 Housing Element	Corresponding 1990 Residence Element Policy
Direct growth to certain areas of the City.	Policy 1.1: Encourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of units that are affordable to lower income households. Set allowable densities in established residential areas	Policy 2.1: Set allowable densities in established residential areas at levels which will promote compatibility with prevailing neighborhood character. Policy 2.2: Encourage higher residential density in areas adjacent to downtown, in underutilized commercial and industrial areas proposed for conversion to housing and in neighborhood commercial districts where higher density will not have harmful effects, especially if the higher density provides a significant number of

Impact	2004 Housing Element	Corresponding 1990 Residence Element Policy
	Policy 3.3: Maintain and improve the condition of the existing supply of public housing.	Policy 5.4: Maintain and improve the existing supply of public housing.
Promote preservation of residential buildings.	Policy 3.6: Preserve landmark historic residential buildings. Implementation Measure 3.6.6: The Planning Department will encourage property owners to use preservation incentives to repair, restore, or rehabilitate historic resources in lieu of demolition. These include federal tax credits for rehabilitation of qualified historical resources, Mills Act property tax abatement programs, the State Historic Building Code, and tax deductions for preservation easements.	Policy 5.5: Preserve landmark historic residential buildings.

As shown above, the 2004 Housing Element proposes policies that discourage demolition and promote the maintenance of existing public housing (including Policies 2.1, 3.3, and 3.6) to a degree similar to the 1990 Residence Element, which could reduce the amount of new housing required to meet the City's housing needs. Essentially, both the 1990 Residence Element and 2004 Housing Element recognize the need for the retention and maintenance of existing housing, and therefore do not represent a shift in policy. The preservation of existing housing reduces the potential for new development to build to maximum allowable height and bulk limits, thereby reducing the potential for subsequent biological resource impacts resulting from new development at maximum allowable height and bulk limits.

Although the 2004 Housing Element would not result in the construction of residential units, it would shape how new residential development should occur and ensures that there is adequate land available to meet future housing needs. Potential impacts related to biological resources would be offset by compliance with the Open Space Element of the San Francisco General Plan, Chapter 8 of the San Francisco Environment Code, San Francisco's Green Building Ordinance, San Francisco's IPM Ordinance, San Francisco's Urban Forest Plan, and San Francisco's Urban Forestry Ordinance to minimize impacts related to biological resources. Furthermore, any new development within the City would be subject, on a project-by-project basis, to independent CEQA review. Therefore, the 2004 Housing Element would have a *less than significant* impact with respect to biological resources.

Impact	2009 Housing Element	Corresponding 1990 Residence Element Policy
	Implementation Measure 64: Planning staff shall support affordable housing projects in the development review process, including allowing sponsors of permanently affordable housing to take advantage of allowable densities provided their projects are consistent with neighborhood character.	
	Implementation Measure 79: Planning staff shall continue to use community planning processes to develop policies, zoning and standards that are tailored to neighborhood character.	Implementation Measure 2.2.1: Densities compatible with neighborhood character

As shown above, the 2009 Housing Element promotes housing through community planning processes (Policies 1.1, 1.6, and Implementation Measures 8, 80 and 97). The 2009 Housing Element also promotes housing on underused, vacant and surplus lands (Policy 1.3 and Implementation Measures 3 and 4), and housing within mixed-use areas (Policy 1.8 and Implementation Measure 80), thereby directing housing to commercial areas. As discussed previously, directing new housing to certain areas of the City could increase the amount of new housing occurring in those areas, thereby potentially resulting in new development potentially requiring tree removal, construction on or near wetlands or sensitive habitats or riparian areas, interference with migration, take of special status-species (e.g, development/redevelopment of abandoned buildings that provide habitat for bats could impact those species), application of pesticides and herbicides, construction of tall buildings with glass walls that could increase bird strikes and possibly interrupt a migration corridor, and conflict with provisions of an adopted habitat conservation plan.

The 2009 Housing Element generally promotes increased density through community planning processes (Policies 1.4, 1.6, and Implementation Measures 13 and 79) and for affordable housing (Policy 7.5 and Implementation Measures 36 and 64). The 2009 Housing Element also includes a strategy designed to reduce the amount of space required for non-housing functions (Implementation Measure 12). While the 2009 Housing Element contains a policy that advocates for family-sized housing units (Policy 4.1 and Implementation Measure 32), overall density increases from such policy would be speculative as less units would be accommodated within a given building envelope. However, as discussed in the analysis of the 2004 Housing Element, increased density standards could result in more units within a given building envelope, which could be partially achieved by the construction of multi-family housing built to maximum allowable height and bulk, thereby potentially resulting in new development potentially requiring tree removal, construction on or near wetlands or sensitive habitats or riparian areas, interference with migration, take of special status-species (e.g, development/redevelopment of abandoned buildings that provide habitat for bats could impact those species), application of pesticides and

herbicides, construction of tall buildings with glass walls that could increase bird strikes and possibly interrupt a migration corridor, and conflict with provisions of an adopted habitat conservation plan.

Similar to the 2004 Housing Element, major themes of the 2009 Housing Element include the preservation and maintenance of existing housing. The following 2009 Housing Element policies discourage demolition and encourage the maintenance of the City's existing housing stock, thereby reducing the amount of new housing required to meet the City's housing needs and subsequent biological resource related impacts resulting from development at maximum allowable height and bulk limits.

Impact	2009 Housing Element	Corresponding 1990 Residence Element Policy
Discourage demolition and improve existing housing supply.	Policy 2.3: Prevent the removal or reduction of housing for parking.	
	Policy 2.4: Promote improvements and continued maintenance to existing units to ensure long term habitation and safety.	Objective 5: To maintain and improve the physical condition of housing while maintaining existing affordability levels. Policy 5.1: Assure that existing housing is maintained in decent, safe sanitary conditions at existing affordability levels. Policy 5.2: Promote and support voluntary housing rehabilitation which does not result in the displacement of lower income occupants.
	Policy 3.1: Preserve rental units, especially rent controlled units, to meet the City's affordable housing needs	Policy 3.1: Discourage the demolition of sound existing housing.
	Policy 3.2: Promote voluntary housing acquisition and rehabilitation to protect affordability for existing occupants.	Policy 5.2: Promote and support voluntary housing rehabilitation which does not result in the displacement of lower income occupants.
	Policy 3.4: Preserve "naturally affordable" housing types, such as smaller and older ownership units.	
	Policy 3.5: Retain permanently affordable residential hotels and single room occupancy (SRO) units.	Policy 3.7: Preserve the existing stock of residential hotels.
	Policy 9.3: Maintain and improve the condition of the existing supply of public housing, through programs such as HOPE SF.	Policy 5.4: Maintain and improve the existing supply of public housing. Policy 7.5: Encourage energy efficiency in new residential development and weatherization in existing housing to reduce overall housing costs.

As shown above, the 2009 Housing Element proposes policies that discourage demolition and promote the maintenance of existing public housing (including Policies 2.4, 3.1, 3.2, 3.4, 3.5 and 9.3) to a degree similar to the 1990 Residence Element. The maintenance and preservation of existing housing would help to preserve the existing housing stock, requiring less new development to meet housing goals, thereby resulting in less development at maximum allowable height and bulk limits. 2009 Housing Element Policy 2.4, 3.1, 3.2, 3.4, 3.5 and 9.3 are essentially the same as their corresponding 1990 Residence Element policies. Essentially, both the 1990 Residence Element and 2009 Housing Element recognize the need for the retention and maintenance of existing housing, and therefore do not represent a shift in policy. The preservation of existing housing reduces the potential for new development to build to maximum allowable height and bulk limits, thereby reducing the potential for subsequent biological resource impacts resulting from new development at maximum allowable height and bulk limits.

The 2009 Housing Element does not propose policies that would directly or indirectly encourage development of areas with sensitive habitat or species. Overall, the 1990 Residence Element promotes increased density on a broader, citywide, scale to a greater extent than the 2009 Housing Element. However, there are three areas under which the 2009 Housing Element promotes greater density than the 1990 Residence Element. These include the following themes: increasing density near transit; construction of affordable housing; and development through the community planning process. Neither the 2009 Housing Element nor the 1990 Residence Element propose increased density specifically for the Downtown area and, therefore, do not represent a shift in policy. Although the 2009 Housing Element would not result in the construction of residential units, it would shape how new residential development should occur and ensures that there is adequate land available to meet future housing needs. Potential impacts related to biological resources would be offset by compliance with the previously discussed regulations. Therefore, the 2009 Housing Element would have a *less than significant* impact with respect to biological resources.

Impact BI-2: The proposed Housing Elements would not conflict with any local policies or ordinances protecting biological resources nor would the proposed Housing Elements conflict with the provisions of an adopted habitat conservation plan. (No Impact)

2004 Housing Element and 2009 Housing Element Analysis

As discussed under Impact BI-1, the 2004 Housing Element policies promote increased density more so than the 1990 Residence Element. The 2004 Housing Element directs growth to commercial and industrial areas, neighborhood commercial districts, the Downtown and on infill development sites, although to a greater degree than the 1990 Residence Element. The 2004 Housing Element also advocates for housing in community plan areas and along transit corridors, both of which are policies that were not included in the 1990 Residence Element.

Overall, the 1990 Residence Element promotes increased density on a broader, citywide, scale to a greater extent than the 2009 Housing Element. However, there are two areas under which the 2009 Housing Element promotes greater density than the 1990 Residence Element. These include the following themes: increasing density for affordable housing projects and increased density as a strategy to be pursued during the community planning process. As shown above, the 2009 Housing Element promotes housing through

community planning processes, near transit and other infrastructure, and in proximity to neighborhood services. The 2009 Housing Element also promotes housing on underused, vacant and surplus lands, and housing within mixed-use areas, thereby directing housing to commercial areas.

Directing growth to certain areas of the City and increased density could increase the amount of new housing occurring in those areas, thereby resulting in new development built to maximum allowable height and bulk, potentially increasing building height and mass. In seeking to achieve the objectives of the proposed Housing Elements, significant impacts could result if new construction conflicts with local policies or ordinances protecting biological resources or an adopted conservation plan. Although the proposed Housing Elements would not result in the construction of residential units, it would shape how and where new residential development should occur and ensures that there is adequate land available to meet future housing needs. A key strategy for meeting the City's housing goals is to maintain the City's existing housing stock. Both the 2004 Housing Element and 2009 Housing Element propose policies that discourage demolition and promote the maintenance of existing public housing to a degree similar to the 1990 Residence Element. The preservation of existing housing reduces the need for new development to maximum allowable height and bulk limits.

Neither the 2004 Housing Element nor the 2009 Housing Element contains policies that would directly or indirectly conflict with any policies protecting biological resources or any adopted habitat conservation plans. New residential development would be required to comply with the previously discussed regulations and plans, including the Open Space Element of the San Francisco General Plan, Chapter 8 of the San Francisco Environment Code, San Francisco's Green Building Ordinance, San Francisco's IPM Ordinance, San Francisco's Urban Forest Plan, and San Francisco's Urban Forestry Ordinance. Development of the opportunity sites within the City would not fundamentally conflict with any applicable habitat conservation plan (HCP) or natural community conservation plan (NCCP) because neither of these exists in the City. Furthermore, the proposed Housing Elements encourage higher density and infill development in already urbanized areas. Furthermore, the proposed Housing Elements would not result in conflicts with plans and policies related to the protection of biological resources because they would not directly or indirectly result in population growth or new development. Therefore, the 2004 and 2009 Housing Elements would have **no impact** with respect to conflicts with local plans or ordinances protecting biological resources or with the provisions of an adopted habitat conservation plan.

Cumulative Impacts

The geographic context for cumulative biological resources impacts are generally localized and affect the immediate vicinity surrounding development. Cumulative impacts occur when impacts that are significant or less than significant from a proposed project combine with similar impacts from other past, present, or reasonably foreseeable projects in a similar geographic area. This would include the demolition of existing structures or new construction in the project area or immediately adjacent to its project boundaries resulting from past, present and reasonably foreseeable future projects combining with similar impacts from the 2004 Housing Element and 2009 Housing Element. The cumulative effect of development within the City could contribute to impacts related to biological resources. As discussed throughout this EIR, growth would occur regardless of implementation of the proposed Housing

Elements. The proposed Housing Elements provide direction for how residential development in the City should occur. Furthermore, any new development within the City would be subject, on a project-by-project basis, to independent CEQA review as well as policies in the San Francisco General Plan, governing area plans, design guidelines, zoning codes (including development standards), and other applicable land use plans that are intended to reduce impacts to biological resources. The 2004 Housing Element and 2009 Housing Element policies would not directly or indirectly affect biological resources. New development could affect such resources, but would be evaluated on a project-by-project basis. In addition, the 2004 Housing Element and 2009 Housing Element are public policy documents and would not result in direct significant impacts. The contribution of potential impacts from the proposed Housing Elements to the cumulative biological resource impacts would not be cumulatively considerable. Therefore, cumulative impacts related to biological resources would be *less than significant*.

MITIGATION AND IMPROVEMENT MEASURES

Mitigation Measures

No mitigation measures are warranted by the proposed Housing Elements.

Improvement Measures

No improvement measures are warranted by the proposed Housing Elements.

Industrial Waste Ordinance (Ordinance No. 199-77)

The San Francisco Industrial Waste Ordinance requires that groundwater meet specified water quality standards before it may be discharged into the sewer system. The Bureau of Systems Planning, Environmental and Compliance of the San Francisco Public Utilities Commission must be notified of projects necessitating dewatering. Should dewatering be necessary, the final soils report would address the potential settlement and subsistence impacts of this dewatering.

Unreinforced Masonry Buildings Ordinance

Adopted by the Board of Supervisors in 1992, UMB Ordinance No. 225-92 requires the City to notify all owners of UMBs and requires all property owners to retain a licensed civil structural engineer or architect to file a Building Inventory Form with the City to identify the "hazard class" of a particular UMB building. The ordinance also requires all owners of UMBs to seismically upgrade buildings by February 15, 2006. Building owners are responsible for financing the cost of the work.

The UMB ordinance spells out four different alternative standards for seismic strengthening of UMBs. Each standard requires a different level of construction and range of costs. The ordinance also specifies conditions that must be met if either of the two less extensive and costly approaches is used to seismically upgrade a UMB. The DBI, who is charged with oversight and enforcement of the program, also has the authority to initiate abatement proceedings in cases where an owner fails to seismically upgrade a building.

Exterior alterations, seismic retrofit and/or demolition of UMBs must be evaluated by the Planning Department in order to determine the type of review process required prior to the authorization of a building permit application. Some projects, however, may be approved administratively. Seismic retrofitting of UMBs is guided by the *Architectural Design Guidelines for the Exterior Treatment of Unreinforced Masonry Buildings During Seismic Retrofit*, developed by the American Institute of Architects.

IMPACTS***Significance Thresholds***

The proposed Housing Elements would normally have a significant effect on the environment if they would:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; (Refer to Division of Mines and Geology Special Publication 42.)

- Strong seismic ground shaking;
- Seismic-related ground failure, including liquefaction; or
- Landslides.
- Result in substantial soil erosion or the loss of topsoil;
- Be located on geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial risks to life or property;
- Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater; or
- Change substantially the topography or any unique geologic or physical features of the site.

Impact Evaluation

As discussed previously, the 2004 Housing Element and 2009 Housing Elements would not change the land use objectives and policies in the City's area and redevelopment plans. According to Part I of the 2009 Housing Element (Data and Needs Analysis), the City has available capacity to meet the Regional Housing Needs Allocation (RHNA) as determined by the Association of Bay Area Governments (ABAG). Therefore, the rezoning of land uses is not required. To meet the City's share of the RHNA, the proposed Housing Elements aim to do the following: 1) preserve and upgrade existing housing units to ensure they do not become dilapidated, abandoned, or unsound, and 2) provide direction for how new housing development in the City should occur. With respect to the latter, the 2004 Housing Element encourages new housing in Downtown and in underutilized commercial and industrial areas. The 2004 Housing Element also encourages increased housing in neighborhood commercial districts and mixed-use districts near Downtown. The 2009 Housing Element encourages housing in new commercial or institutional projects and accommodating housing through existing community planning processes.

The San Francisco Bay Area and surrounding areas are characterized by numerous geologically young faults. However, there are no known fault zones or designated Alquist-Priolo Earthquake Fault Zones in the City. Therefore, the proposed Housing Elements would have *no impact* with respect to rupture of a known earthquake fault.

Although the proposed Housing Elements would not result in the construction of residential units, all new development would be connected to the City's existing wastewater treatment and disposal system. Development would not involve the use of septic tanks or alternative wastewater disposal systems.

Impact GE-2: The proposed Housing Elements would not result in substantial soil erosion or the loss of topsoil. (Less than Significant)

New construction could result in impacts related to soil erosion and the loss of topsoil if new housing, particularly on vacant or undeveloped sites, would result in grading activities, or if new development would require much more extensive grading. This exposure could result in erosion or loss of topsoil. The 2004 and 2009 Housing Element policies that promote increased density could result in heavier buildings on soil types or in proximity to slopes that are susceptible to erosion. Heavier buildings would require stronger and deeper foundations, involving more excavation than lighter buildings.

2004 Housing Element Analysis

As discussed under Impact GE-1, the 2004 Housing Element policies promote increased density more so than the 1990 Residence Element. (See 2004 Housing Element Policies 1.1, 1.6, 1.7, 1.8, 4.4, 4.5, 11.6, 11.7, 11.8, 11.9 and Implementation Measures 1.1.1, 1.3.1, 1.6.2, 1.8.1, 1.8.3, 4.4.1, 11.6.1 and 11.7.1.) Directing growth to certain areas of the City and increased density could increase the amount of new housing occurring in those areas, thereby resulting in new development built to maximum allowable height and bulk, potentially increasing building height and mass compared to existing buildings. In addition, new construction could result in impacts related to erosion and the loss of topsoil by promoting housing construction on undeveloped sites. Both the potential for heavier buildings and the construction of housing on vacant or undeveloped sites could result in erosion or the loss of topsoil due to the need for extensive grading.

As discussed under Impact GE-1, the 2004 Housing Element proposes policies that promote development on undeveloped sites to the same extent as the 1990 Residence Element. 2004 Housing Element Policy 1.5 does not represent a policy shift from 1990 Residence Element Policy 1.1. The City's soft site analysis is essentially the identification of the underutilized and vacant sites, which is the subject of 2004 Implementation Measure 4.1.4. A portion of 2004 Implementation Measure 4.1.4 is similar to 2004 Housing Element Implementation Measure 1.3.3 with respect to development of Brownfield sites, which is not viewed as a policy shift. Therefore, the 2004 Housing Element would result in grading activities to an extent similar to the 1990 Residence Element and would result in a similar amount of erosion or loss of topsoil. In addition, as discussed under Impact GE-1, 2004 Housing Element Policies 3.1, 3.3, and 3.4 would retain existing housing by promoting seismic upgrades/retrofits, maintenance of existing housing, and correction of code violations to a degree similar to the 1990 Residence Element. The preservation of existing housing reduces the pressure for new housing development that could result in increased soil erosion or loss of topsoil. However, as discussed under Impact GE-1, 2004 Housing Element Policies 1.7, 4.4, 11.6, 11.7, and 11.8 would promote increased density compared to the 1990 Housing Element. Construction associated with housing could potentially result in substantial soil erosion or the loss of topsoil through the need for grading activities because increased density would result in heavier buildings that would require deeper foundations and more grading. Therefore, the 2004 Housing Element could promote increased density, which could potentially result in more soil erosion and a greater loss of topsoil compared to the 1990 Residence Element. Although the 2004 Housing Element would not result in the construction of residential units, it would shape how new residential development should occur and

on underused, vacant and surplus lands (Policy 1.3 and Implementation Measures 3 and 4), which have the potential to be contaminated. Although some 2009 Housing Element policies could increase the potential to encounter contaminated sites, 2009 Housing Element Policy 13.4 and Implementation Measure 36 could potentially reduce this impact by encouraging preservation of existing housing units, potentially reducing demolition and the corresponding exposure hazards, as described under Impact HZ-1. Furthermore, as discussed extensively in Section V.E (Cultural and Paleontological Resources) under Impact CP-1, and throughout this EIR, both the 2009 Housing Element contains numerous policies that promote the preservation of existing housing units. Retention of existing housing could reduce the potential for new construction that may occur on contaminated sites, but could also maintain units that may already be contaminated with LBP and ACM.

The 2009 Housing Element would not result in the construction of residential units, though all new development would be required to comply with all applicable federal, state, and local regulations. Therefore, the 2009 Housing Element would have a *less than significant* impact with respect to upset and accident conditions involving the release of hazardous materials into the environment.

Impact HZ-3: The proposed Housing Elements would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. (Less than Significant)

Residential uses typically do not generate hazardous materials and household hazardous materials are typically labeled to ensure proper use. The exact location and quantity of hazardous materials associated with new housing is unknown. However, as discussed under Impact HZ-1, an increase in residential uses could result in additional transport, use and disposal of hazardous materials. The majority of the City's industrial and commercial land uses are clustered in the southeastern portion of the City near U.S. Highway 101. However, the Housing Elements would not directly result in new construction or locating new housing near existing or proposed schools and would have no effect on the emission of hazardous substances.

Although hazardous materials and waste generated from construction of housing may pose a health risk to nearby schools, all businesses associated with housing construction that handle or involve on-site transportation of hazardous materials would be required to comply with the provisions of the City's Fire Code and any additional regulations as required in the California Health and Safety Code Article 1 Chapter 6.95 for a Business Emergency Plan, which would apply to those businesses associated with construction activities. Both the federal and state governments require all businesses that handle more than a specified amount of hazardous materials to submit a business plan to a regulating agency. In addition, implementation of federal and state regulations would minimize potential impacts by protecting schools from hazardous materials and emissions. For example, federal regulations such as RCRA would ensure that hazardous waste is regulated from the time that the waste is generated until its final disposal, and NESHAP would protect the general public from exposure to airborne contaminants that are known to be hazardous to human health. The HMUPA is responsible for CUPA authority in the City and would require all businesses handling hazardous materials to create a Hazardous Materials Business Plan which would reduce the risk of an accidental hazardous materials release.

Brownfield or infill development sites. As discussed under Impact HZ-1, 2004 Housing Element Policies 1.7, 4.4, 11.6, 11.7, and 11.8 could promote increased density and housing construction, which could potentially increase development pressure on hazardous materials sites. 2004 Housing Element Implementation Measures 1.3.3 and 4.1.4 are both related to development of Brownfield sites, but are not considered to represent a shift in City policy. 2004 Housing Element Implementation Measure 4.1.7 more generally states that appropriate sites, which could include Brownfields, shall be identified for permanently affordable housing. Because of restrictions already imposed on such sites, there would be no significant impacts related to hazardous materials sites following remediation. Remediation efforts could, however, impact below ground resources including cultural resources, geology and soils, and hydrology and water quality. Impacts related to hazardous waste sites are typically project-specific and projects on Brownfield sites would be subject to the review and/or mitigation imposed by the City's SFDPH and/or the applicable regulator of hazardous waste. Specific mitigation measures would be developed in consultation with the SFDPH based on the real or perceived contaminants that may be onsite.

As discussed above, the 2004 Housing Element includes policies that would encourage higher residential density in underutilized commercial and industrial areas but also stresses that harmful effects should not occur as a result. For the most part, the areas mentioned in 2004 Housing Element Implementation Measure 1.3.2 comprise the Eastern Neighborhoods portion of the City. As outlined in the Eastern Neighborhoods EIR, the change in land use from an existing industrial use to new residential units would require adherence to strict cleanup levels. Compliance with facility closure requirements specified in Article 21 of the San Francisco Health Code, and site assessment and remediation requirements that may be triggered by Article 22A or the California Land Reuse and Revitalization Act, would ensure that the potential for hazardous materials to be present is addressed and that further remediation would be conducted under the oversight of the appropriate regulatory agency, if required. Because of the well-established regulatory framework for site assessment and remediation, impacts related to exposure to hazardous materials due to land use changes are considered less than significant.

Development of Brownfield sites or redevelopment of former commercial and industrial sites to residential uses would be required to undergo remediation and cleanup under DTSC and the SFBRWQCB before construction activities could begin. If contamination at any specific project were to exceed regulatory action levels, the project proponent would be required to undertake remediation procedures prior to grading and development under the supervision of the City's SFDPH, HMUPA, or the SFBRWQCB (depending upon the nature of any identified contamination). The 2004 Housing Element would direct new construction to Brownfield sites and former commercial and industrial sites that would be required to comply with all applicable federal, state, and local regulations. Therefore, the 2004 Housing Element would have a *less than significant* impact with respect to development of hazardous materials sites.

2009 Housing Element Analysis

The following 2009 Housing Element implementation measures could result in impacts related to hazardous materials sites by siting residential uses in formerly commercial or industrial areas and on Brownfield or infill development sites. The 2009 Housing Element promotes residential development on

point informing the public of potential risks associated with use of the structure and prohibiting public access.

Impact GE-4: The Proposed Project would not create substantial risks to life or property as a result of locating buildings or other features on expansive or corrosive soils. (*Less than Significant*)

Much of the project site is underlain directly by bedrock, which is not expansive. The artificial fill beneath the project site is sandy and gravelly and would not be expansive. The Young Bay Mud is below the water table and is permanently saturated; therefore, it would not be subject to moisture changes that would cause expansion and contraction of the clay materials. Further, any backfill materials used for the Proposed Project would have a low expansion potential and would be adequately compacted in accordance with the recommendations of the geotechnical report prepared for the Proposed Project. Although corrosive soils have been identified at the project site, as discussed in "Corrosive Soils" on pp. 4.N.8-4.N.9, buried features of the Proposed Project would be constructed to resist corrosion in accordance with the San Francisco and Port of San Francisco Building Codes. Therefore, impacts related to problematic soils would be less than significant. No mitigation is necessary.

Impact GE-5: The Proposed Project would not substantially change the topography or any unique geologic or physical features of the site. (*Less than Significant*)

The 35-foot-tall Irish Hill remnant is not considered a unique geologic or physical feature because it does not embody distinctive characteristics of any regional or local geologic principles; does not provide a key piece of information important to geologic history; does not contain minerals not known to occur elsewhere in the county; and is not used as a teaching tool. The remnant of Irish Hill is a prominent historic topographic feature in San Francisco. However, it was nearly leveled by extensive blasting and quarrying during the late 1800s and early 1900s, as described in "Project Site Topography and Geology," p. 4.N.2. Therefore, the existing hill is not representative of the original topography. In addition, construction of the new 21st Street would remove only the northern spur of the hill, and would not substantially alter the existing topography. Irish Hill is a contributing landscape feature of the Union Iron Works Historic District; the potential effects on this historic resource are addressed in Section 4.D, Cultural Resources.

As described in "Site Grading," in Chapter 2, Project Description, p. 2.67-2.69, site grades would be increased by up to 5 feet to prevent inundation due to sea level rise. However, this grading would not result in a substantial change in topography because no existing slopes would be eliminated and no new slopes would be created as a result of raising the site grade. Therefore, impacts related to alteration of topography and unique geologic or physical features of the site would be less than significant. No mitigation is necessary.

located in the center of the property. There is also a much smaller, one-story Service Building in the northwest corner of the property. The two buildings were designed to complement each other in character and materials. The Office Building is a glass walled building with an open character. The Service Building is a brick building with a closed character. The Office Building is an International Style building which despite its size is built into its sloping hillside site in such a way as to minimize its presence. Its four wings, each built for different functions, range from three floors to seven floors. It is characterized by its horizontality, its bands of windows separated by the thin edges of projecting concrete floors, and brick trim. The wings of the building frame outdoor spaces whose landscape design connects the outdoors with the indoors both functionally and conceptually. The landscape design includes outdoor spaces for use by employees, parking lots, circulation paths, and vegetation. The principal outdoor spaces are the Entrance Court, the Terrace, and small areas around the Auditorium.

SETTING

The Fireman’s Fund Home Office property is located in a central area of the north half of the City of San Francisco near the intersection of two principal streets, California and Presidio. The property occupies almost all of a large irregular block bound by California Street on the north, (continuing clockwise) Presidio Avenue on the east, Masonic Avenue on the southeast, Euclid Avenue on the south, and Laurel Street (in straight and curved sections) on the west. Fireman’s Fund occupies about 10.2 acres—the entire block except for a small triangular parcel at the corner of California and Presidio. (See Map 1 and Map 4)

The site itself slopes down from about 300 feet in elevation in the southwest corner to about 225 feet in the northeast corner. It is part of a cluster of low hills associated with Lone Mountain whose several high points were developed as cemeteries in the nineteenth century. The Fireman’s Fund site was previously a portion of the Laurel Hill Cemetery, and was long recognized for its views. Today there are distant views from the property to the southeast and downtown, to the northwest and a partial view of the Golden Gate Bridge, and to the west into the Richmond District.

The property is surrounded on all sides by thoroughly developed parts of the City of San Francisco. The site itself is at a junction of several different historical developments. To the east and north, the streets are laid out in a modified extension of the original grid of the city. Across Presidio Avenue on the east the neighborhood is called the Western Addition, characterized by a mix of middle-class homes built in the nineteenth century, and by flats and apartments built in

 of the Bench and Bar.
 Former Member, California Legislature
 (1935-1947; 18th Assembly District)

San Francisco - May 31, 1961

"LAUREL HILL CEMETERY - BURIAL PLACE OF
 SAN FRANCISCO'S HISTORIC DEAD."

As a member of the California Historical Society I am pleased to join with my associates in that organization and the members of the State Park Commission in placing this plaque marking the site of historic "Laurel Hill Cemetery," which was originally known as "Lone Mountain Cemetery."

The inscriptions on the monuments in a city's early cemeteries usually record the dramatic history and the adventure of its founding. In Laurel Hill Cemetery, which existed from 1854 to 1946, were found the most famous and illustrious names of early San Francisco. For instance, here there were recorded the inscriptions on the graves of eleven United States Senators; six from California; four from Nevada; and one from Oregon.

Here were buried the last remains of Baker and Broderick:

Edward D. Baker, the former San Francisco lawyer who became a United States Senator from Oregon, and who, while still a member of the Senate, was killed leading his first charge at the Battle of Ball's Bluff on the banks of the Potomac on October 21, 1861; and

David C. Broderick, stone-cutter's son and volunteer fireman in New York City, who became a United States Senator from California only to be killed in a duel with Judge David S. Terry of the State Supreme Court. He died on September 16, 1859.

In addition to Broderick, the other United States Senators from California buried in Laurel Hill were James A. McDougall, William M. Gwin, Milton Latham, Aaron A. Sargent, and John F. Miller.

The four Senators from Nevada were William Sharon, James G. Fair, John Percival Jones, and William M. Stewart. The Senator from Oregon was Edward D. Baker.

For many years prior to 1853 San Francisco's principal cemetery was the Cemetery of Yerba Buena which was located in the area between Market, McAllister and Larkin Streets (near where the City Hall stands to-day). By November, 1853, many thoughtful people in San Francisco considered the Yerba Buena Cemetery site to be too near to the city for a permanent burial place. Accordingly, the Lone Mountain Cemetery project was undertaken by a private corporation composed of Nathaniel Gray, Frank B. Austin and William H. Ranlett.

The new cemetery grounds were to be located near "Lone Mountain" situated three or four miles west of the plaza. From the summit of this beautifully-shaped hill it was then possible to obtain one of the finest and most extensive views of both land and water. The title "Lone Mountain" Cemetery was selected by a council of advisers. The name was changed to Laurel Hill Cemetery in 1867.

Originally the planners intended to include in the grounds a tract of land about 320 acres in extent, the entire tract lying between the Presidio and the Mission. Subsequently, it was found that 160 acres would form a sufficiently large cemetery, and so the limits of the original plan were reduced. Because of the reduction in the size of the project, "Lone Mountain" was not situated within the cemetery boundaries, but adjoined them on the south.

The dedication of Lone Mountain Cemetery was held at 11:00 o'clock A.M. on May 30, 1854. It was reported that the weather was beautiful, and that ladies comprised at least one-half of those present. There were no street cars at that time; in fact, there were no streets within miles of the place. The only available

LANGAN TREADWELL ROLLO

Groundwater levels encountered in borings drilled at the site were generally between 18 and 38 feet bgs, which is below the soil susceptible to liquefaction. Therefore, we conclude the potential for liquefaction at the site is very low. Consequently, we conclude the potential for lateral spreading is also very low.

6.3 Seismic Densification

Seismic densification can occur during strong ground shaking in loose, clean granular deposits above the water table, resulting in ground surface settlement. Up to 15 feet of loose to medium dense sand was encountered in the borings above the water table. The loose and medium-dense sand may densify during an earthquake. We estimate settlement that may result from cyclic densification of the sand would be between $\frac{1}{4}$ and 1 inch, depending on thickness of the sand. The basement for the proposed buildings should remove most of the soil susceptible to seismic densification; therefore, we estimate less than $\frac{1}{4}$ inch of settlement should occur under the proposed buildings.

7.0 DISCUSSION AND CONCLUSIONS

On the basis of the results of our subsurface exploration, laboratory testing, and engineering studies, we conclude the proposed development is feasible from a geotechnical engineering standpoint. The primary geotechnical issue associated with the proposed development is the presence of fill and loose sand. These materials will affect foundation support and temporary excavation support. Our discussion and conclusions regarding these issues and their impact on the design and construction of the proposed structure are discussed in the following sections.

7.1 Foundations and Settlement

We understand the new buildings are planned with one below-grade level for parking. We anticipate stiff to very stiff clay, medium dense sand, and bedrock will be exposed at the foundation level. Where fill or loose sand is present below the planned depth of excavation additional excavation will be required to gain adequate support. Where this condition exist, the footing can be deepened or the over-excavation backfilled with lean concrete. On the basis of our engineering studies, we conclude the proposed buildings can be supported on shallow footings gaining support in the native soil or bedrock. We estimate total settlement of footings would be on the order of $\frac{1}{2}$ to 1 inch, depending on the bearing material. Differential settlement between adjacent footings would be on order on one half of the total settlement. Where footing subgrade consists of medium dense sand, we estimate up to $\frac{1}{4}$ inch of seismic densification settlement could occur as discussed in Section 6.3.

The existing parking garage beneath the eastern wing of the main building extends three levels below grade. New building that will be constructed adjacent to the parking garage may impose surcharge on the basement wall of the parking garage. To avoid surcharging the wall, the western perimeter wall of the new building may need to be supported on drilled piers that gain support in the bedrock below the elevation of the bottom of the parking garage.

7.2 Excavation and Shoring

The proposed single basement will require an excavation of approximately 12 feet below the ground surface. The primary considerations related to the selection of the shoring system are:

- the presence of fill (which contains construction debris) and loose to medium-dense sand
- the potential settlement of adjacent structures and improvements caused by movement of the temporary shoring.

During excavation, the sides of the excavation and adjacent streets should be retained. The most common, and generally the most economical shoring system in the San Francisco Bay area is a soldier-pile-and-wood-lagging system. This shoring system consists of steel piles that are placed in predrilled holes; the annulus between the piles and the sides of the hole is backfilled with concrete. Wood lagging is placed between the soldier piles as excavation proceeds. For an excavation on the order of 12 feet deep, the shoring can be designed as a cantilever system. If the excavation is significantly deeper than 12 feet, tiebacks or internal bracings could be installed to provide lateral resistance and limit deflection. Considering the proposed depth of the excavation, we judge a cantilever soldier-pile-and-lagging shoring system could be used for this project.

A three-level, below-grade, parking garage is present beneath the eastern wing of the main building. To retain the excavation sides for the multi-level basements, a retaining system with tiebacks may have been used. Therefore, tiebacks may be encountered during basement excavation for new structure located east of the parking garage.

Drilling of the shafts for the soldier piles will likely require casing and/or use of drilling mud (slurry) to prevent caving. To prevent settlement of adjacent improvements, soldier

piles should not be installed by driving or vibratory methods. A monitoring program should be established to evaluate the effects of the construction on the adjacent buildings and surrounding ground.

Sand with low fines content was encountered within the zone of excavation. To reduce caving, lagging boards should be placed with every foot of excavation to limit caving. Voids that result from caving soil behind wood lagging should be grouted before proceeding to the next row of lagging.

The bottom of excavation should be above the groundwater level. During drilling of the soldier-pile holes, groundwater or perched water may be encountered. To keep the holes from caving, casing and/or drilling slurry may be needed. Alternatively, the soldier piles may be installed using auger-cast method.

Generally, soldier piles can be installed under the City's sidewalk provided that the top 3 feet of the soldier piles are removed after the permanent basement wall is cast. If tiebacks are needed, it has been our experience that using hollow-stem augers to install tiebacks in sand will result in loss of ground. Therefore, tiebacks, if required, should be installed using smooth-cased method (such as a Klemm rig) to reduce loss of ground.

The selection, design, construction, and performance of the shoring system should be the responsibility of the contractor and its shoring designer. A structural engineer knowledgeable in this type of construction should design the shoring.

7.3 Basement Floor Slabs

The soil at slab subgrade should consist of stiff to very stiff clay, medium dense sand, and bedrock. Therefore, the slabs may be supported on grade. If weak soil is present at subgrade level, the weak soil should be removed and replaced as engineered fill.

7.4 Corrosion Potential

The near surface soil was determined to be moderately corrosive. The corrosive soil will adversely affect below grade improvements, such as foundations and utilities. The results of the tests and more specific commentary and recommendations for protection of buried structures are presented in Appendix D.

7.5 Construction Considerations

If site grading is scheduled for the rainy season, usually between November and April, the near-surface soil may be too wet to achieve adequate compaction during site preparation and fill placement and may deflect significantly under the weight of construction equipment. For these conditions, moisture conditioning of the material and the use of lightweight equipment may be required to lower the soil to a moisture level that will promote proper compaction. Methods of moisture conditioning include mixing and turning (aerating) the soil to naturally dry the soil and lower the moisture content to an acceptable level. Aeration typically requires at least a few days of warm, dry weather to effectively dry the material. Other soil stabilization alternatives to provide a stable, workable subgrade for grading operations and other equipment include over-excavating the wet soil and replacing with drier material and/or mixing the soil with lime and/or cement.

If localized soft or wet areas are encountered, it may be necessary to over-excavate to a depth of 18 to 24 inches, place a layer of stabilizing geo-synthetic, and backfill with granular material to stabilize the subgrade and bridge the soft material.

At some locations, the excavation for the basement will encounter bedrock. Rock types will vary vertically and laterally. Also, the degree of weathering, fracturing and jointing will vary within each rock type. In San Francisco, excavation in rock has been performed with earth moving equipment, such as loaders and heavy-duty backhoes. However, because the quality of the rock varies, hard rock may be encountered that will require excavation using hoe-rams or dozers equipped with rippers. Jack hammering may be required in areas where the rock exhibits little weathering, fracturing, or jointing and in confined areas, such as footing and utility excavations.

Bedrock encountered in the borings consists of serpentinite and sandstone. Serpentinite contains naturally occurring asbestos. Therefore, a Site Mitigation Plan (SMP) may need to be prepared prior to construction. Bedrock handling and disposal should be performed in accordance with the SMP.

The contractor should be aware that there may be existing shoring elements, such as tiebacks behind basement walls, which could have been installed during the construction of the three-level parking garage. In addition, remnants of building footings within the site may be encountered during excavation.

8.0 RECOMMENDATIONS

Recommendations regarding site preparation, foundation design, floor slabs, and seismic design are presented in the following sections.

8.1 Site Preparation and Grading

This section presents earthwork recommendations for site preparation and grading.

8.1.1 Site Clearing

Site demolition should include the removal of all slabs, foundations, retaining walls, pavements, utilities, and other below-grade improvements that will interfere with the proposed construction. Where utilities that are removed extend off site, they should be capped or plugged with grout. It may be feasible to abandon utilities in-place by filling them with grout, provided they will not impact future utilities or building foundations. The utility lines, if encountered, should be addressed on a case-by-case basis.

8.1.2 Temporary Slopes

Excavations deeper than five feet that will be entered by workers should be shored or sloped for safety in accordance with the Occupational Safety and Health Administration (OSHA) standards (29 CFR Part 1926). Inclinations of temporary slopes should not exceed those specified in local, state or federal safety regulations. As a minimum, the requirements of the current OSHA Health and Safety Standards for Excavations (29 CFR Part 1926) should be followed. The Contractor should determine temporary slope inclinations based on the subsurface conditions exposed at the time of construction. However, temporary slopes less than 10 feet high should be inclined no steeper than 1.5:1 (horizontal to vertical). In addition, we recommend all vehicles and other surcharge loads be kept at least 10 feet away from the tops of temporary slopes.

8.1.3 Site and Subgrade Preparation

All areas to receive improvements should be stripped of vegetation and organic topsoil. Stripped materials should be removed from the site or stockpiles for later use in the landscaped areas, if approved by the landscape architect. Voids resulting from the demolition activities should be properly backfilled with lean concrete or engineered fill as described below.

Prior to placement of any engineered fill, the onsite soil exposed by stripping should be scarified to a depth of at least 12 inches, moisture-conditioned to at least three percent above optimum moisture content, and compacted to at least 95 and 90 percent relative compaction⁹ for sand and clay, respectively. The soil subgrade should be kept moist until it is covered by select fill.

If soft areas are encountered during site preparation and grading, the soft material should be removed and replaced with engineered fill. If the soft material is deeper than 24 inches, we recommend over-excavating to a depth of 18 to 24 inches, placing a geotextile fabric, such as Mirafi 500X or approved equal at the bottom of the over-excavation, and backfilling with granular material. Alternatively, the over-excavation can be backfilled with lean concrete.

8.1.4 Fill Placement and Compaction

Fill should consist of onsite or imported soil that is non-corrosive, free of organic matter or other deleterious material, contains no rocks or lumps larger than four inches in greatest dimension, has a liquid limit of less than 25 and a plasticity index lower than 8, and is approved by the Geotechnical Engineer.

Fill should be placed in horizontal lifts not exceeding eight inches before compacted, moisture-conditioned to above optimum moisture content, and compacted to at least 90 percent relative compaction. Fill thicker than five feet and/or consisting of clean sand or gravel (soil with less than 10 percent fines by weight) should be compacted to at least 95 percent relative compaction.

We should be provided with samples of proposed fill at least three days before use at the site. The grading contractor should provide analytical test results or other suitable environmental documentation indicating the imported fill is free of hazardous materials at least three days before use at the site. If this data is not available, up to two weeks should be allowed to

⁹ Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557 laboratory compaction procedure.

perform analytical testing on the proposed import material. A bulk sample of approved fill should be provided to us at least three working days before use at the site so a compaction curve can be prepared.

8.1.5 Utility Trenches

We anticipate excavations for utility trenches can be made with a backhoe. All trenches should conform to the current CAL-OSHA requirements.

Utility trenches should be excavated a minimum of four inches below the bottom of pipes or conduits and have clearances of at least four inches on both sides. Where necessary, trench excavations should be shored and braced to prevent cave-ins and/or in accordance with safety regulations. If trenches extend below the groundwater level, it will be necessary to temporarily dewater them to allow for placement of the pipe and/or conduits and backfill.

To provide uniform support, pipes or conduits should be bedded on a minimum of four inches of sand or fine gravel. After pipes and conduits are tested, inspected (if required), and approved, they should be covered to a depth of six inches with sand or fine gravel, which should then be mechanically tamped to at least 90 percent relative compaction. If fill with less than 10 percent fines is used, the entire depth of the fill should be compacted to at least 95 percent relative compaction. Jetting of trench backfill should not be permitted. Special care should be taken when backfilling utility trenches in pavement areas. Poor compaction may cause excessive settlements resulting in damage to the pavement section.

Where utility trenches backfilled with sand or gravel enter the building pads, an impermeable plug consisting of either native clay or lean concrete, at least five feet in length, should be installed where the trenches enter the building. Furthermore, where sand- or gravel-backfilled trenches cross planter areas and pass below asphalt or concrete pavements, a similar plug should be placed at the edge of the pavement. The purpose of these recommendations is to reduce the potential for water to become trapped in trenches beneath the building or pavements. This trapped water can cause heaving of soils beneath slabs and softening of subgrade soil beneath pavements.

8.1.6 Exterior Slabs

To reduce the potential for differential movement and cracking, exterior concrete slabs should be underlain by at least 4 inches of Class 2 aggregate base. The upper 12 inches of the soil subgrade should be compacted to at least 95 and 90 percent relative compaction for sand and clay, respectively.

TABLE 4
Depths to Bedrock

Boring	Approximate Ground Surface Elevation Feet	Approximate Depth to Bedrock Feet
B-1	269	31
B-2	269	15
B-3	245	7
B-4	302	18
B-5	301	10
EB-5	246	11

Uplift loads may be resisted by the weight of the footings and any overlying soil. If the weight of these is no sufficient to provide the necessary uplift resistance, drilled piers or anchors may be used. If anchors are required, we should provide recommendations for their design. Drilled pier recommendations are presented in section 8.3.

The foundation subgrade should be free of standing water, debris, and disturbed materials prior to placing concrete. If fill, soft, or loose soil is present at the foundation subgrade, it should be removed to expose competent material and be replaced by lean concrete.

We should check foundation excavations prior to placement of reinforcing steel to check for proper bearing and moisture. Maintaining proper moisture will likely require wetting the excavations periodically until the concrete is placed.

8.3 Drilled Piers

As mentioned in Section 7.1, the existing parking garage beneath the eastern wing of the main building extends three levels below grade. New building that will be constructed adjacent to the parking garage may impose surcharge on the basement wall of the parking garage. To avoid surcharging the wall, the western perimeter wall of the new building may need to be supported on drilled piers that gain support in the bedrock below the elevation of the bottom of the parking garage. After the building layout is finalized, we should evaluate the need and refine our recommendations for drilled piers.

Drilled piers should be designed to derive their axial capacity from skin friction in the bedrock below adjacent building walls and foundations. For axial compression loads, drilled piers should

*Preliminary Geotechnical Investigation
3333 California Street
San Francisco, California*

*3 December 2014
731639901
Page 18*

be designed using an allowable friction value of 2,000 psf; this value includes a factor of safety of approximately 2. Drilled piers should have a minimum diameter of 24 inches. Piers installed in a group should be spaced at least three diameters on center. For temporary uplift load, the skin friction value recommended for compressive capacity should be used. Total settlement of drilled piers should be small.

Resistance to lateral loads can be obtained from: 1) passive resistance acting on pier caps and grade beams oriented perpendicular to the direction of lateral load, and 2) lateral resistance of the piers. Passive resistance of pier caps and grade beams may be calculated using the recommendations we provided for shallow foundations. Lateral resistance of piers will depend on the stiffness of the pier, the strength of the surrounding soil, allowable deflection of the pier top, and the moment induced by the pier. If drilled piers are used, we can prepare moment and deflection profiles resulting from lateral loads.

Drilled piers should be installed by a qualified contractor with demonstrated experience in this type of foundation. Loose material may potentially cave during drilling, thus casing and/or drilling fluid may be required. Casing should extend to below any caving material. If casing is not extended through caving material, water or drilling slurry should be used, to stabilize holes. Concrete placement should start upon completion of the drilling and clean out. Concrete should be placed from the bottom up in a single operation using a tremie and/or a pumper pipe. The pipe should be maintained at least five feet below the upper surface of the concrete during casting of the piers. As the concrete is placed, casing used to stabilize the hole can be withdrawn. The bottom of the casing should be maintained at least three feet below the surface of the concrete.

8.4 Excavation and Temporary Shoring

Where space does not permit a sloped excavation, shoring will be required. We judge a cantilever soldier pile and lagging shoring system is the most appropriate for the depth of the excavation planned and types of soil present. For the design of the cantilever shoring system, we recommend using a lateral pressure corresponding to equivalent to an equivalent fluid unit weight of 40 pcf in soil and 25 pcf in rock; the depth to bedrock at boring location is presented in Table 4.

Penetration of soldier piles should be sufficient to provide lateral stability. For lateral resistance below the bottom of the excavation, we recommend using an allowable passive pressure of 2,000 psf. The passive value includes a factor of safety of about 1.5 and can be applied over

*Preliminary Geotechnical Investigation
3333 California Street
San Francisco, California*

*3 December 2014
731639901
Page 19*

three pile diameters or the pier spacing, whichever is less. If traffic loads are expected within 10 feet of the shoring system, we recommend designing for an additional load of 100 psf applied to the upper 10 feet of the wall.

A soldier pile and lagging system is relatively flexible, and movement should be anticipated. If the shoring system is properly designed and installed, we expect movements at the top of the shoring should not exceed one inch.

8.5 Basement Floor Slabs

We anticipate that stiff to very stiff clay, medium dense sand, or bedrock will be exposed beneath the proposed building floor slabs; therefore, we conclude the slabs can be supported on grade.

If the subgrade is disturbed during excavation for footings and utilities, it should be prepared to provide firm support for casting of the slab. Loose, disturbed materials should be excavated, removed, and replaced with engineered fill or lean concrete during final subgrade preparation.

We recommend installing a capillary moisture break and a water vapor retarder if water vapor moving through the slab is unacceptable or if there are finished floor coverings susceptible to moisture. A capillary moisture break consists of at least four inches of clean, free-draining gravel or crushed rock. The vapor retarder should meet the requirements for Class C vapor retarders stated in ASTM E1745-97. The vapor retarder should be placed in accordance with the requirements of ASTM E1643-98. These requirements include overlapping seams by six inches, taping seams, and sealing penetrations in the vapor retarder. The vapor retarder should be covered with two inches of sand to aid in curing the concrete and to protect the vapor retarder during slab construction. The particle size of the gravel/crushed rock and sand should meet the gradation requirements presented in Table 5.

8.6 Permanent Below-Grade Walls

Permanent below-grade walls should be designed using an at-rest lateral pressure equivalent to a fluid unit weight of 60 pcf for soil and 45 pcf for rock. Because the site is in a seismically active region, the wall design should be checked for seismic condition. During earthquakes, the walls will be subjected to active pressure plus seismic pressure increment. We used the procedures outlined in (Sitar, et. al., 2012) to compute the seismic pressure increment. The results of our analyses indicate that the design wall pressure for seismic condition is similar to that for static at-rest condition.

If surcharge loads are present above an imaginary 1.5:1 (horizontal: vertical) projected up from the bottom of a retaining wall, a surcharge pressure should be included in the wall design. If this condition exists, we should be consulted to estimate the added pressure on a case-by-case basis.

Where traffic will pass within 10 feet of walls, traffic loads should be considered in the design of the walls. Traffic loads may be modeled by a uniform pressure of 100 psf applied in the upper 10 feet of the walls.

The lateral earth pressures given assume the walls are properly backdrained to prevent buildup of hydrostatic pressure. Backdrains can be provided by using a prefabricated drainage panels over the entire height of the walls. To protect against moisture migration, below-grade walls should be waterproofed and water stops placed at all construction joints. The waterproofing should be placed directly against the backside of the walls unless the manufacturer of the waterproofing directs otherwise.

8.7 Seismic Design

As discussed in Section 4.2, bedrock is relatively deep (31 feet bgs at boring B-1) in the northwest portion of the site, and less than 20 feet bgs (B-2 through B-5) the south and eastern portions of the site.

In accordance with the provision of the 2013 CBC, for the northwestern portion of the site, where bedrock is relatively deep, we recommend seismic design parameters listed below:

- Risk Targeted Maximum Considered Earthquake (MCE_R) S_S and S_1 of 1.514g and 0.688g, respectively.
- Site Class D

- Site Coefficients F_a and F_v of 1.0 and 1.5, respectively
- Maximum Considered Earthquake (MCE) spectral response acceleration parameters at short periods, S_{MS} , and at one-second period, S_{M1} , of 1.514g and 1.032g, respectively.
- Design Earthquake (DE) spectral response acceleration parameters at short period, S_{DS} , and at one-second period, S_{D1} , of 1.009g and 0.688g, respectively.

For the eastern and southern portions of the site, where bedrock is relatively shallow, we recommend seismic design parameters listed below:

- Risk Targeted Maximum Considered Earthquake (MCE_R) S_s and S_1 of 1.514g and 0.688g, respectively.
- Site Class C
- Site Coefficients F_a and F_v of 1.0 and 1.3, respectively
- Maximum Considered Earthquake (MCE) spectral response acceleration parameters at short periods, S_{MS} , and at one-second period, S_{M1} , of 1.514g and 0.895g, respectively.
- Design Earthquake (DE) spectral response acceleration parameters at short period, S_{DS} , and at one-second period, S_{D1} , of 1.009g and 0.596g, respectively.

9.0 FUTURE GEOTECHNICAL SERVICES

Prior to construction, we should review the project plans and specifications to check their conformance to the intent of our recommendations. During construction, we should observe excavation, temporary shoring and foundation installation, subgrade preparation and compaction of backfill. These observations will allow us to compare the actual with the anticipated subsurface conditions and check that the contractor's work conforms to the geotechnical aspects of the plans and specifications.

10.0 LIMITATIONS

The conclusions and recommendations presented in this report result from limited engineering studies and are based on our interpretation of the geotechnical conditions existing at the site at the time of investigation. Actual subsurface conditions may vary. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that described in this report, Langan Treadwell Rollo should be notified to make supplemental recommendations, as necessary.

Dear John, Kathy, Catherine, M.J., and Dick:

First of all John, thank you for the meeting last week at your home. As we agreed in the meeting, we are responding to your recent questions regarding the project. We have re-arranged your questions slightly to group them according to subject. If we haven't answered any of your questions, please let us know. We very much appreciate your willingness to promptly write back to us with your five outstanding issues on the project that are currently preventing us from obtaining LHIA support for the project. We appreciate your doing this so we can set a follow up meeting to find a mutually workable solution.

LHIA Questions:

Q: You also stated that Prado wants to have a development agreement to lock in entitlements for longer periods of time than would normally be allowed?

A: Yes, we are looking to enter into a development agreement (DA) with the City for a term of approximately 15 years. For large projects with multiple buildings like 3333 California Street, the City generally requires a DA. The DA vests the entitlements, protecting the entitlements from changes in the law in exchange for certain community benefits. This would include the community benefit of certainty of the entitlements during that period. If we did not build the project during the term of the DA, then the DA would expire and we would lose the protections of the DA.

Q: What portion of the project would be built first?

A: At this time, we have assumed that the Masonic and Euclid buildings would be built first. In general, we anticipate construction beginning with a staging and site preparation phase, which will include some demolition, then excavation for underground parking, followed by construction of the buildings. With the exception of work on the sidewalks, addition of landscaping, paving, and connecting to the City's various systems and utilities, our general contractor, Webcor Builders, is anticipating that construction will occur within the site. We will be preparing a detailed construction management plan, and the EIR will include mitigation measures around construction emissions, air quality, etc. with which we will have to comply.

Q: What would you expect to be built in each successive phase of the project?

A: At this time, we anticipate the following in each phase – Phase 1: Masonic and Euclid buildings; Phase 2: Center Buildings A and B; Phase 3: Plaza A, Plaza B and Walnut buildings; and Phase 4: Mayfair Building and Laurel Duplexes.

Q: What do you anticipate the total period of time will be during each phase of construction?

A: Our current planning assumes that each phase would overlap, e.g., Phase 2 begins approximately 20 months after Phase 1. Specifically, we think Phase 1 could take 30 months, Phase 2 could take 24 months, Phase 3 could take 36 months, and Phase 4 could take 20 months. Assuming an overlap of phases, from start to finish it could take approximately six to seven years to complete all phases of the construction. This construction phasing and related

durations are consistent with and defined in the phasing schedule under review in our environmental application. While the phasing could be accelerated, we have assumed a relatively conservative approach to the construction phasing.

Q: What is the period of time that you anticipate that construction will occur?

A: We anticipate that construction will occur in the spring of 2020.

Q: What is the reason for constructing the project in phases?

A: By allowing for potential phased construction, we would have the ability to complete and occupy portions of the project as each phase is completed. If conditions do not exist to build out the entire project, we can phase construction in order to align with market conditions and financing availability.

Q: How many extensions do you anticipate requesting for the entitlements?

A: None. Any extension of the DA's term would be a material amendment that would require Board of Supervisor's approval.

Q: During those extended periods, would it be possible for Prado to request changes in the project as related specifically to increased height, increased bulk, increased numbers of residential units, increased amounts of retail or office space? What about the possibility of design changes or other changes? Could Prado apply to change any part of the construction to provide the opportunity to have high rise construction?

A: Once the EIR is certified and the project is approved, any material changes to the project would be subject to new environmental review, would require Planning Commission and Board of Supervisor approvals and also an amendment to the DA. Any increase in height over what is entitled in our project would require a revision to the Planning Code and Zoning Maps that would entail Planning Commission and Board of Supervisors approval.

Q: There are genuine concerns about reducing open spaces and reduced on-site parking places.

A: Open space will be part of the entitlements and will likely be considered by the City as one of the public benefits supporting the DA -- for that reason alone, reducing the amount of it would be very difficult if not impossible. The open space requirements will be carefully described in the project's approvals and will also be recorded against the property. So, as with any material changes to the approved project, any material change to the open space would be very difficult and would involve a public process and City approval. As to parking spaces, as you know, the City would like to see the number of spaces reduced. We plan to continue advocating for the proposed number of project parking spaces in our application.

Q: During the phased construction could Prado transfer shares in the project to provide for new or additional investors?

A: We have no plan to transfer any shares in the project and construction lenders generally prohibit any changes of ownership by the project developer during construction and stabilization of a project. PSKS, along with our equity partners and lenders, intend to provide all of the capital necessary to construct, own and operate the project. We plan to

retain day-to-day control of the project during development, construction, stabilization and ongoing operations. We design and build our projects to hold for the long-term owner.

We look forward to reconnecting and thank you again for making the time to meet with us.

Sincerely, Dan

EXHIBIT J

SAN FRANCISCO URBAN FOREST PLAN

FINAL FALL 2011

SIDEWALK GARDEN PLANTING.

FOLSOM STREET.

GREEN ROOF, ACADEMY OF SCIENCES.

Introduction

San Francisco was once a largely treeless landscape of expansive grasslands, sand dunes, coastal scrub and wetlands. Today, almost 700,000¹ trees grow along the city's streets, parks and private properties. From the Embarcadero's stately Palms to the tall Cypresses of Golden Gate Park, trees are a beloved feature of the city and critical piece of urban infrastructure.

Our urban forest creates a more walkable, livable and sustainable city. Trees and other vegetation clean our air and water, create greener neighborhoods, calm traffic, improve public health, provide wildlife habitat and absorb greenhouse gases. Annually, the benefits provided by trees in San Francisco are estimated at over \$100 million².

Trees in San Francisco, however, face a number of challenges. Historically underfunded and inadequately maintained, the city's tree canopy is one of the smallest of any large U.S. city. Lack of funding has restricted the City's ability to plant and care for its street trees. Maintenance responsibility is increasingly being transferred to property owners. Widely unpopular with the public, this approach puts trees at further risk for neglect and potential hazards.

Our urban forest is a valuable capital asset worth \$1.7 billion². Like the public transit and sewer systems, it needs a long-term plan to ensure its health and longevity. The Urban Forest Plan offers a vision and strategy to ensure an expanded, healthy and thriving urban forest now and for the future.

¹ United States Forest Service, Northern Research Station, 2007, Assessing Urban Forest Effects and Values: San Francisco's Urban Forest, Resource Bulletin NRS-8, Newton Square, PA: USDA Forest Service.

² Simpson, J. R., McPherson, E.C., December 2007, San Francisco Bay Area State of the Urban Forest Final Report, Center for Urban Forest Research, USDA Forest Service, Pacific Southwest Research Station.

Habitat & Biodiversity

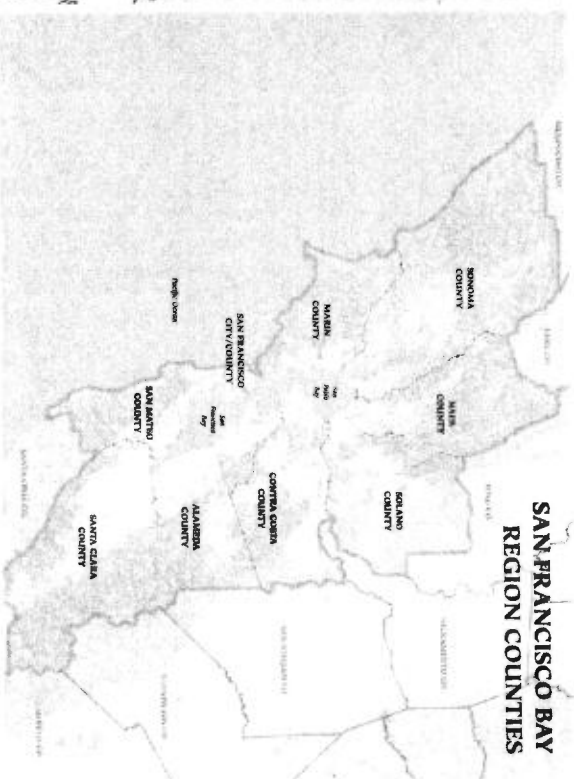

San Francisco is home to diverse ecological communities of native habitats, plants and animals - some of which can be found nowhere else on earth. The term *biodiversity* is short for "biological diversity." It refers to the variety of interconnected species - flora, fauna, fungi and bacteria - that have co-evolved into the local ecological communities, ecosystems and processes of a particular place on Earth. In cities like San Francisco this also includes species imported from other places that contribute positively to the vibrant and thriving dynamics of the city's remaining indigenous ecology.

San Francisco's trees and vegetation support local wildlife by providing food, nectar, shelter and nesting areas for a variety of birds, insects and animals. The Western Tiger Swallowtail butterfly has found an unlikely habitat among Market Street's London Plane trees. The iconic Canary Island Date Palms used to mark prominent streets have contributed to the northward range extension of Hooded Orioles and are a favorite feeding place for the famous Wild Parrots. Several species of raptors nest in Eucalyptus trees which also have served as roosts for Monarch Butterflies. One of the best trees for promoting wildlife diversity is the native Coast Live Oak, which serves a variety of species of insects as well as resident and migratory birds.

The Plan strives to increase the carrying capacity of the city's urban forest to support more wildlife and enhance local biodiversity. Strategies include diversifying plantings on streets with wildlife-serving native as well as non-native trees, shrubs, grasses and perennials. San Francisco still harbors approximately 500 native plant species creating a vast palette of wildlife enhancement opportunities. For specific recommendations see the CROW chapter.

THE CALIFORNIA FLORISTIC PROVINCE

California including the San Francisco Bay Area is located in one of 34 globally recognized biodiversity hotspots. Combined, these areas contain about half of the plant and animal species on earth yet cover only 2.3% of the earth's surface. These areas are defined by their exceptional number of animal and plant species including high number of endemic (found nowhere else) species.

Yellow-faced Bumble Bee
Bombos vosnesenskii

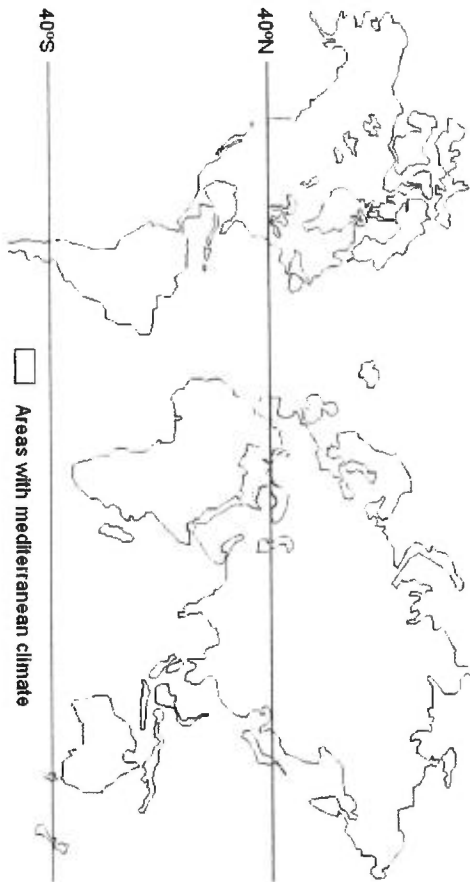

Clarkia Rubicunda

Anna's Hummingbird

MEDITERRANEAN CLIMATE

San Francisco's proximity to the ocean and moderate climate spare the city from extremes of hot and cold. Typical of the California coast, our Mediterranean climate is characterized by dry summers and wet winters. Similar climatic conditions are found in parts of Australia, South America, Africa, and the Mediterranean. This allows a wide variety of animals, trees and other plants from around the globe able to grow and thrive here.

THE PACIFIC FLYWAY

The Pacific Flyway is a major north-south route of travel for migratory birds throughout North and South America, extending from Alaska to Patagonia. Every year, migratory birds travel some or all of this distance both in spring and in fall, to follow food sources, find breeding grounds, or reach overwintering sites. The San Francisco Bay consists of many protected estuaries and mountain open space preserves that provide suitable winter quarters for birds as they fly south. San Francisco's trees, parks and water bodies provide important habitat for these migratory birds.

Wild Parrot

Green Hairstreak Butterfly

Mission Blue Butterfly

Related Plans & Documents

The Urban Forest Plan builds on several City focused on improving the city's ecological function, street design and mobility. These documents provide a foundation and starting point for the Urban Forest Plan. For a comprehensive list of Urban Forest related City policies, see **Appendix: Existing San Francisco Urban Forest & Greening Policies, Plans and Codes**.

URBAN FOREST PLAN

The 2006 Urban Forest Plan provided a framework and goals of maintaining, conserving, and expanding upon the existing urban forest in San Francisco. *Adopted 2006.*

GREEN CONNECTIONS

The Green Connections Project identified a network of streets and paths that improve pedestrian and bicycle access to parks and open spaces. These green connectors' are prioritized for tree and landscape planting that support habitat creation and recreational opportunities. *Completed 2013.*

BETTER STREETS PLAN

A set of standards, guidelines, and implementation strategies to govern how the City designs, builds, and maintains its pedestrian environment. The plan outlines specific design guidelines for a variety of street types. *Adopted 2010.*

STORMWATER DESIGN GUIDELINES

The Stormwater Design Guidelines outline ways to incorporate on-site stormwater management using green infrastructure strategies that include trees and landscaping. *Adopted 2010.*

SAN FRANCISCO GENERAL PLAN

The General Plan's Urban Design and Recreation & Open Space Elements provide policy frameworks that support urban forestry and landscaping on the City's streets and in open spaces.

CLIMATE ACTION PLAN

The Plan includes an inventory of San Francisco's greenhouse gases (GHGs) and set goals for GHG reduction for the city to meet. *Adopted 2004, Update expected in 2014.*

PEDESTRIAN & BICYCLE PLANS

The City's Bicycle Plan and WalkFirst strategy both identify priority bicycling and walking streets. Street trees have been proven to have traffic calming benefits and should be employed as part of strategies to create more bikable and walkable streets.

PLAN GOALS

The Plan is based on the following five goals for the urban forest. Each goal is accompanied by a series of strategies and actions required to achieve it.

GOAL 1

GROW THE URBAN FOREST THROUGH NEW PLANTING TO MAXIMIZE THE SOCIAL, ECONOMIC AND ENVIRONMENTAL BENEFITS OF TREES AND URBAN GREENING.

GOAL 2

PROTECT THE URBAN FOREST FROM THREATS AND LOSS BY PRESERVING THE CITY'S EXISTING STREET TREES.

GOAL 3

MANAGE THE URBAN FOREST THROUGH COORDINATED PLANNING, DESIGN AND MAINTENANCE TO ENSURE ITS LONG-TERM HEALTH AND SUSTAINABILITY.

GOAL 4

FUND THE URBAN FOREST BY ESTABLISHING A LONG-TERM FUNDING STRATEGY FOR THE CITY'S TREES.

GOAL 5

ENGAGE RESIDENTS, PUBLIC AGENCIES, COMMUNITY GROUPS AND THE PRIVATE SECTOR IN CARING FOR THE URBAN FOREST AND DEEPENING THEIR CONNECTION TO NATURE.

- 1 PURSUE AN EXPANDED AND EQUITABLE DISTRIBUTION OF TREES AND GREENING THROUGHOUT THE CITY
- 2 MAXIMIZE BENEFITS OF THE URBAN FOREST FOR SOCIAL, ENVIRONMENTAL, ECONOMIC.
- 3 PROMOTE A RANGE OF GREENING TOOLS IN THE PUBLIC RIGHT-OF-WAY.

- 1 STABILIZE THE URBAN FOREST BY ACHIEVING A NET ZERO LOSS OF TREES
- 2 REDUCE THE IMPACTS OF DEVELOPMENT ON THE URBAN FOREST.
- 3 DEVELOP STRATEGIES TO COMBAT DISEASES AND PESTS.
- 4 PROMOTE PROPER CARE AND MAINTENANCE OF STREET TREES.

- 1 CREATE A COHESIVE MANAGEMENT PROGRAM FOR THE CITY'S STREET TREES.
- 2 EMPLOY BEST MANAGEMENT PRACTICES IN STREET TREE MAINTENANCE TO CREATE A MORE COST-EFFICIENT AND EFFECTIVE PROGRAM.
- 3 MANAGE AND CARE FOR STREET TREES THROUGHOUT THEIR ENTIRE LIFE CYCLE
- 4 PLAN FOR THE LONG-TERM HEALTH AND BEAUTY OF THE URBAN FOREST.
- 5 COLLECT AND USE DATA TO MANAGE AND MONITOR THE URBAN FOREST.
- 6 IMPROVE COORDINATION AND COMMUNICATION BETWEEN AGENCIES, POLICY MAKERS AND THE COMMUNITY.

- 1 SECURE FUNDING FOR TREE PLANTING, ESTABLISHMENT AND MAINTENANCE
- 2 SEEK PRIVATE FUNDING AND OTHER SOURCES FOR THE URBAN FOREST.
- 3 CONSIDER NEW AND INNOVATIVE FUNDING SOURCES.

- 1 PROMOTE URBAN FOREST EDUCATION AND EXPERIENTIAL OPPORTUNITIES.
- 2 ENCOURAGE PARTICIPATION IN THE PLANTING, ESTABLISHMENT AND MAINTENANCE OF TREES.
- 3 RECOGNIZE TREES WITH SPECIAL CONTRIBUTIONS (ECOLOGICAL, HISTORICAL, SOCIAL OR AESTHETIC) TO SAN FRANCISCO'S LANDSCAPE

ical street tree can intercept range from 760 - 4,000 gallons/tree per year.³ Large and medium broadleaf evergreen trees, large conifers and some deciduous trees with large leaf surface areas and a mature canopy typically demonstrate greater stormwater benefits. These trees should be considered for planting where space allows to maximize their benefits. Some large stature trees will not be appropriate as street trees due to their size and space requirements, but in those cases sidewalk gardens and medium stature trees can be utilized to maximize stormwater benefits. Recommendations for enhancing stormwater management through the urban forest are described below.

- Improve design of new tree wells to allow better infiltration of stormwater.
- Create sidewalk gardens and install sidewalk landscaping.
- Remove impermeable surfaces where possible.
- Conduct a study to determine which street tree species have the greatest runoff reduction capacity for San Francisco.

³ Stormwater, Trees, and the Urban Environment: A Comparative Analysis of Conventional Street Tree Pits and Stormwater Tree Pits for Stormwater Management in Ultra Urban Environments, Charles River Watershed Association (2009).

PUBLIC HEALTH

124 Target trees to achieve public health benefits, especially for children and seniors. Some strategies to improve public health through tree planting are described below.

Air quality and respiratory health can be improved by tree planting in:

- High-volume traffic corridors and freeways
- Areas with increased asthma rates

Trees have pedestrian safety and traffic calming effects by buffering of pedestrians from vehicles along:

- Higher-speed arterial streets that are also priority transit or walking streets

Mental health and physical activity are supported by trees in:

- Areas with limited access to parks and green space
- Areas with lower than average tree canopy

Shading and temperature control can be provided by trees in:

- Areas with higher risk of heat vulnerability

CARBON SEQUESTRATION & CLIMATE CHANGE

125 Maximize carbon storage potential of urban forest to combat climate change. Almost half of San Francisco's greenhouse gas emissions come from vehicles. Trees along city streets can provide a direct benefit to reducing San Francisco's climate impacts. As trees grow, they store carbon in woody tissues and soil. Healthy mature forests can sequester carbon for long periods acting as carbon "sinks." A variety of strategies should be considered to support the urban forest's ability to store greenhouse gases:

- Quantify carbon storage potential of City trees by species.
- Re-use urban wood from dead or removed trees to retain carbon storage capacity of woody biomass.
- Research innovative tree farming/harvesting techniques that may increase carbon storage potential.
- Plant trees with high uptake of carbon including fast-growing species and those with significant biomass.

126 Consider adaptation to climate change in identifying a local tree species palette. As the climate changes, San Francisco may experience more extreme weather fluctuations that may result in increased fog and rain as well as intense periods of

Stabilize the urban forest by achieving a net zero loss of trees.

Aside from growing the urban forest through new planting, one of the biggest steps the City can take is to protect and stabilize our existing urban forestry assets. The urban forest has an estimated 4% annual mortality rate. This means thousands of trees die or are removed each year. Many are lost to age, disease, vandalism and illegal removal without permits. New tree planting in San Francisco has not historically kept pace with these losses resulting in a shrinking urban forest canopy. Efforts should be made to replace lost trees and expand tree planting whenever possible.

2202 Replace all dead or removed trees on streets on a 1:1 basis. To stabilize existing tree resources, the City should plant replacement trees whenever trees are removed. If trees cannot be replaced in the same location, plantings should take place in available planting sites elsewhere on other streets.

2203 Improve enforcement of existing codes for tree protection including: Public Works Code (Article 16: Urban Forestry Ordinance) and Planning Code (Sec. 138.1 & 428). See Appendix for list of additional tree codes and policies. The City should continue to enforce and look for ways to improve existing regulations governing tree maintenance, care and planting. The City should regularly track the enforcement of these codes and the agencies responsible for implementing them.

Reduce impacts of development on the urban forest.

2204 Improve care and maintenance of street trees through a comprehensive management program. (See MANAGE chapter). Regular ongoing maintenance of the City's trees is one of the most important ways to protect and ensure their long-term health.

2205 Encourage developers to incorporate existing trees into building and site designs. While street trees and significant trees (within 10' of the public right-of-way) are afforded certain protections, many trees on vacant or redevelopment sites are removed to allow for new development. Consideration should be given during review of building plans to the existing trees on the site, especially "significant" trees (20 ft or more in height, 15 ft or greater canopy width, and/or 12 inches or greater in trunk diameter). If trees are removed efforts should be made to harvest or re-use the wood if possible.

2206 Explore regulatory devices to increase protection of trees during permitting process for garages, curb cuts and driveways. Installation of parking facilities on public and private development often requires the removal of street trees. These include trees of significant size that provide valuable public benefits and a mature canopy. In such cases, where a tree would be impacted, design alternatives such as offset driveways or denial of a permit may be appropriate where existing trees would be removed or new trees cannot be planted.

2207 Require contractors to carry Tree Protection Bonds during construction projects. Construction activities frequently result in accidental damage or loss of trees - including street trees. Development projects with the potential to disturb existing trees should be required to carry Tree Protection Bonds as insurance. Such bonds would allow recourse in the event that significant damage to trees occurs during the development process through fines, tree replacement or other measures.

2208 Improve process for approving Tree Protection Plans for construction projects. Currently Tree Protection Plans are collected by the Planning Department. Review of these plans should take place with appropriate urban forestry staff. The inspection and enforcement of plans should be carried out. These plans include important provisions to protect trees such as protective barriers, construction exclusion zones, and the restriction of material and equipment storage within tree drip zones.

2209 Fully integrate DPW into the Building Permit and Project Tracking System (PPTS). DPW should be fully integrated into the development review and building permit process. The inclusion of DPW into the Permit and Project Tracking System (PPTS) used by the Planning Department and Department of Building Inspection (DBI) will facilitate the effective review of planning issues (e.g. appropriate siting, interference from pre-existing infrastructure, pedestrian and vehicular safety) by staff at an early stage in the development review process. The current process requires more staff time than is necessary, causes undue delay to development projects, and has com-

II. Neighborhood Character

DESIGN PRINCIPLE: Design buildings to be responsive to the overall neighborhood context, in order to preserve the existing visual character.

Most residents live in areas that are distinct neighborhoods. Many neighborhoods have defining characteristics such as street trees, buildings with common scales and architectural elements, and residential and commercial uses that make the neighborhood identifiable and an enriching place to be. The neighborhood is generally considered as that area around a home that can easily be traversed by foot. Neighborhoods may also be defined by natural or man-made elements such as parks, streets and hilltops.

NEIGHBORHOOD CONTEXT

Though each building will have its own unique features, proposed projects must be responsive to the overall neighborhood context. A sudden change in the building pattern can be visually disruptive. Development must build on the common rhythms and elements of architectural expression found in a neighborhood. In evaluating a project's compatibility with neighborhood character, the buildings on the same block face are analyzed. However, depending on the issues relevant to a particular project, it may be appropriate to consider a larger context.

Neighborhood patterns that are important to the character of the neighborhood include:

- The **block pattern**: Most buildings are one piece of a larger block where buildings define the main streets, leaving the center of the block open for rear yards and open space. Some blocks are bisected by mid-block alleys where service functions that detract from the public pedestrian environment, such as garage entries, trash collection, and utilities, are located.
- The **lot pattern**: Residential blocks are typically made up of narrow and deep lots (25' x 100'), creating uniform building pattern, with a pedestrian scale.

Immediate Context: When considering the immediate context of a project, the concern is how the proposed project relates to the adjacent buildings.

Broader Neighborhood Context: When considering the broader context of a project, the concern is how the proposed project relates to the visual character and scale created by other buildings in the general vicinity.

Corner Lot Context: When considering the context of a corner lot, the concern is how the proposed project relates to buildings on both streets near the intersection.

WHAT IS THE CHARACTER OF THE NEIGHBORHOOD?

Defined Visual Character

GUIDELINE: In areas with a defined visual character, design buildings to be compatible with the patterns and architectural features of surrounding buildings.

On some block faces, there is a strong visual character defined by buildings with compatible siting, form, proportions, texture and architectural details. On other blocks, building forms and architectural character are more varied, yet the buildings still have a unified character. In these situations, buildings must be designed to be compatible with the scale, patterns and architectural features of surrounding buildings, drawing from elements that are common to the block.

This block face has a strong visual character because of the uniform width and height of the buildings on the block, compatible building details, and consistent placement of features such as entries and bays.

The buildings on this block have a variety of building forms and details, however the overall building scale is uniform, helping to define the block's visual character.

Mixed Visual Character

GUIDELINE: In areas with a mixed visual character, design buildings to help define, unify and contribute positively to the existing visual context.

Some block faces do not have an apparent overriding visual character, or the character may be mixed or changing. When no clear pattern is evident on a block face, a designer has a greater opportunity and responsibility to help define, unify, and contribute positively to the existing visual context. Designs should draw on the best features of surrounding buildings. Existing incompatible or poorly designed buildings on the block face do not free the designer from the obligation to enhance the area through sensitive development.

With a variety of building scales, forms and details, this block has a mixed visual character.

III. Site Design

DESIGN PRINCIPLE: Place the building on its site so it responds to the topography of the site, its position on the block, and to the placement of surrounding buildings.

Site design relates to how a building is placed on the site. It establishes how the building addresses the street and surrounding buildings. In designing the building on a site, the topography of the site and its location on the block must be considered. A property on a sloping site will have a different form than one on a flat site, as will a building on a corner rather than in the middle of the block. Other factors in site design include the site's relationship to adjacent properties and the location of front, side and rear yards.

TOPOGRAPHY

Guideline: Respect the topography of the site and the surrounding area.

New buildings and additions to existing buildings cannot disregard or significantly alter the existing topography of a site. The surrounding context guides the manner in which new structures fit into the streetscape, particularly along slopes and hills. This can be achieved by designing the building so it follows the topography in a manner similar to surrounding buildings.

These buildings respect the topography of the surrounding area by stepping down to the street. This is reinforced by garages at the street edge, elevated building entrances and setbacks to the mass of the buildings.

the overall rhythm of the streetscape. In designing the front setback, consider the following measures; other measures may also be appropriate depending on the circumstances of a particular project:

- Articulate the facade with well-defined building entrances and projecting and recessed facade features that will establish a rhythm and add visual interest to the block face.
- Articulate the front facade in “steps” to create a transition between adjacent buildings.
- Avoid creating blank walls at the front setback that detract from the street composition.

Similarly, a proposed project may be located next to a historic or architecturally significant building that is set back from the street or is on a wider lot with front and side gardens. The front setback of the proposed project must respect the historic building’s setbacks and open space. Additionally, the front setback must serve to protect historic features of the adjacent historic building.

The subject building unifies adjacent buildings with an appropriate front setback, landscaping and finished building materials.

The subject building uses an alternative method of averaging the front setback (Planning Code Section 132(b)) to unify the streetscape.

With an encroachment permit from the Department of Public Works, planting can be provided in front of a building without a setback

Planning Code Section 132(g) requires that 20% of the required front setback area be unpaved and devoted to plant material.

On properties where there is no front setback, landscaping is still encouraged. Planting opportunities include the following:

- Provide street trees.
- At the ground level, incorporate planters into porches, stairways and recessed building entrances.
- At the upper levels, incorporate planters on decks and balconies.
- Install trellises on the front facade.

The use of native vegetation or climate appropriate plantings is encouraged. Consider irrigation and maintenance issues in selecting plant materials. When outdoor lighting is incorporated in the front setback, provide lighting that is energy efficient and is shielded to avoid excess glare.

SIDE SPACING BETWEEN BUILDINGS

Planning Code Section 133 requires setbacks in RH-1(D) Districts only. Planning Code Section 136 limits projections into the side yard to three feet or 1/6 of the required side yard, whichever is less.

GUIDELINE: Respect the existing pattern of side spacing.

Side spacing is the distance between adjacent buildings. In many cases, only a portion of the building is set back from the side. Side spacing helps establish the individual character of each building while creating a rhythm to the composition of a proposed project. Projects must respect the existing pattern of side spacing.

VIEWS

GUIDELINE: Protect major public views from public spaces.

The Urban Design Element of the General Plan calls for the protection of major public views in the City, with particular attention to those of open space and water. Protect major views of the City as seen from public spaces such as streets and parks by adjusting the massing of proposed development projects to reduce or eliminate adverse impacts on public view sheds. The General Plan, Planning Code and these Guidelines do not provide for protecting views from private property.

The Urban Design Element identifies streets that are important for their quality of views (page I.5.16) and identifies outstanding and unique areas that contribute to San Francisco's visual form and character (page I.5.25).

Views from this private building and deck are not protected.

Views from public areas, such as parks, are protected. The massing of this building impacts the view from the public park.

IV. Building Scale And Form

DESIGN PRINCIPLE: Design the building's scale and form to be compatible with that of surrounding buildings, in order to preserve neighborhood character.

BUILDING SCALE

GUIDELINE: Design the scale of the building to be compatible with the height and depth of surrounding buildings.

The building scale is established primarily by its height and depth. It is essential for a building's scale to be compatible with that of surrounding buildings, in order to preserve the neighborhood character. Poorly scaled buildings will seem incompatible (too large or small) and inharmonious with their surroundings.

A building that is larger than its neighbors can still be in scale and be compatible with the smaller buildings in the area. It can often be made to look smaller by facade articulations and through setbacks to upper floors. In other cases, it may be necessary to reduce the height or depth of the building.

This building is out of scale with surrounding buildings because it is not articulated to make it more compatible with the scale of surrounding two-story homes.

A fourth story setback and facade articulations make the building more compatible with the scale of surrounding buildings.

Building Scale at the Street

GUIDELINE: Design the height and depth of the building to be compatible with the existing building scale at the street.

If a proposed building is taller than surrounding buildings, or a new floor is being added to an existing building, it may be necessary to modify the building height or depth to maintain the existing scale at the street. By making these modifications, the visibility of the upper floor is limited from the street, and the upper floor appears subordinate to the primary facade. The key is to design a building that complements other buildings on the block and does not stand out, even while displaying an individual design.

Refer to Planning Code Section 130, 136 and 250 for setbacks, permitted obstructions and height limits.

A partial third-story setback provides a transitional height to the adjacent two-story building and maintains the scale of the buildings at the street level.

In modifying the height and depth of the building, consider the following measures; other measures may also be appropriate depending on the circumstances of a particular project:

- Set back the upper story. The recommended setback for additions is 15 feet from the front building wall.
- Eliminate the building parapet by using a fire-rated roof with a 6-inch curb.
- Provide a sloping roofline whenever appropriate.
- Eliminate the upper story.

On this block face of two-story buildings, it is possible to preserve the building scale at the street by setting back the third floor. However, an additional setback for a proposed fourth floor is not sufficient. The fourth floor must be eliminated to respect the neighborhood scale.

The three-story scale of the block face is maintained by setting the fourth floor back so it is subordinate to the primary facade.

Building Scale at the Mid-Block Open Space

GUIDELINE: Design the height and depth of the building to be compatible with the existing building scale at the mid-block open space.

Rear yards provide open space for the residences to which they are attached, and they collectively contribute to the mid-block open space that is visible to most residents of the block. This visual open space can be a significant community amenity.

BUILDING FORM

GUIDELINE: Design the building's form to be compatible with that of surrounding buildings.

Building form is the three-dimensional shape of the building. The elements of building form include the width and proportions of the facade and the shape of the roofline. Though the Planning Code establishes the maximum building envelope by dictating setbacks and heights, the building must also be compatible with the form of surrounding buildings.

Facade Width

GUIDELINE: Design the building's facade width to be compatible with those found on surrounding buildings.

Most building widths are related to the lot width, typically 25 feet. This uniform building width contributes to the overall character of the neighborhood and the scale of buildings within the area. Therefore, it is very important to respect the facade widths typically found in the neighborhood. If a project is located on a site that is wider than usual, articulate the facade to respect traditional facade widths. For example, a facade may be broken into separate forms that match the widths of surrounding buildings. Design this articulation to be substantive, not merely be a surface treatment.

Although this building is twice the width of surrounding buildings, it has been designed to have two gabled forms, similar in width to other buildings.

Proportions

GUIDELINE: Design the building's proportions to be compatible with those found on surrounding buildings.

Proportions are the dimensional relationships among the building's features, and typically involve the relationship between the height and width of building features. A building's proportions are evident in the floor-to-floor heights of a building, the size and placement of windows and doors, and the scale of features such as porches, cornices and bay windows. Building features must be proportional not only to other features on the building, but also to the features found on surrounding buildings.

The horizontal emphasis of this building's windows and the lack of facade articulation results in a building that disrupts the character of the street and is inconsistent with the proportions of surrounding buildings.

Through the use of vertical oriented windows, the proposed building has proportions similar to surrounding buildings.

V. Architectural Features

DESIGN PRINCIPLE: Design the building's architectural features to enhance the visual and architectural character of the neighborhood.

Architectural features add visual interest to a building, and provide relief by breaking up a building's mass. Architectural features include building projections such as bay windows, porches, garage structures, rooftop forms, and building entrances. They are a significant component of the architectural character for both the building and the neighborhood.

In designing architectural features, it is important to consider the type, placement and size of architectural features on surrounding buildings, and to use features that enhance the visual and architectural character of the neighborhood. Architectural features that are not compatible with those commonly found in the neighborhood are discouraged. Many architectural features are permitted as obstructions in the front or rear yard under Planning Code Section 136; however many architectural features may also be located within the buildable area of the lot.

BUILDING ENTRANCES

GUIDELINE: Design building entrances to enhance the connection between the public realm of the street and sidewalk and the private realm of the building.

Building entrances are an important building feature, providing the connection between the public realm of the street and sidewalk, and the private realm of the building. A well-designed building entrance will appear welcoming and inviting to the pedestrian, making the neighborhood a pleasant place to live. In addition to the doorway itself, the entry may be comprised of stairways, landings, porches, and other elements.

character of the neighborhood. The use of decorative brackets, eaves, dentils, cornices, columns and capitals, for example, should come from an awareness of the evolution of such building elements and of their original structural function: columns hold up buildings, brackets support overhangs, etc. Do not use detail that makes the building stand out as excessively plain or overly decorated, or that results in building facades designed as replicas of historic buildings. Ornament that has been carelessly tacked on to the facade of a building can cause architectural disorder, and will appear superficial and cluttered.

A relatively flat facade with little articulation and detail will be inconsistent in an area that has a high degree of facade ornamentation. Likewise, if the detailing on buildings in the neighborhood is simple and restrained, adding a great deal of ornament is discouraged.

A building with no detail looks out of place on a block face with rich detailing.

This building has added details around the windows and building entries, making it more compatible with other buildings on the block face.

WINDOWS

GUIDELINE: Use windows that contribute to the architectural character of the building and the neighborhood.

Windows are one of the most important decorative features, establishing the architectural character of the building and the neighborhood. Windows provide human scale and emphasize the proportions of a building. They are also a link between the inside private space and the outdoor public space. The proportions, features and materials of a building's windows articulate the architectural rhythm along the block-face and contribute to the building's sense of mass.

Planning Code Section 136(c)(2) requires that the glass area on a projecting bay window be equal to at least 50 percent of the vertical surfaces on the bay.

EXTERIOR MATERIALS

GUIDELINE: The type, finish, and quality of a building's materials must be compatible with those used in the surrounding area.

For more information about green building design and construction, see the "Green Building Guidelines" at www.sfenvironment.org.

For information on sustainable materials and the reuse of building materials as part of new construction, contact the San Francisco Department of the Environment at 355-3700 or www.sfenvironment.org.

When choosing building materials, look at the types of materials that are used in the neighborhood, and how those materials are applied and detailed. Ensure that the type and finish of these materials complement those used in the surrounding area, and that the quality is comparable to that of surrounding buildings. In neighborhoods with uniform materials, it is best to utilize the same materials. For example, a shingled house would not fit in with a row of stucco houses.

Use material finishes that are compatible with those of surrounding buildings. If the materials are predominantly painted wood siding or shingles, a stained finish may not be compatible. Masonry (brick and stone) that is not painted should be left unpainted.

Also consider the visual qualities of a material, such as a smooth or rough texture. For example, in choosing masonry, the color and size of the bricks or stone may be a factor. Wood siding is available in a variety of widths and styles. Stucco may be smooth or rough, or scored to look like stone. Choosing among the varieties of a specific material is as important as choosing among the materials themselves.

This unpainted shingled building is not compatible with the painted stucco of surrounding buildings.

- Low (14)
- Moderately Low (36)
- Medium (54)
- Moderately High (91)
- High (283)

that involve several blocks should always be made as part of a community based planning process.

Any new community based planning processes should be initiated in partnership with the neighborhood, and involve the full range of City stakeholders. The process should be initiated by the Board of Supervisors, with the support of the District Supervisor, through their adoption of the Planning Department's or other overseeing agency's work program; and the scope of the process should be approved by the Planning Commission. To assure that the Planning Department, and other agencies involved in land use approvals conduct adequate community outreach, any changes to land use policies and controls that result from the community planning process may be proposed only after an open and publicly noticed process, after review of a draft plan and environmental review, and with comprehensive opportunity for community input. Proposed changes must be approved by the Planning Commission and Board of Supervisors at a duly noticed public hearing. Additionally, the Department's Work Program allows citizens to know what areas are proposed for community planning. The Planning Department should use the Work Program as a vehicle to inform the public about all of its activities, and should publish and post the Work Program to its webpage, and make it available for review at the Department.

POLICY 1.5

Consider secondary units in community planning processes where there is neighborhood support and when other neighborhood goals can be achieved, especially if that housing is made permanently affordable to lower-income households.

Secondary units (in-law" or "granny units") are smaller dwelling units within a structure containing another much larger unit(s), frequently in basements, using space that is surplus to the primary dwelling. Secondary units represent a simple and cost-effective method of expanding the housing supply. Such units could be developed to meet the needs of seniors, people with disabilities and others who, because of modest incomes or lifestyles, prefer or need small units at relatively low rents.

Within a community planning process, the City may explore where secondary units can occur without adversely affecting the exterior appearance of the building, or in the case of new construction, where they can be accommodated

within the permitted building envelope. The process may also examine further enhancing the existing amnesty program where existing secondary units can be legalized. ~~for example through an amnesty program that requires~~ Such enhancements would allow building owners to increase their safety and habitability of their units. Secondary units should be limited in size to control their impact.

POLICY 1.6

Consider greater flexibility in number and size of units within established building envelopes in community based planning processes, especially if it can increase the number of affordable units in multi-family structures.

In San Francisco, housing density standards have traditionally been set in terms of numbers of dwelling units in proportion to the size of the building lot. For example, in an RM-1 district, one dwelling unit is permitted for each 800 square feet of lot area. This limitation generally applies regardless of the size of the unit and the number of people likely to occupy it. Thus a small studio and a large four-bedroom apartment both count as a single unit. Setting density standards encourages larger units and is particularly tailored for lower density neighborhoods consisting primarily of one- or two-family dwellings. However, in some areas which consist mostly of taller apartments and which are well served by transit, the volume of the building rather than number of units might more appropriately control the density.

Within a community based planning process, the City may consider using the building envelope, as established by height, bulk, set back, parking and other Code requirements, to regulate the maximum residential square footage, rather than density controls that are not consistent with existing patterns. In setting allowable residential densities in established neighborhoods, consideration should be given to the prevailing building type in the surrounding area so that new development does not detract from existing character. In some areas, such as RH-1 and RH-2, existing height and bulk patterns should be maintained to protect neighborhood character.

open space purposes by providing major tax deductions; a similar program could be developed for charitable contribution of land for housing purposes.

POLICY 7.5

Encourage the production of affordable housing through process and zoning accommodations, and prioritize affordable housing in the review and approval processes.

Public processing time, staffing, and fees related to City approval make up a considerable portion of affordable housing development costs. The City should expedite the review process and procedures as appropriate; to reduce overall development costs and increase the performance of public investment in affordable housing.

Local planning, zoning, and building codes should be applied to all new development, however when quality of life and life safety standards can be maintained zoning accommodations should be made for permanently affordable housing. For example exceptions to specific requirements including open space requirements, exposure requirements, or density limits, where they do not affect neighborhood quality and meet with applicable design standards, including neighborhood specific design guideline, can facilitate the development of affordable housing. Current City policy allows affordable housing developers to pursue these zoning accommodations through rezoning and application of a Special Use District (SUD).

City review and approval of affordable housing projects should be improved to reduce costly delays. Affordable housing projects already receive Priority Application Processing through coordination with the Planning Department, Department of Building Inspection, and Department of Public Works. This process could be further enhanced by designating a planner(s) to coordinate governmental activities related to affordable housing.

POLICY 7.6

Acquire and rehabilitate existing housing to maximize effective use of affordable housing resources.

The city's existing housing stock provides a resource which can be used to fulfill a number of affordable housing needs.

The City should pursue and facilitate programs that enable households to better access existing housing stock. By acquiring and rehabilitating such units, the City can use affordable housing funds in a cost-effective way that provides stability in existing low-income neighborhoods, where units may be at risk of poor safety or conversion. Such housing acquisition and rehabilitation should happen only on a voluntary basis, and must not displace occupants.

San Francisco should also explore opportunities to take advantage of projects that are delayed, abandoned or are on the market. Having a readily accessible pool of funding available for purchase of such projects would enable affordable housing developers to take over the land and entitlements of such projects. The City should explore a number of options to assist in securing these opportunities for permanently affordable housing, co-ops or land-trust housing, including subsidies, affordable housing programs, new tax incentives or government intervention.

POLICY 7.7

Support housing for middle income households, especially through programs that do not require a direct public subsidy.

Market rate housing in the City of San Francisco is generally available affordable to households making at or above 180% of median income or above. Affordable housing programs, including City subsidized affordable housing and inclusionary housing, are provided to households at or below making 120% of median income or below. This leaves a gap of housing options for households in between those two categories, referred to as "middle income" households and defined for the purposes of this Housing Element as housing affordable to households making between 120 and 150% of median income. Unfulfilled demand for middle income housing impacts the supply and pressure on housing stock for lower income households.

San Francisco prioritizes federal, state, and local subsidies for lower income households; therefore the City should support innovative market-based programs and practices that enable middle income housing opportunities. Creating smaller and less expensive unit types that are "affordable by design" can assist in providing units to households falling in this gap. Development strategies that reduce construction costs, such as pre-fabricated housing and other low cost construction types can decrease overall housing costs,

Planning Department review of projects and development of guidelines should build on adopted local controls, including recently adopted Area Plans, neighborhood specific design guidelines, and historic preservation district documents. Planning staff should be aware of, and be a resource for, on-going individual community efforts that support good planning principles, such as neighborhood-specific Covenants, Conditions, and Restrictions (CC&R's) and design guidelines. New development and alterations or additions to existing structures in these neighborhoods should refer to these controls in concert with the citywide Residential Design Guidelines, although only those guiding documents approved by the Planning Commission may be legally enforced by Planning staff. Also projects in historic preservation districts should refer to related design documents.

POLICY 11.3

Ensure growth is accommodated without substantially and adversely impacting existing residential neighborhood character.

Accommodation of growth should be achieved without damaging existing residential neighborhood character. In community plan areas, this means development projects should adhere to adopted policies, design guidelines and community review procedures. In existing residential neighborhoods, this means development projects should defer to the prevailing height and bulk of the area.

To ensure character is not impacted, the City should continue to use community planning processes to direct growth and change according to a community-based vision. The Planning Department should utilize residential design guidelines, neighborhood specific design guidelines, and other documents describing a specific neighborhoods character as guideposts to determine compatibility of proposed projects with existing neighborhood character.

The Department should support the adoption of neighborhood-specific design standards in order to enhance or conserve neighborhood character, provided those guidelines are consistent with overall good-planning principles and help foster a more predictable, more timely, and less costly pre-development process. To this end, the Department should develop official procedures for submittal of neighborhood-initiated design guidelines, for review by Department staff, and for adoption or endorsement.

POLICY 11.4

Continue to utilize zoning districts which conform to a generalized residential land use and density plan and the General Plan.

Current zoning districts result in land use and density patterns shown on the accompanying Generalized Permitted Housing Densities by Zoning District, Map 6; and the accompanying table illustrating those densities, Table I-64, in Part 1 of the Housing Element. The parameters contained in the Planning Code under each zoning districts can help ensure that new housing does not overcrowd or adversely affect the prevailing character of existing neighborhoods. The City's current zoning districts conform to this map and provide clarity on land use and density throughout the city. When proposed zoning map amendments are considered as part of the Department's community planning efforts, they should conform generally to these this map, although minor variations consistent with the general land use and density policies may be appropriate. They should also conform to the other objectives and policies of the General Plan.

POLICY 11.5

Ensure densities in established residential areas promote compatibility with prevailing neighborhood character.

Residential density controls should reflect prevailing building types in established residential neighborhoods. Particularly in RH-1 and RH-2 areas, prevailing height and bulk patterns should be maintained to protect neighborhood character. Other strategies to maintain and protect neighborhood character should also be explored, including "neighborhood livability initiatives" that could examine guidelines and principles to preserve what is beloved about the area. Such an initiative could result in strategies to improve the appearance and accessibility of neighborhood commercial districts, or neighborhood specific design guidelines for specific RH-1 and RH-2 neighborhoods.

DISCLAIMERS:

This Preliminary Project Assessment (PPA) letter provides feedback to the project sponsor from the Planning Department regarding the proposed project described in the PPA application submitted on March 29, 2016, as summarized below. This PPA letter identifies Planning Department review requirements for the proposed project, including those related to environmental review, approvals, neighborhood notification and public outreach, the Planning Code, project design, and other general issues of concern for the project. Please be advised that the PPA application does not constitute an application for development with the Planning Department. The PPA letter also does not represent a complete review of the proposed project, does not grant a project approval of any kind, and does not in any way supersede any required Planning Department approvals listed below.

The Planning Department may provide additional comments regarding the proposed project once the required applications listed below are submitted. While some approvals are granted by the Planning Department, some are at the discretion of other bodies, such as the Planning Commission or Historic Preservation Commission. Additionally, it is likely that the project will require approvals from other City agencies such as the Department of Building Inspection, Public Works, the Municipal Transportation Agency, Department of Public Health, San Francisco Public Utilities Commission, and others. The information included herein is based on the PPA application and plans, the Planning Code, General Plan, Planning Department policies, and local/state/federal regulations as of the date of this document, all of which are subject to change.

filed by the developer of any "major project." A major project is a real estate development project located in the City and County of San Francisco with estimated construction costs exceeding \$1,000,000 where either: (1) The Planning Commission or any other local lead agency certifies an EIR for the project; or (2) The project relies on a program EIR and the Planning Department, Planning Commission, or any other local lead agency adopts any final environmental determination under CEQA. A final environmental determination includes: the issuance of a Community Plan Exemption (CPE); certification of a CPE/EIR; adoption of a CPE/Final Mitigated Negative Declaration; or a project approval by the Planning Commission that adopts CEQA Findings. (In instances where more than one of the preceding determinations occur, the filing requirement shall be triggered by the earliest such determination.) A major project does not include a residential development project with four or fewer dwelling units. The first (or initial) report must be filed within 30 days of the date the Planning Commission (or any other local lead agency) certifies the EIR for that project or, for a major project relying on a program EIR, within 30 days of the date that the Planning Department, Planning Commission, or any other local lead agency adopts a final environmental determination under CEQA. Please submit a Disclosure Report for Developers of Major City Projects to the San Francisco Ethics Commission. This form can be found at the Planning Department or online at <http://www.sfethics.org>.

PLANNING DEPARTMENT APPROVALS:

The project requires the following Planning Department approvals. These approvals may be reviewed in conjunction with the required environmental review, but may not be granted until after the required environmental review is completed.

1. **Rezoning.** As indicated in the 'Preliminary Project Comments' below, various aspects of the project conflict with both the current RM-1 Zoning of the site, as well as City Planning Commission Resolution No. 4109. The Preliminary Project Assessment application indicates the intent of the property owner to pursue a rezoning, potentially to an NC District. Additionally, as noted in the comments below, a Special Use District overlay to the current RM-1 District may also be a potential path for rezoning. In either case, rezoning of the property requires approval by the Board of Supervisors.
2. **Height District Reclassification.** As indicated in the 'Preliminary Project Comments' below, various components of the project exceed the current 40 foot height limit. Accordingly, a height district reclassification of the property must be sought. This also requires approval by the Board of Supervisors.
3. **Conditional Use.** Because the project may seek a rezoning to an NC District, the Code analysis below takes into consideration requirements related to the current RM-1 District, in addition to NC-1, NC-2, NC-3 and NC-S Districts. Depending on the applicable zoning, the following elements of the project may require Conditional Use Authorization by the Planning Commission: development of a building

Preliminary Project Assessment

Case No. 2015-014028PPA
3333 California Street

more than 50 feet tall in an RM-1 District, establishment of an 'Other Entertainment Use' in an NC-1 District; establishment of an 'Administrative Service Use' in an NC-3 or NC-S District; establishment of an 'Automobile Parking' use in NC-1, NC-2, and NC-3 Districts; and, the Development of Large Lots in NC-1, NC-2, or NC-3 Districts. Additionally, through the Conditional Use Authorization process, the project may seek modifications to the front setback, rear yard, open space, and street frontage requirements of the Planning Code, as a Planned Unit Development pursuant to Section 304.

4. An **Office Allocation** from the Planning Commission is required per Planning Code Section 321 et seq. to establish more than 25,000 gross square feet of new office space.
5. A **Shadow Analysis** is required under Planning Code Section 295 as the project proposes building heights in excess of 40 feet, as measured by the Planning Code. A shadow analysis, attached, indicates that the project may cast new shadow on Laurel Hill Playground, which is under the jurisdiction of the Recreation and Parks Department. As a result the project requires that a shadow analysis must be performed per Planning Code Section 295. Please note that this preliminary analysis reflects the maximum building height (plus mechanical features) as applied to the entire lot.
6. A **General Plan Referral** application is required for the lot line adjustment of the Masonic Avenue property line.
7. A **Building Permit Application** is required for the proposed demolition of the existing structure(s) on the subject property.
8. A **Building Permit Application** is required for the proposed alteration of the existing structure(s) on the subject property.
9. A **Building Permit Application** is required for the proposed new construction on the subject property.

Conditional Use Authorization, Office Allocation, Shadow Analysis and General Plan Referral applications are available in the Planning Department lobby at 1650 Mission Street, Suite 400, at the Planning Information Center at 1660 Mission Street, and online at www.sfplanning.org. Building Permit applications are available at the Department of Building Inspection at 1660 Mission Street.

NEIGHBORHOOD NOTIFICATIONS AND PUBLIC OUTREACH:

Project Sponsors are encouraged, and in some cases required, to conduct public outreach with the surrounding community and neighborhood groups early in the development process. Additionally, many approvals require a public hearing with an associated neighborhood notification. Differing levels of neighborhood notification are mandatory for some or all of the reviews and approvals listed above.

Preliminary Project Assessment

Case No. 2015-014028PPA
3333 California Street

In addition to neighborhood notification as required per Planning Code Section 311 (or 312), this project is required to conduct a **Pre-Application** meeting with surrounding neighbors and registered neighborhood groups before a development application may be filed with the Planning Department. The Pre-Application packet, which includes instructions and template forms, is available at www.sfplanning.org under the "Permits & Zoning" tab. All registered neighborhood group mailing lists are available online at www.sfplanning.org under the "Resource Center" tab.

Notification of a Project Receiving Environmental Review. Notice may be required to be sent to occupants of the project site and properties adjacent to the project site, as well as to owners and, to the extent feasible, occupants of properties within 300 feet of the project site at the initiation of the environmental review process. Please be prepared to provide mailing addresses on a CD upon request during the environmental review process.

PRELIMINARY PROJECT COMMENTS:

The following comments address specific Planning Code and other general issues that may substantially impact the proposed project.

1. **RM-1, NC and Special Use Districts.** The project proposes a combination of residential, office, commercial parking, retail and entertainment uses. Of these proposed land use categories, only residential uses are currently permitted in the existing RM-1 District. Accordingly, pursuing the project as proposed would require a rezoning of the subject property. The project description provided in the Preliminary Project Assessment application indicates the owner's interest in pursuing a rezoning of the property to an NC (Neighborhood Commercial) District, but does not specify which type of NC District. The four general NC Districts in Article 7 of the Planning Code are as follows: NC-1 (Neighborhood Commercial Cluster) District, NC-2 (Small-Scale Neighborhood Commercial) District, NC-3 (Moderate-Scale Neighborhood Commercial) District, and NC-S (Neighborhood Commercial Shopping Center District). The applicable land use controls for each proposed use are noted below and will be discussed, as relevant, in each forthcoming Planning Code requirement. The Project Sponsor is encouraged to match the proposal to the most appropriate district; however, a Special Use District overlay on RM or NC Zoning may be a preferred approach. For example, the California Street and Presidio Avenue – Community Center Special Use District, directly north of the subject property, is a hybrid of the RM-1 District and Sacramento Street Neighborhood Commercial District zoning controls. Ultimately, any such rezoning effort must be reviewed and approved by the Board of Supervisors. The Department strongly encourages the continued collaboration with the neighboring communities, as well as the District Supervisor, to determine the most appropriate zoning district.
 - a. **Residential Uses.** The project proposes residential uses throughout the property. All four general NC Districts principally permit residential uses subject to other requirements noted

in Articles 1.2, 1.5 and 2 of the Planning Code such as density, open space, parking, unit exposure, and buildable area constraints.

- b. **Retail Uses.** The project proposes retail uses throughout the property. 'Other Retail Sales and Service' uses, as defined in Planning Code Section 790.102 are generally principally permitted in every NC District at the 1st story. In NC-1 Districts, such uses are also subject to the more restrictive controls of any other (named) NC District or Restricted Use Subdistrict within a ¼-mile. In NC-2 and NC-S Districts such uses are principally permitted up to the second story, and at every story in NC-3 Districts. Please note that additional controls may apply to other types of retail uses such as Bars, Limited-Restaurants, and Restaurants.
- c. **Other Entertainment.** The project proposes retaining an existing 12,455 square foot auditorium space, which is currently accessory to the existing office use. The existing auditorium is an accessory use to the UCSF offices, and retaining the auditorium as part of the project would convert it to a principle use, such as 'Other Entertainment,' defined in Planning Code Section 790.38. Establishing an 'Other Entertainment' use in an NC-1 District requires Conditional Use authorization by the Planning Commission. All other general NC Districts principally permit 'Other Entertainment' uses at the 1st story; and at the 2nd story in NC-3 and NC-S Districts.
- d. **Office.** The demolition of existing structures or conversion of floor area dedicated to the site's 363,218 square feet of existing nonconforming office use is an abandonment of that nonconforming use per Planning Code Section 183. Therefore, to re-establish office uses in the proposed new structures, the uses must comply with any applicable zoning controls. NC Districts allow two types of commercial office uses: 'Business and Professional Service' as defined in Planning Code Section 790.108, and 'Administrative Service' as defined in Planning Code Section 790.106. Business and Professional Service uses are principally permitted only on the 1st story in an NC-1 District, only up to the 2nd story in NC-2 and NC-S Districts, and at all levels in NC-3 Districts. Administrative Service uses are only allowed through Conditional Use authorization by the Planning Commission at the 1st and 2nd stories of NC-S Districts and at all levels in the NC-3 Districts. Further, the current proposal of 49,999 gross square feet of office space requires an Office Allocation from the Planning Commission per Planning Code Section 321 et seq. if establishing more than 25,000 gross square feet.
- e. **Commercial Parking.** The project includes 60 off-street parking spaces as part of a 'Public Parking Garage' defined in Planning Code Section 102. The existing RM-1 District does not permit public parking garages and, at this time, it is unclear if the described 60 "paid public parking spaces for community use" are legally noncomplying with regard to the Planning Code. Additional information is needed regarding the existing and proposed location of

these spaces and the date of their establishment to make that determination. Details relative to the existing and proposed depth of excavation for garages is also needed. Please note that if the spaces are determined to be legally noncomplying, but are otherwise removed or relocated through the elimination of existing surface parking lots or the reconstruction of an existing parking garage, the spaces will then be abandoned pursuant to Planning Code Section 183 and their re-establishment will need to conform to any applicable zoning controls. In NC Districts 'Automobile Parking' as a commercial use is defined in Planning Code Section 790.8 and is principally permitted in NC-S Districts, but requires Conditional Use authorization in NC-1, NC-2, and NC-3 Districts. Please note that any Conditional Use applications for parking exceeding accessory amounts must meet the additional criteria set forth in Planning Code Section 157. Given the Planning Department's concerns regarding the amount of proposed off-street parking referenced in both the 'Environmental Review' and 'Preliminary Design Comments' sections of this letter, you are strongly encouraged to substantially reduce or eliminate any proposed non-accessory commercial parking.

10. City Planning Commission Resolution 4109. In 1952, the City Planning Commission adopted Resolution 4109 which approved a rezoning of the subject property to a First Residential District and included additional stipulations subject to future development of the site. The site has subsequently undergone additional rezoning, as it is now within an RM-1 District. However, the stipulations of future development as outlined in Resolution 4109 continue to apply, absent modification by the Board of Supervisors per Planning Code Section 174. As expected, given that there have been more than 60 years of changes to the Planning Code there are some distinctions between the current RM-1 District controls and the stipulations outlined in Resolution 4109. In the project comments that follow, when there is an inconsistency, the more restrictive is noted as the guiding control. As indicated in the Preliminary Project Assessment application, the project may result in the rezoning of the property which requires review and approval by the Board of Supervisors. Amending Resolution 4109 would also require review and approval by the Board of Supervisors.

- a. **Residential Uses.** In general, the RM-1 District controls are more restrictive than the Stipulations of Resolution 4109. However, the stipulations are more restrictive when defining the density and buildable area requirements as applicable to a portion of the subject property fronting on Laurel and Euclid Avenues. At present, the project does not comply with these restrictions and would require amending the Resolution.

11. Residential Density. The subject property is within an RM-1 District which permits a residential density of up to one unit per 800 square feet of lot area. However, as a Planned Unit Development the proposal may seek approval for a density equal to one less unit than what is permitted by the district with the next greater density (RM-2). In consideration of rezoning the property, please note the following maximum residential densities for each zoning district: NC-1, NC-2 and NC-S Districts, generally, up to one unit per 800 square feet of lot area; and, in NC-3 Districts, generally up to one

unit per 600 square feet of lot area. While additional information is necessary to calculate the exact maximum density for the area subject to Resolution 4109, initial calculations estimate approximately 508 units are allowed pursuant to the current RM-1 District zoning and Resolution and upon seeking the additional density allowed as a Planned Unit Development, the estimated maximum is 660 dwelling units. If the Resolution did not apply, these respective amounts become 558 and 743.

Ultimately, the proposal entails significantly fewer dwelling units than would be permitted under the site's current zoning. Given the City's need for housing and the tremendous opportunity presented by this unique 10-acre site, the Department strongly suggests that the project pursue residential densities approximating those which are currently allowed. As discussed in the comments that follow, any exceptions to the scale and massing provisions of the Planning Code that may ultimately be sought typically warrant a proportional increase in density. Should additional height and/or mass be necessary to achieve such density, it would seem most fitting along the California, Masonic and Presidio block faces, and generally in the northwest portion of the site.

12. **Height Requirement.** The subject property is within a 40-X Height and Bulk District, restricting the maximum height of buildings to 40 feet above grade, as measured generally from curb at the center of each existing and proposed building. The upper measurement of the height limit changes depending on the grade at that location per Planning Code Section 260(a)(1). Additionally, the upper measurement of the height of a building varies based on the roof form per Planning Code Section 260(a)(2). While in general the proposal accurately applies these methodologies, curbs along the Walnut Street extension may not be used as the base of measurements because the Walnut Street extension is not a public right-of-way. Additionally, to confirm the accuracy of measurements for the existing office building please provide a section through the center of the structure that includes the location of existing grade at that location. Because the building has frontage on two or more streets, the owner may choose the street or streets from which the measurement of height is to be taken. The additional stories proposed for the altered structures will require that the project seek a Height District reclassification, which is reviewed and approved by the Board of Supervisors.
13. **Proposed Buildings and Structures Exceeding 50 Feet in RM Districts.** Planning Code Section 253 requires Conditional Use authorization by the Planning Commission for any proposed building more than 50 feet in height. The existing office building is 66.5 feet tall from existing grade to the finished roof. The project proposes converting existing mechanical equipment above the roof to an additional two stories. This will require a Height District reclassification, as well as the required Conditional Use authorization from the Planning Commission if the property's zoning remains as an RM-1 District.
14. **Special Height Exceptions for Active Ground Floor Uses.** The Preliminary Project Assessment application indicates an interest in rezoning the subject property to an NC District so that the buildings fronting on California Street may receive an additional 5 foot height increase if they provide active uses on the ground floor. Please note that Planning Code Section 263.20 does not

currently apply this special height exception to general NC Districts. The districts that can apply this increase are specifically identified in Section 263.20. Accordingly, to achieve a five foot height increase on California Street the project would need to reclassify the applicable Height District, integrate this exception into a proposed Special Use District, or pursue a text amendment to Section 263.20. Each of these options requires review and approval by the Board of Supervisors.

15. **Lot Line Adjustment.** The project proposes a lot line adjustment that would extend the property's Masonic Avenue boundary into the public right-of-way. This adjustment requires a General Plan Referral because it includes the vacation of a public way and transportation route owned by the City and County. This adjustment will also require review by the Department of Public Works as a partial street vacation request.
16. **Development of Large Lots.** Planning Code Section 121.1 requires Conditional Use authorization to develop on lots that are equal to, or greater than, 5,000 square feet in an NC-1 District, or 10,000 square feet in NC-2 and NC-3 Districts. This requirement is not applicable to lots of any size in RM-1 or NC-S Districts.
17. **Floor Area Ratio.** Planning Code Sections 124 (NCs) and 209.2 (RM-1) limit the Floor Area Ratio of non-residential uses to the following maximums: 1.8 in RM-1, NC-1, and NC-S Districts; 2.5 in NC-2 Districts and 3.6 in NC-3 Districts. The Floor Area Ratio calculation includes all non-residential uses, accessory parking located above grade, and any non-accessory parking. Assuming the proposed non-accessory off-street parking occupies 93,023 square feet of gross floor area; the total non-residential uses result in a Floor Area Ratio less than 1.8 and would comply with the current RM-1 District requirement.
18. **Front Setback.** Planning Code Section 132 requires that new developments in RM-1 Districts provide front setbacks. If situated on a corner lot, the owner may elect which street or alley to designate as the front of the property. The Preliminary Project Assessment application does not indicate this designation. If the Project Sponsor elects either the property's California Street or Presidio Avenue/Masonic Avenue frontages, the required front setback is equal to half of the adjacent neighbor's front setback. Alternatively, the Project Sponsor could choose the Laurel Street or Euclid Avenue frontages and adhere to the setback noted in Resolution 4109 for the portion of the property to which it applies, and then apply Section 132 to any remaining frontage. The project can seek a modification to the requirements of Section 132 through a Planned Unit Development. Note that NC Districts do not have front setback requirements.
19. **Rear Yard.** The required rear yard for properties in RM-1 Districts is 45 percent of the lot depth. The project does not currently provide a code-complying rear yard. Therefore, the project must seek a modification to the requirements of Planning Code Section 134 as a Planned Unit Development. If the property is re-zoned to an NC District, Planning Code Section 134 requires a rear yard of 25 percent

of the lot depth at the lowest level containing a dwelling unit. However, the required rear yard for corner lots in NC Districts may be further modified by the Zoning Administrator per Section 134(e)(2). In general, this alternative requires that the project provide compensating open areas on the lot equal to 25 percent of the lot area, with minimum horizontal dimensions of 15 feet. Alternatively, under NC District zoning, the project could also seek a modification as a Planned Unit Development.

20. **Open Space.** Planning Code Section 135 requires each dwelling unit in an RM-1 District to have access to a minimum of 133 square feet of open space, if private, or 100 square feet of open space if common. In NC Districts the range of open space required per unit, depending on the specific district, is 100 to 133 square feet, if private, or 80 to 100 square feet, if common. Additional information is needed to determine how the project complies with this requirement for each individual unit and to confirm that the spaces comply with the dimensional requirements for either private or common spaces. If necessary, the project can pursue a modification as a Planned Unit Development. However, when evaluating a Planned Unit Development, per Section 304(d)(3), the Planning Commission must consider whether the project provides open space usable by the occupants and, where appropriate, by the general public, at least equal to the open spaces required by the Code.
21. **Streetscape Plan.** The project proposes new construction on a property greater than half an acre, and as such, requires the submittal of a Streetscape Plan to the Planning Department to ensure that the new streetscape and pedestrian elements are in conformance with the Department's Better Street Plan. This Streetscape Plan shall be submitted to the Planning Department no later than 60 days prior to any Planning Commission action, and shall be considered for approval at the time of other project approval actions. The streetscape plan should show the location, design, and dimensions of all existing and proposed streetscape elements in the public right-of-way directly adjacent to the fronting property, including street trees, sidewalk landscaping, street lighting, site furnishings, utilities, driveways, and curb lines, and the relation of such elements to proposed new construction and site work on the property. Please see the Department's Better Streets Plan and Section 138.1(c)(2)(ii) for the additional elements that may be required as part of the project's streetscape plan. Additional comments from the Streetscape Design Advisory Team (SDAT) are provided in the 'Preliminary Design Comments' section below.
22. **Dwelling Unit Exposure.** Section 140 requires that each dwelling unit have at least one room that meets the 120 square foot minimum superficial floor area requirement of Section 503 of the Housing Code, and that it faces directly onto a street right-of-way, code-complying rear yard, or an appropriately sized courtyard. It's unclear if units in the inner northeast corner of Plaza B and the inner northwest corner of the Walnut Building comply with this section because of the proposed notching in the building. Please consider these units when revising the plans. While the project may pursue a modification as a Planned Unit Development, the Department generally encourages projects to minimize the number of units needing an exposure exception.

RECORDED AT REQUEST OF
OFFICE OF THE COUNTY OF SAN FRANCISCO
At 3:30 Min. Past 10 A. M.

140126

JAN 8 - 1953

OFFICIAL RECORDS
City and County of San Francisco, Calif.

Stipulation as to Character of Improvements on
that portion of Lot 1A, Block 1032 Affected by
Zoning Proposal Z-52.62.2

Official

The San Francisco Unified School District, being the owner of the above property described, and the applicant in Proposal No. Z-52.62.2 for reclassification thereof from a Second Residential District to a Commercial District, set for hearing before the City Planning Commission of the City and County of San Francisco on October 23, 1952, hereby agrees that the said property shall be developed only as set forth in the following stipulations, which if accepted by the said City Planning Commission shall be observed by the applicant and by its successors in interest for as long as the property remains in the zone classification presently sought. The owner further agrees that no improvements shall be constructed on said property in violation of the conditions of the property forth, and recognizes that the reclassification of the property to a Commercial District is by the Commission's action made contingent, and will remain contingent unless further reclassified, upon adherence to these stipulations.

Stipulations

1. The character of the improvement for commercial purposes of the subject property, or any portion thereof, shall be limited to a building, or buildings designed as professional, institutional or office buildings, including service buildings which are normally accessory thereto.
2. The aggregate gross floor area of all such buildings, calculated exclusive of cellars, of basement areas used only for storage or services incidental to the operation and maintenance of a building, and of indoor or other covered automobile parking space, shall not exceed the total area of the property allotted to such use.
3. For each five hundred square feet of gross floor area in such buildings, calculated as in stipulation 2, above, there shall be reserved and kept available on the property or the portion thereof allotted to such use, one off-street automobile parking space, or equivalent open space suitable for the ultimate provision of such parking space as needed for the accommodation of users of the premises.
4. No such building, other than a minor accessory building, having a floor area of not more than 400 square feet, shall occupy any portion of the property which is within 100 feet of the line of the Euclid Avenue boundary thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

140126-1-53

0006071 22540

-2-

5. If the subject property, or any portion thereof, is developed as a site for residential buildings, such buildings shall be limited as follows:

a. No residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

b. No dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than thirty three hundred (3300) square feet, nor shall any such dwelling cover more than fifty percent (50%) of the area of such parcel or be less than twelve (12) feet from any other such dwelling, or be set back less than ten (10) feet from any presently existing or future public street, or have a height in excess of forty (40) feet, measured and regulated as set forth in pertinent section of the Building Code of the City and County of San Francisco.

c. No residential building in other portions of the subject property shall have a ground coverage in excess of fifty percent (50%) of the area allotted to such building.

6. Development of the subject property, or of any separate portion thereof, for commercial use as stipulated herein, shall include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building or buildings there shall be submitted to the City Planning Commission, for approval as to conformity with these stipulations, a site plan showing the character and location of the proposed building or buildings, and related parking spaces and landscaped areas upon the property, or upon such separate portion thereof as is allotted to such building or buildings. It shall be understood that approval of any such plan shall not preclude subsequent approval by the Commission of a revised or alternative plan which conforms to these stipulations.

CITY PLANNING COMMISSION

RESOLUTION NO. 4109

RESOLVED, That Proposal No. Z-52.62.2, an application to change the Use District Classification of the hereinafter described parcel of land from a First Residential District to a Commercial District, be, and the same is hereby APPROVED; subject to the stipulations submitted by the applicant and set forth herein:

Commencing at a point on the S/L of California Street distant thereon 187 feet west of the W/L of Presidio Avenue (produced), thence westerly on said line 707.375 feet to a curve to the left having a radius of 15 feet, thence 23.562 feet measured on the arc of the curve to the left to the E/L of Laurel Street, thence southerly on the E/L of Laurel Street 127.227 feet to the curve to the left having a radius of 60 feet, thence 77.113 feet measured on the arc of the curve to the left to a curve to the right having a radius of 120 feet, thence 149.153 feet measured on the arc of the curve to the right to a curve to the right having a radius of 4033 feet, thence 388.710 feet measured on the arc of the curve to the right to a curve to the left having a radius of 20 feet, thence 35.186 feet measured on the arc of the curve to the left to the northwest line of Euclid Avenue, thence N 73° 12' E on the northwest line of Euclid Avenue 312.934 feet to a curve to the left having a radius of 65 feet, thence 42.316 feet, measured on the arc of the curve to the left to the northwesterly line of Masonic Avenue (proposed extension), thence N 35° 54' E, 380.066 feet to the arc of a curve to the left having a radius of 425 feet, thence 254.176 feet measured on the arc of the curve to the left, thence N 52° 36' 29.74" W, 252.960 feet to the point of commencement. Being the major portion of lot 1A, Block 1032, containing 10.2717 acres, more or less.

RESOLVED, FURTHER, That this change shall be and at all times remain contingent upon observance by the owner or owners and by his or their successors in interest of the conditions contained in the following stipulations as to the use of the land affected.

1. The character of the improvement for commercial purposes of the subject property, or any portion thereof, shall be limited to a building or buildings designed as professional, institutional or office buildings, including service buildings which are normally accessory thereto.
2. The aggregate gross floor area of all such buildings, calculated exclusive of cellars, of basement areas used only for storage or services incidental to the operation and maintenance of a building, and of indoor or other covered automobile parking space, shall not exceed the total area of the property allotted to such use.

- 2 -

3. For each five hundred square feet of gross floor area in such buildings, calculated as in stipulation 2, above, there shall be reserved and kept available on the property or the portion thereof allotted to such use, one off-street automobile parking space, or equivalent open space suitable for the ultimate provision of such parking space as needed for the accommodation of users of the premises.

4. No such building, other than a minor accessory building having a floor area of not more than 400 square feet, shall occupy any portion of the property which is within 100 feet of the line of the Euclid Avenue boundary thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

5. If the subject property, or any portion thereof, is developed as a site for residential buildings, such buildings shall be limited as follows:

a. No residential building other than a one-family dwelling or a two-family dwelling shall occupy any portion of the property which is within 100 feet of the Euclid Avenue boundary line thereof, or which is within 100 feet of the easterly line of Laurel Street and south of the northerly line of Mayfair Drive extended.

b. No dwelling within the said described portion of the subject area shall occupy a parcel of land having an area of less than thirty three hundred (3300) square feet, nor shall any such dwelling cover more than fifty percent (50%) of the area of such parcel or be less than twelve (12) feet from any other such dwelling, or be set back less than ten (10) feet from any presently existing or future public street, or have a height in excess of forty (40) feet, measured and regulated as set forth in pertinent section of the Building Code of the City and County of San Francisco.

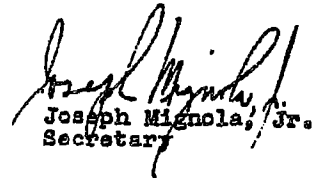

c. No residential building in other portions of the subject property shall have a ground coverage in excess of fifty percent (50%) of the area allotted to such building.

6. Development of the subject property, or of any separate portion thereof, for commercial use as stipulated herein, shall include provisions for appropriate and reasonable landscaping of the required open spaces, and prior to the issuance of a permit for any building or buildings there shall be submitted to the City Planning Commission, for approval as to conformity with these stipulations, a site plan showing the character and location of the proposed

- 3 -

building or buildings, and related parking spaces and landscaped areas upon the property, or upon such separate portion thereof as is allotted to such building or buildings. It shall be understood that approval of any such plan shall not preclude subsequent approval by the Commission of a revised or alternative plan which conforms to these stipulations.

I hereby certify that the foregoing resolution was adopted by the City Planning Commission at its special meeting on November 13, 1952, and I further certify that the stipulations set forth in the said resolution were submitted in a written statement placed on file.

Initial Study

1629 Market Street Project

Planning Department Case No. 2015-005848ENV

A. Project Description

[Note: A full project description is not provided with this Initial Study because a detailed project description is located in Chapter II, *Project Description*, of the EIR to which this Initial Study is attached.]

The project site occupies approximately 97,617 square feet, or 2.2 acres, on the block bounded by Market, 12th, Otis, and Brady Streets located within the boundaries of San Francisco's Market & Octavia Area Plan, an area plan of the *San Francisco General Plan (General Plan)*. Most of the site is located within the NCT-3 (Moderate-Scale Neighborhood Commercial Transit) Zoning District, while the southwestern portion of the site, occupying approximately 20,119 square feet is in a P (Public) Zoning District. The portions of the project site north of Stevenson Street and east of Colusa Place are located within an 85-X height and bulk district, while the portion of the project site south of Colton Street is in a 40-X height and bulk district.¹ The project site is currently occupied by four surface parking lots containing 242 parking spaces, an approximately 15-foot-tall Bay Area Rapid Transit (BART) ventilation structure for the below-grade BART tunnel, as well as three buildings: the Civic Center Hotel, the United Association of Journeymen and Apprentices of the Plumbing and Pipe Fitting Industry (UA) Local 38 building, and the Lesser Brothers Building.

The proposed project would demolish the existing UA Local 38 building, located at 1621 Market Street, demolish the majority of the Lesser Brothers Building, located at 1629-1637 Market Street, rehabilitate the Civic Center Hotel, located at 1601 Market Street, and demolish the 242-space surface parking lots on the project site. The proposed development would construct a total of five new buildings on the project site, including a new four-story, 58-foot-tall, 27,300-square-foot UA Local 38 building adjacent to the Civic Center Hotel, as well as a 10-story, 85-foot-tall, 187,100-square-foot addition to the Lesser Brothers Building at the corner of Brady and Market Streets containing 198 residential units and 6,600 square feet of ground-floor retail/restaurant space ("Building A"). A 10-story, 85-foot-tall, 118,300-square-foot building containing 136 residential units and 2,500 square feet of ground-floor retail/restaurant space ("Building B") would be constructed on Market Street between the new UA Local 38 building and Building A. A nine-story, 85-foot-tall, 74,700-square-foot building containing 78 residential units would be constructed south of Stevenson Street and north of Colton Street ("Building D"). The five-story, 55-foot-tall Civic Center Hotel would be rehabilitated to contain 65 residential units and 4,000 square feet of ground-floor retail/restaurant space (also referred to as "Building C"), and a new six-story, 68-foot-tall, 50,900-square-foot Colton Street Affordable Housing building containing up to 107 affordable units would be constructed south of Colton Street as part of the proposed project. The proposed project would construct the new 18,300-square-foot Brady Open Space at the northeast corner of Brady and Colton Streets. In addition, the proposed project would include construction of a two-level, below-grade garage with up to 316 parking spaces (some of which may include the use of stackers) accessible from Brady and Stevenson Streets. Overall, the proposed project would include construction of 498,100 square feet of residential use that would contain up to 477 residential units and up to 107 affordable units in the Colton Street Affordable

¹ Following San Francisco convention, Market Street and streets parallel to it are considered to run east/west, while 12th Street and streets parallel to it are considered to run north/south.

SECTION C Compatibility with Existing Zoning and Plans

San Francisco Law School are located north of the project site near Market Street, and the City College of San Francisco has an auditorium and administrative offices along Gough Street, west of the project site. The project site is immediately surrounded by a mix of two- to nine-story commercial, residential, community facility, and light industrial buildings. Vegetation in the area is generally limited to street trees. Nearby public parks and open spaces within approximately 0.50 mile of the project site include Patricia's Green, Page & Laguna Mini Park, Koshland Park, Hayes Valley Playground, and Civic Center Plaza.

C. Compatibility with Existing Zoning and Plans

	Applicable	Not Applicable
Discuss any variances, special authorizations, or changes proposed to the <i>Planning Code</i> or Zoning Map, if applicable.	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Discuss any conflicts with any adopted plans and goals of the City or Region, if applicable.	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Discuss any approvals and/or permits from City departments other than the Planning Department or the Department of Building Inspection, or from Regional, State, or Federal Agencies.	<input checked="" type="checkbox"/>	<input type="checkbox"/>

See Chapter III, *Plans and Policies*, in this Draft Environmental Impact Report (DEIR) for a detailed discussion of land use plans applicable to the 1629 Market Street Mixed-Use Project and identification of the proposed project's potential to conflict with those plans or policies.

D. Summary of Environmental Effects

The proposed project could potentially affect the environmental factor(s) checked below, for which mitigation measures would be required to reduce potentially significant impacts to less than significant. The following pages present a more detailed checklist and discussion of each environmental factor.

<input type="checkbox"/> Land Use	<input type="checkbox"/> Greenhouse Gas Emissions	<input checked="" type="checkbox"/> Geology and Soils
<input type="checkbox"/> Population and Housing	<input type="checkbox"/> Wind and Shadow	<input type="checkbox"/> Hydrology and Water Quality
<input checked="" type="checkbox"/> Cultural Resources	<input type="checkbox"/> Recreation	<input type="checkbox"/> Hazards/Hazardous Materials
<input checked="" type="checkbox"/> Transportation and Circulation	<input type="checkbox"/> Utilities and Service Systems	<input type="checkbox"/> Mineral/Energy Resources
<input checked="" type="checkbox"/> Noise	<input type="checkbox"/> Public Services	<input type="checkbox"/> Agricultural/Forest Resources
<input checked="" type="checkbox"/> Air Quality	<input type="checkbox"/> Biological Resources	<input checked="" type="checkbox"/> Mandatory Findings of Significance

This Initial Study evaluates the proposed 1629 Market Street Mixed-Use Project to determine whether it would result in significant environmental impacts. The designation of topics as "Potentially Significant" in the Initial Study means that the EIR will consider the topic in greater depth and determine whether the impact would be significant. On the basis of this Initial Study, topics for which there are project-specific effects that have been determined to be potentially significant are:

- Cultural Resources (historical architectural resources only); and
- Transportation and Circulation (all topics).

The Cultural Resources (historic architectural resources only) and the Transportation and Circulation topics are evaluated in the DEIR prepared for the proposed project. The project has the potential to result in a significant, cumulative transportation-related construction impact; therefore, for ease of reference all Transportation and Circulation topics will be included together in the DEIR.

The proposed project would cast net new shadow on nearby sidewalks including those along Market Street, Brady Street, Stevenson Street, and around the confluence of Mission Street and South Van Ness Avenue at certain times of day throughout the year. Most of the sidewalks in this area are already shadowed by existing buildings and, given that sidewalks are typically used by pedestrians traveling between destinations and not as a recreational resource, the additional project-related shadow would not substantially affect the use of the sidewalks. Therefore, the shadow impact on the surrounding sidewalks as a result of the proposed project would be less than significant.

For the above reasons, the proposed project's net new shadow would not be anticipated to substantially affect the use of any publicly-accessible areas, including nearby streets and sidewalks. Given the foregoing, the proposed project would result in a *less-than-significant* impact with respect to shadow.

The proposed project would develop a new privately-owned, publicly-accessible open space (POPOS), referred to herein as the Brady Open Space. The Brady Open Space would be publicly-accessible, but would not be under the jurisdiction of the Recreation and Park Commission and would not be subject to Section 295. CEQA analysis covers impacts of a project on existing conditions, and not on elements of the project itself. Therefore, there is no shadow impact to this open space, which does not exist under current conditions. For informational purposes, the shadow diagrams prepared depict project shadow on the planned Brady Open Space, and those effects are discussed below for informational purposes only.

The shadow diagrams in **Figure 2 through Figure 4** reveal that the proposed project would add net new shadow to portions of the planned Brady Open Space primarily in the morning before 11:00 a.m. and afternoon after 3:00 p.m. throughout the year but allow relatively open sunshine during the middle of the day. The planned Brady Open Space would receive shadow from the proposed project on the north side of the park beginning at 6:46 a.m. on June 21, a time when much of the open space would already be in shadow from existing structures. By 8:00 a.m., existing shadow would be largely gone, and shadow from the proposed project would increase on the open space until 11:00 a.m. when it would be mostly gone. Shadow from the proposed project would begin to encroach again on the north side of the open space by 2:00 p.m. and would cover a majority of the open space by shortly after 4:00 p.m. Even by 6:00 p.m., the southwest corner of the open space would remain in sunshine. By 7:00 p.m., the entire open space would be in shade from a combination of the proposed project and existing structures.

On the morning of the fall equinox the Brady Open Space would be nearly entirely in shadow from the project and surrounding existing structures at 8:00 a.m. Sunlight would then begin to increase, and the open space would be nearly entirely in sunshine from 12:00 noon to 2:00 p.m. After 2:00 p.m., shade from the project would increase through the afternoon, covering the majority of the open space by 4:00 p.m. but leaving the southwestern corner in sun until after 6:00 p.m.

On the winter solstice, the Brady Open Space would be mostly in shade in the morning from the project and existing structures until 10:00 a.m., at which time the western half of the open space would be in sunlight. Between about 1:00 p.m. and 2:30 p.m., nearly all of the park would be in sunlight. Shadow from the project would encroach onto the northern portion of the open space by 3:00 p.m., and shadow from existing buildings to the west would begin to cover the western portion of the open space shortly thereafter, although, even by just before 4:00 p.m. there would still be a good portion of the open space on the southeast side in sunlight.

INTRODUCTION

This notice provides a summary description of the proposed project; identifies environmental issues anticipated to be analyzed in the Initial Study (IS) and Environmental Impact Report (EIR); and provides the time, date, and location of the public scoping meeting (see page 21 for information on the public scoping meeting). The comments received during the public scoping process will be considered during the preparation of the IS and EIR for this project.

PROJECT SUMMARY

The project sponsor, Strada Brady, LLC, proposes a mixed-use project fronting on Market Street between Brady and 12th Streets. The proposed project would demolish the existing United Association of Journeymen and Apprentices of the Plumbing and Pipe Fitting Industry (UA) Local 38 building, located at 1621 Market Street, demolish the majority of the Lesser Brothers Building, located at 1629–1637 Market Street, rehabilitate the Civic Center Hotel, located at 1601 Market Street, for residential and retail/restaurant uses, and demolish the 242-space surface parking lots on the project site. The proposed project would construct a new four-story, 58-foot-tall, 27,300-square-foot UA Local 38 building, as well as a 10-story, 85-foot-tall, 187,100-square-foot addition to the Lesser Brothers Building at the corner of Brady and Market Streets containing 198 residential units and 6,600 square feet of ground-floor retail/restaurant space.^{1,2} A 10-story, 85-foot-tall, 118,300-square-

¹ Square footages presented for the proposed project are approximate.

² Building heights for the existing buildings and the proposed project do not include rooftop mechanical penthouses. In accordance with *Planning Code* Section 260(b)(1)(B), elevator, stair, and mechanical penthouses would be a maximum of 16 feet in height above the roof line.

Air Quality

The topic of Air Quality will include analysis of consistency of the proposed project with applicable air quality plans and standards, the potential for the proposed project to result in emissions of criteria air pollutants and other toxic air contaminants (TACs) that may affect sensitive populations, as well as the potential for the proposed project to result in sources of odor. The air quality analysis will include quantification of both construction-related and operational air pollutant emissions. The analysis will also summarize the results of a health risk assessment prepared to evaluate potential long-term health effects of emissions from both project construction and operation.

Greenhouse Gas Emissions

The topic of Greenhouse Gas Emissions will include an analysis of the proposed project's consistency with the City's Greenhouse Gas Reduction Strategy and the degree to which the proposed project's greenhouse gas emissions could result in a significant effect on the environment.

Wind and Shadow

The topic of Wind will evaluate the potential to alter wind in a manner that substantially affects public areas. Based on a preliminary shadow fan analysis prepared by the Planning Department, no City parks or other publicly-accessible open space exists within the potential shadow area of the proposed project, and therefore no parks or open spaces would be affected by project shadow. The topic of Shadow will include an evaluation of the potential for the proposed project to result in shadow impacts on nearby sidewalks. In addition, for informational purposes the Shadow section will describe the potential for the proposed project to result in shadow on the project site itself, including the proposed Brady Open Space.

Recreation

The topic of Recreation will include an analysis of whether the proposed project could adversely affect existing parks and open spaces.

Utilities and Service Systems

The topic of Utilities and Service Systems will include analysis of potable water and wastewater treatment capacity, and will discuss disposal of solid waste that may be generated by the proposed project. This topic will also include an assessment of whether the proposed project would require the construction of new water supply, wastewater treatment, and/or stormwater drainage facilities, and if so, whether that construction could result in adverse environmental effects.

Public Services

The topic of Public Services will include analysis of whether existing public services (e.g., schools, police and fire protection, etc.) would be adversely affected by the proposed project so as to require new or physically altered facilities, the construction of which could cause significant impacts.

EXHIBIT Q

SAN FRANCISCO PLANNING DEPARTMENT

MEMO

DATE: July 2014
 TO: Planning Department Staff, Shadow Analysis Consultants
 FROM: Rachel Schuett, Kevin Guy, SF Planning Department
 RE: Shadow Analysis Procedures and Scope Requirements

1650 Mission St.
 Suite 400
 San Francisco,
 CA 94103-2479

Reception:
 415.558.6378

Fax:
 415.558.6409

Planning
 Information:
 415.558.6377

In the City and County of San Francisco, there are two circumstances which could trigger the need for a shadow analysis:

- (1) If the proposed project would be over 40 feet tall, and could potentially cast new shadow on a property under the jurisdiction of the Recreation and Park Department, per *San Francisco Planning Code Section 295*; and/or
- (2) If the proposed project is subject to review under the California Environmental Quality Act (CEQA) and would potentially cast new shadow on a park or open space such that the use or enjoyment of that park or open space could be adversely affected.

This memorandum documents the Planning Department's standard procedures for conducting a shadow analysis both for the purposes of CEQA review and for the purposes of *Section 295* review. A complete Shadow Analysis has three main components: (1) Shadow Diagrams, (2) Shadow Calculations, and (3) a Technical Memorandum. In some cases, survey information may also be required.

A shadow analysis should be completed in five sequential steps:

- Step 1. Preliminary Shadow Fan
- Step 2. Project Initiation
- Step 3. Shadow Diagrams
- Step 4. Shadow Calculations
- Step 5. Technical Memorandum

Each of these steps is described, in detail, below.

Step 1. Preliminary Shadow Fan

The Planning Department typically prepares a preliminary shadow fan as part of the Preliminary Project Assessment (PPA) process for projects which exceed 40 feet in height. If the preliminary shadow fan indicates that the proposed project has the potential to cast new shadow on a park or open space which is protected by Section 295 of the *Planning Code*, a shadow analysis will be required for the purposes of Section 295 review.

Typically, this information is included in the PPA Letter. For projects not subject to the PPA process, and/or if the project is over 40 feet in height and has potential to cast new shadow on a park or open space that is not protected by Section 295 of the *Planning Code*, or if the project is less than 40 feet in height and could cast new shadow on any park or open space a shadow analysis may also be required for the purposes of CEQA review. This would be determined on a case-by-case basis as part of the scoping process for the environmental review. A preliminary shadow fan would be prepared by Planning Department staff at that time.

Step 5. Technical Memorandum

The shadow diagrams, shadow calculations, and any other supporting materials should be accompanied by a technical memorandum which includes (at a minimum) the following information:

- **Project Description.** Include the location of the project site (neighborhood, address, Assessor's Block/Lot, nearby landmarks), general topography, and project boundaries. Describe existing building(s) and land use(s) on and around the project site, including building height(s). Include proximity to parks, open spaces, and community gardens. Describe the proposed project including demolition and new construction. Describe the physical characteristics of the proposed building(s) as well as the proposed use(s). Include and refer to building elevations.
- **Modeling Assumptions.** The shadow graphics and calculations should be accompanied by clear documentation of the assumptions for the modeling including:
 - The height assumed for each of the buildings (or building envelopes).
Please note: Please contact the Planning Department for specific direction in how to model intervening shadow cast from buildings between the proposed project site and the affected park or open space.
 - The allowance for penthouses and parapets (which should be determined in consultation with Planning Department staff).
Please note: the Planning Department typically requires that final building designs be modeled rather than building envelopes, or hypothetical building forms based on existing or proposed zoning. However, building envelopes may be substituted in some circumstances as directed by Planning Department staff.
 - Building sections and elevations (for the proposed project).
 - If the project site is steep and/or has varied topography the documentation should identify where the height of the envelope of the building was measured from.
- **Potentially Affected Properties.** Potentially affected properties including: parks, publicly-accessible open spaces, and community gardens identified in the graphical depictions should be listed and described. The description of these properties should include the physical features and uses of the affected property, including but not limited to: topography, vegetation, structures, activities, and programming. Each identified use should be characterized as 'active' or 'passive.' Aerial photographs should be included, along with other supporting photos or graphics. The programming for each property should be verified with the overseeing entity, such as the Port of San Francisco, the Recreation and Parks Department, etc. Any planned improvements should also be noted.
- **Shadow Methodology and Results.** Describe how the analysis was conducted, what assumptions were made? Describe the "solar year", the "solar day" and define any other terms, as needed. Refer to shadow diagrams and describe results.
- **Quantitative Analysis (for properties subject to Section 295, and as required by the Planning Department).** The Technical Memorandum should include a narrative summary of the quantitative shadow effects that would result from the project, and discuss how these effects relate to the quantitative criteria set forth in the "Proposition K – Implementation Memo" as jointly adopted by the Planning and Recreation and Park Commissions in 1989.

Ms. Mary Woods
Planner - North West Quadrant
San Francisco Planning Department
1650 Mission Street, Suite 400
San Francisco, CA 94103-2414

RE: 3333 California St. Development

Dear Ms. Woods:

I am writing regarding the development of the 3333 California Street development, currently the UCSF Laurel Heights Campus (the "Site"). It is my understanding that the San Francisco Planning Department is working with the developer of the Site regarding the initial project plans for the proposed development. The owner of the fee interest and the developer of the Site are limited in their joint ability to develop the Site because the owner of the Site does not have free and clear title; rather the general public holds a permanent recreational interest in all of the open space at the Site. Therefore, any development plans at the Site may not impinge upon this open space.

The general public holds a **permanent** right of recreational use on all of the open space at 3333 California and such rights were obtained by implied dedication. Dedication is a common law principle that enables a private landowner to donate his land for public use. Implied dedication is also a common law principle and is established when the public uses private land for a long period of time, which period of time is five (5) years in California. In 1972, the California legislature enacted Civil Code Section 1009 to modify the common law doctrine of implied dedication and to limit the ability of the public to secure **permanent** adverse rights in private property. Here, however, the existing open space at the Site was well established and well used as a park by the general public long before the completion of the construction of the full footprint of the improvements at the Site in 1966. Therefore, the general public has permanent recreational rights to the open space at the Site; the rights were obtained by implied dedication prior to the enactment of Cal. Civil Code Sec. 1009 in 1972.

Even if the general public had not secured permanent rights to recreational use through implied dedication prior to 1972, the public and countless individuals have acquired a prescriptive easement over the recreational open space. The recreational use has been continuous, uninterrupted for decades, open and notorious and hostile (in this context, hostile means without permission). Every day, individuals and their dogs use the green space along Laurel, Euclid and along the back of the Site at Presidio. Individuals ignore the brick wall along Laurel and regularly use the green space behind the wall as a park for people and for their dogs. The use of the Site has not been permissive. For example, the owner of the Site has not posted permission to pass signs in accordance with Cal. Civil Code Sec. 1008. If such signs ever were posted, they have not been reposted at least once per year. Although it is counterintuitive, an owner typically posts such signs to protect against the public securing adverse rights. One might assume the owner of the Site has not posted such signs, as the owner is aware of the pre-existing and permanent recreational rights the general public has secured to the open space. Because the

public's rights to the open space were secured decades ago through implied dedication, it is not necessary for the general public to rely upon its prescriptive easement rights outlined in this paragraph; rather it is another means to the same end.

It is important that the Planning Department understand these legal issues as any project plan (or any future project description in an Environmental Impact Report ("EIR") for the Site) cannot include development of the open land over which the public has a secured permanent rights of recreational use. It would not be a concession by the owner/developer to leave the open space undeveloped and allow public recreational use as the general public holds permanent recreational rights to this space. It is important to note that even the open space behind the walls that has been used as park space is also included in this dedication to the public. According to well-established case law, a wall or fence is not effective in preventing the development of adverse property rights if individuals go around the wall, as is the case here.

In sum, the open space at the Site cannot be developed as the public secured such rights through implied dedication prior to 1972 (or, alternatively, by prescriptive easement). In reviewing the development plans for the Site, the City cannot decide to allow development of any of the open space as the recreational rights to the space are held by the public at large. Any project description in the future EIR for the Site that contemplates development of any of the open space would be an inadequate project description and would eviscerate any lower impact alternative presented in the EIR. One only need to look to the seminal land use case decided by the California Supreme Court regarding this very Site¹ to see that an EIR will not be upheld if the project alternatives are legally inadequate. It would be misleading to the public to suggest that a lesser impact alternative is one that allows the public to use the space to which it already has permanent recreational use rights.

In sum, please be advised of the public's permanent recreational rights to all of the existing open space at the Site and please ensure that a copy of this letter is placed in the project file.

Sincerely,

Meg Fitzgerald

that urban decay effects might result, and the court upheld the city's determination that changing the site plan for the shopping center to allow a supercenter did not result in any new significant effects that would require revisions to an EIR that it had previously certified for the project. 183 CA4th at 52.

The difficulty of formulating effective mitigation measures for urban decay effects is illustrated by the decision in *California Clean Energy Comm. v City of Woodland* (2014) 225 CA4th 173. The court upheld a measure requiring that specific project uses consist primarily of regional retail uses that would not compete with stores in the city's downtown area. The court rejected several other measures, however, that called for submission of future market studies and development of plans for retail and other uses in areas likely to be affected by the new development, finding no basis for concluding they might be effective.

§13.65 H. Hazardous Waste and Release Sites

When preparing an EIR, the lead agency must consult the "Cortese" list of hazardous waste sites (compiled under Govt C §65962.5) to determine whether the project or any project alternatives are located on a listed site. Pub Res C §21092.6(a). Any information derived from consultation of the Cortese list must be included in the notice of preparation and the draft EIR. Pub Res C §21092.6(a).

An EIR for a project that involves the purchase of a school site or construction of a new elementary or secondary school by a school district must include sufficient information to determine whether the site is a former hazardous or solid waste disposal site, an identified hazardous substance release site, or a site containing certain types of pipelines. Pub Res C §21151.8(a); 14 Cal Code Regs §15186.

On CEQA and hazardous waste disposal and release sites, see §§20.49–20.52.

§13.66 I. Greenhouse Gas Emissions and Climate Change

Following enactment of the California Global Warming Solutions Act of 2006 (Health & S C §§38500–38599), the legislature directed that CEQA Guidelines be adopted addressing the mitigation of greenhouse gas (GHG) emissions. Pub Res C §21083.5. Following that directive, a number of new and amended Guidelines provisions were adopted in 2010; see,

an EIR, depending on the specific issues presented by a particular project.

A California Climate Change Adaptation Strategy was prepared by a multi-agency task force headed by the Natural Resources Agency and finalized in 2009. The December 2009 strategy document summarizes information about the impacts of climate change in various sectors as well as efforts to manage against the threats posed by climate change. These documents generally can be found on the websites of the particular state agencies or on the California Climate Change Portal website.

Guidance from local air districts. Some local air districts have adopted or published guidance documents with recommended thresholds of significance for GHG emissions of projects. These include interim thresholds for stationary sources within the South Coast Air Quality Management District and significance thresholds adopted by the San Joaquin Valley Air Pollution Control District and the Bay Area Air Quality Management District. On use of regulatory agency guidance documents generally, see §§6.55, 13.13–13.14.

In December 2008, the South Coast Air Quality Management District adopted an interim GHG threshold for stationary sources of 10,000 metric tons of CO₂ equivalents per year (MT/yr), which applies when the district is the lead agency. See South Coast Air Quality Management District, A Resolution of the Governing Board of the South Coast Air Quality Management District Approving the Interim Greenhouse Gas Significance Threshold to Be Used by the SCAQMD for Industrial Source Projects, Rules and Plans When It Is the Lead Agency for Projects Subject to the California Environmental Quality Act (CEQA).

In December 2009, the San Joaquin Valley Air Pollution Control District adopted a threshold for all types of development projects. The district's approach is derived from AB 32's goal of reducing GHG emissions to 1990 levels by 2020, which generally would require statewide emissions to be reduced by approximately 29 percent below CARB's 2020 "business as usual" projections for California. See CARB Climate Change Scoping Plan (Dec. 2008) at ES-1. Generally, the recommended threshold bases the determination of significance on whether the analysis for a proposed project demonstrates that the project can achieve a comparable reduction against "business as usual" emissions.

In June 2010, the Bay Area Air Quality Management District adopted recommended thresholds with two alternatives for determining significance for most nonindustrial development projects. One is a bright-line threshold of 1100 MT/yr of carbon dioxide equivalent emissions. The other recommended threshold is a per capita threshold of 4.6 MT/yr of

CO₂-equivalent emissions, based on the service population of the project. For industrial projects, the threshold is emissions greater than 10,000 MT/yr of CO₂ equivalents.

NOTE ➤ On the basis of the pendency of *California Bldg. Indus. Ass'n v Bay Area Air Quality Mgmt. Dist.* (2015) 62 C4th 369, the Bay Area Air Quality Management District had not been recommending that agencies use these thresholds as a general measure of a project's impacts, stating that agencies should make significance determinations on the basis of substantial evidence. See <http://www.baagmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES.aspx>. This case has been remanded to the trial court for issuance of an order partially granting the petition for writ of mandate. *California Bldg. Indus. Ass'n v Bay Area Air Quality Mgmt. Dist.* (2016) 2 CA5th 1067, 1091. In *Center for Biological Diversity*, 62 C4th at 230 n7, however, the court noted that the validity of the District's GHG thresholds was not before the court in that case. Also, the 2015 court of appeal decision in *California Bldg. Indus. Ass'n v Bay Area Air Quality Mgmt. Dist.*, *supra*, did not discuss the District's GHG thresholds. Practitioners should check the District's website for updates to this guidance.

Local or regional plan policies on GHGs. An increasing number of cities and counties have adopted GHG emission reduction goals in their general plans; some jurisdictions are preparing or adopting formalized GHG reduction plans or climate action plans. In appropriate circumstances, such general plan policies can be used as a possible basis for determining the significance of emissions impacts. See generally §§6.56, 13.11. In *Center for Biological Diversity*, 62 C4th at 223, the court suggested that in appropriate circumstances local agencies could evaluate compliance with such plans to streamline the review of GHG emissions impacts. In *North Coast Rivers Alliance v Marin Mun. Water Dist.* (2013) 216 CA4th 614, 653, the court upheld an EIR that relied on a county policy of reducing GHG emissions by a specified percentage to reach AB 32 goals. Under CEQA's existing provisions for streamlining review for projects consistent with a plan (see chap 10), and under the CEQA Guidelines on tiering from adopted GHG reduction plans, the more formalized GHG reduction plans may be used in appropriate circumstances to streamline the review of consistent projects.

Addressing Analysis and Mitigation of Greenhouse Gas
Emissions Pursuant to SB97**

December 2009

SECTION 15064.4. DETERMINING THE SIGNIFICANCE OF IMPACTS FROM GREENHOUSE GAS EMISSIONS

Specific Purposes of the Amendment

A key component of environmental analysis under CEQA is the determination of significance. (Pub. Resources Code § 21002; *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1106-07.) Guidelines on the analysis of GHG emissions must, therefore, include provisions on the determination of significance of those emissions.

New section 15064.4, on the determination of significance of GHG emissions, reflects the existing CEQA principle that there is no iron-clad definition of “significance.” (State CEQA Guidelines, § 15064(b); *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comm.* (2001) 91 Cal.App.4th 1344, 1380-81 (“*Berkeley Jets*”).) Accordingly, lead agencies must use their best efforts to investigate and disclose all that they reasonably can regarding a project’s potential adverse impacts. (*Ibid*; see also State CEQA Guidelines, § 15144.) Section 15064.4 is designed to assist lead agencies in performing that required investigation. In particular, it provides that lead agencies should quantify GHG emissions where quantification is possible and will assist in the determination of significance, or perform a qualitative analysis, or both as appropriate in the context of the particular project, in order to determine the amount, types and sources of GHG emissions resulting from the project. Regardless of the type of analysis performed, the analysis must be based “to the extent possible on scientific and factual data.” In addition, lead agencies should also consider several factors. The specific provisions of section 15064.4 are discussed below.

Quantitative Analysis

Subdivision (a) of section 15064.4 states that lead agencies should calculate or estimate the GHG emissions resulting from the proposed project. This directive reflects the holding in the *Berkeley Jets* case, which required a Port Commission to quantify emissions of toxic air contaminants even in the absence of a universally accepted methodology for doing so. (*Berkeley Jets, supra*, 91 Cal.App.4th at p. 1370 (“The fact that a single methodology does not currently exist that would provide the Port with a precise, or ‘universally accepted,’ quantification of the human health risk from TAC exposure does not excuse the preparation of any health risk assessment—it requires the Port to do the necessary work to educate itself about the different methodologies that are available”) (emphasis in original).) That case also required quantitative analysis of single-event noise, even though the applicable thresholds were expressed as cumulative noise levels. (*Id.* at 1382.) Quantification was required in that context in order to identify existing noise levels, the number of additional flights, the frequency of those flights, the degree to which the increased flights would cause increased noise levels at a given location, and ultimately, the community’s reaction to that noise. (*Ibid.*) In other words, quantification would assist the lead agency in determining whether the increased noise would be potentially significant. (*Ibid.* (“CEQA requires that the Port

and the inquiring public obtain the technical information needed to assess whether the ADP will merely inconvenience the Airport's nearby residents or damn them to a somnambulate-like existence"); see also *Protect the Historic Amador Waterways*, *supra*, 116 Cal.App.4th at 1109 ("in preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect").)

With the foregoing principles in mind, the quantification called for in proposed section 15064.4(a)(1) is reasonably necessary to ensure an adequate analysis of GHG emissions using available data and tools, in accordance with Public Resources Code Section 21083.05. Even where a lead agency finds that no numeric threshold of significance applies to a proposed project, the holdings in the *Berkeley Jets* and *Protect the Historic Amador Waterways* cases, described above, require quantification of emissions if such quantification will assist in determining the significance of those emissions. OPR and the Resources Agency find that quantification will, in many cases, assist in the determination of significance, as explained below. (State CEQA Guidelines, § 15142 ("An EIR shall be prepared using an interdisciplinary approach which will ensure the integrated use of the natural and social sciences and the consideration of qualitative as well as quantitative factors").)

First, quantification of GHG emissions is possible for a wide range of projects using currently available tools. Modeling capabilities have improved to allow quantification of emissions from various sources and at various geographic scales. (Office of Planning and Research, *CEQA and Climate Change: Addressing Climate Change Through the California Environmental Quality Act Review*, Attachment 2: Technical Resources/Modeling Tools to Estimate GHG Emissions (June 2008); CAPCOA White Paper, at pp. 59-78.) Moreover, one of the models that can be used in a GHG analysis, URBEMIS, is already widely used in CEQA air quality analyses. (CAPCOA White Paper, at p. 59.) Second, quantification informs the qualitative factors listed in proposed section 15064.4(b). Third, quantification indicates to the lead agency, and the public, whether emissions reductions are possible, and if so, from which sources. Thus, if quantification reveals that a substantial portion of a project's emissions result from energy use, a lead agency may consider whether design changes could reduce the project's energy demand.

Proposed section 15064.4(a)(1) also reflects existing case law that reserves for lead agencies the precise methodology to be used in a CEQA analysis. (See, e.g., *Eureka Citizens for Responsible Gov't v. City of Eureka* (2007) 147 Cal.App.4th 357, 371-373.) As indicated above, a wide variety of models exist that could be used in a GHG analysis. (CAPCOA White Paper, at pp. 59-78.) Further, not every model will be appropriate for every project. For example, URBEMIS may be an appropriate tool to analyze a typical residential subdivision or commercial use project, but some public utilities projects, such as waste-water treatment plants, may require more specialized models to accurately estimate emissions. (*Id.* at pp. 60-65.) The requirement to

disclose any limitations in the model or methodology chosen also reflects the standard for adequacy of EIRs in existing State CEQA Guidelines section 15151.

Qualitative and Performance Standard Based Analysis

As explained in greater detail below in the Thematic Responses, CEQA does not require quantification of emissions in every instance. If the lead agency determines that quantification is not possible, would not yield information that would assist in analyzing the project's impacts and determining the significance of the GHG emissions, or is not appropriate in the context of the particular project, section 15064.4(a) would allow the lead agency to consider qualitative factors or performance standards. Consideration of qualitative factors is appropriate for several reasons. First, CEQA directs lead agencies to consider qualitative factors. (Pub. Resources Code, § 21001(g) (CEQA's purpose includes to: "require governmental agencies at all levels to consider qualitative factors as well as economic and technical factors and long-term benefits and costs, in addition to short-term benefits and costs and to consider alternatives to proposed actions affecting the environment").) Second, existing section 15064.7 of the State CEQA Guidelines indicate that thresholds of significance may be qualitative, which implies that a determination of significance without a threshold could also evaluate qualitative factors. Third, the existing CEQA Guidelines state that the determination of significance requires a lead agency to use its judgment based on *all* relevant information. (State CEQA Guidelines, § 15064(b); see also *id.* at §§ 15064.7 (thresholds may be qualitative), 15142 (analysis should be interdisciplinary and both qualitative and quantitative).)

Subdivision (a) would also allow a lead agency to rely on performance-based standards to assist in the determination of significance. Just as with quantification, the purpose of engaging in a qualitative or performance standard based analysis is to develop information relevant to a significance determination. Several examples exist of the types of performance standards that might appropriately be used in determining the significance of greenhouse gas emissions. Proposed section 15183.5(b)(1)(D), for example, contemplates that a plan for the reduction of greenhouse gas emissions may contain performance based standards. Where such standards are developed as part of such a plan, a lead agency would have evidence indicating that compliance with such standards would indicate that the impact of greenhouse gas emissions would be less than significant. Further, in adopting SB375, the Legislature acknowledged that regional transportation plans, and the environmental impact reports prepared to analyze those plans, may contain performance standards that would apply to transit priority projects. (See, e.g., Public Resources Code, § 21155.2.) Other potential examples include the Bay Area Air Quality Management District's proposed Best Management Practices for Construction Greenhouse Gas Emissions (calling for use of alternative fuels, local building materials and recycling), and the California Public Utilities Commission's Performance Standard for Power Plans (requiring emissions no greater than a combined cycle gas turbine plant). Compliance with such standards may be relevant to the significance determination, when considered in conjunction with the

project's total projected emissions. Section 15064.4(a) was revised in response to comments to clarify that lead agencies may rely on quantitative or qualitative analyses, or both, in part to emphasize that qualitative analyses and performance standards may be useful supplements to a quantitative analysis.

Similar to use of a significance threshold, a lead agency must exercise care to ensure that performance standards do not replace a full analysis of all potential emissions. (*Protect the Historic Amador Waterways, supra*, 116 Cal.App.4th at 1109 (“in preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect”).) For example, while a Platinum LEED® rating could assist a lead agency in determining whether emissions related to a building's energy use may be significant, that performance standard may not reveal sufficient information to evaluate transportation-related emissions associated with that proposed project.

As indicated above, even a qualitative analysis must be based to the extent possible on scientific and factual data. Further, the type of analysis that is required will depend on the context of a particular project. Given the multitude of different project types and sizes, and different agencies subject to CEQA, the CEQA Guidelines, which are general by necessity, cannot specify precisely when a quantitative analysis may be required or a qualitative analysis may be appropriate. The following hypothetical examples may illustrate, however, how section 15064.4(a) could operate:

Project 1: a small habitat restoration project is proposed in a remote part of California. Workers would drive to the site where they would camp for the duration of the project. Some gas-powered tools and machinery may be required. Cleared brush would either be burned or would decay naturally.

Project 2: a large commercial development is proposed in an suburban context. Heavy-duty machinery would be required in various construction phases spanning many months. Following construction, the development would rely on electricity, water and wastewater services from the local utilities. Natural gas burners would be used on site. The development would employ several hundred workers and attract thousands of customers daily. A traffic study has been prepared for the project. The local air quality management district's guidance document recommends that projects of similar size and character should use of URBEMIS, or another similar model, to estimate the air quality impacts of the development.

In the context of Project 2 a quantitative analysis would likely be appropriate. The URBEMIS model, which would likely be used to analyze other emissions, could also be used to estimate emissions from both project-related transportation and on-site indirect emissions (landscaping, hot-water heaters, etc.) Modeling is typically done for projects of like size and character. Other models are readily available to estimate emissions associated with utility use. In the context of Project 2, a lead agency may

find it difficult to demonstrate a good faith effort through a purely qualitative analysis. (See, e.g., *Berkeley Keep Jets Over the Bay Com. v. Board of Port Comm.* (2001) 91 Cal.App.4th 1344, 1370.)

In the context of Project 1, however, a qualitative analysis would likely be appropriate. Project 1's emissions are not easily modeled, and the Project is small in scale. While it may be technically possible, quantification of the emissions may not reveal any additional information that indicates the significance of those emissions or how they may be reduced that could not be provided in a qualitative assessment of emissions sources. (See, e.g., Public Resources Code, § 21003(f) ("public agencies involved in the environmental review process be responsible for carrying out the process in the most efficient, expeditious manner in order to conserve the available financial, governmental, physical, and social resources with the objective that those resources may be better applied toward the mitigation of actual significant effects on the environment").)

Factors Potentially Indicating Significance

The qualitative factors listed in the proposed section 15064.4(b) are intended to assist lead agencies in collecting and considering information relevant to a project's incremental contribution of GHG emissions and the overall context of such emissions. Notably, while subdivision (b) provides a list of factors that should be considered by public agencies in determining the significance of a project's GHG emissions, other factors can and should be considered as appropriate.

Determine Whether Emissions Will Increase or Decrease

The first factor in subdivision (b), for example, asks lead agencies to consider whether the project will result in an increase or decrease in different types of GHG emissions relative to the existing environmental setting. All project components, including construction and operation, equipment and energy use, and development phases must be considered in this analysis. (State CEQA Guidelines, § 15378 (project includes "the whole of the action").) For example, a mass transit project may involve GHG emissions during its construction phase, but substantial evidence may also indicate that it will cause existing commuters to switch from single-occupant vehicles to mass transit use. Operation of such a project may ultimately result in a decrease in GHG emissions. Such analysis, provided that it is supported with substantial evidence and fully accounts for all project emissions, may support a lead agency's determination that GHG emissions associated with a project are not cumulatively considerable.

This section's reference to the "existing environmental setting" reflects existing law requiring that impacts be compared to the environment as it currently exists. (State CEQA Guidelines, § 15125.) This clarification is necessary to avoid a comparison of the project against a "business as usual" scenario as defined by ARB in the Scoping Plan. Such an approach would confuse "business as usual" projections used in ARB's Scoping Plan with CEQA's separate requirement of analyzing project effects in

comparison to the environmental baseline. (*Compare* Scoping Plan, at p. 9 (“The foundation of the Proposed Scoping Plan’s strategy is a set of measures that will cut greenhouse gas emissions by nearly 30 percent by the year 2020 as compared to business as usual”) with *Fat v. County of Sacramento* (2002) 97 Cal.App.4th 1270, 1278 (existing environmental conditions normally constitute the baseline for environmental analysis); see also *Center for Bio. Diversity v. City of Desert Hot Springs*, Riverside Sup. Ct. Case No. RIC464585 (August 6, 2008) (rejecting argument that a large subdivision project would have a “beneficial impact on CO2 emissions” because the homes would be more energy efficient and located near relatively uncongested freeways).) Business as usual may be relevant, however, in the discussion of the “no project alternative” in an EIR. (State CEQA Guidelines, § 15126.6(e)(2) (no project alternative should describe what would reasonably be expected to occur in the future in the absence of the project).)

Notably, section 15064.4(b)(1) is not intended to imply a zero net emissions threshold of significance. As case law makes clear, there is no “one molecule rule” in CEQA. (CBE, *supra*, 103 Cal.App.4th at 120.)

Thresholds of Significance

The second factor in subdivision (b) asks whether a project exceeds a threshold of significance for GHG emissions. Section 21000(d) of the Public Resources Code expressly directs public agencies to identify whether there are any critical thresholds for health and safety to identify those areas where the capacity of the environment is limited. A threshold is an “identifiable quantitative, qualitative or performance level” at which impacts are normally less than significant. (State CEQA Guidelines, § 15064.7(a); see also *Protect the Historic Amador Waterways*, *supra*, 116 Cal.App.4th at 1107.) Lead agencies may rely on thresholds developed by other agencies that have particular expertise in the subject matter under consideration. (See, e.g., State CEQA Guidelines, Appendix G, Sample Question III (“[w]here available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make” a significance determination).) For example, a lead agency may look to standards included in a Basin Plan to assist in the determination of whether water quality impacts are significant. (*Protect the Historic Amador Waterways*, *supra*, 116 Cal.App.4th at 1107 (“[s]uch thresholds can be drawn from existing environmental standards, such as other statutes or regulations”).)

Several agencies have developed, or are in the process of developing, thresholds of significance for GHG emissions.³ For example, thresholds are currently being developed, or have already been adopted by the Bay Area Air Quality Management District for operations and construction,⁴ the City of Davis for residential

³ Reference to these thresholds and proposed thresholds does not reflect an endorsement of those thresholds; rather, they are cited solely for the purpose of demonstrating that agencies are developing such thresholds.

⁴ BAAQMD CEQA Guidelines Update: work in progress - <http://www.baaqmd.gov/pln/ceqa/index.htm>.

developments,⁵ and the South Coast Air Quality Management District for industrial projects.⁶ Regardless of the threshold chosen, however, this section does not alter the pre-existing rule under CEQA that if substantial evidence supports a fair argument that a project may result in significant impacts, despite compliance with a threshold, an EIR must be prepared. (*Mejia v. City of Los Angeles* (2005) 130 Cal.App.4th 322, 342.) Further, "in preparing an EIR, the agency must consider and resolve every fair argument that can be made about the possible significant environmental effects of a project, irrespective of whether an established threshold of significance has been met with respect to any given effect." (*Protect the Historic Amador Waterways, supra*, 116 Cal.App.4th at 1109.)

Consistent with the above, if relying on a threshold developed by another agency, lead agencies must exercise caution in selecting a threshold to ensure that the threshold is appropriately applied. For CEQA purposes, a threshold identifies a level below which an environmental impact will normally be less than significant. (State CEQA Guidelines, § 15064.7(a).) Some agencies have adopted "thresholds" pursuant to other laws that may not be applicable in the CEQA context. ARB has adopted several thresholds pursuant to AB32, for example, to address specific purposes that are unrelated to CEQA. For example, the *de minimis* threshold governs the level at which emissions will be regulated by ARB's AB32 regulations. (Health & Safety Code, § 38561(e); Scoping Plan, at pp. 96-97.) CEQA does not permit use of a *de minimis* threshold, however. (*CBE, supra*, 103 Cal.App.4th at p. 121.) Additionally, the Reporting Threshold is the level at which emissions from large industrial sources are required to be reported. (Scoping Plan, at pp. 108-109; see also CARB Board Resolution 07-54 (2007).) Again, this reporting threshold reflects a policy decision regarding regulation by the ARB, but does not address the level at which environmental harm may occur, and does not satisfy a lead agency's duties under CEQA related to review of projects which may result in significant adverse environmental impacts.

Consistency with a Plan or Regulation

Finally, the third factor in subdivision (b) directs consideration of the extent to which a project complies with a plan or regulation to reduce GHG emissions. That section further states, however, that to be used for the purpose of determining significance, a plan must contain specific requirements that result in reductions of GHG emissions to a less than significant level. This clarification is necessary because of the wide variety of climate action plans and GHG reduction plans that are currently being adopted by public agencies. ARB, for example, recently adopted its statewide Scoping Plan. That plan may not be appropriate for use in determining the significance of individual projects, however, because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping

⁵ City of Davis (2009) Greenhouse Gas Emission Threshold and Standards for New Residential Development; Accessed 5/27/09, http://cityofdavis.org/pgs/sustainability/pdfs/15_4.21.09_GHG%20Standards.pdf

⁶ SCAQMD (2008) Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, Accessed 5/27/09 <http://www.aqmd.gov/hb/2008/December/081231a.htm>.

Plan. (Scoping Plan, at p. 9.) Regulations that will require actual reductions of GHG emissions may not be adopted until 2012. (*Ibid.*) Once those regulations are adopted and being implemented, they may, if appropriate, be used to assist in the determination of significance, similar to the current use of air quality, water quality and other similar environmental regulations. (*CBE, supra*, 103 Cal. App. 4th at 111 (“a lead agency’s use of existing environmental standards in determining the significance of a project’s environmental impacts is an effective means of promoting consistency in significance determinations and integrating CEQA environmental review activities with other environmental program planning and regulation”).)

In addition to the regulations that will be developed to implement the Scoping Plan, this factor would also allow lead agencies to consider plans that are developed to reduce GHG emissions on a regional or local level. (Scoping Plan, at p. 26.) The proposed section 15064.4(b)(3) is intended to be read in conjunction with the section 15064(h)(3), as proposed to be amended, and proposed section 15183.5. Those sections each indicate that local and regional plans may be developed to reduce GHG emissions. If such plans reduce community-wide emissions to a level that is less than significant, a later project that complies with the requirements in such a plan may be found to have a less than significant impact.

Notably, CEQA does not provide a specific definition of “comply” in the context of determining a project’s consistency with a particular plan. Some guidance may be gleaned, however, from case law interpreting the requirement that a local government’s activities be consistent with its General Plan. In that context, a “zoning ordinance [for example] is consistent with the city’s general plan where, considering all of its aspects, the ordinance furthers the objectives and policies of the general plan and does not obstruct their attainment.” (*City of Irvine v. Irvine Citizens Against Overdevelopment* (1994) 25 Cal. App. 4th 868, 879.) Reading section 15064.4 together with 15064(h)(3), however, to demonstrate consistency with an existing GHG reduction plan, a lead agency would have to show that the plan actually addresses the emissions that would result from the project. Thus, for example, a subdivision project could not demonstrate “consistency” with the ARB’s Early Action Measures because those measures do not address emissions resulting from a typical housing subdivision. (ARB, Expanded List of Early Action Measures to Reduce Greenhouse Gas Emissions in California Recommended for Board Consideration, October 2007; see also State CEQA Guidelines, §§ 15063(d)(3) (initial study must be supported with information to support conclusions), 15128 (determination in an EIR that an impact is less than significant must be briefly explained).)

Necessity

The Legislature directed OPR and the Resources Agency to develop guidelines on the analysis of GHG emissions. (Pub. Resources Code, § 21083.05.) A key component of environmental analysis under CEQA is the determination of significance. (*Id.* at § 21002; *Protect the Historic Amador Waterways, supra*, 116 Cal.App.4th at

SECTION 15064.7. THRESHOLDS OF SIGNIFICANCE

Specific Purposes of the Amendment

Proposed subdivision (c) of section 15064.7 would allow a lead agency to adopt a threshold developed by another agency, or recommended by experts, provided that such threshold is supported with substantial evidence. This proposed regulation is reasonably necessary because many lead agencies perform general governmental functions, and may lack the specific expertise necessary to develop their own thresholds of significance for GHG emissions. Such agencies may rely on thresholds developed by other agencies with specialized expertise (such as an air quality management district) in conducting their CEQA analyses. (OPR, Thresholds of Significance: Criteria for Defining Environmental Significance, September 1994, at p. 7.) In fact, Appendix G of the State CEQA Guidelines expressly encourages lead agencies to rely on thresholds established by local air quality management districts. (State CEQA Guidelines, Appendix G, Question III.)

Several local and regional air districts are in the process of developing thresholds for GHG emissions. As noted above, for example, thresholds are currently being developed, or have already been adopted by the Bay Area Air Quality Management District for operations and construction, the City of Davis for residential developments, and the South Coast Air Quality Management District for industrial projects. Lead agencies within the jurisdiction of an air district, or other agency, that adopts a GHG emissions threshold may adopt such a threshold as its own. In adopting any threshold of significance, including one developed by an expert or agency with specialized expertise, the lead agency must support the threshold with substantial evidence in the administrative record. (State CEQA Guidelines, § 15064.7(b).)

Independent experts may also develop such thresholds for use by public agencies. For example, the California Air Pollution Control Officers Association has published a White Paper on developing thresholds of significance for GHG emissions. (CAPCOA White Paper, at pp. 31-58.) A lead agency could potentially use CAPCOA's suggestions in developing its own thresholds. Because any threshold must be supported with substantial evidence, and must be adopted through a public process, any threshold recommended by an expert that is ultimately adopted will undergo sufficient scrutiny to ensure its legitimacy. (State CEQA Guidelines, § 15064.7(b).)

Necessity

The Legislature directed OPR and the Resources Agency to develop guidelines on the analysis of GHG emissions. (Pub. Resources Code, § 21083.05.) Defining "significance" is a critical step in the lead agency's impact analysis and therefore needs to be addressed as part of the Proposed Action. Section 21000(d) of the Public Resources Code encourages the development of thresholds. These sections together

SECTION 15126.4. CONSIDERATION AND DISCUSSION OF MITIGATION MEASURES PROPOSED TO MINIMIZE SIGNIFICANT EFFECTS.

Specific Purposes of the Amendment

Section 21083.05 of the Public Resources Code expressly requires OPR and the Resources Agency to develop regulations on the “mitigation of greenhouse gas emissions.” The goals of this legislative mandate are to (1) reduce GHG emissions and (2) to provide consistency in the development of GHG emissions reduction measures. There is no indication, however, that the Legislature intended to alter any existing laws governing mitigation under CEQA. The Amendments, therefore, interpret and make specific existing CEQA law and regulations for mitigation of significant impacts resulting from GHG emissions.

Existing section 15126.4 provides guidance on CEQA’s general mitigation requirements. To emphasize that mitigation of GHG emissions is subject to those existing CEQA requirements, OPR and the Natural Resources Agency added a new subdivision (c) to the existing section 15126.4. The Amendments identify five general methods of mitigation that may be tailored to the specific circumstances surrounding a specific project. In response to public comments, the Natural Resources Agency provided additional guidance, described below, in the lead-in sentences introducing those five broad categories of mitigation.

Mitigation of Greenhouse Gas Emissions

Comments submitted on the Amendments indicated general concerns that mitigation for GHG emissions may not be effective or reliable. To further clarify the existing mitigation requirements that would apply to measures to reduce greenhouse gas emissions, the Natural Resources Agency revised the lead-in sentences in subdivision (c). Specifically, the Natural Resources Agency added that all mitigation must be supported with substantial evidence and be capable of monitoring or reporting. This addition reflects the requirement in Public Resources Code that a lead agency’s findings on mitigation be supported with substantial evidence and that it must adopt a mitigation monitoring and reporting program along with the project if mitigation measures are required. (Public Resources Code, §§ 21081(a)(1), 21081.6.)

In response to comments, the Natural Resources Agency had originally also proposed to add a sentence indicating that only emissions reductions that were not required by some other law or contract could qualify as mitigation. In response to comments on that proposed revision, that sentence is no longer proposed to be added to the lead-in section; rather, subdivision (c)(3) will be clarified, as described below.

Mitigation Identified in an Existing Plan

The first type of mitigation of GHG emissions that may be considered includes measures identified in an existing plan. As indicated above, many agencies are

Forestry Greenhouse Gas Protocols for Voluntary Purposes (October 17, 2007), at pp. 6-7.) ARB has adopted Forest Protocols for large forestry projects. (ARB, Resolution 07-44 (adopting California Climate Action Registry Forestry Sector Protocol (September 2007), Forest Project Protocol (September 2007) and Forest Verification Protocol (May 2007).) ARB has also adopted Urban Forest Protocols for urban forestry projects. (California Climate Action Registry, Urban Forest Project Reporting Protocol and Verification Protocol (August 2008) (ARB adopted on September 25, 2008).) Such projects could be located on the project site or off-site. (Urban Forest Project Reporting Protocol, at pp. 4-5.) The protocols include methods of measuring the ability of various forestry projects to store capture and store carbon.

Consistent with section 15126.4(a), a lead agency must support its choice of, and its determination of the effectiveness of, any reduction measures with substantial evidence. Substantial evidence in the record must demonstrate that any mitigation program or measure is will result in actual emissions reductions. As a practical matter, where a mitigation program or measure is consistent with protocols adopted or approved by an agency with regulatory authority to develop such a program, a lead agency will more easily be able to demonstrate that off-site mitigation will actually result in emissions reductions. Examples of such protocols include the forestry protocols described above. Where a mitigation proposal cannot be verified with an existing protocol, a greater evidentiary showing may be required.

Measures to be Implemented on a Project-by-Project Basis

Finally, the fifth type of measure that could reduce GHG emissions at a planning level is the development of binding measures to be implemented on a project-specific basis. As explained in greater detail in the discussion of proposed section 15183.5, below, ARB's Scoping Plan strongly encourages local agencies to develop plans to reduce GHG emissions throughout the community. In addition, the CEC's Power Plant Siting Committee is assessing the impacts of GHG emission from proposed new power plants and how they can be mitigated. Comments received during the CEC's informational proceedings warranted a lengthy discussion on the practical application of a programmatic approach to mitigating GHG emissions from new power plants. (CEC, *Committee Guidance on Fulfilling California Environmental Quality Act Responsibilities for Greenhouse Gas Impacts in Power Plant Siting Applications* (2009) at p. 26 to 28.) Existing State CEQA Guidelines sections 15168(b)(4) and 15168(c)(3) recognize that programmatic documents provide an opportunity to develop mitigation plans that will apply on a project-specific basis. Proposed subdivision (c)(5) recognizes that, for a planning level decision, appropriate mitigation of GHG emissions may include the development of a program to be implemented on a project-by-project basis. (State CEQA Guidelines, § 15126.4(a)(2) ("[i]n the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation or project design").)

This type of mitigation is subject to the limits of existing law, however. Thus, proposed subdivision (c)(5) should not be interpreted to allow deferral of mitigation.

Rather, it is subject to the rule in existing section 15126.4(a)(1)(B) that such measures “may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way.” (See also *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal. App. 4th 645, 670-71.)

Suggestions Rejected

During its public involvement process, OPR received comments on its preliminary draft of the proposed amendments related to mitigation. Some comments suggested provisions that were not included in these Proposed Amendments. Several comments, for example, suggested that the Guidelines provide a specific “hierarchy” of mitigation requiring lead agencies to mitigate GHG emissions on-site where possible, and to allow consideration and use of off-site mitigation only if on-site mitigation is impossible or insufficient. OPR and the Resources Agency recognize that there may be circumstances in which requiring on-site mitigation may result in various co-benefits for the project and local community, and that monitoring the implementation of such measures may be easier. However, CEQA leaves the determination of the precise method of mitigation to the discretion of lead agencies. (State CEQA Guidelines, § 15126.4(a)(1)(B); see also *San Franciscans Upholding the Downtown Plan v. City & Co. of San Francisco* (2002) 102 Cal. App. 4th 656, 697.)

Several comments also suggested that mitigation for GHG emissions must be “real, permanent, quantifiable, verifiable, and enforceable.” The Proposed Amendments do not include such standards, however, for several reasons. The proposed standard appears to have been derived from section 38562(d) of the Health and Safety Code, which prescribes requirements for regulations to be promulgated to implement AB32. AB32 is a separate statutory scheme, and, as noted above, there is no indication that the legislature intended to alter standards for mitigation under CEQA. Similarly, standards for mitigation under CEQA already exist and are set out in section 15126.4(a). Specifically, mitigation must be fully enforceable, which implies that the measure is also real and verifiable. Additionally, substantial evidence in the record must support an agency’s conclusion that mitigation will be effective, and in the context of an EIR, courts will defer to an agency’s determination of a measure’s effectiveness. (*Environmental Council of Sacramento v. City of Sacramento* (2006) 147 Cal.App.4th 1018, 1041 (mitigation ratio is supportable even at less than 1:1 given the project’s circumstances); *Ass’n of Irrigated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1398 (lead agency has discretion to resolve dispute regarding the effectiveness of an EIR’s mitigation measures).) No existing law requires CEQA mitigation to be quantifiable. Rather, mitigation need only be “roughly proportional” to the impact being mitigated. (State CEQA Guidelines, § 15126.4(a)(4)(B); see also *id.* at § 15142.)

Necessity

SECTION 15130. DISCUSSION OF CUMULATIVE IMPACTS

Specific Purposes of the Amendment

The Proposed Amendments include two revisions to the existing section 15130 of the State CEQA Guidelines. The two proposed amendments are described below.

Section 15130(b)(1)(B)

Section 21083(b) of the Public Resources Code requires that an EIR be prepared if the "possible effects of a project are individually limited but cumulatively considerable." That section further defines "cumulatively considerable" to mean that "the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects."

In determining whether a project may have significant cumulative impacts, a lead agency must engage in a two-step process. First, it must determine the extent of the cumulative problem. To do so, a lead agency must examine the "effects of past projects, the effects of other current projects, and the effects of probable future projects." Once it does so, the lead agency then determines whether the project's incremental contribution to that problem is cumulatively considerable. Section 21100(e) further provides that "[p]reviously approved land use documents, including but not limited to, general plans, specific plans, and local coastal plans, may be used in a cumulative impact analysis."

The existing Guideline section 15130(b) addresses the first step of the process. It offers two options for estimating the effects resulting from past, present and reasonably foreseeable projects. A lead agency may either rely on a list of such projects, or a summary of projections to estimate cumulative impacts. Existing section 15130(b)(1)(B) allows a lead agency to rely on projections in a land use document or certified environmental document that addresses the cumulative impact under consideration.

The proposed amendments would clarify that plans providing such projections need not be limited to land use plans, so long as the plan evaluates the relevant cumulative effect. The proposed amendments would also allow a lead agency to rely on information provided in regional modeling programs. The best projections of the cumulative effect of GHG emissions may be available in up-to-date models such as the International Council for Local Environmental Initiative's Local Government GHG Protocol⁸ and the California Climate Action Reserve's Registry general,⁹ industry¹⁰ and

⁸ ICLEI (2008) Local Government Operations Protocol; Accessed 6/08/09, <http://www.icleiusa.org/action-center/tools/lgo-protocol-1>

⁹ California Climate Action Registry (2009) General Reporting Protocol; Accessed 6/08/09, http://www.climateregistry.org/resources/docs/protocols/grp/GRP_3.1_January2009.pdf

project type protocols.¹¹ Such projections may also be supplied in plans that are not strictly "land use" plans. For example, regional transportation plans in certain areas will ultimately include sustainable community strategies which will include projections a region's GHG emissions and related cumulative effects. (Gov Code, § 65080(b)(2).) Finally, some agencies are beginning to develop GHG reduction plans or climate action plans that may also include such projections. (ARB, Scoping Plan, Appendix C, at p. C-49; OPR, Book of Lists, at pp. 92-100.)

The proposed amendments are consistent with section 21083 of the Public Resources Code and CEQA case law. Section 21083 requires consideration of "the effects of past projects, the effects of other current projects, and the effects of probable future projects." Projections in the listed types of plans and models may include inventories of existing emissions and projected future emissions. Section 21100 of the Public Resources Code provides that land use plans "may" be used in a cumulative impacts analysis, but that section does not purport to limit the types of plans that can be used in a cumulative impacts analysis to land use plans. Finally, case law has supported reliance on projections provided by industry, for example, to satisfy the requirement for a discussion of impacts caused by closely related projects. (*Ass'n of Irrigated Residents, supra*, 107 Cal. App. 4th at 1404.)

While models may provide the most up to date information, lead agencies should still look first to information provided in adopted or certified environmental documents. First, such information has already gone through a public and agency review process. Second, to the extent the model provides information that is not provided in the prior environmental document, the relationship of the model and applicable plans must be explained, along with any changes in circumstances.

Section 15130(d)

The Office of Planning and Research had originally proposed the addition of certain plans to section 15130(d). That section states that previously approved land use plans may be used in a cumulative impacts analysis. Those additions were inadvertently excluded from the proposed amendments that were made available for public review on July 3, 2009. Therefore, the revisions were added to revisions that were made publicly available on October 23, 2009.

The added plans include regional transportation plans and plans for the reduction of greenhouse gas emissions. This change is sufficiently related to the proposal that was originally published. Those plans were proposed for addition to other sections of the proposed amendments, for example, and comments were submitted regarding the use of such plans in cumulative impacts analysis. Plans for the reduction of greenhouse gas emissions were described under section 15064(h)(3), above. Regional

SECTION 15364.5. GREENHOUSE GAS

Specific Purposes of the Amendment

The Legislature has not included a definition of “greenhouse gases” in CEQA, though it did include a definition in AB32. (Health & Saf. Code, § 38505(g).) Thus, new section 15364.5 adds a definition of greenhouse gases. The specified gases are consistent with existing law as they are defined to include those identified by the Legislature in section 38505(g) of the Health and Safety Code.

Notably, the definition in AB32 states that GHG “includes all of the following....” In so stating, the Legislature implies that other gases may also be considered GHGs. The ARB’s Scoping Plan also acknowledges that other gases contribute to climate change. (Scoping Plan, at p. 11.) In fact, the EPA’s Endangerment Finding explained that several other gases share attributes with GHGs but would not be appropriate for regulation under the Clean Air Act at this time. (EPA Endangerment Finding, at pp. 18896-98.) Therefore, similar to the statutory definition of GHGs in AB32, the definition in the Amendments is not exclusive to the six primary GHGs. The purpose of a more expansive definition is to ensure that lead agencies do not exclude from consideration GHGs that are not listed, so long as substantial evidence indicates that such non-listed gases may result in significant adverse effects. This approach is consistent with the Supreme Court’s directive that CEQA be interpreted to provide the fullest possible protection to the environment. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal. 3d 376, 390.)

Necessity

The Legislature directed OPR and the Resources Agency to develop guidelines on the analysis of GHG emissions. (Pub. Resources Code, § 21083.05.) Section 15364.5 is necessary to make specific the instruction to analyze GHG emissions because it states which gases are considered to be “greenhouse gases” and should be included in the analysis.

Reasonable Alternatives to the Regulation, Including Alternatives that Would Lessen Any Adverse Impact on Small Business, and the Resources Agency’s Reasons for Rejecting Those Alternatives

The Natural Resources Agency considered reasonable alternatives to the Amendments and determined that no reasonable alternative would be more effective in carrying out the purpose for which the action is proposed or would be as effective as, and less burdensome to affected private persons than, the Amendments. This conclusion is based on the Natural Resources Agency’s determination that the Amendments are necessary to implement the Legislature’s directive in SB97 in a manner consistent with existing statutes and case law, and the Amendments add no new substantive requirements. The Natural Resources Agency rejected the no action

URB.CPN.1.6	Make centers of activity more prominent through design of street features and by other means.
URB.CPN.1.7	Recognize the natural boundaries of districts, and promote connections between districts.

INTRODUCTION

Nature and Purpose

The Urban Design Element concerns the physical character and order of the city, and the relationship between people and their environment.

San Francisco's environment is magnificent, and the city is a great city, but the unique relationships of natural setting and man's past creations are extremely fragile. There are constant pressures for change, some for growth, some for decay.

Image and Character

POLICY 1.1

Recognize and protect major views in the city, with particular attention to those of open space and water.

Views contribute immeasurably to the quality of the city and to the lives of its residents. Protection should be given to major views whenever it is feasible, with special attention to the characteristic views of open space and water that reflect the natural setting of the city and give a colorful and refreshing contrast to man's development.

Overlooks and other viewpoints for appreciation of the city and its environs should be protected and supplemented, by limitation of buildings and other obstructions where necessary and by establishment of new viewpoints at key locations.

Visibility of open spaces, especially those on hilltops, should be maintained and improved, in order to enhance the overall form of the city, contribute to the distinctiveness of districts and permit easy identification of recreational resources. The landscaping at such locations also provides a pleasant focus for views along streets.

POLICY 1.2

Recognize, protect and reinforce the existing street pattern, especially as it is related to topography.

Streets are a stable and unifying component of the city pattern. Changes in the street system that would significantly alter this pattern should be made only after due consideration for their effects upon the environment. Such changes should not counteract the established rhythm of the streets with respect to topography, or break the grid system without compensating advantages.

The width of streets should be considered in determining the type and size of building development, so as to provide enclosing street facades and complement the nature of the street. Streets and development bordering open spaces are especially important with respect to the strength and order in their design. Where setbacks establish facade lines that form an

The stakes are high for both the developers and the future of the city, with a resulting tendency toward controversy and frustration, and unfortunate divisive effects in the community. For these reasons, the larger sites require separate and more intensive consideration in policies relating to building form.

OBJECTIVE 3

MODERATION OF MAJOR NEW DEVELOPMENT TO COMPLEMENT THE CITY PATTERN, THE RESOURCES TO BE CONSERVED, AND THE NEIGHBORHOOD ENVIRONMENT.

As San Francisco grows and changes, new development can and must be fitted in with established city and neighborhood patterns in a complementary fashion. Harmony with existing development requires careful consideration of the character of the surroundings at each construction site. The scale of each new building must be related to the prevailing height and bulk in the area, and to the wider effects upon the skyline, views and topographic form. Designs for buildings on large sites have the most widespread effects and require the greatest attention.

Fundamental Principles for Major New Development

These fundamental principles and their illustrations reflect the needs and characteristics with which this Plan is concerned, and describe measurable and critical urban design relationships in major new development.

1.

The relationship of a building's size and shape to its visibility in the cityscape, to important natural features and to existing development determines whether it will have a pleasing or a disruptive effect on the image and character of the city.

A. Tall, slender buildings near the crown on a hill emphasize the form of the hill and preserve views.

B. Extremely massive buildings on or near hills can overwhelm the natural land forms, block views, and generally disrupt the character of the city.

C. Low, smaller-scale buildings on the slopes of hills, at their base and in the valleys between complement topographic forms and permit uninterrupted views.

D. Low buildings along the waterfront contribute to the gradual tapering of height from hilltops to water that is characteristic of San Francisco and allows views of the Ocean and the Bay. Larger buildings with civic importance, as evidenced by a vote of the people, providing places of public assembly and recreation may be appropriate along the waterfront at important locations.

E. Larger, taller buildings can blend pleasantly with small-scaled areas if the change in scale is not excessive and if their

POLICY 3.3

Promote efforts to achieve high quality of design for buildings to be constructed at prominent locations.

Certain buildings will achieve prominence, whatever their design, because of their exposed locations. Among such locations are those at tops of hills; those fronting on permanent open space such as the Bay, parks, plazas and areas with height limits; those facing wide streets or closing the vista at the end of a street; and those affording a silhouette against the sky, a muted background or a formal order such as in the Civic Center.

At locations of such prominence, the quality of building design is of special significance, and special efforts should be made to promote the best architectural solutions in both public and private buildings. In such solutions, the positive potentials of the site should be emphasized.

Height and Bulk

POLICY 3.4

Promote building forms that will respect and improve the integrity of open spaces and other public areas.

New buildings should not block significant views of public open spaces, especially large parks and the Bay. Buildings near these open spaces should permit visual access, and in some cases physical access, to them.

Buildings to the south, east and west of parks and plazas should be limited in height or effectively oriented so as not to prevent the penetration of sunlight to such parks and plazas. Larger squares and plazas will benefit, in addition, from uniform facade lines and cornice heights around them which will visually contain the open space.

Large buildings and developments should, where feasible, provide ground level open space on their sites, well situated for public access and for sunlight penetration. The location and dimensions of such open space should be carefully considered with respect to the placement of other buildings and open spaces in the area, and with respect to the siting and functioning of the building with which it is provided. Where separation of pedestrian and vehicular circulation levels is possible in provision of such open space, such separation should be considered.

POLICY 3.5

Relate the height of buildings to important attributes of the city pattern and to the height and character of existing development.

The height of new buildings should take into account the guidelines expressed in this Plan. These guidelines are intended to promote the objectives, principles and policies of the Plan, and especially to complement the established city pattern. They weigh and apply many factors

buildings. For any given location, urban design considerations indicate the appropriateness of a height coming within the range indicated. The guidelines are not height limits, and do not have the direct effect of regulating construction in the city.

POLICY 3.6

Relate the bulk of buildings to the prevailing scale of development to avoid an overwhelming or dominating appearance in new construction.

When buildings reach extreme bulk, by exceeding the prevailing height and prevailing horizontal dimensions of existing buildings in the area, especially at prominent and exposed locations, they can overwhelm other buildings, open spaces and the natural land forms, block views and disrupt the city's character. Such extremes in bulk should be avoided by establishment of maximum horizontal dimensions for new construction above the prevailing height of development in each area of the city.

map 5 - Urban Design Guidelines for Bulk of Buildings

The guidelines for building bulk expressed in this Plan are intended to form an urban design basis for such regulation. These guidelines favor relatively slender construction above prevailing heights, but would not limit the horizontal dimensions of buildings below those heights. Generally speaking, the guidelines would not limit the total floor space that could be built, but would help to shape it to avoid negative external effects. If two or more towers are to be built on a single property, their total effect should be considered and a significant separation should be required between them. The precise form of the building or buildings would in large measure be left to the individual developer and his architects under these guidelines.

The guidelines of this Plan for building bulk are only minimum guidelines, and they are not intended to reduce the necessity for other expressed policies pertaining to height, visual harmony or other factors. Even with building bulk kept within these guidelines, efforts should be made to articulate and soften building surfaces to reduce the massiveness of appearance to a great degree.

METHOD OF MEASURING BULK

MAXIMUM PLAN DIMENSION: The greatest horizontal dimension along any wall of the building, measured at a height corresponding to the prevailing height of other development in the area.

BULK MEASUREMENTS APPLIED TO OTHER BUILDING FORMS

MAXIMUM DIAGONAL PLAN DIMENSION: The horizontal dimension between the two most separated points on the exterior of a building, measured at a height corresponding to the prevailing height of other development in the area.

Large Land Areas

POLICY 3.7

Recognize the special urban design problems posed in development of large properties.

The larger a potential site for development, the greater are apt to be the size and variety of the urban design questions raised. Larger sites may mean greater visual prominence of development and greater impact upon the city pattern. As more land area is included in a single project, the possibilities are increased that the public resources in natural areas, historic buildings and street space will be affected. Larger developments also have substantial requirements for public services, including transportation.

Under normal land use controls, most large development is governed by a "floor area ratio", which permits floor space to be built in each project in proportion to the amount of land area available. The floor area ratio limit tends to be geared to development of sites of small and moderate size, but not to take account of the impact of occasional developments that take up one or more whole blocks of land. Such developments, under this type of formula, may have a single building of truly massive proportions, or a series of building forms constructed in one or more phases.

These differences in nature and impact require that large sites be given close consideration in urban design planning.

POLICY 3.8

Discourage accumulation and development of large properties, unless such development is carefully designed with respect to its impact upon the surrounding area and upon the city.

The height and bulk guidelines of this Plan will help to some extent in reducing the negative effects of development on large sites. They will not, however, deal with all the special problems raised or guarantee good quality of design.

Other measures are available and may be necessary. In some cases, ordinary zoning restrictions might be tightened, or rezoning to permit a large development might be deferred in the absence of adequate assurances of compatible development. New standards might be added to require open space in large projects, and floor area ratios might be reduced or made less advantageous for larger sites.

Because government involvement often occurs as larger sites are developed, through marketing of the site itself, through redevelopment powers, through vacation of streets or in some other manner, the government role might be made more restrictive in such involvement.

There is no substitute, however, for early and frequent communication as to the merits and design of a proposed project between the developer and his architects on the one hand and public urban design professionals and interested citizens on the other. Such communication will give an early and more reasoned assessment of the positive and negative effects of the project upon the city and the surrounding area, and will reduce the chances of later delays and controversies. Processes toward these ends should be employed for all major projects in the city.

POLICY 3.9

Encourage a continuing awareness of the long-term effects of growth upon the physical form of the city.

directly to the waterfront and provide a sense of contact with the water.

Health and Safety

POLICY 4.1

Protect residential areas from the noise, pollution and physical danger of excessive traffic.

In order to reduce the hazards and discomfort of traffic in residential neighborhoods, a plan for protected residential areas should be put into effect. Such a plan is intended to prevent or discourage heavy, fast and through traffic from using residential streets, and to put such traffic on arterial streets where the impact upon residential areas will be less disruptive. Although development of further traffic-carrying capacity on some arterials may be warranted, the local streets should remain as they are or have their capacity reduced.

The speed and volume of traffic on protected streets should be limited by all practical means. Such means include making streets discontinuous to divert traffic from a straight path, narrowing streets and intersections, creating the appearance of narrowness through landscaping and other improvements, and prohibiting access from arterial streets by signs and barriers. Such changes in streets should be so designed that they will not limit the access of vehicles for police and fire protection and other emergency purposes in the protected areas. The total effect of these changes in residential streets should be to give the dominant position to residential qualities and pedestrians rather than to vehicles.

Land uses throughout the city should be regulated in such a way that heavy traffic will not be drawn through protected streets by large commercial, industrial and institutional traffic generators. Traffic for these generators should be channeled as much as possible on arterial streets. High traffic speeds should be discouraged on non-residential streets where the traffic on those streets is destined for protected residential streets.

POLICY 4.2

Provide buffering for residential properties when heavy traffic cannot be avoided.

Subject: 3333 California Street - Letter of Support
Date: Monday, December 10, 2018 3:57:21 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Greetings hard-working, respected and gracious - Planning Commissioners, Planner Zushi and Supervisor Stefani,

As a neighbor and resident who has lived in the city for twelve years, and in Laurel Village for 5 years, I am writing to express my support for the proposed development at 3333 California Street. I am a developer of affordable and market-rate housing in San Francisco, however, for the purposes of this letter, I will take off my business hat, and write you as a neighbor, a husband, a father, and a concerned citizen.

As many of you know, the city of San Francisco is grappling with a housing affordability crisis. The Planning Department recently published a report (2017) titled the “Family Friendly Briefing” that noted with the building boom in the city, which for the most part has introduced more studios and one-bedroom apartments, was unlikely to bring in more families. California, which has one of the world’s 10 largest economies, recently released data showing the lowest birth rate since the Great Depression. Most of these stats, from my generation, are due to the higher cost of living for families.

By creating units designed for two or more bedrooms, the project will be a great place to house families, and a great amenity for existing residents and neighbors. Our growing family is most excited about the 5 acres of open space where our daughter (and future kids) can play. It will help create a family-friendly community environment. The pedestrian walkways through the site will create a beautiful thoroughfare so that neighbors can connect and enjoy views of all of the city.

I urge you to approve this project so that families like ours can continue to thrive in San Francisco. We have benefited so much from the wonderful opportunity in this great city – we hope future families can as well.

Warmly,

Jon Dishotsky
CEO & co-founder

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

As a homeowner and neighborhood resident for more than 20 years, I fully support projects that provide additional housing, but in a way that maintains the character of the neighborhood. The real need is for housing, not for additional retail, as proposed by the developer. There are long-time small businesses in Laurel Village, Sacramento Street, and a few blocks away at Geary and Masonic that fill this purpose.

1
(ME-1)

I fully support the Community Full Preservation Residential Alternative for 3333

2
(AL-2)

It preserves the Historic Characteristics of this wonderful site.

It provides 558 (or 744 in the Variant) housing units.

It builds them in three years.

It does not include the massive unneeded and unwanted Retail/Office/Commercial Complex that the Developer continues to insist upon.

It does not create 8,000 retail auto trips per day.

It does not generate approx. 15,000 tons of greenhouse gases.

It preserves both the present childcare center and the existing café.

It is compatible with the surrounding neighborhoods for character, style, scale and bulk.

I strongly oppose the Developers Proposal as it brings excessive, unnecessary, unwanted and destructive noise, pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it poses threats to pedestrian safety; it contributes to climate change.

3
(ME-1)

Thank you,

Jane Drake

To all concerned,

I have lived on Presidio Ave. between Ca. and Pine St. for 34 years. This is my home and neighborhood and I would like to voice my concerns regarding this development which will affect myself, the neighborhood, and future generations.

I fully support the Community Full Preservation Alternative:

It preserves the historic character of the site

It provides 558 housing units built in 3 years

It does not include retail or office space, it does not generate increased auto traffic for retail

It preserves the present childcare center and dining cafe

It matches the surrounding neighborhoods for character and style

It will preserve the existing small businesses in the neighborhood (Laurel shopping and Sacramento St.)

I strongly oppose the Developer's Destructive Proposal:

It will bring excessive, unnecessary, and destructive noise, pollution, traffic and congestion to the area.

It will affect the quality of life, threaten safety of pedestrians, and contribute to increased climate change

The traffic and congestion are already huge problems on Presidio Ave. The intersections are already crowded with pedestrians, bicyclists, buses, vans, and delivery trucks. I am opposed to the increased delivery traffic on Presidio ave. The soot on my building and steps is terrible, and it is difficult at rush hour getting out of my garage. I am concerned about the air pollution which will affect our health and the increased height which will cut out sunlight. The landscaping and green areas are our only relief and I think as much as possible should be preserved.

Thank you for your time and study of this proposal.

Sharon Esker

Subject: 3333 California Draft EIR comments
Date: Tuesday, January 08, 2019 1:53:44 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

My wife and I live in the Laurel Heights neighborhood, on the block that would be across from the 3333 California development. I have very strong concerns about the impacts to the neighborhood mentioned in the the draft EIR.

1
(GC-1)

The huge increase in traffic, the impact on parking, the ridiculous length of time to complete this project, and environmental/pollution impact are all MAJOR concerns. The influx of hundreds of new residents and the proposed retail will greatly reduce the amount of street parking in the neighborhood (which hurts people such as us who have no garage) and create horrible traffic. Speaking of the proposed retail, there are already empty retail shops in the Laurel Village shopping center and on Sacramento street (not to mention throughout the city). It seems like adding a large retail space would hurt the existing businesses and be hard to fill up (not to mention adding a ton of time, traffic, and pollution to this project).

2
(TR-11)

3
(ME-1)

The developer's request for 15 years to complete the project is a **ludicrously** long time. It seems like something in the 3-5 year range would be more reasonable and would limit the construction impact of traffic, noise and pollution on the neighborhood. Considering that there are already several other large developments happening in the same neighborhood (e.g. 3700 California, Lucky Penny) there will already be a lot of ongoing construction. The environmental report is very concerning. This has been for the most part a quite, residential neighborhood with a lot of families. Pollution, traffic, noise, etc....all have huge, negative impacts on our community.

4
(PD-1)

5
(GC-1)

As an alternative to the proposed development, I would like to support the Community Full Preservation Residential Alternative for 3333 (to be built in 3 years). Please take our concerns seriously.

6
(AL-2)

Thank you,

Zhubin Fardis

Subject: 3333 California Street, Planning Commission Meeting Today

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Good Morning Commissioners,

I am very much disappointed that I am not able to attend today's meeting regarding 3333 California Street. For your information, I am thoroughly familiar with the Developer's Proposal (which I find to be intrusive to say the least) but **strongly support the Community Full Preservation Alternative.**

The Alternative is of great importance to my fellow neighbors, to my family and to our family business (also located near the proposed project).

1
(AL-2)

I ask that you please listen to those neighbors that will appear before you; regretfully, the Developers have had no interest in listening to our concerns.

I strongly urge the Planning Commission to grant a 15 day extension of the due date for comments on this DEIR. Without a doubt, it is a lengthy and complex document and Christmas Eve is surely not a reasonable date for the DEIR Comments to be due. Time is needed.

2
(GC-3)

I would appreciate your consideration and I thank you for your attention.

Subject: DEIR 3333 California Street
Date: Monday, January 07, 2019 8:52:52 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Commissoners,

I am a long time resident of the Laurel Heights area and have attended many meetings regarding the development of the 3333 California Street property. Like so many of my neighbors, I am in opposition to the Developer's Proposal and I state this for the following reasons:

The Developer's proposed 100,000 square feet of Retail/Office/Commercial space is unneeded. We are currently surrounded by numerous small businesses (many of them family owned). They have long provided for our needs and are greatly appreciated.

The Developer's Proposal destroys the historical characteristics of the site. Sadly, under the Developer's Proposal, much of Laurel Hill will be gone as will most of the mature trees and the very welcoming green space.

The requested fifteen years to construct the project is unreasonable. Why should neighbors be subjected to fifteen years of demolition, excavation, noise and pollution?

While I am very much against the Developer's Proposal, I am in favor of the Community Full Preservation Alternative. Unlike the Developer's Proposal, the Alternative does not include the massive Retail/Office/Commercial Complex. It retains the character of the neighborhood and provides 558 housing units to be built in three years and not fifteen.

I would appreciate your consideration.

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

My husband and I live in the Laurel Heights neighborhood, on the block that would be across from the 3333 California development. I have strong concerns about the impacts to the neighborhood mentioned in the the draft EIR.

1
(GC-1)

One of our main concerns is the increase of traffic and the impact on parking and the length of time that the project will take. Since we don't have a parking spot, we rely on being able to park on the street. The influx of hundreds of new residents and the proposed retail will greatly reduce the amount of street parking in the neighborhood. Speaking of the proposed retail, there are already empty retail shops in the Laurel Village shopping center and on Sacramento (not to mention throughout the city) it seems like adding a large retail space would hurt the existing businesses and be hard to fill up.

2
(TR-11)
3
(ME-1)

The developer's request for 15 years to construct the project seems like a ludicrously long time to construct a project. It seems like something into the 3-5 year range would be more reasonable and would limit the construction impact of traffic, noise and pollution on the neighborhood. Considering that there are already several other large developments happening in the same neighborhood (e.g. 3700 California, Lucky Penny) there will already be a lot of ongoing construction..

4
(PD-1)

As an alternative to the proposed development, I would like to support the Community Full Preservation Residential Alternative for 3333 (to be built in 3 years).

Subject: Comments on 3333 California project
Date: Monday, January 07, 2019 9:30:01 PM

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Dear Mr. Zushi and Commissioners,

I am writing to express my deep concerns over the current proposal for 3333 California, and to express support for the Community Alternative.

1
(GC-1)
2
(AL-2)

I have lived in Pacific Heights for 7 years, initially next to Lafayette park and for the past three years next to Alta Plaza park, with my kindergarten age daughter and my husband. We live on Jackson between Baker and Broderick, about six blocks from the corner of California and Presidio, one of the major intersections that would be affected by the project.

We use the JCC frequently, and are constantly using both California, Presidio, Masonic and other streets around the site to get to our destinations, both by car and bus (1, 3 and 43). We also shop at Laurel Village, Trader Joe's and other local destinations.

We are concerned that the proposed project would affect us in numerous ways, the most important of which I outline below:

3
(GC-1)

- The proposed 7-15 year time frame for the project is mind-boggling. It will disrupt the very fabric of the neighborhood as its very important areas will become unusable for entire childhood of kids of our daughters age.
- The long timeframe makes it more likely that in the case of an economic downturn, such as in 2008, the project could halt indefinitely.
- The truck traffic and other construction traffic is a threat to pedestrian safety. The congestion will force cars onto nearby side streets, affecting the whole area.
- The size and scope of the project will have major environmental impact in terms of the amount of GHG released.

4
(PD-1)

5
(TR-6)

6
(GHG-3)

Instead, I strongly support the Community Alternative, which will produce the same amount of much-needed housing. It will increase the density of housing in the area, but will not have the excessive and unneeded retail, office and commercial space. It also can be completed in a reasonable timeframe, thus balancing the needs of the neighborhood and the city as a whole.

7
(AL-2)

I understand that the city needs more housing, but letting developers proposal can not possibly be the right way to go. I urge the commission to work with the developer to be responsive to community concerns by scaling down the proposal.

8
(ME-1)

Thank you very much for your consideration.

Sincerely,

I-FRIDLYAND

Jane Fridlyand
2947 Jackson Street
San Francisco, CA 94115

Cc: LaurelHeights2016@gmail.com
Subject: 3333 California Street development

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Planning Commissioners,

Please grant a 15-day extension of the 45-day comment period on the Draft EIR from December 24 to January 8, 2019. The project construction would last for 7-15 years and there is substantial community opposition to the developers concept. Sixty (60) days are allowed by law and have been granted for complex or controversial projects. Last week the SF Historic Preservation Commission expressed support for a full preservation alternative.

1
(PD-1)

2
(AL-2)

Our Community Full Preservation Residential Alternative which I totally support preserves this historic site plus offers the same amount of housing units (558 with a 744 variant) as the developers. Our Alternative plan does not destroy the award winning building and landscaping with trees dating back to the days of the Laurel Hill Cemetery. This plan is expected to be completed in approximately 3 years. It is a thoughtful, balanced and timely use of this property.

PSKS has not considered the historical significance of this property nor the consequences of dragging this construction out for up to 15 years. This length of construction would be intolerable for the surrounding neighborhoods. In addition, I find it shocking that the developers would be allowed up to 15 years to complete this project when there is a very real housing crisis in The City.

3 (CR-2)

4
(PD-1)

The amount of excavation the developers propose is of great concern. It totally destroys this beautiful and historic site. The amount of dirt, dust, noise and congestion is unimaginable. Also, there is serpentine rock on this site which, if disturbed, can release asbestos dust, clearly a documented health hazard.

5 (CR-3)

6 (GC-1)

7 (HZ-1)

Therefore, for these reasons I fully support the Community Full Preservation Residential Alternative for 3333 California Street and strongly oppose the PSKS plan.

8
(AL-2)

Very truly yours,
Janet Frisbie
525 Laurel st, 94118

Subject: 3333 California Street

I completely support the Community Full Preservation Residential Alternative plan for 3333 California Street. The reasons are many including the fact that it preserves the historical characteristics of this site by keeping the existing award winning building plus the original landscape and hardscape. This Community Alternative plan provides the same number of housing units as the developers plan, that is 558 or 744 in the variant, without generating massive amounts of greenhouse gases. There will not be unnecessary excavation as in the developers plan thereby lessening the dirt, dust, noise and other pollutants. There is serpentine rock under the site that, if disturbed, can release asbestos dust, a well known health hazard. The Community Full Preservation Residential Alternative plan is expected to be completed in about 3 years. This bears repeating. The Community Full Preservation Residential Alternative plan is expected to be completed in about 3 years.

1
(AL-2)

I strongly oppose the Developers proposal with its unnecessary retail and resulting congestion, its destructive excavation and ruination of a California State Historical Site and the alarming construction time schedule. I find it shocking that the Developers would propose to need up to 15 years to complete this project.

2
(ME-1)

3
(PD-1)

Again, up to 15 years to complete this project! That makes a mockery of The City's very real and current housing crisis and shows zero concern for the residents in the surrounding neighborhoods. Fifteen years of construction would make this area unlivable for these neighborhoods. I fully expect that my husband and I will have to move out for at least part of this intolerable construction period. Not a pleasant experience to look forward to for a couple in their 70's.

3
(PD-1)
cont'd

These desirable neighborhoods surrounding the 3333 California Street property deserve a thoughtful, balanced and relevant use of this beautiful 10+ acre parcel. The Community Full Preservation Residential Alternative plan will give them the best of the historical characteristics and a 21st century prospective that will continue the tradition for what has always been a very special area of The City. Show the 800+ signers of the petition that you understand the importance and magnitude of this decision.

4
(AL-2)

Very truly yours,

Janet Wennergren Frisbie

This message is from outside the City email system. Do not open links or attachments from untrusted sources.

Find attached my general comments concerning the Project and Variant proposed in the DEIR and the supporting information. In general the DEIR is rife with inaccuracies, incorrectness and incompleteness. I will submit more detailed and referenced comments prior to 5 pm January 8, 2018.
Richard Frisbie

1
(GC-1)

I-FRISBIER1

SUMMARY of DEFICIENCIES/INACCURACIES for the 3333 California DEIR

“Incorrect, Incomplete, Inaccurate”

The developer's request for 15 years to construct the project is suspect. This looks like a plan to sell a new entitlement on an up-zoned property. Developers all over town are selling new entitlements rather than build housing. Alternatives analyzed in the Draft EIR would be built in 3 to 5 years. The Community Preservation Alternative would be built within three years.

2
(PD-1)

I fully support the Community Full Preservation Residential Alternative for 3333

It preserves the Historic Characteristics of this wonderful historic site.
It provides 558 (or 744 in the Variant) housing units.
It builds them in three years.
It does not include the massive unneeded and unwanted
Retail/Office/Commercial Complex that the Developer continues to insist upon.
It does not create 8,000 retail auto trips per day.
It does not generate approx. 15,000 tons of greenhouse gases.
It preserves both the present childcare center and the existing café.
It is compatible with the surrounding neighborhoods for character, style, scale
and bulk.

3
(AL-2)

I strongly oppose the Developers Destructive Proposal as it brings excessive, unnecessary, unwanted and destructive noise, pollution, traffic and congestion to the neighborhoods surrounding 3333; it threatens the quality of life; it poses threats to pedestrian safety; it contributes to climate change.

4
(ME-1)

The Community Full Preservation Alternative will generate ZERO retail auto trips to 3333 as opposed to the 8,000 retail caused the Developers Destructive Proposal.

5
(AL-2)

The Community Full Preservation Alternative Preserves and Protects Small and Family Owned Businesses

The Community Full Preservation Alternative will protect the small, family owned businesses in Laurel Village, Sacramento St. and Presidio Ave. A quick walk around these neighborhoods will clearly show the immense pressure these businesses are experiencing. More retail is unneeded and unwanted. It will destroy our local businesses.

The Neighborhoods are well served by businesses at Laurel Village, Sacramento St., Trader Joe's, City Center, California St. etc. we do not need more, more, more.

We do not need the more than 100,000 square feet of Retail, Office, Commercial space that the Developers Destructive Proposal calls for.

One of the reasons the Developer destroys this historic site is to create enough space for this unneeded and unwanted Retail/Office/Commercial (ROC) nonsense.

The CPMC development, a Community supported plan by the way, adds 270 housing units and the Developer and neighbors have agreed to have no Retail. Why is 3333 being treated differently by forcing unneeded and unwanted ROC (Retail/Office/Commercial) against the overwhelming opposition of the surrounding residents?

The Community Unanimously Opposed the Developers' Massive Retail, Office, Commercial (ROC) Complex.

In a recent Petition Drive at Laurel Village over 800 residents signed the Petition opposing the Developers Full Destruction and Massive ROC plan and supporting the Community's residential Alternative. Three people opposed it the Petition. These signatures were gathered in less than 8 hours.

In the Petition Drive the 800 signatories opposed rezoning 3333 and also opposed revoking Resolution 4109, an agreement between the City and the surrounding neighborhoods.

"A deal is a deal" was how everyone felt.

The Community Full Preservation Alternative will already be more than twice as dense as the surrounding neighborhoods so any rezoning is uncalled for, unneeded and unwanted.

These signatures are in the hands of the District 2 Supervisor.

The Developers Destructive Proposal Generates Excessive Levels of Greenhouse Gases and Even More Destructive Climate Gases.

Based on current estimates, it will generate approx. 15,000 tons of Greenhouse Gases (GHG)

5
(AL-2)
cont'd

6
(PP-1)

7
(GHG-2)

and the many associated and far more destructive climate changing gases that accompany the primary Carbon Dioxide gas.

The Community's Full Preservation Alternative will, by comparison, generate approx. 4,100 tons of GHG.

The Community Alternative mitigates the GHG generated by more than 70 percent, providing a dramatic reduction in a time of climate change.

The GHG calculation is our best estimate. Neither Planning nor the Developer will provide the volume of concrete or weight of steel required.

The Developer claims to have built many buildings and many complexes, Planning claims to oversee thousands of such projects and yet no one can even make an educated estimate as to the concrete and steel required.

Could there be something they want to conceal from the public?

Much like they concealed the Historic nature of 3333 for over 4 years?

Planning ignores the GHG generated by the construction materials despite the requirement to address "indirect" GHG. Planning requires the GHG generated in dispensing water to control dust, etc, to be calculated but not the GHG generated in manufacturing the materials used in the construction!

Example: The GHG generated by the diesel fuel burned to deliver a load of concrete is calculated to the decimal point but the GHG generated by the concrete itself is ignored.

What do the numbers show?

Assume a 30 mile round trip: the truck burns approx. 10 gallons of diesel and generates 225 lbs. of CO₂. The concrete in the truck generated over 5,000 lbs. of CO₂ during manufacture. So, Planning recognizes the 225bs. but claims the 5,000lbs. is irrelevant **essentially ignoring 95% of the real GHG!**

And using this logic throughout the Initial Study Planning concludes that GHG are "Less than Significant" and therefore need not be addressed!

Folks, you can't make this stuff up as its beyond one's imagination.

The steel, glass, etc. are all treated similarly.

Apparently if you can't see the GHG actually being emitted into the air it doesn't actually exist so there is no need to consider it. So much for a responsible approach to Climate Change.

As noted above the Community Full Preservation Alternative generates less than one third the GHG, however Planning chooses to calculate them.

NOTE: Over 95% of the cement/concrete used in the Bay Area is totally manufactured in the Bay Area beginning with the mining process so these GHG are being injected into our air.

The Community Alternative is Superior, Sooner and Safer

We pollute less and protect the environment: the Community Alternative will ALWAYS generate less than one third the GHG generated the Developers Full Destructive Alternative:

We destroy less: we preserve the historic site.

We build less: 4 new buildings versus the Developers' 11 new buildings plus creating two tall towers out of the existing main building.

One single level underground parking garage for 450 spaces versus a complex of parking garages, some of three levels, for 896 spaces;

We excavate less: 90,000 cubic yards (9,000 dump truck loads) versus 288,000 cubic yards (32,000 dump truck loads);

We preserve and protect our local businesses and shops: no added unwanted and unneeded and neighborhood destroying family-owned or small retail or business;

We better protect the health and well being of everyone: no 13,000+ auto trips to pollute the air, generate the noise, put pedestrians at risk, unload trucks on the streets, etc.

The Community's Full Preservation Alternative solution will always be three times More Climate Friendly; Far Less Disruptive; Far More Family Friendly; Far Safer for Pedestrians; Far Healthier Air Quality-wise; and Provide Critical Housing at Least Three Times Faster than Developers' solution.

We fully support housing

The Community has supported the Lucky Penny (95 units), CPMC (270 units) and now 3333 (558) units. It was the Community that spearheaded the effort that led to the approval of the Lucky Penny Project.

Over 1,000 units in a half mile radius.

So please don't offend me and misrepresent the Community's position.

We support housing and history; we oppose unneeded, unwanted and unnecessary Retail and mindless destruction of a historic site.

AND we provide housing in as much as 12 years sooner than the Developers Full Destructive Plan does.

The YIMBYs should be 100% in favor of the Community's Full Preservation plan and if they're not then they are being grossly hypocritical.

The Community Full Preservation Alternative Prevents Excessive Traffic from the Massive ROC Complex, Uber & Lyft. Etc. from Overrunning our Neighborhoods.

10
(TR-2)

Recent studies have shown that the City's method of calculating auto trips, and the resulting chaos and congestion is deeply flawed, to the point of being misleading.

At the time the VMT (Vehicle Miles Travelled) methodology was developed, SF CHAMP last updated Nov. 2014, the Transportation Networking Companies (TNCs) -Uber/Lyft/Chariot etc. were still in their infancy and so the VMT methodology fails to account for their incredibly disruptive impact.

The TNCs average, conservatively, in excess of 170,000 trips per day in San Francisco.

There are about 2,000 taxi medallions in San Francisco so TNCs do not just replace taxis they overwhelm them by orders of magnitude.

Also, implementation of the VMT methodology is not mandated until 2019 but as Planning and The Developers were unable to explain away the 8,000 Retail Auto trips generated by the existing, and still acceptable, Level of Service methodology, they implemented the VMT methodology with "refinements." Planning calculates the Developers Destructive Proposal using VMT methodology will generate approx. 5,800 total auto trips for 3333 for Retail + Office + Residential which is an entirely bogus number based on questionable assumptions, such as "The SF Guidelines **do not provide a specific methodology to** assess the number of trips...." Planning has therefore, with no supporting documentation or analyses, applied "appropriate refinements to the standard travel demand...."

Rather amazing that these "refinements" all work in the Developers favor.

Nowhere in these "refinements" have TNCs been taken into account!

Oh, by the way, the "refinements" used were created for The Mission Rock Project at Seawall Lot 337 and Pier 48 as well as the Pier 70 Mixed Use District Project!

Seawall Lot 337 & Pier 48 summary:

Project type Mixed-use, open space, residential, commercial

Project area Approx. 28 acres

Proposed building area 1.3 – 1.7 million sf commercial; 750,000 - 1.5 million sf residential; 150,000 – 200,000 sf retail, 850,000 sf structured parking

Seawall Lot 337 & Pier 48

Pier 70 summary: “The 35acre waterfront mixed-use neighborhood will provide housing, waterfront parks, artist space, local manufacturing and rehabilitated historic buildings.” Altogether the redevelopment covers 35 acres and up to 3,025 new units of housing—the exact count is still in flux, with a low end of 1,645—and its roots stretch back a decade to a 2007 port plan.

WOW! What remarkably similar projects to 3333. What “refinements” could possibly be comparable? Simply bogus.

The DEIR consistently attempts to misrepresent and mislead the public.

It is incomplete, incorrect, inaccurate and invalid and NOTHING demonstrates this better than the above.

Under their previous, Level of Service, methodology they would have calculated 8,000 retail trips alone.

I think it safe to say that the numbers presented by Planning are simply “Developer friendly!”. Their VMT methodology with “refinements” will generate fewer trips, especially since there are no criteria for calculating the impact of TNCs, but there is nothing in the legislation that remotely suggests it would generate 35% less trips! This entire section is suspect and Planning must explain this profound discrepancy.

As noted above, nowhere are the TNCs incorporated into the calculations.

All of which renders the Traffic Analysis incorrect, incomplete, inaccurate, invalid.

The Planning Department proposes to reduce the number of retail parking spaces as a mitigation measure to reduce the significant traffic impact.

This is a false assumption and shows the extent to which the Developer and Planning misunderstand, or simply choose not to understand, the impact that the TNCs have.

Planning’s mitigation measure is a stone age solution to a digital age problem.

How will many people respond to a perceived lack of parking?

They’ll simply call a TNC and go anyway.

Eliminating parking won't eliminate auto trips it will actually increase auto trips.

A UC Davis study shows that people make MORE trips because of TNCs than if they had to use their own cars or take public transit. People now make trips they would never have made in the past – by any mode of transport.

The VMT methodology used by the Planning Department fails to account for the impact of TNCs.

And, the use of TNCs makes the GHG situation worse.

Let's assume I want to go to 3333 by auto. I could personally drive 2 miles to get to the 3333 Retail/Office/Commercial complex, park, then shop or do business, the drive 2 miles home for a total of 4 miles.

Data shows that many people will now use a TNC rather than drive their own cars. This will be even more pronounced if Parking is reduced!

So now the TNC has to come to me, assume 2 miles, and take me the 2 miles to 3333 for a total of 4 miles.

When I go home the same thing happens or an additional 4 miles for a grand total of 8 miles. Twice the GHG generated per trip!

So, not only do we have 8,000 retail auto trips, excluding the effect of TNCs (not addressed) to deal with we have many of them generating significant more GHG per trip!

Planning needs to do a comprehensive analysis using credible data and a credible methodology so that the public knows the extent of the GHG generated.

We are in a crisis with climate change and the methodology shown in the DEIR fails to address this crisis credibly.

In fact climate change is more of a threat to the future of San Francisco than housing is and it isn't being addressed accurately in the DEIR.

11
(GHG-1)

The Community Full Preservation Alternative Protects the Historic Site, Protects the Greenspaces, Maintains the Existing RM-1 Zoning and Resolution 4109, Maintains the Public's Permanent Right-of-Use of the Greenspaces .

The Developers Destructive Proposal first demolishes and destroys the Historic Characteristics and nature of 3333.

Then it virtually destroys all of Laurel Hill itself, with the exception of a small sliver at the southwest corner, by excavating the entire site to depths ranging from 15 to 40 ft.

The only area that isn't excavated is under a portion of the existing building!

Not sure how they missed that opportunity!

Removal of the demolition debris and the excavated soils will require approx. 28,000 dump

12
(AL-2)

13
(CR-2)

14
(GEO-3)

15
↓
(AQ-1)

truck loads, all of which have to pass though and pollute our neighborhoods.

By contrast, the Community Full Preservation Alternative generates approx. 9,000 dump truck loads, one quarter as many!

After the demolition the Developer has to then deliver all the new materials required to rebuild what they demolished plus 11 new buildings.

How many large truck loads, concrete truck loads, etc. will this require?

The Community Alternative only builds 4 new buildings so like the GHG and the debris/soil removals the Community Full Preservation Alternative requires far fewer, probably about one third, or less, as many delivery loads.

A quick look at the turning radii of the trucks, ie. SU-30 Circulation Exhibit and WB-40 Circulation Exhibit clearly demonstrates that all the deliveries during destruction, demolition, excavation, construction and long term operations pose significant threats to traffic safety, pedestrian safety, congestion and pollution.

In fact, as WB-40 shows large trucks cannot safely navigate 5 of the 6 major intersections surrounding the site. There are no plans to mitigate this profound situation which will essentially exist from the beginning of the project ad infinitum. Planning and the Developers have simply washed their hands of the problem a la Pontius Pilate.

The Community Full Preservation Alternative will preserve most of the mature trees at 3333, some of which date back to the time of the Laurel Hill cemetery whereas the Developers Destructive Proposal will attempt to spare approx. 4.

The Community Full Preservation Alternative Keeps the Loading and Unloading Traffic Within the Site as Opposed to External to the Site

The Developers Destructive Proposal surrounds 3333 with five major Loading/unloading zones for TNCs and Freight traffic. Initially the Developers promised that all the unloading would be done underground or on-site and now the site is ringed with these zones! These zones not only eliminate approx. 40 parking spaces but they will create additional traffic congestion and pollution. So we have a ring of loading zones in addition to the inevitable double parking that occurs for deliveries and drop-offs. A perfect storm!

Section A: DEIR Deficiencies for Greenhouse Gas Calculations and Demolition Debris Processing – Attachment E to this document is separately attached due to its size.

Section B: DEIR Deficiencies for Construction Trip Generation.

Section C: Deficiencies for Hydrology and Water Quality.

Section D: Attachment E – From Section A above.

Section A

DEIR Deficiencies for Greenhouse Gas Calculations and Demolition Debris Processing

DEIR Deficiencies - Greenhouse Gas (GHG) Calculation and Demolition Debris Processing

Attachment 1: Comments on 3333 California St. GHG Calculation Deficiencies with respect to the Initial Study dated April 25, 2018 and Version 2 dated May 14, 2018.

Attachment 2: 3333 California Street Mixed-Use Project Application for Environmental Leadership Development Project including Attachment E of same.

Attachment 3: 3333 California St. Initial Study pg. 146 Impact C-AQ-1.

Attachment 4: San Francisco 2004 and 2009 Housing Element, Cover and pg.V.1-17

Attachment 5: FN 130 SF Planning Department "Compliance Checklist Greenhouse Gas Analysis" Cover and pg. 19.

Attachment 6: San Francisco Planning Department "Greenhouse Gas Analysis Pursuant to CEQA" dated November 12, 2010.

Attachment 7: Initial Study No. 2015-014028ENV. Project Description pg. 6.

1
(GHG-1)

In addition to the comments in this letter I am resubmitting my revised Initial Study Comments (Attachment 1) as the Planning Department has failed to address them and has withheld critical, pertinent and specific information from the public. The revisions reflect information gleaned from the Initial Study and subsequent documents. It also reflects corrections and adjustments to relevant criteria.

As noted below, had Planning provided the information requested it would have permitted the GHG issue to be analyzed quickly but, to date, the public has not been provided this fundamental data.

Regardless, the Community Alternative will generate less than one third the GHG generated by the Developers' Project. It will also clearly shows that the Community Alternative is a far superior solution in that it generates approx. 30% of the total GHG generated by the Developers' Plan. A significant Mitigation Measure in itself.

In the Initial Study Impact C-AQ-1 (Attachment 3) was deemed "less than Significant." No data or analyses was provided to support this erroneous determination which was incomplete, incorrect and inadequate. The text which followed was simply a rehash of all the relevant documents but nowhere was there any analyses that showed compliance with the requirement to consider "greenhouse gas emissions, directly or indirectly"

No Indirect GHG were calculated as noted in Attachment 1 and required by Attachments 3, 4 and 5.

The only information provided in Volume 2 dealt with construction GHG and operational GHG, nothing addressed the GHG related to the manufacture and use of the basic building materials

to be used in constructing the buildings, underground garages, etc.

Indirect GHG are required to be calculated, analyzed and incorporated into the conclusions and Mitigation Measures. The Planning Department has failed to do any of this.

Indirect GHG are also required to be similarly addressed in the San Francisco 2004 and 2009 Housing Element Impact GH-1 (Attachment 4). None of this was done.

CEQA Guidelines section 15358(a)(2) defines "effects" of a project to include "indirect" effects. These indirect effects are cumulative in nature. They are also reasonably foreseeable and the DEIR was inadequate for failure to consider them.

15358. EFFECTS "Effects" and "impacts" as used in these Guidelines are synonymous. (a) Effects include: (1) Direct or primary effects which are caused by the project and occur at the same time and place. Association of Environmental Professionals 2018 CEQA Guidelines 261 (2) Indirect or secondary effects which are caused by the project and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect or secondary effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems. (b) Effects analyzed under CEQA must be related to a physical change. Note: Authority cited: Section 21083, Public Resources Code; Reference: Sections 21068 and 21100, Public Resources Code.

Despite multiple requests we have not been provided with an estimate of the volumes of concrete, weights of steel and glass to be used in the project. This information would quickly reveal the massive amounts of GHG involved in the Developers' 3333 Plan.

Planning supposedly oversees thousands of major projects and PSKS supposedly develops multiple large buildings/projects and yet no such estimates are available, or so we are told.

Planning has had access to a detailed GHG Study prepared by SWCA since August 2018 which specifically addresses GHG in the Attachment E AB900 Analysis by Ramboll. The SWAC Study lists total construction GHG of 4,273 metric tons (Attachment E Construction GHG Emissions Table 4 pg. 8) which clearly exceeds the limits in Attachment 6.

However, these are only "direct" GHG and do not include the "indirect" GHG generated by the manufacture of the concrete, steel, glass, etc. which will be used to construct the buildings. ALL indirect GHG are missing from ALL the Planning Department's documents and conclusions which are incorrect, incomplete, and inadequate. Nothing in Attachment 6 excludes construction materials from the process. In fact the very term "energy associated with treatment" on page 2 can refer to the treatment of raw materials. The etc. at the end of the same sentence clearly indicates that a number of other "indirect" GHG are to be considered if present. None of this has been done.

The DEIR Lacks Substantive Evidence That GHG are "Less Than Significant."

Processing of Demolition Debris

Furthermore, nowhere in the Initial Study, the DEIR or the SWAC Report is there any mention, analyses or compilation for the GHG generated by processing the debris from the demolition of the site as required by the City's applicable Ordinance - Planning Department's Reference FN 130 "Compliance Checklist Greenhouse Gas Analysis" pg. 19 "San Francisco Construction and Demolition Debris Recovery Ordinance" (Attachment 5).

The first paragraph of the Requirements says that "All (100 percent)...to be processed for recycling."

Second paragraph says that "projects that include full demolition of a structure..." allows for the processing of a minimum 65% of the demolition debris..."

The Developer is NOT demolishing 100% of the main building and MUST recycle 100% of the demolition debris from the main building. Attachment 7 "the existing approx. 55.5-foot tall building at the center of the site would be partially demolished....." Pretty clear statement and supporting drawings.

Demolishing 100% of the Annex building does not qualify as exempting the debris from the main building from the 100% requirement.

In the Remarks column the Planning Department states that a "minimum of 65%..." and then references the Annex building in an attempt to limit the overall processing to 65%.

The Annex Building demolition is trivial with comparison to the main building and yet is used in an attempt to reduce the 100 percent processing required of the main building debris.

This is a deliberate abuse of the language and intent of the Ordinance.

The Annex building and main building are separate and distinct and the disparity in volume of debris is more than an order of magnitude.

The Developer must process 100% of all the debris from the main building demolition.

Using the annex building as a pretext for setting the processing percentages is disingenuous and violates the City's own Ordinance.

In addition, no calculation is shown that indicates the amount of GHG generated from the processing of the 65% of the Annex Building and the 100% of the main building debris as well as the parking lots, garage ramps, etc.

All of these generate the "indirect GHG" required to be addressed in the GHG totals. No calculations for the processing of the demolition debris has been presented.

The GHG analysis is further invalidated by the incorrect interpretation and implementation of the City's own Ordinance and the failure to make the appropriate GHG calculation.

Frankly this is a deliberate attempt to circumvent the City's own rules!

In addition, Attachment 2 Item 9 "Consistency with statutory Requirements for CEQA Streamlining" states "to offset GHG emissions...." certain steps will be taken. Interesting that mitigation measure are proposed for a situation that is already defined "Less than Significant" in the Initial Study. One might even consider it bizarre. (GHG-1) cont'd

However, the steps proposed fall woefully short of offsetting the "direct and indirect" (the indirect are yet to be calculated but I offer the attached table in order to assist the Planning Department in complying with CEQA) GHG generated during the construction phases(s). It is simply impossible to conclude, as C-AQ-1 attempts to do, that the GHG generated are "less than Significant."

Furthermore, the California Air Resource Board itself requires that both direct and indirect GHG be calculated.

DEMAND is that we be provided with ALL data, calculations, documentation, etc. that have any bearing on GHG associated with 3333 California Street inclusive of Initial Study, Application for an Environmental Leadership Project, the DEIR and 3333 California Street in toto.

DEMAND is that ALL GHG, direct and indirect, including those generated by the manufacture and transport of the building materials themselves, be calculated as required by both the City and the State.

DEMAND is also that the GHG be reclassified properly as "Significant" and are as of now Unmitigated.

DEMAND is that the Community's Alternative GHG levels, one third of the Developers' levels, be used as the baseline for setting the standard for 3333 California St.

DEMAND is that the processing of demolition debris from the main building be properly calculated by requiring 100% processing of the main building debris.

DEMAND is that the GHG generated by this processing be accounted for: a minimum of 65% of the Annex Building and 100% of the main building debris. No information is provided as to the percentage of the parking lots and garage ramps that will be processed. We require this information.

The DEIR is incomplete, inaccurate and incorrect in totally ignoring GHG from construction material manufacture and transport, demolition debris, etc.

Attachment 1

Comments on 3333 California St. GHG Calculations Deficiencies with respect to Initial Study
dated April 25, 2018 and Version 2 dated May 14, 2018

GREENHOUSE GAS EMISSIONS (see note 1)

EXECUTIVE SUMMARY

This document is a revised and updated version with corrections to the document submitted to the Planning Department April 25, 2018. It addresses the incorrect, incomplete and inaccurate data (where provided), analyses (where provided) and conclusions stated in the Initial Study.

None of these were corrected in the DEIR.

The Initial Study's (Reference 4 to this submission) conclusion on page 146 per the Table, items 7(a) and (b) as well as on page 148 "Impact C-GG-1" that the construction phase of the project will generate "Less than significant" Greenhouse Gases is incomplete, inaccurate, inadequate and invalid.

The approximate 14,000 tons of Greenhouse Gases generated, direct and indirect, as a consequence of the construction phase of the proposed development is hardly a "less than significant" tonnage as stated in the Initial Study and not addressed in the DEIR. Essentially the subject is being ignored.

The Community Residential Alternative, supported by the coalition of neighbors surrounding 3333, will generate only 30% (4,100 tons) of the Greenhouse Gases generated by the PSKS plan, as a consequence of their construction phases, while protecting the historically significant main building and landscaping. The Community Alternative provides a significant mitigation of Greenhouse Gases and the destructive impact they have on health, quality of life and climate change.

Notes:

This document addresses only the generation and release of Carbon Dioxide, direct and indirect, as a consequence of the construction phase.

However, the other Greenhouse Gases associated with this type of work –methane, nitrous oxide, etc.- although present at much lower levels than carbon dioxide have a GWP (Global Warming Potential) anywhere from 25-300 times greater than carbon dioxide (Reference 11) and need to be addressed as well.

The indirectly generated Greenhouse Gases has not been taken into account in either the Initial Study or the DEIR.

San Francisco and the California Air Resources Board (CARB) require that all Greenhouse Gases, direct and indirect, be calculated, analyzed and properly presented with mitigation measures being required.

The DEIR is incomplete, incorrect and inadequate as it fails to address the indirect Greenhouse Gases.

2

(GHG-1)

INTRODUCTION

Reference 4 Section E. 7 - Greenhouse Gas Emission pages 146-150:

Impact C-AQ-1 (Potentially Significant). "Potential cumulative air quality impacts will be addressed in the EIR."

2
(GHG-1)
cont'd

Table: 7 GREENHOUSE GAS EMISSIONS (page 146)

Would the project:

- (a) "Generate greenhouse gas emissions, either directly or indirectly (underline added), that may have a significant impact on the environment?"
"Less Than Significant" is checked.
- (b) "Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing emissions of greenhouse gases?"
"Less Than Significant" is checked.

Not a single calculation, analysis, compilation or comparison is presented to support these inadequate conclusions of "Less Than Significant."

These conclusions are incomplete, inaccurate, inadequate and invalid in toto.

The project proposed by the developers (PSKS) would generate as a consequence of the construction phase alone approximately:

13,525 TONS OF GREENHOUSE GASES (see Note 1)

Due to the complete absence of any supporting data, as well as Planning's delayed response to relevant questions, it has been necessary to make some assumptions in analyzing details of the PSKS plans.

By comparison, the Community Residential alternative, supported by the coalition of neighbors surrounding 3333, would generate Greenhouse Gases at levels less than 30 percent (4,100 tons) of the PSKS levels. The Community Residential alternative represents a 70% mitigation of these harmful gases to health, well-being and the environment.

Thus, without the relevant data and corresponding analyses based on available air emission models, Planning's conclusions have no basis in fact and are incorrect, incomplete, inadequate and invalid.

On page 148, first paragraph, of reference 4, it is stated "The following analysis of the proposed project....."

In reality there is no analysis whatsoever in the referenced document as to the Greenhouse Gases generated as a consequence of the construction phase which, as shown above, produces significant amounts of harmful Greenhouse gases.

Pages 148-150 speak exclusively to the Operational phase of the project while completely omitting even a reference to the construction phase.

There is no reference made as to the volume of concrete, weight of steel, weight of glass, etc. included in the project - all of which have profound implications as to the levels of Greenhouse Gases emitted into the atmosphere as a consequence of the construction phase.

I am still awaiting answers to question submitted to Planning on related issues.

It would appear that no analyses have been made, certainly none are presented, as to the Embodied Energy content of the construction methods and materials.

Such analyses would immediately highlight the significant levels of Greenhouse Gases that would be generated as a consequence of the PSKA planned construction phase and highlights the need for mitigation measures.

Due to the absence of data it was necessary to use information listed in the references to develop the approximate levels of Greenhouse Gas tonnages generated as a consequence of the construction phase. Had the Initial Study, which, forms the basis for the EIR, carried out some fairly straightforward analyses we could have compared the results to determine where additional study is required.

At such time as the City provides the necessary technical data, such as the energy required to recycle the main building debris (see note 1), volume of concrete and weight of steel, glass, etc. required for the re-construction, etc. the estimated Greenhouse Gas tonnages generated as a consequence of the construction phase could be re-calculated accordingly.

Notes:

1. There appears to be no calculation or consideration in any of the City's documents that addresses the Greenhouse Gases generated by the recycling of the debris from the main building.

Recycling steel and concrete is energy intensive and needs to be properly accounted for in the Greenhouse Gases budget.

The only thing more harmful is to simply dispose of reusable materials in a landfill.

2
(GHG-1)
cont'd

DISCUSSION

The Greenhouse Gases generated as a consequence of the Construction phase will be discussed in the following order:

1. Demolition of portions of main building, service building, parking lots, garage ramps.
2. Removal of Debris generated in 1. Above.
3. Excavation of site for underground parking, building foundations, etc.
4. Removal of Spoils generated in 3. Above.
5. Reconstruction, strengthening and increased height of the main building.
6. Construction of underground parking garages.
7. Construction of Masonic, Euclid and Mayfair buildings.
8. Construction of Plaza A & B and Walnut buildings.
9. Construction of Laurel St. duplexes.

2
(GHG-1)
cont'd

1-4: DEMOLITION, EXCAVATION AND REMOVAL OF DEBRIS AND SPOILS.

The first four activities, 1-4, listed above will be looked at together as they basically utilize energy to carry out the activity.

PSKS proposes to demolish approximately 50% of the existing main historic building as well as most of the historic landscaping. In addition, the various parking lots and roadways on the site will be demolished as well as the circular garage ramps. After demolition the debris will be removed and the site will be excavated and the spoils hauled away. Reference 26 shows the approximate amount of fuel, diesel and gasoline, and electricity consumed. Some of this is spread over the construction phase of the building cycle. As items such as the map of the routes selected (Reference 9) have not been made available, but have been requested, it is impossible to judge the reasonableness of some of these calculations.

It should be noted that the 0.05 gallons per horsepower-hour used in the Reference 26 is 10-15% lower than industry data available from multiple sources (see Reference 29, the value 0.056, as an example).

Also of significance, which is not addressed, is the volume of serpentine that could be present and which requires significantly more energy to remove than soils and clays.

The five primary boring sites related to geology are of considerable interest.

Major excavation will take place along Masonic and Euclid and yet no borings were made at any intermediate location along this >600ft segment of the property.

The boring sites appear in Reference 30.

A boring (B-3) was done at Masonic and Presidio where no excavation will take place.

The only other boring on the southern half of the property was taken very near the Euclid-Laurel intersection (B-4) where, again, no excavation will take place.

So, all the excavation for the Masonic and Euclid buildings will be done without any specific first-hand knowledge of the geology at those locations.

And yet it was deemed appropriate to do boring B-5, a site where the Laurel St. duplexes will be constructed and which require significant less critical subsoil information as they do not have underground garages supporting major buildings.

2
(GHG-1)
cont'd

Outcrops of serpentine exist throughout this general area so it is probable that these areas of excavation will encounter significant deposits of serpentine, the excavation of which is far more difficult and energy intensive than for stiff clays etc. as well as posing a health risk which could be of a much greater magnitude than that presented in the Initial Study.

Frankly one could conclude that the boring sites were carefully selected to avoid discovering any controversial conditions that may well underlay the site!

The net result is that the energy discussed in Reference 26 must be considered to be at the very low end of likelihood.

Higher values should be expected and this likelihood is not addressed in the DEIR.

Despite the optimistic view of Reference 26, these phases of the project will still generate approx.

3,500 TONS OF GREENHOUSE GASES

As noted above in the Introduction, no consideration appears to have been made for the energy associated with the recycling of the reusable components of the debris from the main building.

So, what would be a more realistic estimate?

The Community Residential alternative would generate approx. 23 percent of that, or 800 tons, of Greenhouse Gases.

5. RECONSTRUCTION, STRENGTHENING AND INCREASED HEIGHT OF MAIN BUILDING

First, the remaining portions of the historical main building will require strengthening as it was not originally designed or built to accommodate three additional floors and their related infrastructure.

The volumes of concrete and steel involved will result in significant generation of Greenhouse Gases, no mention of which appears anywhere in the Initial Study or the DEIR! The DEIR is simply incorrect, incomplete and inaccurate with respect to direct and indirect greenhouse gases and also Air Quality.

The DEIR should, but did not, disclose the volumes of concrete and/or weight of wood, as well as the weights of steel and glass that would be used in the PSKS proposed development.

This information is relevant to the calculation of Greenhouse Gas Emissions.

Projects involving buildings of this size, and larger, have seen significant reductions savings of Greenhouse Gases saved through re-use of the building as opposed to major demolition and re-construction.

So, conservatively it can be estimated that this re-construction will generate approx.

2,000 TONS OF GREENHOUSE GASES

Had we been provided with information regarding volumes of concrete and weight of steel required for this rebuild, strengthening and height increases, we could have provided a more specific estimate.

It should be noted that concrete has an Embodied Energy Content of 12.5MJ/kg, Steel 11.0MJ/kg. and Wood 2.0MJ/kg.

Cement is an energy intensive product and generates significant Greenhouse Gases during its production process so a cubic yard of concrete is responsible for approximately 500 lbs. of Greenhouse Gases being released into our atmosphere. See References 16, 17, 18 and 23.

95% of the cement used in the Bay Area is manufactured here so these GHG are our GHG.

This estimated 2,000 tons of Greenhouse Gas generated by PSKS would hardly seem to be compatible with Page 146 and the "Less Than Significant" conclusion by the City, further reinforcing the conclusion that the Initial Study, and this DEIR, is inaccurate, inadequate, incomplete and invalid.

The Community Residential alternative generates 0 tons of Greenhouse Gas emissions.

There is no demolition of the main building; no additional strengthening or structure for additional floors; no rebuilding of the exterior of the main historic building.

However, to take into account modifications for providing sunlight courts, etc. let's assign a number of 200 tons of Greenhouse Gases.

6. CONSTRUCTION OF UNDERGROUND PARKING GARAGES.

The site will be underpinned by underground parking garages over approx. 60% of the site.

Along California St. these are two and three levels.

Under Masonic, Euclid and Mayfair these are one level.

Construction is assumed to be steel reinforced concrete designed to support the buildings that are above all the parking garage areas.

The DEIR failed to disclose the volumes of concrete and weight of steel, glass, etc. required.

Concrete's Embodied Energy is 12.5MJ/kg., weighs approx. 2 ton per cubic yard which emits up to 500 lbs. in Greenhouse Gases, CO₂, during the manufacture and construction processes.

As no volumes of concrete or weight of reinforcing steel has been provided by the City, the calculations of Greenhouse Gases generated as a consequence of the construction phase has used industry standards for parking garages (Reference 25).

These are all above ground garages without any overlying buildings so the calculations should be considered on the low end when applied to an underground complex supporting 4-7 story buildings above.

The average cubic yards of concrete to square foot of structural slab ratio varies from 4.5% to 10% (Reference 25).

Assume a 6% ratio which is conservative due to the nature of the complex AND excludes any consideration of the required reinforcing steel.

When Planning provides the necessary information, these calculations can be updated.

Again, with apparently no information, no calculations, etc. Planning concluded that the

6,000 TONS OF GREENHOUSE GASES

generated as a consequence of the construction of the underground parking garages are "Less Than Significant" on page 146 of the Initial Study and not even addressed in the DEIR.

The DEIR fails to address indirect Greenhouse Gases as required; it is incomplete, inaccurate and incorrect.

The Community Residential alternative generates approx. 1,000 tons of greenhouse gases, as it requires only a new single level residential parking garage along California St.

2
(GHG-1)
cont'd

7. CONSTRUCTION OF MASONIC, EUCLID AND MAYFAIR BUILDINGS.

Once again it is necessary to include the following caveat "the Initial Study provides no information as to the construction methodology proposed nor the volumes of concrete and weight of steel required."

However, at public meetings, as well as smaller private ones, it was indicated that reinforced concrete and glass would be the primary components of construction so these assumptions have been adopted herein.

Applying References 16-24 with included references to the proposed buildings for reasonably equivalent sized buildings, the proposed buildings would generate approx.

450 TONS OF GREENHOUSE GASES.

If Planning will provide the appropriate information concerning construction methodology, materials, volumes of concrete, weight of steel, etc. we can adjust the calculations accordingly.

The All Residential alternative will construct only the Mayfair Building and generate approx.. 100 tons of Greenhouse Gases as we do not intend to destroy these historically significant landscaped areas.

8. CONSTRUCTION OF PLAZA A & B AND WALNUT BUILDINGS.

The same assumptions as to construction methodology applied in 7 above is utilized herein.

These three buildings will generate

1,500 TONS OF GREENHOUSES GASES WITH THE VARIANT PROPOSED.

The Community Residential alternative would generate less than 1,000 tons of greenhouse gases. For details refer to References 16-24 with included references.

9. CONSTRUCTION OF LAUREL ST. DUPLEXES.

It is assumed that these are constructed predominantly of wood should generate less than

75 TONS OF GREENHOUSE GASES.

If this assumption is incorrect the tonnage of greenhouse gases generated would be significantly higher.

I await Planning's information on construction methodology.

The Community Residential alternative concept will generate ZERO tons of Greenhouse Gases as it does not envision destruction of the historic nature of that area.

Construction of Masonic, Euclid & Mayfair buildings.	450	100
Construction of Plaza A & B and Walnut buildings.	1,500	1,000 (4)
Construction of Laurel St. duplexes.	75	0
TOTALS (5)	13,525	4,100

1. AR: All Residential alternative supported by the coalition of neighbors surrounding the site.
2. The literature indicates that the fuel consumption listed in Reference 26 is approx. 10-15% lower than other industry consumption figures. The lower SWCA (reference 26) number is used.
3. Low estimate: approx. 26,000 cubic yards of concrete; no reinforcing steel included.
4. As noted previously this number is based on a 7 story Walnut Building to be consistent with the PSKS Variant. The All Residential alternative envisions a 4 story Walnut Building which achieves the requisite 558 residential units.
5. At such time as Planning provides all the relevant data associated with the project the Greenhouse Gas tonnage estimates can be revised.
However, regardless of revisions to the tonnages, the All Residential alternative will always represent a small, less than one third, portion of the PSKE proposed development and the required mitigation measures will have to reflect this.

INTRODUCTION

The Project Sponsor, Laurel Heights Partners, LLC, is submitting this Application for certification of the 3333 California Street Mixed-Use Project as an Environmental Leadership Development Project (ELDP), pursuant to AB 900, the Jobs and Economic Improvement through Environmental Leadership Act of 2011, as amended effective January 1, 2018, and codified in Public Resources Code Section 21178 et. seq. Although codified within the California Environmental Quality Act (CEQA), the process for certification of the project as an ELDP is separate from all but a few of the steps required for preparing a CEQA environmental review document.

PROJECT DESCRIPTION

Proposed Development Project

The project site, an approximately 10.25-acre parcel in San Francisco's Laurel Heights/Jordan Park neighborhood, is developed with a 1950s-era corporate campus featuring a four-story office building at the center of the site, a three-level, partially below-grade parking garage, a one story annex building, three surface parking lots, two circular garage ramp structures leading to below-grade parking levels, and mature landscaping or landscaped open space. A portion of the space in the surface parking lots accommodates 60 parking spaces allocated to public use, with payment.

The project sponsor, Laurel Heights Partners, LLC, owns the site and leases it to the Regents of the University of California, which uses the project site for its University of California San Francisco (UCSF) Laurel Heights Campus. Prior to the project sponsor's recent acquisition of fee title to the site, the project sponsor had entered into a 99-year pre-paid ground lease with the Regents in 2014. The office building provides space for UCSF administrative, academic research, and social and behavioral science department uses (including common areas) and space for accessory uses and support programs, such as a daycare center, a conference center/auditorium, and a cafeteria.

The project sponsor is proposing to redevelop the site with adaptively reused and new buildings and shift the primary use from office to residential. The 14,000-gross-square-foot annex building and the two garage ramp structures would be demolished, and the three surface parking lots would be removed. The 455,000-gross-square-foot office building would be partially demolished, divided into two separate buildings (Center Buildings A and B), connected by a covered bridge, expanded to include two to three new levels, and adapted for residential use. A total of 13 new buildings—the Plaza A, Plaza B, Walnut, Masonic, Euclid, and Mayfair buildings, and the Laurel Duplexes (seven buildings)—would be constructed along the California Street, Masonic Avenue, Euclid Avenue, and Laurel Street edges of the project site. **Attachment A**, Project Drawings, provides a site plan, elevations of buildings along each street frontage, and representative floor plans of proposed buildings. **Attachment B**, Project Photo-simulations, presents the proposed project in context of existing surrounding streets and buildings.

All of the renovated or new buildings except one, the Walnut Building, would contain residential uses; the Walnut Building would provide space for two different uses—office and a childcare center. Retail space would be provided on the ground floor in the proposed Plaza A, Plaza B, Walnut, and Euclid buildings. Overall, the proposed project would include 558 dwelling units within 824,691 gross square feet of residential floor area; 49,999 gross square feet of office floor area; 54,117 gross square feet of retail floor area; a 14,690-gross-square-foot childcare center; 428,773 gross square feet of parking with 895 parking spaces; and approximately 236,000 square feet of open areas.

The proposed parking program would replace the existing 543 surface and subsurface parking spaces on the project site and would provide 352 more parking spaces than are currently on the site. The spaces would be allocated to offer 558 spaces for residential uses, 138 spaces for retail uses, 100 spaces for office uses, 29 spaces for the childcare use, 60 spaces for commercial (paid) parking, and 10 spaces for car-share vehicles. Four separate below-grade parking garages with 883 spaces are planned: the California Street Garage, which would be constructed under the Plaza A, Plaza B, and Walnut buildings; the Center Building B Garage, which would encompass the two renovated below-grade parking levels under Center Building B; the Masonic Garage, which would be developed under the Masonic and Euclid buildings; and the Mayfair Garage, which would be developed under the Mayfair Building. In addition, six two-car parking garages would be provided for the Laurel Duplexes. The seventh Laurel Duplex would have two parking spaces in the Masonic Garage.

The project site is proposed to be laid out so that it would be newly integrated with the existing street grid. New pedestrian promenades would align with Walnut Street and connect to Masonic and Euclid avenues (north/south direction), and with Mayfair Drive connecting to Presidio and Masonic avenues and Pine Street (east/west direction). These interior promenades would be closed to vehicular traffic, except at the Walnut Street extension a short distance into the site where a driveway and roundabout would allow for passenger drop-off and pick-up as well as provide access to the California Street Garage. Sidewalks along the project boundaries on Presidio Avenue, Masonic Avenue, Euclid Avenue, and Laurel Street would be widened.

Approximately 53 percent of the overall lot area (approximately 236,000 square feet, excluding green roofs) would be retained as open area, with portions developed as a combination of common open space (some of which would be open to the public) and private open space such as ground-level terraces, interior courtyards and private internal walkways. Overall, the proposed project would provide approximately 103,000 square feet of common useable open area that meets the San Francisco Planning Code section 135 definition of open space. New landscaped open space would be added throughout the project site. The proposed project would remove 185 of the approximately 195 trees on the site, retaining 10 of the mature trees. The 15 street trees along California Street would be removed and replaced. The project includes installation of 270 replacement trees on the project site plus 92 street trees to be planted along California Street, Masonic Avenue, Euclid Avenue and Laurel Street.

The project sponsor is considering a project variant, the Walnut Building Variant, that would change the uses and height of the proposed Walnut Building. With the variant, the building's proposed office space would be replaced with residential uses, three new residential floors would be added, and the retail space and the childcare center space would be reduced. Overall, with the variant there would be 186 additional residential units, for a total of 744 residential units within 978,611 gross square feet of residential floor area; no office space; 48,593 gross square feet of retail floor area; a 14,650-gross-square-foot childcare center; and 435,133 gross square feet of parking with 971 parking spaces. The amount of space devoted to open areas would be the same as under the proposed project.

The proposed project or variant would be constructed in four overlapping development phases, with full build-out expected to occur approximately seven years after project entitlements, if executed from start to finish of the prescribed overlapping development phases.

The project sponsor submitted a Transportation Demand Management (TDM) Plan Application to the San Francisco Planning Department in August 2017 and has agreed to implement selected TDM measures, such as improving walking conditions and providing onsite child care, bicycle parking, and car share parking, to reduce per capita automobile use. The project sponsor has committed to meeting and exceeding the requirements of the San Francisco Green Building Ordinance (part of the San Francisco Building Code) by achieving Leadership in Energy and Environmental Design (LEED) for Neighborhood

Development certification at a minimum Gold level for the full development. The Applicant is considering living (green) roofs, solar photovoltaic systems for some roofs, solar thermal hot water systems for other roof areas, and water-smart landscaping, among other sustainability features. Each of the new buildings would comply with the San Francisco Non-Potable Water Ordinance that requires use of onsite alternate water sources including graywater and/or rainwater.

The proposed project would include affordable housing units as required under San Francisco Planning Code section 415 and/or as set forth in a Development Agreement (DA) for the proposed project between the project sponsor and the City. The terms of the DA regarding provision of affordable housing and other matters are still under discussion, and, in addition, the project sponsor is gathering community input regarding this matter.

Project Site

3333 California Street is a Midcentury Modern-designed corporate campus originally constructed in 1956-1957. The approximately 10.25-acre project site occupies Lot 003 on Assessor's Block 1032 in the Laurel Heights/Jordan Park area of San Francisco's Presidio Heights neighborhood. The irregularly shaped parcel is bounded by California Street to the north (an approximately 730-foot-long frontage), Presidio Avenue to the east (an approximately 280-foot-long frontage), Masonic Avenue to southeast (an approximately 422-foot-long frontage), Euclid Avenue to the south (an approximately 348-foot-long frontage), and Laurel Street/Mayfair Drive to the west (an approximately 742-foot-long frontage).

The campus contains a four-story office building with three levels of partially below-grade parking; a one-story annex building (which contains equipment such as boilers, chillers and water treatment facilities for the office building, other plant operations systems, office space for the physical plant engineers, and unused laboratory office space) at the northwestern corner of the project site; approximately 2.75 acres of surface parking in three lots; and 3 acres of designed landscape or landscaped open space. Approximately 63 percent of the site is covered by buildings or other impermeable surfaces, such as internal roadways and surface parking lots, and 37 percent is landscaping or landscaped open space. UCSF currently grants public access to the grass lawns on the site at the corner of Euclid Avenue and Laurel Street, extending partially down Euclid Avenue, and at Presidio Avenue just north of the Masonic Avenue and Pine Street intersection.

The project site is well-served by Muni transit service, with the 1 California, 1 BX California Express (AM and PM peak hours only), and 2 Clement bus routes on California Street; the 3 Jackson bus route on Presidio Avenue, California Street, and Walnut Street; and the 43 Masonic bus route on Presidio Avenue.

The area in which the project site is located is highly urbanized and essentially fully built out. Low- to mid-rise mainly multi-family residential uses surround the project site to the north, east, and south, across California Street, Presidio Avenue, and Euclid Avenue. The west side of Laurel Street across from the project site is lined by single-family houses between Euclid and Mayfair avenues. Other nearby land uses include the SF Fire Credit Union, at the southwest corner of California Street and Presidio Avenue, adjacent to the project site; the Jewish Community Center of San Francisco, across California Street from the project site; San Francisco Fire Station 10, across Masonic Avenue southeast of the project site; the San Francisco Municipal Railway's (Muni) Presidio Yard bus storage depot, across Euclid and Masonic avenues south of the project site; and the Laurel Village Shopping Center along California Street, across Laurel Street west of the project site.

CONSISTENCY WITH STATUTORY REQUIREMENTS FOR CEQA STREAMLINING

This Application was prepared in accordance with the Governor's Guidelines for Streamlining Judicial Review under CEQA, provided on the Governor's Office of Planning and Research (OPR) website and updated in January 2018 to comply with Senate Bill 734 (2016) and Assembly Bill 246 (2017).¹ The following information (including all Attachments) is submitted to show that the project and variant each satisfies the statutory requirements for CEQA streamlining, as further set forth in the Governor's Guidelines, pursuant to Public Resources Code Section 21187 *et seq.*

1. Information to show the project or variant is residential, retail, commercial, sports, cultural, entertainment, or recreational in nature.

The proposed project or variant is residential, commercial, and retail in nature. As explained above, the proposed project would have approximately 558 dwelling units, 49,999 gross square feet of office floor area, 54,117 gross square feet of retail floor area, and a 14,690-gross-square-foot childcare center, in addition to parking, circulation and loading space, and approximately 236,000 square feet of open space. The project variant would replace the office space with 186 additional dwelling units for a total of 744 units, approximately 48,593 gross square feet of retail space and a 14,650 gross square foot childcare center, with parking, circulation and loading space and open space similar to the proposed project.

The proposed project and variant would demolish a portion of the existing office building and adapt it for residential use. The perimeter of the site is proposed to be developed with 13 new buildings, with all except the Walnut Building containing primarily residential uses (with ground floor retail in some buildings). The Walnut Building, located at the Walnut Street entrance to the project site from California Street, is proposed with office, childcare, and retail uses. The new buildings would front on California Street, Masonic Avenue, Euclid Avenue, and Laurel Street. The variant would construct residential, childcare, and retail uses in a taller Walnut Building, replacing the proposed office use.

Open space would be provided on the site in the form of public plazas and walkways, and as private open space for the use of new residents. A total of approximately 236,000 square feet of open space is included, excluding green roofs. One of the publicly accessible open areas, the proposed Euclid Green, would maintain most of the existing open space along Euclid Avenue to which UCSF has been granting public access (although privately owned).

The site plans for the proposed project and variant are included in **Attachment A**. Several renderings of the proposed project in the existing urban context are shown in **Attachment B**.

¹ Governor's Office of Planning and Research, *Governor's Guidelines for Streamlining Judicial Review under the California Environmental Quality Act Pursuant to AB 900 (Chapter 352, Statutes of 2011)*, available at http://opr.ca.gov/docs/20180103-AB_900_Guidelines_January_2018.pdf. Accessed July 11, 2018.

2. Information to show that the project or variant, upon completion, will qualify for LEED Gold Certification or better. The Application shall specify those design elements that make the project or variant eligible for LEED Gold Certification, and the Applicant shall submit a binding commitment to delay the project or variant until it receives LEED Gold Certification or better. If, upon completion of construction, LEED Gold Certification or better is delayed as a result of the certification process rather than a project deficiency, the Applicant may petition the Governor to approve project operation pending completion of the LEED certification process.

The design for the proposed project or variant would meet or exceed current uniform codes, and is created to achieve at the minimum a Leadership in Energy and Environmental Design (LEED) Neighborhood Development (ND) Gold rating. The LEED ND certification has four certification levels that correspond to the number of credits that are achieved in five categories: Smart Location and Linkage (SLL), Neighborhood Pattern and Design (NPD), Green Infrastructure and Buildings (GIB), Innovation (IN), and Regional Priority (RP). The number of points that a project earns within the credits it achieves determines the level of certification that it will receive:

- LEED Certified™: 40-49 points earned
- LEED Silver®: 50-59 points earned
- LEED Gold®: 60-79 points earned
- LEED Platinum®: 80+ points earned.

LEED provides a level of flexibility for projects to choose the credits and project features that will contribute to certification. The proposed project and variant will each integrate low-impact development and transportation demand management, energy efficiency, water conservation, and other green-building practices to achieve a minimum LEED ND Gold certification; however, at the time of submitting this Application, the exact LEED credits that would contribute to the achievement of LEED ND Gold certification (i.e., 60-79 LEED points) have not yet been determined. That said, most or all of the following features will contribute to LEED certification.

In the charts below, “yes” indicates high confidence points and “likely” indicates other anticipated points. Additional points will also be targeted as the design develops to increase confidence in achievement of LEED Gold. The stars (*) indicate prerequisites, which are required for all LEED certifications and carry no points.

SMART LOCATION AND LINKAGE (SLL)

A proposal earns many conservation and proximity credits by virtue of its location. The project or variant is situated on a previously developed infill site that is served by existing water and wastewater infrastructure and within walking distance of enough full-time equivalent jobs to serve the anticipated number of residents. Additionally, transit access credits are earned through existing service: multiple types of transit service currently serve this site, with numerous trips made daily. All trips are made available to 100% of the proposed dwelling units.

Smart Location and Linkage – LEED ND v4 Preliminary Checklist

Yes	Likely	Prerequisite or Credit	Key Applicable Requirements and Assumptions
*		Smart Location	Project site is served by existing water/wastewater infrastructure.
	*	Imperiled Species and Ecological Communities	No listed endangered species on the project site.
*		Wetland and Water Body Conservation	No wetlands or water bodies on site
*		Agricultural Land Conservation	Project site is an infill site with no agricultural use or zoning designation
*		Floodplain avoidance	Project site is outside flood hazard area based on San Francisco's Preliminary Floodplain Maps.
5		Preferred Locations	Project site is an infill site that is also a previously developed site → 5 points. There are only 179 intersections in closest 1 square mile → 0 additional points.
7		Access to quality transit	Minimum daily transit service with multiple transit types: Project site has 470 weekday trips total. 293 weekend trips from bus lines 1, 2, 3, 43. All trips are available to 100% of dwelling units.
2	1	Housing and Jobs Proximity	Proposal is at least 30% Residential AND is within a 1/2-mile walking distance of enough existing full-time equivalent jobs to serve residents→2 points AND Provide affordable housing meeting various criteria for a minimum of 15 years →1 point
1		Site Design for Habitat or Wetland and Water Body Conservation	No significant habitat and no wetland/water bodies on proposed site.
15	1		

Source: ARUP, 2018

NEIGHBORHOOD PATTERN AND DESIGN (NPD)

The proposal's location within a dense, mixed-use neighborhood, as well as its strong internal connectivity, walkability, community connectivity, and integrated parking all contribute to its achievement of numerous Neighborhood Pattern and Design credits. The proposed parking integration strategies contribute to the achievement of the Compact Development, Walkable Streets, and Community Connectivity prerequisites and credits. The existing transit infrastructure and the transportation demand management strategies contribute to the achievement of the Transit Facilities, Transportation Demand Management, and Reduced Parking Footprint credits. The site location and internal connectivity contribute to its achievement of several prerequisites and credits, including the Walkable Streets, Access to Civic and Public Space, Connected and Open Community, Mixed-Use Neighborhoods, and Neighborhood Schools credits. The integrated design approach, which has been highly inclusive of the community, contributes directly to the achievement of the Community Outreach and Involvement credit, but the approach has also indirectly contributed to the majority of credits achieved in this category.

Neighborhood Planning & Design – LEED ND v4 Preliminary Checklist

Yes	Likely	Prerequisite or Credit	Key Applicable Requirements and Assumptions
*		Walkable Streets	90% of proposed buildings have a functional entry onto the circulation network/public space. At least 15% of the block length of the existing/planned circulation networks within and bordering the project have a minimum building-height-to-street-centerline ratio of 1:1.5 for every 1.5 feet of width from street centerline to building façade. The proposal provides continuous sidewalks or equivalent all-weather routes for walking along both sides of 90% of the circulation network block length within the project. No more than 20% of the block length of the circulation network within the proposal is faced directly by garage and service bay openings.
*		Compact Development	The proposal includes 54.7 dwelling units per acre of buildable land are available for residential uses, well over the 12 required and a floor-area ratio of 1.8 for non-residential components.
*		Connected and Open Community	Proposal includes over 140 intersections per square mile and 13 internal intersections. No more than 10% of the project area may be accessed via gated circulation network. The proposal includes more than one through-connection that terminates at the project boundary and intersects the circulation network. These connections are approximately 400' between entries
5	2	Walkable Streets	Proposal includes a high total linear distance of building façades that face the circulation network, with high ground-level window and door percentages, parking, and safe pedestrian and bicycle travel lanes.
4		Compact Development	The residential density per acre of the proposed project is 54.7, which is between the 38 and 63 thresholds.
4		Mixed-Use Neighborhoods	100% of proposed units are within a ¼-mile walk of >23 uses.
4	2	Housing Types and Affordability	Proposal includes many different housing types of diverse sizes and 12% of housing priced up to 120% of area median income.
	1	Reduced Parking Footprint	Proposed project includes no new off-street surface parking lots and provides preferred parking for carpool or shared-use vehicle parking space that is equivalent to at least 10% of the total off-street parking space for each nonresidential and mixed-use building on the site.
2		Connected and Open Community	Proposed site has 805 intersections within 1 square mile → 2 points
	1	Transit Facilities	Proposed site includes existing transit agency-approved shelters that meet minimum LEED criteria at existing stops.
	1	Transportation Demand Management	Proposed project will include unbundled parking and will likely include vehicle sharing → 1 Point
1		Access to Civic & Public Space	90% of planned dwelling units and nonresidential entrances within a ¼-mile walk of at least one civic and passive use space.
1		Access to Recreation Facilities	90% of planned dwelling units in the proposed project are located within a ½-mile walking distance of a publicly accessible indoor recreational facility of at least 25,000 square feet.
	1	Visitability and Universal Design	Proposal will likely include a minimum of 20% of units with one of: 1) Universal Design Throughout the Home; 2) Universal Design Kitchen Features; 3) Universal Design Bedroom and Bathroom Features.
2		Community Outreach and Involvement	Community has been included in predesign, preliminary design, and ongoing communication Proposal has obtained endorsement from local NGOs, including the Housing Action Coalition and the San Francisco Bay Area Planning and Urban Research Association (SPUR)
1	2	Local Food Production	Proposal includes ample landscaped space, some of which has been allocated for food production → 1 Point Tenants in proposal may enroll in CSA programs → 1 Point Proposal is less than ½ mile to Kaiser Farmer's Market → 1 Point

3333 California Street, San Francisco
Application for Environmental Leadership Development Project

2		Tree-Lined and Shaded Streetscapes	Proposal provides trees at intervals of no more than 50 feet along at least 60% of the total existing and planned block length within the project → 1Point Proposal provides shade from trees or permanent structures over at least 40% of the total length of existing and planned sidewalks within or bordering the project → 1Point
1		Neighborhood Schools	Proposed project at least 30% residential, AND at least 50% of the proposed units are within a 1/2-mile walk of the entry of an existing or new elementary or middle school or within a 1-mile walk of the entry of an existing or new high school.

GREEN INFRASTRUCTURE AND BUILDINGS (GIB)

Water credits are achieved through the integration of ultra-low flow fixtures in residential restrooms and non-potable water reuse strategies, which reduce indoor water use by at least 40 percent from baseline. Outdoor water use reductions are achieved through the use of native/adapted plant species and minimal turf grass. Energy performance credits are achieved through optimized orientation and massing strategies, high-performance mechanical equipment, and on-site renewable energy production, which collectively reduce building energy by an estimated average of 20% from baseline. Materials credits are achieved through the partial reuse of the existing building on site and a detailed and progressive solid waste management strategy.

Green Infrastructure and Buildings – LEED ND v4 Preliminary Checklist

Yes	Likely	Prerequisite or Credit	Key Applicable Requirements and Assumptions
*		Certified Green Building	The proposal includes one building to be certified under LEED-BD+C.
*		Minimum Building Energy Performance	Each building in the proposal performs well above the required 5% modeled energy savings compared to baseline (ASHRAE 90.1 2010).
*		Indoor Water Use Reduction	The proposal reduces indoor water usage by an estimated average of 20% from baseline.
*		Construction Activity Pollution Prevention	The proposal includes an erosion and sedimentation control plan.
	1	Certified Green Buildings	The proposal anticipates that one building will be certified, which account for more than 10% and less than 20% of the total floor area.
	2	Optimize Building Energy Performance	Whole building energy simulation of the proposal shows an average estimated improvement of 20% over baseline.
	1	Indoor Water Use Reduction	The proposal integrates water reuse for flushing, which reduces indoor water usage by an average of 40% from baseline.
1	1	Outdoor Water Use Reduction	The proposal integrates the extensive use of native/adapted plants to achieve an estimated 50% reduction in outdoor water use versus baseline.
1		Building Reuse (50% of 1)	The proposal retains 59% of the floor plate of the main existing building.
1		Heat Island Reduction	The proposal includes both cool and vegetated roofs to reduce heat island effect.
1		Solar Orientation	The project site has favorable solar orientation, with a longer east-west than north-south axis.

	3	Renewable Energy Production	The proposed photovoltaic panels will reduce annual electrical and thermal energy production costs by approximately 20%.
1		Solid Waste Management	The proposal integrates several progressive solid waste management strategies that far exceed the requirements for this credit.
	1	Light Pollution Reduction	Various requirements including full cutoff fixtures in circulation areas

3. Information to show the project or variant will achieve at least 15 percent greater transportation efficiency, as defined in Public Resources Code section 21180(c), than comparable projects. The Applicant shall provide information setting forth its basis for determining and evaluating comparable projects and their transportation efficiency, and how the proposed project will achieve at least 15 percent greater transportation efficiency. For residential projects, the Applicant shall also submit information demonstrating that the number of vehicle trips by residents divided by the number of residents is 15 percent more efficient than for comparable projects. For the purpose of this provision, comparable means a project of the same size, capacity, and location type.

The *AB 900 Transportation Assessment* for the 333 California Street Project, dated July 2018, provides detailed trip generation calculations and other information about the proposed project and project variant as well as a comparison with vehicle trips generated by a comparable project. The *AB900 Transportation Assessment* is attached to this Application as **Attachment C, Transportation Efficiency**, and is summarized here.

The proposed project or project variant would replace the existing office building, the existing 212- space partially below-grade garage and 331 surface parking spaces, and the annex building at the corner of California Street and Laurel Street with a primarily residential mixed-use development on the project site. The proposed project and variant each include a mix of neighborhood-serving commercial uses (day care and retail) that would provide convenient local destinations for the development project's residents without having to drive to other locations. The proposed project also includes office space that could serve project residents as well as other residents in the neighborhood. Office space is not included in the project variant.

The project site is located close to pedestrian networks and bicycle facilities, major transit services, and a diversity of land uses. The project site is in a highly-walkable area of San Francisco with an established pedestrian network. All nearby streets have sidewalks, and crosswalks are well marked. The proposed project and project variant both would improve pedestrian facilities by widening the existing 10-foot-wide sidewalks on Presidio Avenue and Masonic Avenue (adjacent to the project site) to meet the 15-foot recommended width identified in the San Francisco Better Streets Plan.² The existing sidewalks on Euclid Avenue (10.5 feet wide) and Laurel Street (10 feet wide) would be widened to meet the 12-foot minimum width identified in the Better Streets Plan. The proposed project and project variant both include other streetscape changes as part of a series of proposed improvements resulting in changes to the intersections of Presidio Avenue/Masonic Avenue/Pine Street, Masonic Avenue/Euclid Avenue, and Mayfair Drive/Laurel Street to enhance pedestrian safety. There are striped bicycle lanes in nearby streets on Arguello Boulevard from Washington Street in the Presidio to John F. Kennedy Drive in Golden Gate Park; on Euclid Avenue from Arguello Boulevard to Masonic Avenue and connecting to the signed route on Presidio Avenue that runs north-south between Lincoln Boulevard in the Presidio and Page Street via

² San Francisco Planning Department, San Francisco Better Streets Plan, January 2011, http://www.sf-planning.org/ftp/BetterStreets/proposals.htm#Final_Plan, accessed July 27, 2018.

Masonic Avenue; and on Post Street from Presidio Avenue to Steiner Street and continuing as a signed route to Market Street in downtown San Francisco.

The proposed project and variant are close to major transit services. The San Francisco Municipal Railway (Muni) operates ten bus routes with stops located within one half mile of the project site (1 California, 1BX California 'B' Express, 2 Clement, 3 Jackson, 31BX Balboa 'B' Express, 33 Ashbury-18th, 38 Geary, 38BX Geary 'B' Express, 38R Geary Rapid, and 43 Masonic). Bus stops are located adjacent to the project site and across the street at nearby corners on California Street, and on Walnut Street north of California Street. All are less than one block from the project site.

The project site is also served indirectly by a network of regional transportation facilities that provide access to the greater Bay Area. Regional transit provides service to the East Bay via Bay Area Regional Transit (BART) commuter rail service, Alameda-Contra Costa Transit buses, and Water Emergency Transportation Authority ferries; service to the North Bay via Golden Gate Transit buses and ferries; and service to the Peninsula/South Bay via Caltrain commuter rail, BART, and San Mateo County Transit buses. Regional transit services are generally not within walking distance of the project site, but can be reached by bicycle or from various Muni lines. The project site is also served by Chariot, a private commuter shuttle.

PROJECT AND VARIANT TRIP GENERATION

The proposed development project, with 558 residential units, 49,999 gross square feet of office space, 54,117 gross square feet of retail space, a child care center, and 895 off-street vehicle parking spaces,³ would generate 16,462 daily person trips by residents, employees, and visitors to the project site. The calculations of person trips accounts for existing activity on the site by current occupants, and also accounts for internal trip capture. Internalization is dependent on the quantity and mix of uses as well as the varying levels of activity they generate at various times of day. As a result, the internalization percentage is different for each scenario and time period. These internal trips begin and end on the project site and would not be made by automobile but by walking and bicycling. Approximately 17.6 percent of the trips generated by the proposed project would be internal to the project site in the a.m. peak hour, and 18.9 percent would be internal in the p.m. peak hour. The proposed project would generate approximately 5,760 daily vehicle trips external to the project site, with 691 weekday a.m. peak hour vehicle trips, and 752 weekday p.m. peak hour vehicle trips.

The project variant would have the same land uses as the proposed project, with the exception that the 49,999 square feet of office space would not be included and in its place an additional 186 residential units would be constructed, for a total of 744 dwelling units on the site. In addition, the retail and child care spaces would be slightly reduced. With the additional residential units but reduced commercial space, there would be 971 off-street vehicle parking spaces. The project variant would generate approximately 16,171 daily person trips by residents, employees, and visitors. Approximately 19 percent of the trips would be internal to the project site in the a.m. peak hour and approximately 19.2 percent would be internal to the site in the p.m. peak hour. The project variant would result in approximately 5,744 daily vehicle trips external to the project site, with 726 a.m. weekday peak hour vehicle trips, and 804 weekday p.m. peak hour vehicle trips.

Both the proposed project and project variant include bicycle parking in the amounts required in the San Francisco Planning Code. The proposed project includes 592 class 1 secure bicycle parking spaces for residents and employees and 101 class 2 bicycle parking spaces in bike racks for public use. The project

³ Note that for both the proposed project and the project variant, 60 of these parking spaces would replace 60 existing parking spaces on the site that are available for public parking on a paid hourly basis.

variant includes 768 class 1 secure bicycle parking spaces and 122 class 2 bicycle parking spaces in bike racks.

COMPARABLE PROJECT TRIP GENERATION

To analyze the transportation efficiency of the proposed and variant projects, the projects' vehicle trip generation was examined against that of comparable developments. The comparable project is assumed to be a project with similar land uses as the proposed project but with vehicle trip generation that is more typical of national averages. In addition to the same numbers of residential units and a childcare center, the comparable project includes a low-rise shopping center, a donut shop, and a quality restaurant to make its land uses similar to the retail uses in the proposed project and project variant, and includes general office space in the same amount as in the proposed project. The comparable development's vehicle trip generation was calculated using the standard national reference, the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*.⁴ The comparable project has the same land uses and quantities (size/number of units) as the proposed project and project variant, but may not have the same characteristics as the proposed project and project variant that would lead to trip reductions, such as an urban location near transit on an infill site.

The comparable project that corresponds to the proposed project would generate 13,532 total daily vehicle trips, including 1,374 total vehicle trips in the weekday AM peak hour and 975 total vehicle trips in the weekday PM peak hour. The comparable project that corresponds to the project variant would generate 13,847 total daily vehicle trips, including 1,350 total weekday a.m. peak hour vehicle trips and 962 total weekday p.m. peak hour vehicle trips.

VEHICLE MILES TRAVELED

In addition to vehicle trip generation, there are other factors related to vehicular travel. These factors include housing density, diversity of land uses, design of the transportation network, and distance to high-quality transit, among others. Typically, low-density development at greater distances from other land uses and located in areas with poor access to transit generates more automobile travel and higher vehicle miles traveled (VMT) than development in urban areas with higher densities, a greater mix of land uses, and more travel options than private automobiles. San Francisco has a lower average VMT traveled ratio than the San Francisco Bay Area region, because it has higher residential densities, is well-served by transit and other travel modes such as the bicycle network, and has multiple neighborhood-serving commercial areas.

The project site is located in transportation analysis zone (TAZ) 709, which is close to transit services and bicycle and pedestrian networks, and has a diversity of land uses. Therefore, a project located in TAZ 709 has substantially reduced vehicle trips and shorter vehicle distances, and thus reduced VMT per capita and per employee, compared to other areas of the region. The average daily VMT per capita for residential uses in TAZ 709 is 7.3 miles, which is approximately 58% below the regional average daily VMT per capita of 17.2 miles. Additionally, the average daily VMT per employee for office uses in TAZ 709 is 10.1 miles, which is approximately 47% below the regional average daily VMT per employee of 19.1 miles. The average daily VMT per employee for retail uses in TAZ 709 is 8.3 miles, which is approximately 44% below the regional average daily VMT per employee of 14.9 miles.

TRANSPORTATION DEMAND MANAGEMENT (TDM) PROGRAM

The project sponsor will be required to implement a Transportation Demand Management (TDM) Program to encourage the use of non-auto modes and reduce vehicle trips, pursuant to San Francisco

⁴ *Trip Generation Manual 10th Edition*. Institute of Transportation Engineers, 2017.

Planning Code section 169. The measures in the project's TDM Program would reduce vehicle trips generated by the proposed project or project variant; however, they have not been taken into account in calculating trip generation for the proposed project or project variant and therefore are not reflected in the comparison with the comparable project.

The project sponsor currently proposes the following TDM measures. These measures are subject to revision during the planning review process for project entitlements.

- **Improve Walking Conditions (TDM Measure Active-1A):** Streetscape improvements proposed along California Street, Presidio Avenue, Masonic Avenue, Euclid Avenue and Laurel Street will be consistent with the Better Streets Plan. The proposed Mayfair and Walnut walks are intended to integrate the 10-acre site with the existing pedestrian network.
 - **Bicycle Parking (TDM Measure Active-2):** Bicycle parking would be provided for residential, office, and retail uses. For residential uses the project will provide the required class 1 secure space for each dwelling unit and two class 2 spaces for every 20 units. The number of spaces provided for office, childcare, and retail uses will comply with the San Francisco Planning Code.
 - **Showers and Lockers (TDM Measure Active-3):** At least one shower and at least six clothes lockers will be provided for every 30 class 1 bicycle parking spaces. The number of showers and clothes lockers will meet San Francisco Planning Code requirements.
 - **Bicycle Repair Station (TDM Measure Active-5):** A bicycle repair station, with tools and supplies such as a bicycle pump and wrenches, is proposed on the project site.
 - **Car Share Parking (TDM Measure Cshare-1):** Ten car share spaces will be provided in Basement Level B3 of the California Street Garage in accordance with the San Francisco Planning Code.
 - **Delivery Supportive Amenities (TDM Measure Delivery-1):** An area for the receipt and temporary storage of package deliveries will be provided in the off-street loading areas or other location on the project site.
 - **Onsite Childcare (TDM Measure Family-2):** An onsite childcare facility in the Walnut Building is part of the proposed project or project variant.
 - **Multimodal Wayfinding Signage (TDM Measure Info-1):** Multimodal wayfinding signage that directs tenants, residents, visitors, and employees to nearby transportation services will be provided. Signage will comply with San Francisco standards.
 - **Real Time Information Displays (TDM Measure Info-2):** Real time information displays (showing information about transit lines, walk time to transit locations, or the location of onsite car share vehicles, for example) will be provided in prominent locations on the project site.
 - **Tailored Transportation Marketing (TDM Measure Info-3):** Individualized, tailored marketing and communication campaigns regarding sustainable transportation modes will be implemented. A TDM coordinator will manage these marketing services, to include promotions and welcome packets with information about transportation options. Personal consultations will be offered to new residents and retail employees along with a request for a commitment to try sustainable transportation options.
 - **Unbundle Parking (TDM Measure Pkg-1):** All accessory parking for the proposed project will be leased or sold separately from the rental or purchase fees.
-

Based on the analysis included in the TDM Technical Justification Memo,⁵ prepared by various San Francisco city agencies in support of the TDM ordinance, measures from the TDM Program such as improving walking conditions could reduce VMT by up to two percent, and unbundled parking could reduce VMT by up to 4.5 percent. As such, implementation of the proposed TDM package would result in a further reduction in vehicle trips to and from the site.

TRIP GENERATION AND VMT COMPARISON SUMMARY

To compare the overall trip generation of the proposed project and project variant to the comparable project, the trip generation estimates for the proposed project and project variant were adjusted to account for existing uses and internal trips. The resulting vehicle-trip generation estimates were then compared to the trip generation estimates for the comparable project.

As shown in the following tables both the proposed project and the project variant would result in a decrease in vehicle trip generation compared to the respective comparable project. Table 1, Trip Generation Comparison for Proposed Project, shows that the proposed project would generate 7,772 fewer daily vehicle trips than the respective comparable project. This equates to a 57 percent decrease in daily vehicle trips, a 50 percent decrease in weekday a.m. peak hour vehicle trips, and a 23 percent decrease in weekday p.m. peak hour vehicle trips.

Table 1: Trip Generation Comparison for Proposed Project

Project	Land Use	Size	Total Daily Trips	Weekday AM Peak Hour Total (In and Out)	Weekday PM Peak Hour Total (In and Out)
Comparable Development	Residential	558 units	13,532	1,374	975
	Retail/ Childcare	68,807 gsf			
	Office	49,999 gsf			
Proposed Project	Residential	558 units	5760	689	751
	Retail/Childcare	68,807 gsf			
	Office	49,999 gsf			
	Vehicle Trip Decrease	--	7,772	685	224
	Percent Decrease		57%	50%	23%

Source: ITE Trip Generation Manual, 10th Edition; Kittelson & Associates, Inc., 2018

As shown in Table 2: Trip Generation Comparison for Project Variant, it is estimated that there would be 8,103 fewer daily vehicle trips generated compared to the comparable project, which corresponds to a 59 percent decrease in daily vehicle trips, a 46 percent decrease in weekday AM peak hour vehicle trips, and a 16 percent decrease in weekday PM peak hour vehicle trips.

In comparison to the regional average daily VMT per capita/employee, as discussed above, the average daily VMT per capita within TAZ 709 for residential, office, and retail uses is 58 percent, 47 percent, and 44 percent lower, respectively, when compared to the regional averages. This shows that, for both the proposed project and the project variant, there is expected to be lower than average daily VMT when compared to the regional average daily VMT, substantially more than a 15 percent reduction.

⁵ City and County of San Francisco, *Transportation Demand Management Technical Justification*, Appendix B, January 2018. Available online at http://default.sfplanning.org/plans-and-programs/emerging_issues/tsp/TDM_Technical_Justification_update2018.pdf, accessed July 27, 2018

Table 2: Trip Generation Comparison for Project Variant

Project	Land Use	Size	Total Daily Trips	Weekday AM Peak Hour Total (In and Out)	Weekday PM Peak Hour Total (In and Out)
Comparable Development	Residential	744 units	13,847	1,350	962
	Retail/ Childcare	63,243 gsf			
Project Variant	Residential	744 units	5,744	726	804
	Retail/ Childcare	63,243 gsf			
	Vehicle Trip Decrease	--	8,103	624	158
	Percent Decrease		59%	46%	16%

Source: ITE Trip Generation Manual, 10th Edition; Kittelson & Associates, Inc., 2018

CONCLUSION

The combined effects of the project's urban infill location along a major transit corridor that is close to transit, bicycle, and pedestrian amenities would reduce the anticipated daily vehicular trip generation estimates by approximately 57 percent (project) or 59 percent (variant) as compared to a comparable mixed-use project. Therefore, the proposed project or project variant would exceed the 15 percent greater transportation efficiency threshold for an Environmental Leadership Development Project. Implementation of the TDM Program will enhance the transportation efficiency even more.

4. Information to show that the project is located on an infill site as defined at Public Resources Code Section 21061.3, and in an urbanized area, as defined at Public Resources Code Section 21071.

The project site is located in San Francisco on an infill site surrounded by existing residential, commercial, and institutional development. An infill site is defined in Public Resources Code section 21061.3 as a site that "has been previously developed for qualified urban uses." A "qualified urban use" is defined in Public Resources Code section 21072 as "any residential, commercial, public institutional, transit or transportation passenger facility, or retail use, or any combination of those uses." The project site meets this definition as it is currently a commercial office use and a public institutional use occupied by the University of California, San Francisco, with associated parking and landscaping.

The project site is located in an urbanized area as defined in Public Resources Code section 21071, as it is in "an incorporated city" that has a population of at least 100,000 persons. The City and County of San Francisco is an incorporated city that has an estimated population of 884,363 according to the 2017 estimates prepared by the United States Census Bureau.

Thus, the proposed project and variant would be an urban infill development because it is located on an infill site previously developed with a qualified urban use in an urbanized area.

5. Information required by Public Resources Code section 21180(b)(1) is available for projects within a metropolitan planning organization for which a sustainable communities strategy or alternate planning strategy is in effect. For the purposes of this provision, "in effect" means that the sustainable communities strategy or the alternative planning strategy has been adopted by the metropolitan planning organization, and that the Air Resources Board has accepted the metropolitan planning organization's determination that the sustainable communities strategy or alternative planning strategy meets the adopted greenhouse gas reduction targets and is not the subject of judicial challenge.

Senate Bill (SB) 375 was adopted by the legislature in August 2008 and signed into law by the Governor in September 2008. This legislation links regional planning for housing and transportation with the greenhouse gas (GHG) reduction goals in Assembly Bill 32. Each Metropolitan Planning Organization is required to adopt a Sustainable Communities Strategy to encourage compact land development to reduce passenger vehicle miles traveled and vehicle trips so that the region will meet targets established by the California Air Resources Board (CARB) for reducing GHG emissions. In September 2010, the CARB adopted regional GHG targets for passenger vehicles and light trucks for the years 2020 and 2035 for the various Municipal Planning Organizations in California. Two climate protection targets were established for the San Francisco Bay Area by the CARB: a per capita reduction of GHG emissions by 7 percent by year 2020 and 15 percent by year 2035.⁶

The project is within the jurisdiction of the Association of Bay Area Governments (ABAG). ABAG and the Metropolitan Transportation Commission (MTC) published the draft Plan Bay Area, the region's proposed Regional Transportation Plan/Sustainable Communities Strategy, in 2010. ABAG and MTC adopted the final Sustainable Communities Strategy in 2013 and submitted the final Plan Bay Area, containing the final Sustainable Communities Strategy, to the CARB in early 2014. The supporting documentation for the Sustainable Communities Strategy shows that the Plan would accomplish a 10 percent per capita carbon dioxide emissions reduction from passenger vehicles by 2020 and a 16 percent per capita reduction by 2035. CARB Executive Order G-14-028, approved in April 2014, indicated that the CARB accepted ABAG's quantification of GHG emissions from the Sustainable Communities Strategy and determined that if implemented, Plan Bay Area would achieve the established reduction targets in compliance with SB 375. Plan Bay Area was challenged in court in 2014 in multiple actions; each of the challenges has either been settled or the Plan was upheld in the courts.

More recently, MTC and ABAG prepared and adopted Plan Bay Area 2040 in July 2017, containing updates to the original Plan Bay Area based on new forecasts of regional population and employment growth and distribution using upgraded models, and on adjusted approaches to some GHG reduction strategies based on surveys of their effectiveness. The basic land use and transportation strategies from the 2013 Sustainable Communities Strategy remain, promoting infill development with higher densities and more multi-family housing in mixed-use communities focused on neighborhoods with transit. Transportation strategies focus on enhancing transit and improving roadways, with more high-occupancy vehicle lanes and toll lanes.

Plan Bay Area 2040 would exceed the GHG emissions target established by the CARB in 2010, achieving a 16 percent reduction by the year 2035 and an 18 percent reduction in emissions between 2005 and 2040,

⁶ In March 2018 CARB adopted updated targets for ABAG/MTC that will be applicable beginning in October 2018. These new targets are a per capita reduction in GHG emissions of 10 percent by year 2020 and 19 percent by 2025. SB 375 Regional Greenhouse Gas Emissions Reduction Targets, CARB Resolution 18-12, adopted March 22, 2018. Resolution is available at <https://www.arb.ca.gov/cc/sb375/finalres18-12.pdf>. Updated targets are available at <https://www.arb.ca.gov/cc/sb375/finaltargets2018.pdf>.

according to the *Performance Assessment Report* for Plan Bay Area 2040, published by ABAG and MTC in July 2017 [p. 11]. The CARB staff reviewed Plan Bay Area 2040 and approved a technical evaluation of the GHG reduction quantifications in June 2018.⁷

Plan Bay Area focuses on where the region is expected to grow and what transportation investments will support that growth. It encourages infill development and multifamily development particularly close to public transit and in walkable neighborhoods. The proposed project or variant, once approved, will be consistent with the “general use designation, density, building intensity, and applicable policies specified for the project area in ...a sustainable communities strategy” as required in Public Resources Code section 21180(b)(1). The development program provides for reasonable-density infill development in a transit priority area as defined in Public Resources Code Section 21099(a)(7). Although the project site is not in a Priority Development Area designated in Plan Bay Area 2040, it fulfills many of the strategies contained in the plan, as the site is located in a mixed-use neighborhood with retail, restaurant, childcare and other community services that will encourage residents to walk or bicycle to nearby services. The project or project variant will include retail space and a childcare center on the site that will further reduce automobile travel generated.

6. If the project is a multi-family residential project, evidence that (1) private vehicle parking spaces are priced and rented or purchased separately from dwelling units; or (2) the dwelling units are subject to affordability restrictions that prescribe rent or sale prices, and the cost of parking spaces cannot be unbundled from the cost of dwelling units.

The project or variant proposes to provide unbundled parking for all residential units except for any dwelling units subject to affordability restrictions that prescribe rent or sale prices and for which the cost of parking spaces cannot be unbundled from the cost of the affordable dwelling units.

7. Information establishing that the project entails a minimum investment of \$100 million in California through the time of completion of construction.

The proposed project includes 558 residential units in addition to office, retail and childcare space and subsurface parking. The project variant includes 744 residential units in addition to retail and childcare space and subsurface parking. The project or variant will have expended over \$175 million in construction costs by the time construction is completed, according to the estimate presented in the Applicant’s Environmental Evaluation Application to the San Francisco Planning Department in March 2016. In addition, with a range of approximately 75 to 175 construction workers on the site on a typical day during construction, based on current prevailing wages, construction labor costs alone could be approximately \$150 to \$175 million. Thus, the project or variant will exceed the minimum investment of \$100 million by the time of completion of construction.

8. Information establishing that the prevailing and living wage requirements of Public Resources Code section 21183(b) will be satisfied.

Public Resources Code section 21183(b) requires that a project to be certified by the Governor must create “high-wage, highly skilled jobs that pay prevailing wages for construction jobs and living wages and provide construction jobs and permanent jobs for Californians, and help reduce unemployment.” Up to 75 to 175 construction workers would be on the project site on a typical day during the approximately 7-year construction period estimated for the proposed project or variant.

⁷ California Air Resources Board staff, *Technical Evaluation of the Greenhouse Gas Reduction Quantification for the Association of Bay Area Government’s and Metropolitan Transportation Commission’s SB375 2017 Sustainable Communities Strategy*, June 2018. Available at <http://www.arb.ca.gov/cc/sb375/sb375.htm>. Accessed on August 3, 2018.

Public Resources Code section 21183(b) defines “jobs that pay prevailing wages” as “all construction workers employed in the execution of the project will receive at least the general prevailing rate of per diem wages for the type of work and geographic area, as determined by the Director of Industrial Relations pursuant to Sections 1773 and 1773.9 of the Labor Code.” The Applicant will include the prevailing wage requirement in all construction contracts.

The proposed project or variant will create high-wage, highly skilled jobs, both during construction and during operation. Approximately 395 permanent jobs would be created with the proposed project, and approximately 206 permanent jobs would be created by the project variant. In addition to the prevailing wage requirements for construction workers, the Applicant will be required to comply with local ordinances that require payment of living wages. Chapter 12R of the San Francisco Administrative Code requires payment of a minimum wage that is higher than that required by the State of California. As of July 1, 2018, the minimum wage in San Francisco is \$15.00 per hour, substantially higher than the California minimum wage of \$11.00 per hour in 2018. The San Francisco ordinance provides for annual increases in July of each year after 2018 based on the Consumer Price Index for urban wage earners for the San Francisco-Oakland-San Jose, California metropolitan statistical area. The requirements of Chapter 12R are not applicable to employees who are covered by a collective bargaining agreement if the agreement expressly waives the ordinance’s requirements. A copy of Chapter 12R is presented in **Attachment D** to this Application, along with a copy of the California Department of Industrial Relations’ letter approving the San Francisco Office of Labor Standards Enforcement’s Labor Compliance Program.

9. Information establishing that the project will not result in any net additional greenhouse gas emissions. This information is subject to a determination signed by the Executive Officer of the Air Resources Board that the project does not result in any net additional greenhouse gas emissions, following the procedures set forth in section 6 of the Governor’s Guidelines.

The California Air Resources Board (CARB) must review the analysis of greenhouse gas emissions (GHG) from construction and operation of the proposed project or project variant. The analysis should include the technical basis for characterizing and analyzing GHG emissions and for identifying and quantifying the GHG reduction potential of proposed strategies to fully offset any GHG emissions generated by a proposed project. A Memorandum prepared by Ramboll presents the technical methodology for and results of quantifying the GHG emissions from the existing activities on the project site and the GHG emissions from construction and operation of the proposed project or project variant. The Memorandum and its Appendix materials are in **Attachment E**.

The baseline for the analysis of the proposed project and project variant is the emissions from existing activities on the project site. Project-generated emissions were calculated yearly during construction phases, with operation of earlier phases overlapping with later construction phases. Construction was assumed to occur over a 7-year period; however, the applicant may choose to develop the project site over a timeframe of up to 15 years. The calculations assume a seven-year timeframe to present the most conservative approach to the analysis with the most concentrated emissions. Operational emissions were calculated for 2020 through 2057 to account for an approximately 30-year lifespan of the project following buildout.

Total construction emissions of GHG would be 4,273 metric tons (MT) of CO₂e for both the proposed project and project variant. Total operational emissions would be 3,703 MT for the proposed project and 6,235 MT for the project variant. Total gross operational emissions for the lifetime of the proposed project or project variant do not include any credits from years where existing emissions were calculated to be higher than those from the proposed project or the project variant. By 2038 for the proposed project

and by 2044 for the project variant, with anticipated reductions from the California Renewables Portfolio Standard and fleet turnover, operational emissions of the proposed project or project variant would be below existing emissions.

To offset GHG emissions from construction in 2020 through 2027 and from operation in 2026 through 2037 for the proposed project or through 2044 for the project variant, the project sponsor commits to measures to ensure there would be no net additional GHG emissions from the project or project variant. This would be achieved through on-site measures such as installing additional solar panels, additional on-site electric vehicle charging stations, or through the purchase of qualified GHG credits, or a combination of on-site measures and credits.

10. Information establishing that the project will comply with the requirements for commercial and organic waste recycling in Chapters 12.8 (commencing with Public Resources Code section 42649) and 12.9 (commencing with Public Resources Code Section 42649.8), as applicable.

California has had statutory and regulatory requirements related to solid waste recycling for well over 10 years requiring local governments to reduce solid waste in landfills with waste diversion programs. The two more recent statutes, in Chapters 12.8 and 12.9 of Division 30 of the Public Resources Code related to waste management, require recycling of solid waste and organic waste. Chapter 12.8 requires that businesses and multi-family residential buildings with five units or more that generate more than four cubic yards of solid waste per week source separate its solid waste and subscribe to some kind of recycling service consistent with local ordinances or state regulations. Chapter 12.9 requires that businesses generating over specified amounts of organic solid waste per week arrange for recycling services for that organic solid waste, and also requires that if the state has not reached a reduction of 50 percent below the 2014 level of disposal of organic waste by 2020, businesses that generate more than two cubic yards of solid waste per week must source separate and arrange for recycling of organic solid waste. These statutes also require local jurisdictions to establish a commercial solid waste recycling program if it did not already have one as of July 2012, and an organic solid waste recycling program by January 2016 if it did not already have one.

The proposed project or variant will be subject to these statutory requirements, and will comply by following all of the requirements of San Francisco's local recycling and composting ordinances.

San Francisco's Mandatory Recycling and Composting Ordinance (No. 100-09) in Chapter 19 of the San Francisco Environment Code is a local municipal ordinance requiring all persons located in San Francisco to separate their recyclables, compostable and landfilled trash and to participate in recycling and composting programs. The Applicant has included appropriate recycling and composting collection facilities in the design of each building and in the overall site design so that these materials can be easily disposed of by residents and employees and easily collected by the various solid waste collection and disposal companies that serve the project site.

Demolition and construction of the proposed project would generate an estimated 47,000 cubic yards of debris, and an estimated 241,300 net cubic yards of soil from excavation of the site. The San Francisco Construction and Demolition Debris Recovery Ordinance (No. 27-06), Chapter 14 in the San Francisco Environment Code, requires that substantial amounts of construction and demolition debris material removed from a project must be recycled or reused. All demolition and construction debris must be transported by a registered transporter and processed by a registered facility. The processing facility must divert a minimum of 65 percent of total waste received from landfills, including materials separated for reuse and recycling. No construction and demolition debris can be taken to landfill or put in the garbage, according to San Francisco Health Code Section 288. Copies of these local ordinances are provided in **Attachment F**.

Thus, the Applicant will be required to comply not only with the Public Resources Code requirements for commercial and organic waste recycling, but also with the requirements of San Francisco's local ordinances requiring recycling and composting solid waste both during construction and during operation of the proposed project or variant.

11. Information documenting a binding agreement between the project proponent and the lead agency establishing the requirements set forth in Public Resources Code section 21183(e) (all mitigation measures will be conditions of approval and enforceable, and environmental mitigation measures will be monitored and enforced for the life of the obligation), (f) applicant will pay costs for hearing by Court of Appeal, and (g) (applicant will pay costs of preparing the record of proceedings).

Written acknowledgement from the project sponsor containing commitments regarding Public Resources Code sections 21183(e)(f) and (g) is included as **Attachment G**. The Applicant is committed to comply with all Mitigation Monitoring and Reporting Program measures from the EIR that are included as conditions of approval and that those conditions will be fully enforceable by the San Francisco Planning Department, Department of Building Inspection, Health Department, and/or the Department of the Environment. The Applicant agrees to pay the costs for hearing by the Court of Appeal, and will pay the costs of preparing the record of proceedings.

Attachment 3

Operation of the proposed new land uses, which are typical urban land uses, are not anticipated to create significant sources of new odors. Thus, odors would not be expected to occur as a result of the operation of the proposed project or project variant.

Therefore, odor impacts related to the construction and operation of the proposed project or project variant would be less than significant, and no mitigation measures are necessary. This topic will not be discussed in the EIR.

Impact C-AQ-1: The proposed project or project variant, in combination with past, present, and reasonably foreseeable future projects, could contribute to cumulative air quality impacts. (Potentially Significant)

The construction and operational emissions discussed above would be evaluated at a project level. Air quality impacts associated with the proposed project or project variant could substantially contribute to cumulative impacts. For these reasons, the proposed project or project variant, in combination with other past, present, and reasonably foreseeable future projects, could result in a cumulatively considerable air quality impact. Therefore, potential cumulative air quality impacts will be addressed in the EIR.

Topics:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact	Not Applicable
7. GREENHOUSE GAS EMISSIONS.—					
Would the project:					
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Greenhouse gas (GHG) emissions and global climate change represent cumulative impacts. GHG emissions cumulatively contribute to the significant adverse environmental impacts of global climate change. No single project could generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects have contributed and will continue to contribute to global climate change and its associated environmental impacts.

The Bay Area Air Quality Management District (air district) has prepared guidelines and methodologies for analyzing GHGs. These guidelines are consistent with CEQA Guidelines sections 15064.4 and 15183.5, which address the analysis and determination of significant impacts from a proposed project's GHG emissions. CEQA Guidelines section 15064.4 allows lead agencies to rely on a qualitative analysis to describe GHG emissions resulting from a project. CEQA Guidelines section 15183.5 allows for public agencies to analyze and mitigate GHG emissions as part of a larger plan for the reduction of GHGs and describes the required contents of such a plan.

Attachment 4

San Francisco 2004 and 2009 Housing Element

Volume I: Draft EIR (Section I to Section V.G)

PLANNING DEPARTMENT
CASE NO. **2007.1275E**

STATE CLEARINGHOUSE NO. 2008102033

SAN FRANCISCO
PLANNING
DEPARTMENT

Draft EIR Publication Date:	June 30, 2010
Draft EIR Public Hearing Date:	August 5, 2010
Draft EIR Public Comment Period:	June 30, 2010 – August 16, 2010

Written comments should be sent to:

Environmental Review Officer | 1650 Mission Street, Suite 400 | San Francisco, CA 94103

IMPACTS

Significance Thresholds

The proposed Housing Elements would normally have a significant effect on the environment if they would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

As climate change is an irreversible, significant cumulative impact on a global scale, consideration of an impact to climate change is essentially an analysis of the contribution to a cumulatively significant global impact through its emission of GHGs and therefore addressed in the cumulative evaluation.

As discussed previously, the 2004 Housing Element and 2009 Housing Element would not change the land use objectives and policies in the City's area and redevelopment plans. According to Part I of the 2009 Housing Element (Data and Needs Analysis), the City has available capacity to meet the RHNA. Therefore, the rezoning of land uses is not required. To meet the City's share of the RHNA, the proposed Housing Elements aim to do the following: 1) preserve and upgrade existing housing units to ensure they do not become dilapidated, abandoned, or unsound, and 2) provide direction for how new housing development in the City should occur. With respect to the latter, the 2004 Housing Element encourages new housing in Downtown and in underutilized commercial and industrial areas. The 2004 Housing Element also encourages increased housing in neighborhood commercial districts and mixed-use districts near Downtown. On the other hand, the 2009 Housing Element encourages housing in new commercial or institutional projects and accommodating housing through existing community planning processes.

Cumulative Impacts

Impact GH-1: The proposed Housing Elements would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment and would not conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. (Less than Significant)

The subject of this EIR is the proposed revision of the Housing Element of the San Francisco General Plan. The 2004 and 2009 Housing Elements are updates to the 1990 Residence Element of the San Francisco General Plan, a public policy document that addresses issues of housing needs for San Francisco residents and households. As discussed above, new residential development would occur regardless of the proposed Housing Elements; the proposed Housing Elements provide direction for how new housing should occur.

A. GENERAL PROJECT INFORMATION:

Case No: 2015-014028ENV

Project name/Address: 3333 California Street Mixed-Use Project

Block/Lot: 1032/003

Brief Project description: The 10.25-acre project site is currently occupied by the University of California San Francisco Laurel Heights Campus in the Presidio Heights neighborhood of San Francisco. The project would demolish an existing annex building, surface parking lots, and circular garage ramp structures. The existing four-story office building would be partially demolished and divided into two separate buildings, expanded to include new levels (80 to 92 feet in height), and adapted for residential use. Portions of the below-grade parking garage would be retained and incorporated into a larger parking structure. Thirteen new buildings, ranging in height from 30 to 45 feet, would be constructed on the site with a mix of residential, office, retail, and child care uses. The proposed project would result in 558 dwelling units within 824,691 gross square feet of residential floor area; 49,999 gross square feet of office floor area; 54,117 gross square feet of retail floor area; and a 14,690- gross-square-foot child care center. The proposed project would include 895 vehicle parking spaces in four below-grade garages and six individual, two-car garages; 592 class 1 and 101 class 2 bicycle parking spaces; and 236,000 square feet of open areas, including publicly accessible plazas and public walkways. A project variant that would add two levels and replace the proposed office space in one of the buildings with 186 residential units (for a total of 744 dwelling units) is also being considered.

B. COMPLIANCE CHECKLIST TABLE

Complete and attach to this form the appropriate compliance table by determining project compliance with the identified regulations and providing project-level details in the discussion column. Please note that Table 1 applies to Private Development Projects, Table 2 applies to Municipal Projects, and Table 3 is for plan-level analysis. Projects that do not comply with an ordinance/regulation may be determined to be inconsistent with San Francisco's qualified GHG reduction strategy.

Compliance Checklist Table attached: ☒ Table 1. Private Development

☐ Table 2. Municipal Project

Regulation	Requirements	Project Compliance	Remarks
			project site's solid waste collection rooms at the basement levels of the proposed California Street Garage (Basement Level B3) and Masonic Garage (Basement Level B1) to pick up collected solid waste on a regularly scheduled basis. Pickup would also occur off Laurel Street to service the Laurel Street Duplexes and the Mayfair Building.
San Francisco Construction and Demolition Debris Recovery Ordinance (San Francisco Environment Code, chapter 14, San Francisco Building Code, chapter 13B, and San Francisco Health Code, section 288)	<p>Applies to all projects: No construction and demolition material may be taken to landfill or placed in the garbage. All (100 percent of) mixed debris must be transported by a registered hauler to a registered facility to be processed for recycling. Source separated material must be taken to a facility that recycles or reuses those materials.</p> <p>Additionally, projects that include full demolition of an existing structure must submit a waste diversion plan to the Director of the Department of Environment and the plan must provide for a minimum of 65 percent diversion from landfill of construction and demolition debris, including materials source separated for reuse or recycling.</p>	<input checked="" type="checkbox"/> Project Complies <input type="checkbox"/> Not Applicable <input type="checkbox"/> Project Does Not Comply	<p>The proposed project or project variant would comply with San Francisco Construction and Demolition Debris Recovery Ordinance. The project sponsor would not plan to truck construction and demolition material directly to a landfill or place it directly in the garbage. Project sponsor would use a registered hauler to transport the mixed debris to a registered facility for processing and recycling. A waste diversion plan documenting a minimum 65 percent diversion of construction and demolition debris from landfills would be required due to the proposed demolition of the existing annex building. The waste diversion plan would be prepared by the general contractor and submitted to the Director of the Department of Environment.</p>

Attachment 6

SAN FRANCISCO PLANNING DEPARTMENT

MEMO

DATE: November 12, 2010
 TO: Major Environmental Analysis and Environmental Consultants
 FROM: Jessica Range, Environmental Planner
 RE: Greenhouse Gas Analyses Pursuant to CEQA

1650 Mission St.
 Suite 400
 San Francisco,
 CA 94103-2479

Reception:
 415.558.6378

Fax:
 415.558.6409

Planning
 Information:
 415.558.6377

This memorandum supercedes that titled "Consultant Prepared_GHGMemorandums_030408", dated March 4, 2008. This update is necessary to address recent requirements for greenhouse gas (GHG) analyses pursuant to CEQA, namely amendments to the State CEQA guidelines as per Senate Bill (SB) 97 and the Bay Area Air Quality Management District's (BAAQMD) 2010 CEQA Air Quality Guidelines and updated thresholds of significance. SB 97 amended the State CEQA guidelines to address the feasible mitigation of GHG emissions or the effects of GHGs, and added a new section to the CEQA Checklist (CEQA Guidelines Appendix G) to address questions regarding a project's potential to emit GHGs.

Additionally, on June 2, 2010, BAAQMD adopted new and revised CEQA air quality thresholds of significance and issued revised guidelines that replace the 1999 air quality guidelines. The 2010 CEQA Air Quality Guidelines provide for the first time CEQA thresholds of significance for greenhouse gas emissions. The BAAQMD has identified three options for determining whether a project's GHG emissions are significant. These options are as follows:

1. Compliance with a Qualified Greenhouse Gas Reduction Strategy, or
2. Whether a project's GHG emissions exceed 1,100 metric tons of carbon dioxide equivalents (MTCO₂E), or
3. Whether a project's GHG emissions exceed 4.6 MTCO₂E per service population.

A lead agency may choose which threshold to analyze a project against for determining whether the project's GHG emissions are significant, however BAAQMD encourages lead agencies to prepare a Qualified GHG Reduction Strategy. On August 12, 2010, the San Francisco Planning Department submitted to the BAAQMD a draft of the City and County of San Francisco's *Strategies to Address Greenhouse Gas Emissions*. This document presents a comprehensive assessment of policies, programs and ordinances that collectively represent San Francisco's Qualified Greenhouse Gas Reduction Strategy. The BAAQMD reviewed San Francisco's GHG reduction strategy and concluded that the strategy meets the criteria for a Qualified GHG Reduction Strategy as outlined in BAAQMD's CEQA Guidelines (2010).¹ Therefore, projects that

¹ San Francisco's *Strategies to Address Greenhouse Gas Emissions* and BAAQMD's letter are available online at: <http://www.sfplanning.org/index.aspx?page=1570>.

are consistent with San Francisco's GHG reduction strategy would result in less than significant GHG emissions.

Compliance with a Qualified GHG Reduction Strategy

In order to facilitate a determination of compliance with San Francisco's GHG reduction strategy, the Planning Department has prepared a Greenhouse Gas Analysis Compliance Checklist. Projects that are seeking a determination of CEQA GHG significance based on compliance with San Francisco's GHG reduction strategy must complete the Greenhouse Gas Analysis Compliance Checklist. The MEA planner or CEQA consultant in coordination with the project sponsor can prepare this checklist. However, only an MEA planner may make a determination of whether the project is consistent with San Francisco's GHG reduction strategy. Only projects located within the City and County of San Francisco are eligible to seek a determination of compliance with San Francisco's GHG reduction strategy.

For those projects that are seeking a determination of compliance with San Francisco's GHG reduction strategy, the MEA planner or CEQA consultant should prepare the Greenhouse Gas Analysis Compliance Checklist. If the CEQA consultant is preparing the checklist, it should be submitted to the MEA planner for a determination of compliance. The signed checklist should be included in the project file and is used to complete the required CEQA document. For projects that do comply with San Francisco's GHG reduction strategy, the MEA planner or CEQA consultant should follow the Standard Climate Change Language v.7, and include appropriate information from the Greenhouse Gas Analysis Compliance Checklist. A quantitative greenhouse gas analysis is not required.

CEQA Significance Based on Quantitative Thresholds

Generally, projects that do not comply with San Francisco's *Strategies to Address Greenhouse Gas Emissions*, or projects that are located outside of the City and County of San Francisco, or are otherwise not eligible to be analyzed qualitatively must conduct a quantitative analysis of the project's GHG emissions. The quantitative analysis must be prepared pursuant to BAAQMD's 2010 CEQA Air Quality Guidelines and supporting documents. These projects are required to submit a GHG Technical Memorandum that at a minimum includes the following:

- (1) A summary of the **direct** (on-road and off-road mobile sources, heating, electricity generation, and land conversion, etc.) and **indirect** (off-site electricity generation, methane released from landfills, energy associated with water use, transport and treatment, etc.) project induced greenhouse gas emissions. Calculations should be conducted for both project operations and construction emissions.
- (2) Methodology and assumptions used for calculating a project's greenhouse gas emissions. This section should clearly identify the models used, each input and its source (e.g., transportation report, etc.), and any other assumptions relied upon. Calculations should

be included as an attachment, if not directly written into the memorandum. All models and inputs must be referenced appropriately.

- (3) Results of the total direct and indirect project induced greenhouse gas emissions resulting from project operations and construction. Construction emissions should be presented as total emissions as well as amortized emissions over the life of the project.
 - a. If the project is seeking a determination using the service population threshold, the Results section should identify the project's service population and emissions based on this service population.

Greenhouse gas technical memoranda should be submitted to the MEA case planner. The MEA case planner will enter the project into the GHG Review Log. The GHG analysis will be assigned to an MEA planner for review. CEQA consultants should anticipate at least one draft and one final GHG technical memorandum. General practice is that if a project is being prepared by a CEQA consultant, the consultant must also prepare the GHG analysis. For projects in which MEA is preparing the CEQA document in-house, the GHG analysis may also be conducted in-house. However, large or particularly complex projects may require a consultant to prepare the GHG analysis. For in-house GHG analyses, the MEA planner must complete a [Greenhouse Gas Analysis Request Form].

For questions regarding this memorandum, the Greenhouse Gas Analysis Compliance Checklist, or greenhouse gas analyses, please contact Jessica Range at (415) 575-9018 or Debra Dwyer at (415) 575-9031.

Attachment 7

OVERVIEW OF PROPOSED PROJECT AND PROJECT VARIANT

The project sponsor is requesting rezoning and adoption of a Special Use District, Conditional Use authorization and approval of a planned unit development, and approval of a Development Agreement for a multiphase, mixed-use development on the project site to be developed over a 7-to 15-year construction timeframe. The project site plan is shown in Figure 3, p. 5. As envisioned, the proposed project would include phased development (four phases) of residential uses (anticipated to include both market-rate and affordable dwelling units), retail uses, office uses, a child care center, parking, streetscape improvements, and open space. The project sponsor is also studying a variant to the proposed project: the Walnut Building Variant that replaces the proposed office use in the Walnut Building with residential uses and less retail space.⁷

Under the proposed project, the existing annex building, surface parking lots, and circular garage ramp structures along California Street would be demolished. The existing approximately 55.5-foot-tall office building at the center of the site (exclusive of the approximately 13-foot-tall mechanical penthouse) would be partially demolished and adapted to serve as two separate buildings, Center Building A and Center Building B, connected by a covered bridge. Dividing the building would allow for the development of a linear north-south connection from California Street to Euclid Avenue through the middle of the project site. The proposed north-south connection would align with Walnut Street (the proposed Walnut Walk) incorporating the site into the surrounding street grid. Center Building A and Center Building B would be renovated, adapted for residential use, and strengthened to accommodate vertical additions (see Figure 3, p. 5). Two residential levels would be added to Center Building A for a building height of approximately 80 feet tall. Two residential levels would be added to the east portion of Center Building B and three residential levels would be added to the west portion, for a building height ranging from approximately 80 feet on the east portion to 92 feet on the west portion. The heights are measured from the proposed residential lobbies adjacent to the proposed Walnut Walk to the top of the roof. A total of 13 new buildings would be constructed along California Street, Masonic Avenue, Euclid Avenue, and Laurel Street for a total of 15 buildings on site. The new buildings would consist of the following:

- The Plaza A and Plaza B buildings, two four-story mixed-use residential buildings with ground floor retail along California Street between Laurel and Walnut streets with proposed heights of 45 feet⁸
- The Walnut Building, a three-story mixed-use office building with ground floor retail and child care space along California Street east of Walnut Street with a proposed height of 45 feet

⁷ The project variant is also identified as the Mixed-Use Multi-Family Housing Variant in the technical background studies and background supporting documentation.

⁸ The overall heights referenced above, below and throughout the document are determined as described in Planning Code section 260 or will require a modification to the methodology through the planned unit development approval process.

Developers' Demolition of Existing Historic Building

Section B

DEIR Deficiencies for Construction Trip Generation

DEFICIENCIES -CONSTRUCTION TRIP CALCULATIONs in the DEIR.

Attachment 1: SWAC Report 3333 California Street Mixed-Use Project Application for Environmental Leadership Development Project - Attachment E (Ramboll) - Table Con-5 Project Construction Trip Assumptions.

Attachment 2: 3333 California St. Mixed-Use Project DEIR Volume 2c: Appendices D-G Cover: EIR Appendix D "Transportation and Circulation"; Table of Contents: Section 8 "Truck Turning Templates."

Table Con-5 grossly understates the number of trips that will be required to remove the demolition debris and excavated soils from the site. Neither the authors of the reference nor the Planning Department have shown by analyses or data that this information is accurate or correct. The data is provided strictly by the "Project Sponsor" and no one has performed the basic due diligence needed to validate it.

The Project Sponsor understates the number of Hauling Trips by approx. 45% which directly under-represents the GHG calculations (in violation of FN 130 Planning Department "Compliance Checklist for GHG Analysis"; of Impact C-AQ-1 "less than Significant" conclusion pg. 146 of the Initial Study dated April 25, 2018; and of San Francisco 2004 and 2009 Housing element), under-reports the impact on Air Quality calculations and the resulting conclusions based on this discrepancy are simply erroneous and incorrect.

Table Con-5 shows a total of 18,020 Hauling Trips to remove the 288,000 cubic yards of demolition debris and Excavated Soils. This is an average of 16 cubic yards per trip. A dump truck capable of hauling 16 cubic yards would be unable to safely navigate 5 of the 6 major intersections around the site and pass safely through the surrounding neighborhoods. The DEIR Section 8 Truck Turning Templates of Volume 2 Appendix D "Transportation & Circulation Section 8 "truck Turning Templates."

A large tandem dump truck can haul approx. 11 cubic yards of soil and less of a mixed debris such as concrete, asphalt, steel. It is approx. 30ft in length and is also wider, by 11%, than the truck shown on Template SU-30. The narrower truck barely is able to make legal turns and this assume ideal conditions, no obstructions-cyclists, pedestrians, rain, etc. A wider dump truck would impinge on incoming traffic. A 16 cubic yard truck would be significantly more hazardous as s can be seen from Template WB-40 Circulation Exhibit; such a vehicle could not operate safely in any of the neighborhoods surrounding the site.

The number of trips is grossly underestimated by the Project Sponsor.

Assuming approx. 88,000 cubic yards of hard debris – concrete, asphalt, steel, aluminum, etc. - and an average load of 9 cubic yards results in approx. 9,800 dump truck loads.

Assuming the remaining 200,000 cubic yards to be soil, some wet, and an average load of 11

cubic yards results in 18,200 loads for a total of 28,000 loads or 1.55 times the number submitted by the Project Sponsor and accepted without validation by the Planning Department.

As a result the GHG calculations in the Attachment are significantly understated by approx. 45% and the GHG are in fact "Significant" and require that they be correctly and accurately studied in the EIR. The Air Quality around the site will also be impacted by this gross under-calculation and the DEIR GHG, Air Quality and Traffic Analysis conclusions are, by definition, defective and invalid. The information is incomplete, incorrect, inaccurate.

Our DEMAND is that the number of Hauling Loads be recalculated using appropriate load factors; that the resulting GHG be properly and accurately re-calculated; that the Air Quality issues be revised to reflect the higher number of trips by the largest pieces of site equipment; that the Traffic Circulation be redone to reflect accurate information.

Our DEMAND is that GHG be correctly re-classified as "Significant" and addressed appropriately.

Our DEMAND is that the Developer's excessive, unmitigated "Significant" GHG be compared against the Community Alternative Plan which generates less than one third of the GHG; impacts Air Quality by having one third the impact on the Hauling Trip totals alone (9,000 vs 27,000+).

The Community Alternative actually meets the standard for "Less than Significant."

The failure to validate key information provided by the Project Sponsor and their sub-contractors is a major failing of the DEIR. The Planning Department's failure to exercise the appropriate oversight of the information it uses to reach conclusions results in the DEIR being a collection of erroneous and self-serving conclusions that fails to meet the criteria for accuracy, completeness and correctness.

Deficiencies for Hydrology and Water Quality

COMMENTS TO E 14: HYDROLOGY AND WATER QUALITY; INITIAL STUDY 3333 CALIFORNIA STREET
MIXED USE PROJECT

Planning Department Case No. 2015-014028ENV April 25, 2018(reference 1)

On page 216 of the Initial Study (IS), reference 1, the IS states that the project could have significant impact if it could:

c) "Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on- or off-site?"

This is restated in Impact HY-3 on page 222 of reference 1.

An underground stream or flow of water is equally as relevant (and potentially more impactful) as a more visible surface stream. There is no indication in the Initial Study that this has been considered. Planning nevertheless checked "Less Than Significant Impact."

d) "Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increased the rate or amount of surface runoff in a manner that would result in flooding on- or off-site?"

This is also restated In Impact HY-3 on page 222.

Again, as noted above, underground flow of water is equally as important and requires equal consideration.

Planning checked "Less Than Significant Impact."

As discussed below these conclusions are not supported by substantial evidence inasmuch as the factual data and analysis upon which they are based are insufficient to support the determination of "no-significant impact."

The City failed to use best efforts to investigate and disclose all that it reasonably can with respect to the project's potential adverse impacts.

The IS's analysis failed to consider the impact of the project on underground flows of water and did not make a finding as to whether the existing underground drainage patterns of the site or area could be affected.

4
(HWQ-1)

DISCUSSION

The Preliminary Geotechnical Investigation conducted (FN40) by Langan Treadwell Rollo dated 3 Dec. 2014 (Reference 2), page 5, table 1 shows 5 borings with Depth to Groundwater varying from 18.8 feet to 38.8 feet.

However the Phase I Environmental Site Assessment (FN244) by Langan Treadwell Rollo dated 3 Dec. 2014 (Reference 3) page 8 states "However, two borings at the Firemen's Credit Union site (northeast of the site) encountered groundwater levels as shallow as 13 feet bgs."

The Firemen's Credit Union is immediately adjacent to 3333, and is part of the same block. It is not a separate site geologically or hydrologically.

Reference 3 further states "The direction of groundwater flow is assumed (italics and underlining added) to be to the northeast, based on topography and the groundwater monitoring reports for 3201 California Street; however the site is located near the boundary between the Downtown and Westside Groundwater Basins, so it is possible that the groundwater flow direction varies across the site." It is clear from the above that Langan Treadwell Rollo, as well as Planning, has not conducted an investigation that would be adequate to assess the hydrology of the site, including the direction to which the groundwater flows.

The IS states that dewatering the groundwater would likely be required during construction because the depth of excavation would be up as much as 40 feet below ground surface and the groundwater level at the project site is "about 18 to 39 feet below ground surface (IS, page 219).

Actually the groundwater is almost certainly much closer to the surface as noted in reference 3 above as well as for reasons that will be discussed in this section.

There is clearly a subsurface flow of this groundwater. What is it, what is its flow rate and in what direction does it flow?

It would appear prudent to better understand the situation before beginning to excavate up to 40 feet bgs as well as essentially building a concrete dam in the form of underground garages that would stretch from Laurel St. to Presidio Ave., and completely block off any flow across the entire site.

At present there is only minimal obstruction, as the underground garage is a very small portion of the Laurel to Presidio distance and the buildings foundations present a minimal barrier to this subsurface flow.

What is the underground water going to do if this project is constructed?

We know the groundwater under the site will be diverted.

It is reasonable (if we had better data it would probably show with certainty) to conclude that the groundwater diverted by the below ground construction will have considerably higher flow velocities and energy at whatever point(s) it departs the site as the flow will be concentrated at the end(s) of the underground concrete barrier (parking garages).

We know that these higher subsurface flow rates and energies will create higher erosion rates and could lead to flooding at a downstream location due to these higher flow rates.

What are these higher erosion rates going to do to the foundations of buildings exposed to an entirely

4
(HWQ-1)
cont'd

new flow regime, none of which existed when they were constructed?

What analysis has been done concerning these potential impacts on the buildings along the lower portion of Laurel St and Presidio Ave.?

4
(HWQ-1)
cont'd

Unfortunately these are not the only shortcomings of the data presented in the Initial Study.

Nor are they the most damaging to the conclusions reached as to Impact HY-3.

A review of the boring logs indicates the borings were carried out August 20-26, 2014 and generated the groundwater bgs data that appears in table 1, page 5 of FN40, reference 2.

The August 2014 date leaps out like a red flag; as it should have for everyone associated with FN 40 and the Initial Study.

California entered the most severe drought in its history in 2011 and did not exit it until 2017.

August 2014 is the approximate midpoint in this period so any of the FN40 groundwater levels quoted are those determined three years into a prolonged severe drought.

Essentially such data are irrelevant for a normal year(s) and consequentially egregiously understate the hydrological condition of the site.

According to Wikipedia (with additional support in the article's references), "2011-2017 California Drought" (reference 4) page 2: "By February 1, 2014, Felicia Marcus, the chairwoman of the State Water Resources Control Board, claimed the 2014 drought 'is the most serious drought we've faced in modern times.'"

On the same page; "According to NASA, tests published in January 2014 have shown that the twelve months prior to January 2014 were the driest on record, since record-keeping began in 1885."

The references included in this document further reinforce the historic shortfalls of rain during this drought.

Per weather.com/science/environment/news/california-drought-seconds-20141009 (reference 5) page 1: "As a result, 2013 was California's **driest year ever recorded** (emphasis in the report).

San Francisco, which usually averages 23.65 inches of rain a year, only experienced 5.60." This is approximately 24% of a normal year.

The map on page 16 of "275 California drought maps show deep drought and recovery" LA Times April 7, 2017 (reference 6), included at the end of this document, shows the extent and severity of the drought as of Aug.3, Aug. 12, Aug. 19, Aug. 26, Sept.2 – which is the precise period in which the borings took place.

So, in the midst of a record drought, one that was already three years in extent; after the driest year on record (2013); after a year that produced less than 24% of the normal rainfall; and then after five months of a normal zero rainfall dry season the developer commissioned Langan Treadwell and Rollo to carry out borings with one of the specific objectives to determine the depth of groundwater below surface!

It is inconceivable, literally, to conjure up a more perfect set of circumstances to produce a more misleading series of conclusions more amenable and favorable to the developers' plan.

It is also perplexing that Planning has accepted these results on face value, has done no analysis or

research of its own to validate the reasonableness of these results; and has used these results as the basis for a finding of "Less Than Significant."

As a minimum, the conclusions of Impact HY-3 are inaccurate, inadequate, incomplete and invalid. Due to the total absence of relevant analysis and data, the IS failed to consider the impact on the existing underground drainage patterns of the site. The IS discusses impacts on surface runoff and fails to analyze the impact of the construction of the project on the alteration of the existing drainage pattern of the site, including through the alteration of the course of a subsurface stream or river. The EIR should analyze whether the project could alter the existing drainage pattern of groundwater or alter the course and/or characteristics of the underground water flows. It should also analyze the potential impact on existing buildings in the vicinity of the site as a result of the alterations to underground water flows.

The Initial Study and the DEIR Lack Substantive Evidence that the "Less than Significant" finding for Hydrology and Water Quality, Section E-14 of the Initial Study, is correct, complete and accurate. In fact the evidence shows that there is no basis for this conclusion and it must be re-studied and re-concluded using credible evidence.

1. INTRODUCTION

The mixed-use development project located at 3333 California Street in San Francisco, California (herein referred to as the "Proposed Project" or "Project") has applied for California Environmental Quality Act (CEQA) judicial streamlining under Public Resources Code (PRC) Section 21178 et seq. The Application also addresses a variant to the Proposed Project that removes proposed office space and replaces it with additional residences (hereinafter referred to as the "Project Variant"). In support of the Application, Ramboll US Corporation (Ramboll) quantified both direct and indirect greenhouse gas (GHG) emissions associated with the Proposed Project's and Project Variant's operation, including ongoing emissions reductions associated with transportation and building energy usage, to show the Project and Project Variant meet the requirement for no "net additional emission of greenhouse gases [GHG], including greenhouse gas emissions from employee transportation" [California PRC §21183(c)].

Throughout this report, GHG emissions are reported in units of metric tons of carbon dioxide equivalents (MT CO₂e). Carbon dioxide equivalents are emissions of carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O), weighted by the global warming potentials (GWP) from Title 40 of the Code of Federal Regulations (CFR), Part 98, Table A-1, as referenced by the California Mandatory Reporting Rule for GHG (Title 17 of the California Code of Regulations, §§95100- 95158). GHG emissions are quantified for this Project (including construction and operational emissions) as well as existing uses. This document summarizes the assumptions and calculation methodologies Ramboll used to estimate GHG emissions. Summary tables are provided in the text, while more detailed calculation tables are provided in Appendix 1.

1.1 Project Description

1.1.1 Existing Conditions

The project site is currently developed with a four-story office building at the center of the site, a three-level partially subsurface parking garage, three surface parking lots, and a one-story annex building. The site currently has a diesel emergency generator located within Basement Level B1 (within a mechanical room in the easternmost circular garage ramp structure) and an above-ground fuel storage tank immediately east of Basement Level B2 near the Presidio Avenue entry driveway. The emergency diesel generator and above-ground fuel storage tank would be removed from the site during Phase 2 of construction, prior to the installation of a new emergency generator. Land uses are shown in **Table 1**.

The existing buildings contain University of California San Francisco (UCSF) administrative, academic research, social, behavioral, and policy science research department uses (including common areas and space for accessory uses and support programs, such as a daycare center, a conference center/auditorium, and a cafeteria). Prior to commencing Phase 1 of the four-phase construction program for the Proposed Project or Project Variant (see descriptions below), all existing UCSF uses and services are anticipated to be moved to other existing UCSF locations, such as the Mission Bay or Parnassus campuses.

1.1.2 Proposed Project

The Proposed Project would be a mixed-use development with predominantly residential uses and a mix of other uses (office, retail, and childcare). The development site is approximately 446,490 square feet or 10.252 acres located in San Francisco's Presidio

Heights neighborhood. The Proposed Project would include development of 558 residential units, 54,117 gross square feet of retail uses, 49,999 gross square feet of office uses, 14,690 gross square feet of childcare uses, 895 parking spaces in 428,773 gross square feet of below-grade garages, streetscape improvements, and open space. These proposed uses would be located in 13 new buildings and in the adaptively reused office building, which would be divided into two separate residential buildings. Plaza A and Plaza B buildings would be mixed-use residential buildings with ground floor retail units. The Walnut building would be a mixed-used office building with ground floor retail and childcare uses. The Masonic building and Laurel Duplexes (7 buildings) would contain only residential units and the Euclid building would be a mixed-use residential building with ground floor retail space.

Land uses for the Proposed Project are shown in **Table 1**.

1.1.3 Proposed Project Variant

Under the Project Variant, 744 dwelling units would be developed on the project site (186 more than the Proposed Project). The 49,999 gross square feet of commercial office space in the Proposed Project's Walnut Building would be replaced with a larger residential use, the retail floor area would be reduced, and the childcare use would be retained but slightly reduced. Overall, the Walnut Building under the Project Variant would be approximately 368,170 gross square feet, compared to 263,453 gross square feet under the Proposed Project, and would be 22 feet taller. There would be an additional 76 vehicle parking spaces provided under the Project Variant. The other proposed new buildings would not change relative to the Proposed Project.

Land uses for the Proposed Project Variant are shown in **Table 1**.

Table 1: Land Use				
Land Use	Units	Existing Conditions	Project	Project Variant
Office Building*	Square Feet	364,500	49,999	N/A
Childcare Center	Square Feet	11,500	14,690	14,650
Open Space	Acres	3.79	5.42	5.42
Apartments (categorized as Mid Rise)	Dwelling Units	N/A	558	744
Retail	Square Feet	N/A	54,117	48,593
Parking Garage	Spaces	212	895	971
Parking Lot	Spaces	331	N/A	N/A
Bicycle Parking	Spaces	15	693	890
* Includes annex and storage space for the existing conditions scenario.				

2. CONSTRUCTION GHG EMISSIONS

Construction of the Proposed Project and Project Variant will generate “one-time” emissions, that is, discrete emissions that are not associated with ongoing Project/Project Variant operation. These emissions are quantified and disclosed for the Proposed Project and Project Variant. Methodologies for quantifying construction GHG emissions are detailed in the following sections.

2.1 Construction Phasing

The Proposed Project and Project Variant would be constructed in four overlapping development phases with full buildout expected to occur approximately seven years after project entitlements. This analysis is based on an approximately seven-year construction duration and four-phase program that would constitute maximum development on the site; however, the project sponsor may choose to develop the Proposed Project or Project Variant over a timeframe of up to 15 years. Under an up to 15-year construction timeframe the same development program would be implemented; however, periods of dormancy would be introduced between construction phases, and some construction activities currently assumed as concurrent would occur separately over a longer timeframe. Thus, potential physical environmental effects of the Proposed Project or Project Variant under a longer construction timeframe would be similar to, but less severe, than those under a condensed construction timeframe.¹

This analysis conservatively assumes that the residential buildings constructed in each phase of the construction program (i.e., Phase 1, Phase 2, or Phase 3) would be occupied and fully operational as soon as construction of a phase is completed. This is conservative because occupancy and operation of each phase would likely ramp up over time. The analysis also assumes that operational emissions from a phase can overlap with construction emissions from subsequent phases.

The first phase of the construction program (Phase 1) would commence after all existing uses at the UCSF Laurel Heights Campus, including the existing daycare center, have vacated. The preliminary construction schedule assumes that construction would start in 2020, that it would last approximately seven years or longer, and that it would take place for five days per week with different equipment operating for different hours. Due to the similar nature of the Proposed Project and Project Variant (including similar overall square footage), construction phasing, equipment, and schedule would be similar for both. See **Table 2** for a summary of the expected construction phasing timeline, provided by the project sponsor. Table Con-1 in Appendix 1 shows the phased construction duration by year for different phases. Appendix 3 contains construction information provided by the project sponsor.

¹ San Francisco Planning Department. 2018. Initial Study 3333 California Street Mixed Use Project. April 25. Available at: http://sfmea.sfplanning.org/3333%20California%20Street%20Initial%20Study_4-25-18.pdf

Table 2: Construction and Operation Timeline					
Phase	Construction				Operation
	Phase Name	Start Date	End Date	Total Number of Work Days	Start Date
1	Masonic/Euclid	3/2/2020	8/19/2022	645	8/20/2022
2	Center Building A/B	9/10/2021	8/31/2023	515	9/1/2023
3	Plaza A/Plaza B/ Walnut	12/4/2022	11/18/2025	773	11/19/2025
4	Mayfair/Laurel Townhouse/Euclid Park	5/22/2025	1/12/2027	429	1/13/2027
TOTAL				2,362	
Source: Webcor and Prado, 2017.					

Phase 1 would include demolition of the existing annex building and the southern portion of the existing office building. After demolition, Phase 1 would include excavation on the southern portion of the site for the proposed Masonic Garage and construction of the Masonic and Euclid buildings, as well as portions of the privately owned common open spaces that would be open to the public. Phase 2 would include demolition of the northern portion of the existing building and the circular ramp structures, the partial demolition of the existing office building (to be separated into two structures, Center Buildings A and B), as well as some interior renovations, vertical additions of two to three stories, and seismic upgrades to adaptively reuse the existing office building as two separate residential buildings. The existing emergency generator would be removed during this phase and a new emergency generator would be installed.

Phase 3 would include demolition of the existing surface parking lots along California Street, followed by the excavation for the California Street Garage and construction of the California Street buildings (Plaza A, Plaza B and Walnut buildings). The new childcare facility is planned to be occupied by the end of Phase 3 construction. In Phase 4, there would be a limited amount of demolition of surface parking lots, as well as excavation for the Mayfair Garage and the private parking garages for the Laurel Duplexes and construction of the Mayfair Building and Laurel Duplexes. Land uses and amounts are shown by phase in **Table 3**.

Table 3: Project Land Use by Construction Phase						
Land Use	Size Units	Phase 1	Phase 2	Phase 3		Phase 4
				Project	Project Variant	
Apartments (categorized as Mid Rise)	Dwelling Units	196	190	128	314	44
Childcare Center	Square Feet	--	--	14,690	14,650	--
General Office Building	Square Feet	--	--	49,999	--	--
Open Space	Acres	1.4	1.4	2.2		0.5
Retail	Square Feet	4,287	--	49,830	44,306	--
Parking	Spaces	209	190	452	528	44

2.2 Construction-Related GHG Emissions

Construction emissions include emissions from both off-road construction equipment (diesel and electric powered) and on-road construction vehicles, including haul trucks, concrete deliveries, and vendor trips. Due to the similarity in nature of the Proposed Project and Project Variant including construction equipment, phasing, and schedule, estimated construction emissions for the Proposed Project and Project Variant would be similar. Therefore, only one analysis was completed for the two scenarios.

2.2.1 Emissions from Diesel-Fueled Construction Equipment

Emissions calculations associated with off-road construction equipment are based on the construction schedule, type and quantity of equipment and hours of operation for each piece of equipment based on project specific information provided by the project sponsor² which is summarized in Table Con-2 of Appendix 1. GHG emissions from off-road construction equipment are estimated using methodologies consistent with the California Emissions Estimator Model (CalEEMod®) version 2016.3.2. All off-road equipment is assumed to have CalEEMod® default diesel engines without any mitigation. Electric equipment is discussed in section 2.2.2. Emissions associated with diesel fuel include only running exhaust emissions since starting emissions are assumed to be minimal for diesel-fueled equipment. Exhaust emissions calculations are based on California Air Resources Board's (CARB's) OFFROAD 2011 methodology as below:

² Bell, Joe, Webcor Builders, e-mail correspondence with Peter Mye at SWCA regarding construction data, September 14, 2017.

$$E_C = \sum (EF_C * HP * LF * Hr * Red * C)$$

Where:

E_C : off-road equipment exhaust emissions in pounds (lbs.)

EF_C : emission factor (g/bhp-hr). Emission factors for diesel equipment are default CalEEMod emission factors by Tier

HP: equipment horsepower. Project-specific equipment horsepower were provided by the project sponsor.

LF: equipment load factor. Project-specific or CalEEMod defaults

Hr: equipment operating hours

Red: reduction from Diesel Particulate Filter (DPF), as applicable

C: unit conversion factor

GHG emissions for each year of construction were then calculated based on the overall construction duration for each phase in a given year. Table Con-3 in Appendix 1 represents the yearly GHG emissions for each phase from off-road diesel equipment. The total GHG emissions associated with off-road construction diesel equipment are shown in **Table 4**. Supporting construction information provided by the project sponsor is included in Appendix 3.

2.2.2 Emissions from Electric Construction Equipment

GHG emissions from the use of electrical off-road equipment are estimated based on type and usage of each equipment. Usage information for all the electrical construction equipment is from SWCA's "Energy Assessment".³ The Energy Assessment is attached in Appendix 3. Table Con-4 in Appendix 1 shows the yearly electricity consumption by construction equipment and GHG emission by year. Total electricity usage from operation of equipment is estimated to be about 7,170 MWh per year for both the Project and Project Variant.

Yearly GHG emissions were calculated by multiplying the CO₂e intensity factor with the scaled electricity consumption for each year. Electricity consumption was scaled by the overall construction duration of each phase and by the fraction of construction duration of each phase in a given year. The total GHG emissions associated with off-road construction electric equipment are shown in **Table 4**.

2.2.3 Emissions from On-Road Construction Trips

On-road construction vehicles such as passenger vehicles for workers and vendors, and trucks for soil and material hauling generate GHG emissions. These emissions are calculated based on the number of trips and vehicle miles traveled (VMT) along with emissions factors from Emission Factors Model (EMFAC2014).⁴ Trip counts are provided

³ SWCA. 2018. 3333 California Street Mixed-Use Project Energy Assessment / Case No. 2015-015028ENV. April 12. Revised July 23.

⁴ A more recent version of EMFAC, EMFAC2017, has now been released. However, this model has not yet been approved by the USEPA or incorporated into CalEEMod®. Ramboll carried out a preliminary analysis of construction emissions using EMFAC 2017. The preliminary EMFAC2017 results confirmed that results would not change any of the original conclusions. If EMFAC2017 were incorporated, it would not be expected to significantly affect results.

by the project sponsor and CalEEMod® default trip lengths for worker, vendors and haul trips are used in the analysis. Trip counts and trip lengths are shown in Table Con-5 in Appendix 1. Sponsor provided construction data is included in Appendix 3. Running emission factors include running exhaust and running losses estimated for the years 2020-2027. Running emissions are calculated as,

$$E_R = \sum (EF_R * VMT * C)$$

Where:

VMT or Vehicle Miles Traveled: Trip Length*Trip Number

EF_R: running emission factor (g/mile) from EMFAC2014

C: unit conversion factor

On-road emissions also include exhaust emissions from vehicle idling. Idling emissions from EMFAC2014 are estimated only for heavy duty trucks since idling emissions occur during extended idling events for these trucks, and EMFAC-2014 takes account of idling emissions from light duty vehicles and other vehicle types in running emissions estimates. Idling emissions are estimated as,

$$E_I = \sum (EF_I * Idle Time * Trip Number)$$

Where:

EF_I = vehicle idling emissions factor (g/trip) from EMFAC 2014.

Idle Time = assumed to be 5 minutes of idling per one-way trip.

Trip Number = heavy duty truck trips provided by project sponsor

Idle time is consistent with California ATCM to limit diesel-fueled commercial motor vehicle idling (Title 13, CCR, section 2485)

GHG emissions for each year of construction are estimated based on the overall construction duration for each phase in a year. Table Con-3 in Appendix 1 reports the yearly GHG on-road emissions for each phase. The total GHG emissions associated with on-road construction trucks are shown in **Table 4**.

2.2.4 Watering for Dust Control

GHG emissions associated with the electricity consumed during watering for construction dust control are calculated based on the total water consumption, electricity use for watering, and the electricity intensity for water supply, distribution and treatment over the phased construction period. Total water consumption is from the Water Supply Assessment⁵ which was summarized in the Energy Assessment. Table Con-6 in Appendix 1 reports the electricity construction and GHG emissions split by phase and year. Total GHG emissions associated with watering for dust control are shown in **Table 4**.

2.3 Summary of Construction GHG Emissions

The total emissions from construction are summarized in **Table 4**. Total GHG emissions from diesel off-road equipment, on-road trucks and electrical off-road equipment are 1,465, 1,716 and 1,090 MT CO₂e, respectively. Total GHG emissions from construction activities are approximately 4,273 MT CO₂e.

⁵ San Francisco Water Power Sewer. 2017. Water Supply Assessment. June 13.

Table 4: Construction GHG Emissions (MT/year)					
Year	Diesel Off-Road Equipment	On-Road Trucks	Electric Equipment	Electricity Use for Watering Dust Control	Total GHG Emissions
2020	173	259	109	0.028	541
2021	248	318	167	0.035	733
2022	277	243	212	0.028	732
2023	281	271	201	0.030	752
2024	194	252	118	0.026	564
2025	216	278	170	0.029	664
2026	74	92	111	0.012	277
2027	2.2	2.8	3.2	0.0003	8.3
Total GHG emissions from construction (MT)					4,273

3. OPERATIONAL GHG EMISSIONS

GHG emissions are quantified using the California Air Resources Board's current approved model, CalEEMod® version 2016.3.2. CalEEMod® was run for several scenarios including operation of the existing site, the Proposed Project (by phase), and Project Variant (by phase). Emissions categories include on-road vehicle exhaust (mobile), stationary sources within the project site (generators), energy (indirect emissions from electricity and direct emissions from natural gas), water and wastewater, solid waste disposal and area sources such as landscaping equipment.

3.1 GHG Emissions from Existing Conditions

Total GHG emissions from operation of the existing site in 2020 are shown in **Table 5**. Total GHG emissions are 3,873 MT CO₂e/year, with mobile sources being the largest contributor to GHG emissions, followed by electricity and natural gas use. The site currently includes one diesel emergency generator, three natural gas boilers, and two electrical substations within the Basement Levels B1 and B2, respectively and an above-ground diesel fuel storage tank located adjacent to Basement Level B2. The diesel emergency generator along with the substations will be decommissioned in 2023 during the completion of Phase 2 (Center Buildings A and B) of the Proposed Project or Project Variant. Emissions from the natural gas boilers are included in the building natural gas emissions. Emissions from the electrical substations are included in the building electrical emissions. Emissions from the diesel storage tank are minimal and are therefore not quantified.

To calculate emissions, CalEEMod® was run for year 2020 using data on existing land uses, with adjustments from defaults as described below. The lifetime of a building is assumed to be 30 years from full build out. Full build out of the Project and Project Variant was assumed to be 2028 so corresponding lifetime operational emissions occur until 2057. GHG emissions for existing conditions are assumed to be constant between 2020 and 2057, to compare existing emissions to lifetime operational emissions for a full 30 years after the Proposed Project or Project Variant is fully built out. No adjustments are made to existing emissions post-2020, consistent with CEQA methodology. CalEEMod® outputs and detailed calculations for the existing conditions are presented in Appendix 2 and Tables Ops-1 through Ops-17 of Appendix 1.

3.1.1 Mobile

CalEEMod® estimates mobile GHG emissions from running, idling, and starting exhaust for the aggregated projected vehicle fleet in a given calendar year and county. Mobile emissions for existing conditions for trips associated with workers and visitors are estimated using CalEEMod® based on the land uses shown in **Table 1**. Trip rates for the land use sub-types are estimated using the AM and PM peak hour driveway counts from the travel demand memorandum from Kittelson & Associates,⁶ as shown in Table Ops-1a of Appendix 1. Trip lengths, trip types, and vehicle fleet mix are default values from CalEEMod®. Vehicle emission factors are the default values in CalEEMod®, which are obtained from EMFAC2014. Emissions are summarized in **Table 5**.

3.1.2 Energy

Energy emissions include indirect emissions from electricity used by buildings and direct natural gas combustion emissions. For each type of emissions, the historic energy

⁶ Kittelson & Associates. 2018. Travel Demand Memorandum – Final. March 9.

consumption is multiplied by the relevant emission factor per energy unit. Pacific Gas & Electric (PGE) utility bill data is used from 2012-2014 to reflect the existing condition energy use, as shown in Table Ops-2 of Appendix 1. PGE data is included in Appendix 3.

Indirect GHG emissions, which occur when electricity is used, are typically due to electricity generation from offsite power plant locations. Electrical power is supplied to the study area by PGE. To estimate emissions, the electricity usage is multiplied by the emission intensity factors for the GHGs. Emission intensity factors are GHG emission rates from a given source in terms of the amount of GHG released (lbs) per megawatt hour (MWh) of energy produced. The GHG emission factors for electricity use change over time due to the California Renewables Portfolio Standard (RPS), a program designed to meet statewide GHG reduction targets. The RPS requires grid electricity to come from 33% renewable sources by 2020. Ramboll used emission factors and renewables percentages for 2014 through 2016 from PGE to project future electricity intensity based on the State achieving the 2020 target for the baseline inventory. The default electricity intensity for methane (CH₄) and nitrous oxide (N₂O) were obtained from CalEEMod® Appendix D (using PGE values) and were conservatively not adjusted for future inventory years. This calculation is shown in Table Ops-3 of Appendix 1.

GHG emissions from natural gas combustion are generated from commercial usage (e.g., cooking and heating) and industrial usage (e.g., boilers). CalEEMod® default emission factors are used.

Energy emissions are summarized in **Table 5**.

3.1.3 Water and Wastewater

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Water for the study area is sourced from the San Francisco Public Utilities Commission (SFPUC). Additional emissions from wastewater treatment include CH₄ and N₂O, which are emitted directly from the wastewater.

Water use rates are based on CalEEMod® defaults for San Francisco County. The electricity intensity factor is the same as used for electricity emissions, as described in Section 3.1.2. Emissions are summarized in **Table 5**.

3.1.4 Solid Waste Disposal

Emissions from the transport and processing of solid waste are calculated using solid waste generation rates from CalEEMod® for San Francisco County. Indirect GHG emissions associated with waste disposal include CH₄ generation from the decomposition of waste and the CO₂ emissions associated with the combustion of CH₄, if applicable. GHG emissions associated with non-landfill diverted waste streams are not considered, because it is generally assumed that these diversions do not result in any appreciable amounts of GHG emissions when operated effectively. These waste diversion alternatives may result in differences in life-cycle emissions of GHGs, but it is not appropriate to combine life-cycle emissions for only one category of emissions. Biogenic CO₂ emissions were not included when CARB analyzed the GHG emissions inventory under Assembly Bill (AB) 32. Therefore, they are not included in the emissions inventory. Emissions are summarized in **Table 5**.

3.1.5 Area Sources

GHG emissions from area sources, such as architectural coatings and landscaping equipment, were estimated using CalEEMod® based on the type and size of land uses associated with the existing conditions. Emissions are summarized in **Table 5**.

3.1.6 Back-Up Generator

The site contains an existing 380 horsepower (HP) diesel generator that directly emits GHGs. Emissions are calculated as a product of engine horsepower, a CO₂ emission factor of 523.5 grams per horsepower hour (g/hp-hr) based on the CalEEMod® default factor, and 20 hours of annual operation for routine maintenance and testing based on the existing BAAQMD permit. Emissions calculations are shown in Table Ops-4 of Appendix 1.

Table 5: Existing Conditions Emissions Summary	
Category	CO₂e Emissions (MT/year)
Mobile	2,199
Electricity	671
Natural Gas	659
Water and Wastewater	167
Solid Waste	172
Area Sources	0.0174
Stationary Source	4.0
Total¹	3,873
Notes:	
¹ Sub-totals may not sum to the total due to rounding.	

3.2 GHG Emissions from Proposed Project and Project Variant

Project GHG emissions at the first full year of buildout (2028) would be 4,410 MT CO₂e/year, with mobile sources being the largest contributor to GHG emissions, followed by electricity and natural gas. Project Variant GHG emissions at the first full year of buildout (2028) would be 4,585 MT CO₂e/year, with mobile sources being the largest contributor to GHG emissions, followed by electricity and natural gas. An emissions summary at the full buildout year is shown in **Table 6**. Total GHG emissions from operation of the Proposed Project and Project Variant from 2020 to 2057 are shown in **Table 7**.

To calculate emissions, CalEEMod® was run for the buildout year of each phase, with adjustments from defaults and for future years as described below. CalEEMod® outputs and detailed calculations for the Proposed Project and Project Variant are presented in Appendix 2 and Tables Ops-1 through Ops-17 of Appendix 1.

3.2.1 Mobile

Mobile source emissions for the Proposed Project and Project Variant are calculated using the same methodology as described in Section 3.1.1 and represent emissions associated with resident, worker, and visitor trips. Emissions are based on daily vehicle trip data provided in the travel demand memorandum, with adjustments as shown in Table Ops-1b of Appendix 1. Trips were adjusted to remove double-counted internal trips, non-automobile trips, and double-counted carpool trips.

CO₂e emission factors from mobile sources are assumed to decrease over time to reflect fleet turnover and more efficient vehicle standards. Fleet-average emission factors through 2050 were calculated using EMFAC2017, and mobile emissions from the Proposed Project were adjusted to reflect the decreasing factors each year.⁷ The fleet-average mobile emission factors decrease over time due to fleet turnover and regulations such as Advanced Clean Cars (ACC). Table Ops-5 of Appendix 1 summarizes the fleet-average mobile CO₂e emission factors and percent change that was used in the yearly analysis. Tables Ops-6 and Ops-7 of Appendix 1 summarize the yearly mobile emissions for the Proposed Project and Project Variant, respectively.

3.2.2 Energy

As described in Section 3.1.2, energy emissions include indirect emissions from electricity used by buildings and direct natural gas combustion emissions. Energy emissions for the Proposed Project and Project Variant were quantified using the same methodology as for the existing conditions, but reflect buildings constructed to 2013 Title 24 Building Energy Efficiency Standards and incorporate conservation measures such as increased lighting, cooling, and water heating efficiencies, solar photovoltaic (PV) electricity generation, and solar hot water heating. Annual energy use totals for the Proposed Project and Project Variant are taken from the Energy Assessment and supporting CEQA Energy Inputs from Arup ("CEQA Energy Inputs").⁸ The Energy Assessment and supporting CEQA Energy Inputs report are attached in Appendix 3. Project and Project Variant energy use totals are shown in Table Ops-8 of Appendix 1. Energy use is further reduced through solar PV electricity generation and solar hot water heating, as described below and as shown in Table Ops-9 of Appendix 1.

3.2.2.1 Electricity

Indirect electricity emissions for the Proposed Project and Project Variant are estimated using the same methodology as described for the existing conditions in Section 3.1.2, except that intensity factors decrease each year up to 2050. The intensity factors assume that California achieves the State's Senate Bill (SB) 350 requirement to acquire 50 percent of energy from renewable sources by 2030.⁹ For 2050, it assumes that to achieve California's 2050 GHG goal of 80% GHG emissions below 1990 levels, the State will similarly achieve 80% RPS by 2050. This is consistent with the RPS assumptions in the CARB 2017 Climate Change Scoping Plan.¹⁰

⁷ Since these fleet-average emission factors were calculated outside of CalEEMod®, the newest version of the EMFAC model (EMFAC2017) was used to estimate percent change over time.

⁸ Arup. 2018. 3333 California St. CEQA Energy Calculations, Draft 2. January 12.

⁹ CEC. 2016. Clean Energy & Pollution Reduction Act SB 350 Overview. Available at: <http://www.energy.ca.gov/sb350/>. Accessed: July 2018.

¹⁰ CARB. 2017. 2017 Scoping Plan, Appendix D: PATHWAYS, pg. 12 (November). Available at: https://www.arb.ca.gov/cc/scopingplan/2030sp_appd_pathways_final.pdf

Energy use rates from the Energy Assessment that reflect 2013 Title 24 and energy conservation measures are used. Energy use is estimated by phase and calendar year based on the Energy Assessment's supporting data, with maximum energy use at full buildout. Renewable electricity due to rooftop solar PV is projected to offset a portion of the Proposed Project and Project Variant's electricity consumption and emissions. The amount of electricity offset by renewables is taken from the Energy Assessment and the CEQA Energy Inputs.

Emissions are summarized in Table 6. Tables Ops-5 and Ops-10 of Appendix 1 summarize the CO₂e intensity factors used in the yearly analysis and the yearly electricity emissions, respectively. Table Ops-9 of Appendix 1 summarizes the annual reductions due to solar PV.

3.2.2.2 Natural Gas

GHG emissions from natural gas combustion are generated from residential usage, commercial usage (e.g., cooking and heating) and industrial usage. Energy usage rates from the Energy Assessment that reflect 2013 Title 24 and energy conservation measures are used.

Energy use is estimated by phase and calendar year based on the Energy Assessment's supporting data, with maximum energy use at full buildout. Hot water generated by rooftop solar tubes is projected to offset a portion of the Proposed Project and Project Variant's natural gas consumption and emissions. The amount of natural gas offset by solar hot water is taken from the Energy Assessment and the CEQA Energy Inputs.

CalEEMod® default emission factors are used. Emissions are summarized in **Table 6**. Table Ops-10 of Appendix 1 summarizes the yearly natural gas emissions. Table Ops-9 of Appendix 1 summarizes the annual reductions due to solar water heating.

3.2.3 Water and Wastewater

Emissions from water and wastewater use for the Proposed Project and Project Variant are calculated using the same methodology as described in Section 3.1.3. Project-specific water use totals are estimated by phase and calendar year based on the Energy Assessment and supporting SFPUC's Water Supply Assessment¹¹ and CEQA Energy Inputs, with maximum annual water use at full buildout. Water use is shown in Table Ops-8 of Appendix 1. Indirect electricity emissions to supply, treat, and distribute water decrease over time as the electricity intensity factor decreases. The indirect electricity emissions per gallon of water are taken from the CEQA Energy Inputs. Direct and indirect emissions from wastewater are based on CalEEMod® defaults and are shown in Tables Ops-11 and Ops-12 of Appendix 1. Emissions are summarized in **Table 6**, with year-by-year emissions shown in Table Ops-13 of Appendix 1.

3.2.4 Solid Waste Disposal

Emissions from solid waste disposal for the Proposed Project and Project Variant are calculated using the same methodology as described in Section 3.1.4. Project-specific waste use totals are estimated by phase and calendar year based on the Energy Assessment and CEQA Energy Inputs, with maximum annual waste disposal at full buildout. Waste generation and emissions are shown in Table Ops-14 of Appendix 1. Emissions are summarized in **Table 6**.

¹¹ San Francisco Public Utilities Commission (SFPUC). 2017. Water Supply Assessment for the 3333 California Street Project. May 17.

3.2.5 Area

GHG emissions from area sources, such as architectural coatings and landscaping equipment, for the Proposed Project and Project Variant were calculated using the same methodology as described in Section 3.1.5. Emissions are based on the type and size of land uses associated with the Proposed Project and Project Variant. Emissions are summarized in **Table 6**.

3.2.6 Back-Up Generator

Operation of standby emergency engines will result in direct emissions of GHGs. The Proposed Project includes the installation of one 1,073 horsepower (HP) diesel generator. Emissions are calculated as a product of engine horsepower, a CO₂e emission factor of 523.5 g/hp-hr based on Tier 2 diesel equipment, and a limit of 50 hours of operation for routine maintenance and testing. This is consistent with the maximum allowed testing time from the Airborne Toxics Control Measure (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115) for a Tier 2 engine. The final BAAQMD permit for the generator may have a condition for fewer hours of operation for routine maintenance and testing (such as the 20 hours for the existing generator at the site); however, for this analysis we conservatively assumed the highest limit allowed by the ATCM. This is shown in Table Ops-4 of Appendix 1.

3.2.7 Vegetation Changes

The Project and Project Variant propose to create a net increase in new trees and grassland, which sequester GHG emissions over their lifetime. Emissions calculations are shown in Table Ops-15 of Appendix 1.

3.2.8 Emissions by Phase

The fraction of land use subtypes built in each phase is shown in Table Ops-16 of Appendix 1, while area and mobile source emissions by phase for each year of ongoing construction from 2022 through 2028 are presented in Table Ops-17 of Appendix 1.

3.3 Summary of Operational GHG Emissions

Operational source emissions are slightly different for the Project compared to the Project Variant due to differences in land use. Project and Project Variant operational emissions for full buildout are shown in **Table 6**.

Table 6: Project and Project Variant Operational Emissions for Full Build Out Year (2028)		
Category	Project CO₂e Emissions (MT)	Project Variant CO₂e Emissions (MT)
Mobile	3,339	3,396
Electricity	662	695
Natural Gas	568	638
Water and Wastewater	43	54
Solid Waste	37	32
Area Sources	29	39
Stationary Source	28	28
Solar Reductions	-284	-284
Vegetation Reductions	-13	-13
Total	4,410	4,585

4. MEASURES FOR OFFSETTING NET INCREASE GHG EMISSIONS

4.1 Overall Year-by-Year Emissions

The year-by-year summary comparison of the existing condition to the Proposed Project and Project Variant is shown in **Table 7**. Detailed yearly GHG emissions for construction and concurrent operations for the Project and Project Variant are presented in Tables Ops-6 and Ops-7 of Appendix 1. Project emissions would exceed existing condition emissions from 2026 through 2037. Project Variant emissions would exceed existing emissions from 2026 through 2043.

From 2020 to 2025, the Project and Project Variant would not be fully operational and emissions from phases 1 and 2 of operation would be below existing condition emissions. The added operation of phase 3 in 2026 would increase the Project and Project Variant emissions above existing condition emissions. By 2038 for the Proposed Project and by 2044 for the Project Variant, with anticipated reductions from the RPS and fleet turnover, Project and Project Variant emissions would be below existing emissions.

Total construction emissions would be 4,273 MT for both the Project and the Project Variant. Total gross operational emissions would be 3,703MT for the Project and 6,235 MT for the Project Variant. Total gross operational emissions for the lifetime of the Project or Project Variant do not include any benefits or credits from any years where the existing conditions are higher than Project or Project Variant emissions.

Table 7: Year-by-Year Comparison of GHG Emissions						
Year	GHG Emissions (MT CO₂e/year)					
	Existing Condition Emissions	Project Operational Emissions	Project Operational Difference¹	Project Variant Operational Emissions	Project Variant Operational Difference¹	Construction Emissions²
2020	3,873	0	-3,873	0	-3,873	541
2021	3,873	0	-3,873	0	-3,873	733
2022	3,873	340	-3,533	331	-3,542	732
2023	3,873	1,235	-2,637	1,201	-2,672	752
2024	3,873	1,733	-2,140	1,678	-2,195	564
2025	3,873	1,858	-2,015	1,832	-2,041	664
2026	3,873	4,481	609	4,669	796	277
2027	3,873	4,496	623	4,674	801	8
2028	3,873	4,410	537	4,585	712	--

2046	3,873	3,683	-189	3,832	-41	--
2047	3,873	3,677	-196	3,824	-49	--
2048	3,873	3,658	-214	3,805	-68	--
2049	3,873	3,641	-232	3,786	-87	--
2050	3,873	3,625	-248	3,769	-104	--
2051	3,873	3,625	-248	3,769	-104	--
2052	3,873	3,625	-248	3,769	-104	--
2053	3,873	3,625	-248	3,769	-104	--
2054	3,873	3,625	-248	3,769	-104	--
2055	3,873	3,625	-248	3,769	-104	--
2056	3,873	3,625	-248	3,769	-104	--

Table 7: Year-by-Year Comparison of GHG Emissions

Year	GHG Emissions (MT CO ₂ e/year)					
	Existing Condition Emissions	Project Operational Emissions	Project Operational Difference ¹	Project Variant Operational Emissions	Project Variant Operational Difference ¹	Construction Emissions ²
2057	3,873	3,625	-248	3,769	-104	--
Total Gross Emissions (MT)²	--	--	3,703	--	6,235	4,273
Notes: ¹ Where existing emissions are greater than operational emissions, no credit has been taken in the "Total Gross Operational Emissions" summation. ² Project and Project Variant emissions for 2020 through 2021 include only construction-related emissions. Project and Project Variant emissions for 2022 through 2027 include both construction-related and operational emissions. All construction emissions are considered to be a net increase for those analysis years and apply to both the Proposed Project and Project Variant.						

4.2 Mitigation Measures/Voluntary Carbon Credits/Conclusions

To offset the increase in GHG emissions from construction in 2020 through 2027 and from operation in 2026 through 2037 (Project) and 2043 (Project Variant), the project sponsor commits to measures to ensure there will be no net additional GHG emissions associated with the Project or Project Variant. This could be achieved through on-site mitigation measures such as installing additional solar panels or electric vehicle charging stations, or through the purchase of qualified GHG credits.

APPENDIX 1 RAMBOLL SUPPORTING TABLES

Table Con-1. Construction Phase Duration by Year
3333 California St AB900
San Francisco, CA

Phase	Phase Name	Start Date	End Date	Total number of work days	Construction phase duration by year ^{1,2}							
					2020	2021	2022	2023	2024	2025	2026	2027
1	Masonic/Euclid	3/2/2020	8/19/2022	645	34%	41%	26%	--	--	--	--	--
2	Center Building A/B	9/10/2021	8/31/2023	515	--	16%	51%	34%	--	--	--	--
3	Plaza A/Plaza B/ Walnut	12/4/2022	11/18/2025	773	--	--	3%	34%	34%	30%	--	--
4	Mayfair/Townhouse/Euclid Park	5/22/2025	1/12/2027	429	--	--	--	--	--	37%	61%	2%
TOTAL				2,362								

Notes:

¹ Construction duration per year is calculated as construction duration of phase in a year/total construction duration.

² Total percentages in the table may not add up to 100% due to rounding.

Table Con-2. Project Off-Road Diesel Construction Equipment List
3333 California Street
San Francisco, California

Subphase¹	Equipment Type	Number	Hours/day	Horsepower	Load Factor	Phase
Exterior	Aerial Lifts	2	8	63	0.31	All
Demolition	Air Compressors	2	5	78	0.48	All
Excavation	Crawler Tractors with Rippers	1	8	208	0.43	All
Excavation	Excavators	2	8	163	0.38	All
Excavation	Excavators with Hoe Ram	2	8	163	0.38	All
Exterior	Forklifts	1	8	89	0.20	All
Exterior	Pavers	1	8	126	0.42	Street Paving ¹
Exterior	Paving Equipment	1	8	131	0.36	Street Paving ¹
Structure	Pumps	1	8	84	0.74	Pouring Days ²
Exterior	Rollers	1	6	81	0.38	Street Paving ¹

Total		3,182	432	567	520	552	447	494	167	5

Notes:

- ¹ Yearly emissions split by fraction of phase in each year.
- ² Emissions are calculated based on default CalEEMod® off-road construction equipment tiers for each piece of equipment in the emissions year modeled. A construction equipment list and hours of operation for each piece of equipment for each phase were provided by the Project Sponsor.
- ³ Total number of hauling, concrete, and delivery trips and trip distances are discussed in Table Con-5.

Abbreviations:

- CO₂e - carbon dioxide equivalents
- MT - metric ton

	300.5	289.5	221.1	271.453	lbs CO ₂ e/MWh delivered
2050 RPS (80%) ¹⁰	119.2	114.8	87.4	107.6	lbs CO ₂ /MWh delivered
	121.7	117.3	90.0	110.1	lbs CO ₂ e/MWh delivered

Notes:

¹ Total CO₂ emission factor from The Climate Registry. Available at: <https://www.theclimateregistry.org/our-members/cris-public-reports/>. Accessed: June 2018.

² Percent of total energy from eligible renewables is from the PGE 2015 Corporate Responsibility Report. Available at: http://www.pgecorp.com/corp_responsibility/reports/2015/PGE_CRSR_2015.pdf.

³ Percent of total energy from eligible renewables is from the PGE 2016 Corporate Responsibility Report. Available at: http://www.pgecorp.com/corp_responsibility/reports/2016/PGE_CRSR_Environment.pdf.

⁴ Percent of total energy from eligible renewables is from the PGE 2017 Corporate Responsibility Report. Available at: http://www.pgecorp.com/corp_responsibility/reports/2017/assets/PGE_CRSR_2017_Environment.pdf.

⁵ This average uses the most recent three years of data.

⁶ The emissions metric presented here is calculated based on the total CO₂ intensity factor divided by the percent of energy delivered from non-renewable sources.

⁷ The intensity factor for total energy delivered is estimated by multiplying the percentage of energy delivered from non-renewable energy by the CO₂ emissions per total non-renewable energy metric calculated above. The estimate provided here and the energy reports issued by PGE assume that renewable energy sources do not result in any CO₂ emissions.

⁸ Global Warming Potentials (GWP) are based on the IPCC Fourth Assessment Report. CH₄ and N₂O emission factors are from the CalEEMod version 2016.3.2 defaults for PGE, and are conservatively assumed not to change from these estimates. As more renewable energy is integrated into the electricity grid, these intensity factors will also decrease.

⁹ Emission factor presented here is 50% projected RPS for 2030 consistent with SB 32 and SB 350. Available at: <http://www.energy.ca.gov/sb350/>.

¹⁰ The projected 2050 RPS target is based on 80% RPS in 2050, consistent with the CARB Final 2017 Scoping Plan, Appendix D PATHWAYS, pg 12 (November, 2017). Available at: https://www.arb.ca.gov/cc/scopingplan/2030sp_appd_pathways_final.pdf

Abbreviations:

CARB - California Air Resources Board
CO₂ - carbon dioxide
GHG - greenhouse gases
IPCC - Intergovernmental Panel on Climate Change
lbs - pounds

MWh - megawatt-hour
RPS - Renewable Portfolio Standards
PGE - Pacific Gas & Electric
SB - Senate Bill

Table Ops-4. Stationary Source Emissions
3333 California St AB900
San Francisco, California

Stationary Source	Engine Tier	HP	Fuel Type	Operation ¹	CO ₂ e Emission Factor ²	CO ₂ e Emissions
				hrs/yr	g/bhp-hr	MT/yr
Existing Generator	None	380	Diesel	20	523.5	4.0
Proposed Generator	Tier 2	1,073	Diesel	50	523.5	28.1

Notes:

¹ Operation of existing generator is 20 hours, based on the existing BAAQMD Permit. Operation of proposed generator is assumed to be 50 hours per year for routine maintenance and testing. This is consistent with the Maximum Allowed Testing Time from the Airborne Toxics Control Measure for Stationary Compression Ignition Engines (17 CCR 93115) for a Tier 2 engine.

² Generator emission factors are from CalEEMod and do not depend on engine tier.

Abbreviations:

BAAQMD - Bay Area Air Quality Management District

bhp - brake-horsepower

CO₂e - carbon dioxide equivalents

g - grams

hrs - hours

MT - metric tons

yr - year

Notes:

- ¹ Uses a linear interpretation between the electricity intensity factors derived in Table Ops-3.
- ² Approximation of the decrease in vehicle emission factors over time, based on San Francisco fleet-average emission factors from 2020-2050. Assumes no change after 2050, since EMFAC2017 does not project past 2050.
- ³ Assume all buildings become operational as soon as phase is constructed, based on percent of operational land uses by Phase as shown in Table Ops-16. The only changes in emissions are due to transportation and electricity becoming cleaner.
- ⁴ Assumes generator operational with phase 2

Abbreviations:

AB - Assembly Bill	g - gram	MWh - megawatt-hour
CARB - California Air Resources Board	lb - pound	MT - metric ton
CO ₂ e - carbon dioxide equivalent	mi - mile	RPS - Renewables Portfolio Standard

Notes:

- ¹ Uses a linear interpretation between the electricity intensity factors derived in Table Ops-3.
² Does not include the benefits of solar photovoltaics or solar water heating. These are shown in Table Ops-9.
³ While construction is underway, energy use is based on the percent of operational land uses by Phase as shown in Table Ops-16.

Abbreviations:CO₂e - carbon dioxide equivalents

EF - emission factor

lb - pound

kBTU - thousand British Thermal Units

MT - metric ton

MWh - megawatt-hour

2057	110	111	5.6	29	139	6.9	36

Notes:

¹ Electricity use is calculated based on phased water use and usage factors from the Energy Assessment (SWCA, July 2018) and supporting Water Supply Assessment (San Francisco Water Power Sewer, June 2017) and CEQA Energy Inputs (Arup, 2018). While construction is underway, water use is based on the percent of operational land uses by Phase as shown in Table Ops-16. Electricity Usage Factors taken from the Energy Assessment are shown below.

Indoor (kwh/gal)	Outdoor (kwh/gal)
0.0054	0.0035

² Emissions from wastewater treatment are calculated in Table Ops-12.

Abbreviations:

CO₂e - carbon dioxide equivalents
 lb - pounds

MT - metric tons
 MWh - megawatt-hour

Table Ops-14. Waste Generation and Emissions
3333 California St AB900
San Francisco, California

Space Type	Project		Variant	
	Waste Generated	CO ₂ e Emissions ¹	Waste Generated	CO ₂ e Emissions ¹
	Cubic yards/day	MT/yr	Cubic yards/day	MT/yr
Residential	18.3	12.9	19.8	13.9
Commercial	34	23.9	25.5	17.9
Total	52.5	36.8	45.3	31.8

Land Use ²	Total CO ₂ e (MT/yr)	
	Project	Variant
Apartments	13	14
Day-Care Center	3.0	4.1
Parking Structure	0	0
General Office Building	10	0
Parking Lot	0	0
Retail	11	14

Year	Total CO ₂ e (MT/yr) ³	
	Project	Variant
2022	2.0	1.8
2023	6.9	6.1
2024	9.8	8.4
2025	13	11
2026	36	31
2027	37	32
2028	37	32

Notes:

¹ Total waste emissions are from CEQA Energy Inputs (ARUP, January 2018).

² Commercial waste generation was split by total land uses among daycare, office, and retail based on square footage.

³ While construction is underway, waste is based on the percent of operational land uses by Phase as shown in Table Ops-16.

Abbreviations:

CO₂e - carbon dioxide equivalents

MT - metric tons

yr - year

Table Ops-15. GHG Emissions Sequestration from Vegetation
3333 California St AB900
San Francisco, California

Number of Net New Trees¹	Units	Broad Species Class	Annual CO₂ accumulation per tree (MT CO₂/tree/year)²	Project GHG Sequestration (MT CO₂e)
162	Trees	Miscellaneous	-0.0354	-115
Number of Net New Acres¹	Units	Vegetation Land Use Subtype	Annual CO₂ accumulation per acre (MT CO₂/acre/year)²	Project GHG Sequestration (MT CO₂e)
1.63	Acres	Grassland	-4.31	-140
Total, Trees and Acres Covered				-255

Notes:

- ¹. Number of net new trees from Project Description. Total number of trees - number of existing trees
- ². From CalEEMod User's Guide Appendix A.
- ³. All vegetation types are assumed to have a growing period of 20 years.

Abbreviations:

CO₂e - carbon dioxide equivalents

MT - metric tones

Urbanization	Urban	Wind Speed (m/s)	4.6	Precipitation Freq (Days)	64
Climate Zone	5			Operational Year	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	342.03	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

3333 CalSF Project Case Masonic/Euclid Project - San Francisco County, Annual

Project Characteristics - CO2 intensity factor for 2022.

Land Use - Land uses for Phase 1 construction (Masonic/Euclid)

Construction Phase - No construction in this run

Grading -

Vehicle Trips - Updated with trip rates from traffic memo

Woodstoves - No woodstoves or wood fireplaces

Consumer Products - Updated ROG factor

Energy Use - Not modeling energy sources of operational emissions

Water And Wastewater - Not modeling water and wastewater sources of operational emissions

Solid Waste - Not modeling solid waste sources of operational emissions

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Enclosed Parking with Elevator	87.98	1000sqft	2.02	87,977.00	0
Parking Lot	3.94	1000sqft	0.09	3,936.00	0
City Park	1.42	Acre	1.42	61,855.20	0
Apartments Mid Rise	196.00	Dwelling Unit	5.16	266,251.00	561
Strip Mall	4.29	1000sqft	0.10	4,287.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	4.6	Precipitation Freq (Days)	64
Climate Zone	5			Operational Year	2022
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	342.03	CH4 Intensity (lb/MWhr)	0.029	N2O Intensity (lb/MWhr)	0.006

1.3 User Entered Comments & Non-Default Data

3333 CalSF Masonic/Euclid Variant - San Francisco County, Annual

Project Characteristics - CO2 intensity factor for 2022.

Land Use - Land uses for Phase 1 construction (Masonic/Euclid)

Construction Phase - No construction in this run.

Grading -

Vehicle Trips - Updated trip rates from traffic memo

Woodstoves - No woodstoves or wood fireplaces

Consumer Products - Updated ROG Factor

Energy Use - Not modeling energy sources of operational emissions

Water And Wastewater - Not modeling water and wastewater sources of operational emissions

Solid Waste - Not modeling solid waste sources of operational emissions

CalEEMod Version: CalEEMod.2016.3.2

3333 CalSF - Phase 2 Project - Center Building AB - San Francisco County, Annual

Project Characteristics - CO2 intensity factor in 2023 accounting for RPS

Land Use - Phase 2 land uses from Project sponsor

Construction Phase - No construction emissions in this run.

Grading - no grading

Vehicle Trips - Updated trip rates from trip memo

Woodstoves - No woodstoves or wood fireplaces

Consumer Products - Updated ROG factor

Energy Use - Not modeling energy sources of operational emissions.

Water And Wastewater - Not modeling water and wastewater sources of operational emissions.

Solid Waste - Not modeling solid waste sources of operational emissions.
